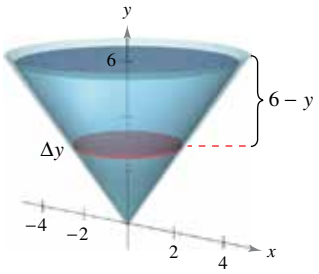
Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

23. Pumping Water An open tank has the shape of a right circular cone (see figure). The tank is 8 feet across the top and 6 feet high. How much work is done in emptying the tank by pumping the water over the top edge?



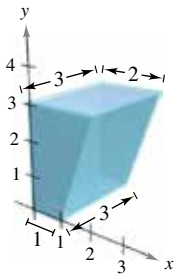
24. Pumping Water Water is pumped in through the bottom of the tank in Exercise 23. How much work is done to fill the tank

(a) to a depth of 2 feet?

(b) from a depth of 4 feet to a depth of 6 feet?

25. Pumping Water A hemispherical tank of radius 6 feet is positioned so that its base is circular. How much work is required to fill the tank with water through a hole in the base when the water source is at the base?

26. Pumping Diesel Fuel The fuel tank on a truck has trapezoidal cross sections with the dimensions (in feet) shown in the figure. Assume that the engine is approximately 3 feet above the top of the fuel tank and that diesel fuel weighs approximately 53.1 pounds per cubic foot. Find the work done by the fuel pump in raising a full tank of fuel to the level of the engine.



Pumping Gasoline **In Exercises 27 and 28, find the work done in pumping gasoline that weighs 42 pounds per cubic foot.**

27. A cylindrical gasoline tank 3 feet in diameter and 4 feet long is carried on the back of a truck and is used to fuel tractors. The axis of the tank is horizontal. The opening on the tractor tank is 5 feet above the top of the tank in the truck. Find the work done in pumping the entire contents of the fuel tank into the tractor.

28. The top of a cylindrical gasoline storage tank at a service station is 4 feet below ground level. The axis of the tank is horizontal and its diameter and length are 5 feet and 12 feet, respectively. Find the work done in pumping the entire contents of the full tank to a height of 3 feet above ground level.

Winding a Chain **In Exercises 29–32, consider a 20-foot chain that weighs 3 pounds per foot hanging from a winch 20 feet above ground level. Find the work done by the winch in winding up the specified amount of chain.**

29. Wind up the entire chain.

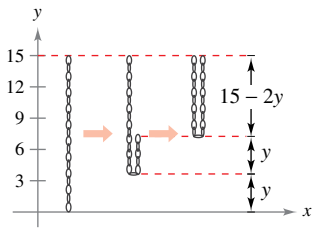
30. Wind up one-third of the chain.

31. Run the winch until the bottom of the chain is at the 10-foot level.

32. Wind up the entire chain with a 500-pound load attached to it.

Lifting a Chain **In Exercises 33 and 34, consider a 15-foot hanging chain that weighs 3 pounds per foot. Find the work done in lifting the chain vertically to the indicated position.**

33. Take the bottom of the chain and raise it to the 15-foot level, leaving the chain doubled and still hanging vertically (see figure).



34. Repeat Exercise 33 raising the bottom of the chain to the 12-foot level.

Exploring Concepts

35. Does it take any work to push an object that does not move? Explain.

36. In Example 1, 200 foot-pounds of work was needed to lift the 50-pound object 4 feet vertically off the ground. Does it take an additional 200 foot-pounds of work to lift the object another 4 feet vertically? Explain your reasoning.

37. Newton's Law of Universal Gravitation Consider two particles of masses m_1 and m_2. The position of the first particle is fixed, and the distance between the particles is a units. Using Newton's Law of Universal Gravitation, find the work needed to move the second particle so that the distance between the particles increases to b units.

38. Conjecture Use Newton's Law of Universal Gravitation to make a conjecture about what happens to the force of attraction between two particles when the distance between them is multiplied by a positive number n.

39. Electric Force Two electrons repel each other with a force that varies inversely as the square of the distance between them. One electron is fixed at the point $(2, 4)$. Find the work done in moving the second electron from $(-2, 4)$ to $(1, 4)$.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

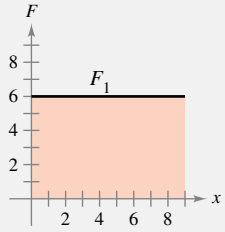
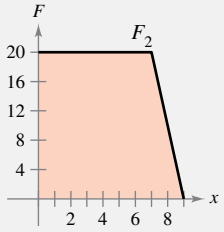
40. HOW DO YOU SEE IT? The graphs show the force F_i (in pounds) required to move an object 9 feet along the x-axis. Order the force functions from the one that yields the least work to the one that yields the most work without doing any calculations. Explain your reasoning.

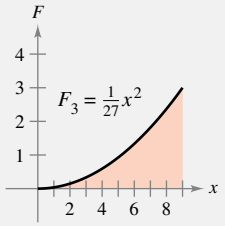
(a)



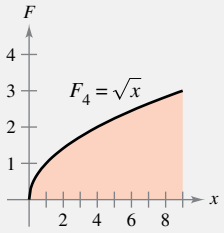
(b)



(c)



(d)



41. Ordering Forces Verify your answer to Exercise 40 by calculating the work for each force function.

42. Comparing Work Order the following from least to greatest in terms of total work done.

(a) A 60-pound box of books is lifted 3 feet.

(b) An 80-pound box of books is lifted 1 foot, and then a 40-pound box of books is lifted 1 foot.

(c) A 60-pound box is held 3 feet in the air for 3 minutes.

Boyle's Law **In Exercises 43 and 44, find the work done by the gas for the given volume and pressure. Assume that the pressure is inversely proportional to the volume. (See Example 6.)**

43. A quantity of gas with an initial volume of 2 cubic feet and a pressure of 1000 pounds per square foot expands to a volume of 3 cubic feet.

44. A quantity of gas with an initial volume of 1 cubic foot and a pressure of 2500 pounds per square foot expands to a volume of 3 cubic feet.

Hydraulic Press **In Exercises 45–48, use the integration capabilities of a graphing utility to approximate the work done by a press in a manufacturing process. A model for the variable force F (in pounds) and the distance x (in feet) over which the press moves are given.**

	Force	Interval
45.	$F(x) = 1000[1.8 - \ln(x + 1)]$	$0 \le x \le 5$
46.	$F(x) = \dfrac{e^{x^2} - 1}{100}$	$0 \le x \le 4$
47.	$F(x) = 100x\sqrt{125 - x^3}$	$0 \le x \le 5$
48.	$F(x) = 1000 \sinh x$	$0 \le x \le 2$

49. Modeling Data The hydraulic cylinder on a woodsplitter has a 4-inch bore (diameter) and a stroke of 2 feet. The hydraulic pump creates a maximum pressure of 2000 pounds per square inch. Therefore, the maximum force created by the cylinder is $2000(\pi \cdot 2^2) = 8000\pi$ pounds.

(a) Find the work done through one extension of the cylinder, given that the maximum force is required.

(b) The force exerted in splitting a piece of wood is variable. Measurements of the force obtained in splitting a piece of wood are shown in the table. The variable x measures the extension of the cylinder in feet, and F is the force in pounds. Use the regression capabilities of a graphing utility to find a fourth-degree polynomial model for the data. Plot the data and graph the model.

x	0	$\frac{1}{3}$	$\frac{2}{3}$	1	$\frac{4}{3}$	$\frac{5}{3}$	2
$F(x)$	0	20,000	22,000	15,000	10,000	5000	0

(c) Use the model in part (b) to approximate the extension of the cylinder when the force is maximum.

(d) Use the model in part (b) to approximate the work done in splitting the piece of wood.

SECTION PROJECT

Pyramid of Khufu

The Pyramid of Khufu (also known as the Great Pyramid of Giza) is the oldest of the Seven Wonders of the Ancient World. It is also the tallest of the three Giza pyramids in Egypt. The pyramid took 20 years to construct, ending around 2560 B.C. When it was built, it had a height of 481 feet and a square base with side lengths of 756 feet. Assume that the stone used to build it weighed 150 pounds per cubic foot.

(a) How much work was required to build the pyramid? Consider only vertical distance.

(b) Suppose that the pyramid builders worked 12 hours each day for 330 days a year for 20 years and that each worker did 200 foot-pounds of work per hour. Approximately how many workers were needed to build the pyramid?

7.6 Moments, Centers of Mass, and Centroids

GO DIGITAL

- Define mass.
- Find the center of mass in a one-dimensional system.
- Find the center of mass in a two-dimensional system.
- Find the center of mass of a planar lamina.
- Use the Theorem of Pappus to find the volume of a solid of revolution.

Mass

In this section, you will study several important applications of integration that are related to mass. Mass is a measure of a body's resistance to changes in motion, and it is independent of the particular gravitational system in which the body is located. However, because so many applications involving mass occur on Earth's surface, an object's mass is sometimes equated with its weight. This is not technically correct. Weight is a type of force and as such is dependent on gravity. Force and mass are related by the equation

$$\text{Force} = (\text{mass})(\text{acceleration}).$$

The table below lists some commonly used measures of mass and force, together with their conversion factors.

System of Measurement	Measure of Mass	Measure of Force
U.S.	Slug	Pound $=$ (slug)(ft/sec^2)
International	Kilogram	Newton $=$ (kilogram)(m/sec^2)
C-G-S	Gram	Dyne $=$ (gram)(cm/sec^2)
Conversions:		
1 pound $\approx$ 4.44822 newtons		1 slug $\approx$ 14.59390 kilogram
1 newton $\approx$ 0.22481 pound		1 kilogram $\approx$ 0.0685218 slug
1 dyne $\approx$ 0.0000022481 pound		1 gram $\approx$ 0.0000685218 slug
1 dyne $=$ 0.00001 newton		1 foot $=$ 0.3048 meter

EXAMPLE 1 Mass on the Surface of Earth

Find the mass (in slugs) of an object whose weight at sea level is 1 pound.

Solution Use 32 feet per second per second as the acceleration due to gravity.

$$\text{Mass} = \frac{\text{force}}{\text{acceleration}} \qquad \text{Force} = (\text{mass})(\text{acceleration})$$

$$= \frac{1 \text{ pound}}{32 \text{ feet per second per second}}$$

$$= 0.03125 \frac{\text{pound}}{\text{foot per second per second}}$$

$$= 0.03125 \text{ slug}$$

Because many applications involving mass occur on Earth's surface, this amount of mass is called a **pound mass.** ■

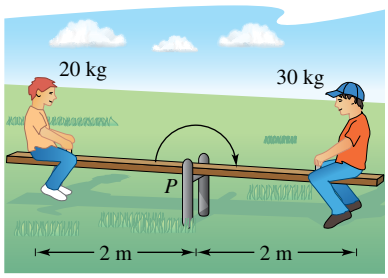
Center of Mass in a One-Dimensional System

You will now consider two types of moments of a mass—the **moment about a point** and the **moment about a line.** To define these two moments, consider an idealized situation in which a mass m is concentrated at a point. If x is the distance between this point mass and another point P, then the **moment of m about the point P** is

$$\text{Moment} = mx$$

and x is the **length of the moment arm.**



The seesaw will balance when the left and the right moments are equal.
Figure 7.53

The concept of moment can be demonstrated simply by a seesaw, as shown in Figure 7.53. A child of mass 20 kilograms sits 2 meters to the left of fulcrum P, and an older child of mass 30 kilograms sits 2 meters to the right of P. From experience, you know that the seesaw will begin to rotate clockwise, moving the larger child down. This rotation occurs because the moment produced by the child on the left is less than the moment produced by the child on the right.

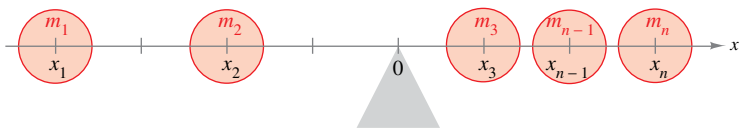
$$\text{Left moment} = (20)(2) = 40 \text{ kilogram-meters}$$
$$\text{Right moment} = (30)(2) = 60 \text{ kilogram-meters}$$

To balance the seesaw, the two moments must be equal. For example, if the larger child moved to a position $\frac{4}{3}$ meters from the fulcrum, then the seesaw would balance, because each child would produce a moment of 40 kilogram-meters.

To generalize this, you can introduce a coordinate line on which the origin corresponds to the fulcrum, as shown in Figure 7.54. Several point masses are located on the x-axis. The measure of the tendency of this system to rotate about the origin is the **moment about the origin,** and it is defined as the sum of the n products $m_i x_i$. The moment about the origin is denoted by M_0 and can be written as

$$M_0 = m_1x_1 + m_2x_2 + \cdots + m_nx_n.$$

If M_0 is 0, then the system is said to be in **equilibrium.**



If $m_1x_1 + m_2x_2 + \cdots + m_nx_n = 0$, then the system is in equilibrium.
Figure 7.54

REMARK Note the use of the summation properties

$$\sum_{i=1}^{n} ka_i = k\sum_{i=1}^{n} a_i$$

where k is a constant, and

$$\sum_{i=1}^{n} (a_i \pm b_i) = \sum_{i=1}^{n} a_i \pm \sum_{i=1}^{n} b_i$$

to rewrite and solve for $\bar{x}$.

For a system that is not in equilibrium, the **center of mass** is defined as the point $\bar{x}$ at which the fulcrum could be relocated to attain equilibrium. If the system were translated $\bar{x}$ units, then each coordinate x_i would become

$$(x_i - \bar{x}) \qquad \text{Translate each } x\text{-coordinate } \bar{x} \text{ units.}$$

and because the moment of the translated system is 0, you have

$$\sum_{i=1}^{n} m_i(x_i - \bar{x}) = 0 \quad \Rightarrow \quad \sum_{i=1}^{n} m_ix_i - \sum_{i=1}^{n} m_i\bar{x} = 0.$$

Solving for $\bar{x}$ produces

$$\bar{x} = \frac{\sum_{i=1}^{n} m_ix_i}{\sum_{i=1}^{n} m_i} = \frac{\text{moment of system about origin}}{\text{total mass of system}}.$$

When $m_1x_1 + m_2x_2 + \cdots + m_nx_n = 0$, the system is in equilibrium.

GO DIGITAL

Moment and Center of Mass: One-Dimensional System

Let the point masses $m_1, m_2, \ldots, m_n$ be located at $x_1, x_2, \ldots, x_n$.

1. The **moment about the origin** is

$$M_0 = m_1x_1 + m_2x_2 + \cdots + m_nx_n.$$

2. The **center of mass** is

$$\bar{x} = \frac{M_0}{m}$$

where $m = m_1 + m_2 + \cdots + m_n$ is the **total mass** of the system.

EXAMPLE 2 The Center of Mass of a Linear System

Find the center of mass of the linear system shown in Figure 7.55.

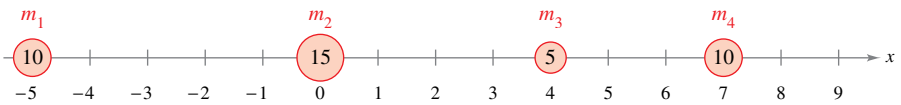

Figure 7.55

Solution The moment about the origin is

$$\begin{aligned} M_0 &= m_1x_1 + m_2x_2 + m_3x_3 + m_4x_4 \\ &= 10(-5) + 15(0) + 5(4) + 10(7) && \text{See Figure 7.55.} \\ &= -50 + 0 + 20 + 70 \\ &= 40. && \text{Moment about origin} \end{aligned}$$

Because the total mass of the system is

$$m = 10 + 15 + 5 + 10 = 40 \qquad \text{Total mass}$$

the center of mass is

$$\bar{x} = \frac{M_0}{m} = \frac{40}{40} = 1. \qquad \text{Center of mass}$$

Note that the point masses will be in equilibrium when the fulcrum is located at $x = 1$. ■

Rather than defining the moment of a mass, you could define the moment of a *force*. In this context, the center of mass is called the **center of gravity.** Consider a system of point masses $m_1, m_2, \ldots, m_n$ that is located at $x_1, x_2, \ldots, x_n$. Then, because

$$\text{force} = (\text{mass})(\text{acceleration})$$

the total force of the system is

$$F = m_1a + m_2a + \cdots + m_na = ma.$$

The **torque** (moment) about the origin is

$$T_0 = (m_1a)x_1 + (m_2a)x_2 + \cdots + (m_na)x_n = M_0a$$

and the **center of gravity** is

$$\frac{T_0}{F} = \frac{M_0a}{ma} = \frac{M_0}{m} = \bar{x}.$$

So, the center of gravity and the center of mass have the same location.

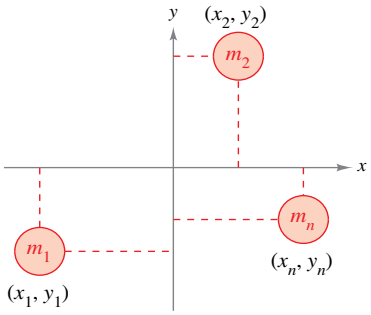
Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Center of Mass in a Two-Dimensional System

To extend the concept of moment to two dimensions, consider a system of masses located in the xy-plane at the points

$$(x_1, y_1), (x_2, y_2), \ldots, (x_n, y_n)$$

as shown in Figure 7.56. Rather than defining a single moment (with respect to the origin), two moments are defined—one with respect to the x-axis and one with respect to the y-axis.



In a two-dimensional system, there is a moment about the y-axis M_y and a moment about the x-axis M_x.
Figure 7.56

Moments and Center of Mass: Two-Dimensional System

Let the point masses $m_1, m_2, \ldots, m_n$ be located at $(x_1, y_1), (x_2, y_2), \ldots, (x_n, y_n)$.

1. The **moment about the y-axis** is
$$M_y = m_1x_1 + m_2x_2 + \cdots + m_nx_n.$$
2. The **moment about the x-axis** is
$$M_x = m_1y_1 + m_2y_2 + \cdots + m_ny_n.$$
3. The **center of mass** $(\bar{x}, \bar{y})$, or **center of gravity,** is
$$\bar{x} = \frac{M_y}{m} \quad \text{and} \quad \bar{y} = \frac{M_x}{m}$$
where
$$m = m_1 + m_2 + \cdots + m_n$$
is the **total mass** of the system.

The moment of a system of masses in the plane can be taken about any horizontal or vertical line. In general, the moment about a line is the sum of the product of the masses and the *directed distances* from the points to the line.

$$\text{Moment} = m_1(y_1 - b) + m_2(y_2 - b) + \cdots + m_n(y_n - b) \quad \text{Horizontal line } y = b$$
$$\text{Moment} = m_1(x_1 - a) + m_2(x_2 - a) + \cdots + m_n(x_n - a) \quad \text{Vertical line } x = a$$

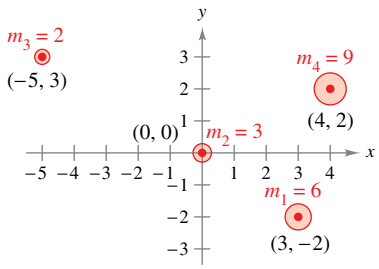


Figure 7.57

EXAMPLE 3 The Center of Mass of a Two-Dimensional System

Find the center of mass of a system of point masses $m_1 = 6$, $m_2 = 3$, $m_3 = 2$, and $m_4 = 9$, located at $(3, -2)$, $(0, 0)$, $(-5, 3)$, and $(4, 2)$, respectively. (See Figure 7.57.)

Solution First, find m, M_y, and M_x.

$$m = 6 + 3 + 2 + 9 = 20 \quad \text{Total mass of system}$$
$$M_y = 6(3) + 3(0) + 2(-5) + 9(4) = 44 \quad \text{Moment about } y\text{-axis}$$
$$M_x = 6(-2) + 3(0) + 2(3) + 9(2) = 12 \quad \text{Moment about } x\text{-axis}$$

Next, use these values to find

$$\bar{x} = \frac{M_y}{m} = \frac{44}{20} = \frac{11}{5}$$

and

$$\bar{y} = \frac{M_x}{m} = \frac{12}{20} = \frac{3}{5}.$$

So, the center of mass is $\left(\frac{11}{5}, \frac{3}{5}\right)$.

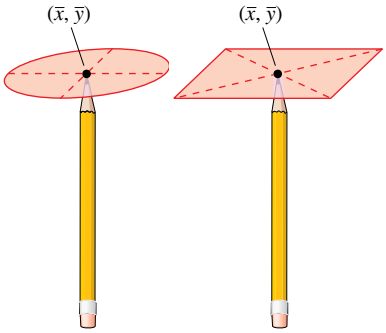
Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.



You can think of the center of mass $(\bar{x}, \bar{y})$ of a lamina as its balancing point. For a circular lamina, the center of mass is the center of the circle. For a rectangular lamina, the center of mass is the center of the rectangle.

Figure 7.58

Center of Mass of a Planar Lamina

So far in this section, you have assumed the total mass of a system to be distributed at discrete points in a plane or on a line. Now consider a thin, flat plate of material of constant density called a **planar lamina** (see Figure 7.58). **Density** is a measure of mass per unit of volume, such as grams per cubic centimeter. For planar laminas, however, density is considered to be a measure of mass per unit of area. Density is denoted by ρ, the lowercase Greek letter rho.

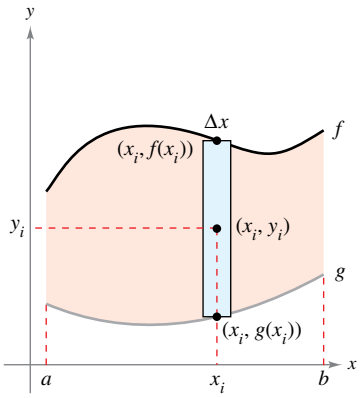
Consider an irregularly shaped planar lamina of uniform density ρ, bounded by the graphs of $y = f(x)$, $y = g(x)$, and $a \le x \le b$, as shown in Figure 7.59. The mass of this region is

$$\begin{aligned} m &= (\text{density})(\text{area}) \\ &= \rho \int_a^b [f(x) - g(x)]\,dx \\ &= \rho A \end{aligned}$$

where A is the area of the region. To find the center of mass of this lamina, partition the interval $[a, b]$ into n subintervals of equal width Δx. Let x_i be the center of the ith subinterval. You can approximate the portion of the lamina lying in the ith subinterval by a rectangle whose height is $h = f(x_i) - g(x_i)$. Because the density of the rectangle is ρ, its mass is

$$m_i = (\text{density})(\text{area}) = \rho[f(x_i) - g(x_i)]\,\Delta x.$$

Density Height Width



Planar lamina of uniform density ρ

Figure 7.59

Now, considering this mass to be located at the center (x_i, y_i) of the rectangle, the directed distance from the x-axis to (x_i, y_i) is $y_i = [f(x_i) + g(x_i)]/2$. So, the moment of m_i about the x-axis is

$$\begin{aligned} \text{Moment} &= (\text{mass})(\text{distance}) \\ &= m_i y_i \\ &= \rho[f(x_i) - g(x_i)]\Delta x\left[\frac{f(x_i) + g(x_i)}{2}\right]. \end{aligned}$$

Summing the moments and taking the limit as $n \to \infty$ suggest the definitions below.

Moments and Center of Mass of a Planar Lamina

Let f and g be continuous functions such that $f(x) \ge g(x)$ on $[a, b]$, and consider the planar lamina of uniform density ρ bounded by the graphs of $y = f(x)$, $y = g(x)$, and $a \le x \le b$.

1. **Moment about the x-axis:** $M_x = \rho \displaystyle\int_a^b \left[\frac{f(x) + g(x)}{2}\right][f(x) - g(x)]\,dx$

   Moment about the y-axis: $M_y = \rho \displaystyle\int_a^b x[f(x) - g(x)]\,dx$

2. **Center of mass** $(\bar{x}, \bar{y})$: $\bar{x} = \dfrac{M_y}{m}$ and $\bar{y} = \dfrac{M_x}{m}$

   Mass of the lamina: $m = \rho \displaystyle\int_a^b [f(x) - g(x)]\,dx$

EXAMPLE 4 The Center of Mass of a Planar Lamina

See LarsonCalculus.com for an interactive version of this type of example.

Find the center of mass of the lamina of uniform density ρ bounded by the graph of $f(x) = 4 - x^2$ and the x-axis.

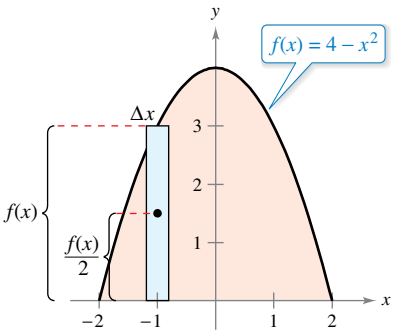
Solution Because the center of mass lies on the axis of symmetry, you know that $\bar{x} = 0$. Moreover, the mass of the lamina is

$$\begin{aligned} m &= \rho \int_{-2}^{2} (4 - x^2)\, dx \\ &= \rho \left[4x - \frac{x^3}{3} \right]_{-2}^{2} \\ &= \frac{32\rho}{3}. \end{aligned}$$

Mass of the lamina

To find the moment about the x-axis, place a representative rectangle in the region, as shown in the figure at the right. The distance from the x-axis to the center of this rectangle is

$$y_i = \frac{f(x)}{2} = \frac{4 - x^2}{2}.$$



Because the mass of the representative rectangle is

$$\rho f(x)\, \Delta x = \rho(4 - x^2)\, \Delta x$$

you have

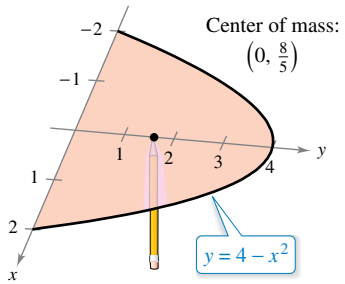
$$\begin{aligned} M_x &= \rho \int_{-2}^{2} \frac{4 - x^2}{2}(4 - x^2)\, dx \\ &= \frac{\rho}{2} \int_{-2}^{2} (16 - 8x^2 + x^4)\, dx \\ &= \frac{\rho}{2} \left[16x - \frac{8x^3}{3} + \frac{x^5}{5} \right]_{-2}^{2} \\ &= \frac{256\rho}{15}. \end{aligned}$$

Moment about x-axis

Now, use M_x and m to find $\bar{y}$.

$$\bar{y} = \frac{M_x}{m} = \frac{256\rho/15}{32\rho/3} = \frac{8}{5}$$

So, the center of mass (the balancing point) of the lamina is $\left(0, \frac{8}{5}\right)$, as shown in Figure 7.60. ■



The center of mass is the balancing point.

Figure 7.60

The density ρ in Example 4 is a common factor of both the moments and the mass, and as such it divides out of the quotients representing the coordinates of the center of mass. So, the center of mass of a lamina of *uniform* density depends only on the shape of the lamina and not on its density. For this reason, the point

$$(\bar{x}, \bar{y})$$

Center of mass or centroid

is sometimes called the center of mass of a *region* in the plane, or the **centroid** of the region. In other words, to find the centroid of a region in the plane, assume that the region has a constant density of $\rho = 1$ and therefore the mass of the region is equal to the area A, or $m = A$. Then calculate the corresponding center of mass, as shown in the next two examples.

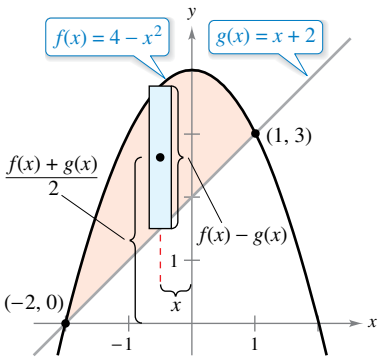

Figure 7.61

GO DIGITAL

EXAMPLE 5 The Centroid of a Plane Region

Find the centroid of the region bounded by the graphs of $f(x) = 4 - x^2$ and $g(x) = x + 2$.

Solution The two graphs intersect at the points $(-2, 0)$ and $(1, 3)$, as shown in Figure 7.61. So, the area of the region is

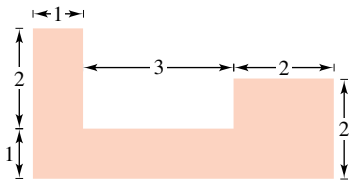
$$A = \int_{-2}^{1} [f(x) - g(x)]\,dx = \int_{-2}^{1} (2 - x - x^2)\,dx = \frac{9}{2}.$$

Now, find the coordinates of the centroid $(\bar{x}, \bar{y})$.

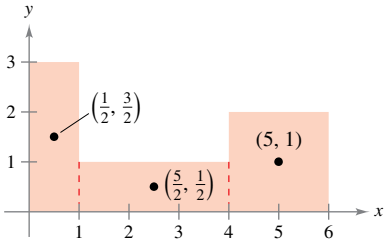
$$\begin{aligned}
\bar{x} &= \frac{1}{A}\int_{-2}^{1} x[(4 - x^2) - (x + 2)]\,dx \\
&= \frac{2}{9}\int_{-2}^{1} (-x^3 - x^2 + 2x)\,dx \\
&= \frac{2}{9}\left[-\frac{x^4}{4} - \frac{x^3}{3} + x^2\right]_{-2}^{1} \\
&= -\frac{1}{2} \\
\bar{y} &= \frac{1}{A}\int_{-2}^{1} \left[\frac{(4 - x^2) + (x + 2)}{2}\right][(4 - x^2) - (x + 2)]\,dx \\
&= \frac{2}{9}\left(\frac{1}{2}\right)\int_{-2}^{1} (-x^2 + x + 6)(-x^2 - x + 2)\,dx \\
&= \frac{1}{9}\int_{-2}^{1} (x^4 - 9x^2 - 4x + 12)\,dx \\
&= \frac{1}{9}\left[\frac{x^5}{5} - 3x^3 - 2x^2 + 12x\right]_{-2}^{1} \\
&= \frac{12}{5}
\end{aligned}$$

So, the centroid of the region is $(\bar{x}, \bar{y}) = \left(-\frac{1}{2}, \frac{12}{5}\right)$. ■

For simple plane regions, you may be able to find the centroids without resorting to integration.



(a) Original region



(b) The centroids of the three rectangles

Figure 7.62

EXAMPLE 6 The Centroid of a Simple Plane Region

Find the centroid of the region shown in Figure 7.62(a).

Solution First, superimpose a coordinate system on the region, as shown in Figure 7.62(b). Notice in the figure that the centroids are located at

$$\left(\frac{1}{2}, \frac{3}{2}\right), \quad \left(\frac{5}{2}, \frac{1}{2}\right), \quad \text{and} \quad (5, 1).$$

Next, use these three points to find the centroid of the region.

$$\begin{aligned}
A &= \text{area of region} = 3 + 3 + 4 = 10 \\
\bar{x} &= \frac{(1/2)(3) + (5/2)(3) + (5)(4)}{10} = \frac{29}{10} = 2.9 \\
\bar{y} &= \frac{(3/2)(3) + (1/2)(3) + (1)(4)}{10} = \frac{10}{10} = 1
\end{aligned}$$

So, the centroid of the region is $(2.9, 1)$. Notice that $(2.9, 1)$ is not the "average" of $\left(\frac{1}{2}, \frac{3}{2}\right)$, $\left(\frac{5}{2}, \frac{1}{2}\right)$, and $(5, 1)$. ■

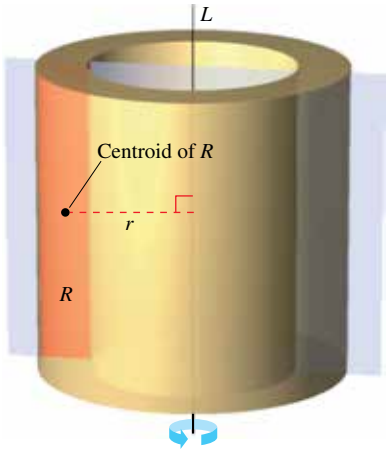
Theorem of Pappus

The final topic in this section is a useful theorem credited to Pappus of Alexandria (ca. 300 A.D.), a Greek mathematician whose eight-volume *Mathematical Collection* is a record of much of classical Greek mathematics. You are asked to prove this theorem in Section 14.4.



The volume V is $2\pi rA$, where A is the area of region R.

Figure 7.63

THEOREM 7.1 The Theorem of Pappus

Let R be a region in a plane and let L be a line in the same plane such that L does not intersect the interior of R, as shown in Figure 7.63. If r is the distance between the centroid of R and the line, then the volume V of the solid of revolution formed by revolving R about the line is

$$V = 2\pi rA$$

where A is the area of R. (Note that $2\pi r$ is the distance traveled by the centroid as the region is revolved about the line.)

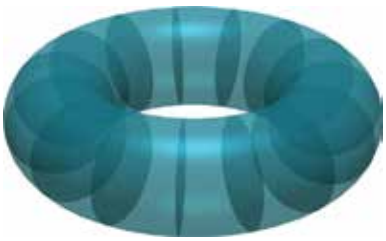
The Theorem of Pappus can be used to find the volume of a torus, as shown in the next example. Recall that a torus is a doughnut-shaped solid formed by revolving a circular region about a line that lies in the same plane as the circle (but does not intersect the circle).

EXAMPLE 7 Finding Volume by the Theorem of Pappus

Find the volume of the torus shown in Figure 7.64(a), which was formed by revolving the circular region bounded by

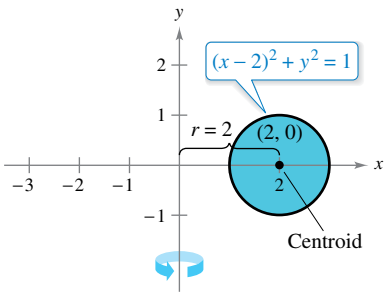
$$(x - 2)^2 + y^2 = 1$$

about the y-axis, as shown in Figure 7.64(b).



Torus

(a)



(b)

Figure 7.64

Solution Notice in Figure 7.64(b) that the centroid of the circular region is $(2, 0)$. So, the distance between the centroid and the axis of revolution is

$$r = 2.$$

Because the area of the circular region is $A = \pi$, the volume of the torus is

$$\begin{aligned} V &= 2\pi rA \\ &= 2\pi(2)(\pi) \\ &= 4\pi^2 \\ &\approx 39.5. \end{aligned}$$

■

Exploration

Use the shell method to show that the volume of the torus in Example 7 is

$$V = \int_1^3 4\pi x\sqrt{1 - (x - 2)^2}\,dx.$$

Evaluate this integral using a graphing utility. Does your answer agree with the one in Example 7?

7.6 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Explain how mass and weight are related.
2. The equation for the moment about the origin of a one-dimensional system is

   $M_0 = 5(-3) + 2(-1) + 1(1) + 5(2) + 1(6)$.

   Is the system in equilibrium? Explain.
3. Give the definition of a planar lamina. Describe what the center of mass of a lamina represents.
4. Explain why the Theorem of Pappus is useful.

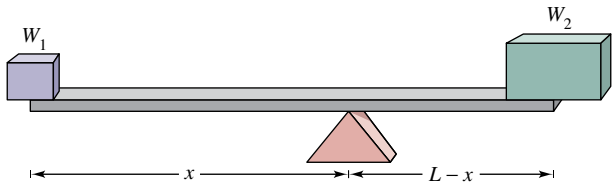
Center of Mass of a Linear System

In Exercises 5–8, find the center of mass of the given system of point masses lying on the x-axis.

5. $m_1 = 7, m_2 = 3, m_3 = 5$
   $x_1 = -5, x_2 = 0, x_3 = 3$
6. $m_1 = 0.1, m_2 = 0.2, m_3 = 0.2, m_4 = 0.5$
   $x_1 = 1, x_2 = 2, x_3 = 3, x_4 = 4$
7. $m_1 = 1, m_2 = 3, m_3 = 2, m_4 = 9, m_5 = 5$
   $x_1 = 6, x_2 = 10, x_3 = 3, x_4 = 2, x_5 = 4$
8. $m_1 = 8, m_2 = 5, m_3 = 5, m_4 = 12, m_5 = 2$
   $x_1 = -2, x_2 = 6, x_3 = 0, x_4 = 3, x_5 = -5$

Equilibrium of a Linear System

In Exercises 9 and 10, consider a beam of length L with a fulcrum x feet from one end (see figure). There are objects with weights W_1 and W_2 placed on opposite ends of the beam, where $W_1 < W_2$. Find x such that the system is in equilibrium.



9. Two children weighing 48 pounds and 72 pounds are going to play on a seesaw that is 10 feet long.
10. In order to move a 600-pound rock, a person weighing 200 pounds wants to balance it on a beam that is 5 feet long.

Center of Mass of a Two-Dimensional System

In Exercises 11–14, find the center of mass of the given system of point masses.

11.

m_i	5	1	3
(x_i, y_i)	$(2, 2)$	$(-3, 1)$	$(1, -4)$

12.

m_i	8	1	4
(x_i, y_i)	$(-3, -1)$	$(0, 0)$	$(-1, 2)$

13.

m_i	12	6	4.5	15
(x_i, y_i)	$(2, 3)$	$(-1, 5)$	$(6, 8)$	$(2, -2)$

14.

m_i	3	4	2	1	6
(x_i, y_i)	$(-2, -3)$	$(5, 5)$	$(7, 1)$	$(0, 0)$	$(-3, 0)$

Center of Mass of a Planar Lamina

In Exercises 15–28, find M_x, M_y, and $(\bar{x}, \bar{y})$ for the lamina of uniform density ρ bounded by the graphs of the equations.

15. $y = \frac{1}{2}x, y = 0, x = 2$
16. $y = 6 - x, y = 0, x = 0$
17. $y = \sqrt{x}, y = 0, x = 4$
18. $y = \frac{1}{3}x^2, y = 0, x = 2$
19. $y = x^2, y = x^3$
20. $y = \sqrt{x}, y = \frac{1}{2}x$
21. $y = -x^2 + 4x + 2, y = x + 2$
22. $y = \sqrt{x} + 1, y = \frac{1}{3}x + 1$
23. $y = x^{2/3}, y = 0, x = 8$
24. $y = x^{2/3}, y = 4$
25. $x = 4 - y^2, x = 0$
26. $x = 3y - y^2, x = 0$
27. $x = -y, x = 2y - y^2$
28. $x = y + 2, x = y^2$

Approximating a Centroid Using Technology

In Exercises 29 and 30, use a graphing utility to graph the region bounded by the graphs of the equations. Use the integration capabilities of the graphing utility to approximate the centroid of the region.

29. $y = 5\sqrt[3]{400 - x^2}, y = 0$
30. $y = \dfrac{8}{x^2 + 4}, y = 0, x = -2, x = 2$

Finding the Center of Mass

In Exercises 31–34, introduce an appropriate coordinate system and find the center of mass of the planar lamina. (The answer depends on the position of the coordinate system.)

35. Finding the Center of Mass Find the center of mass of the lamina in Exercise 31 when the circular portion of the lamina has twice the density of the square portion of the lamina.

36. Finding the Center of Mass Find the center of mass of the lamina in Exercise 31 when the square portion of the lamina has twice the density of the circular portion of the lamina.

Finding Volume by the Theorem of Pappus **In Exercises 37–40, use the Theorem of Pappus to find the volume of the solid of revolution.**

37. The torus formed by revolving the circular region bounded by

$(x - 5)^2 + y^2 = 16$

about the y-axis

38. The torus formed by revolving the circular region bounded by

$x^2 + (y - 3)^2 = 4$

about the x-axis

39. The solid formed by revolving the region bounded by the graphs of $y = x$, $y = 4$, and $x = 0$ about the x-axis

40. The solid formed by revolving the region bounded by the graphs of $y = 2\sqrt{x - 2}$, $y = 0$, and $x = 6$ about the y-axis

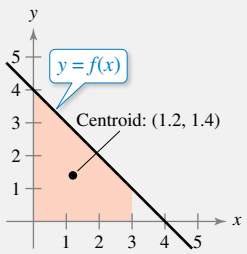
Exploring Concepts

41. Explain what happens to the center of mass of a linear system when each point mass is translated k units horizontally.

42. Explain why the centroid of a rectangle is the center of a rectangle.

43. Use rectangles to create a region such that the center of mass lies outside of the region. Verify algebraically that the center of mass lies outside of the region.

44. HOW DO YOU SEE IT? The centroid of the plane region bounded by the graphs of $y = f(x)$, $y = 0$, $x = 0$, and $x = 3$ is $(1.2, 1.4)$. Without integrating, find the centroid of each of the regions bounded by the graphs of the following sets of equations. Explain your reasoning.



(a) $y = f(x) + 2$, $y = 2$, $x = 0$, and $x = 3$

(b) $y = f(x - 2)$, $y = 0$, $x = 2$, and $x = 5$

(c) $y = -f(x)$, $y = 0$, $x = 0$, and $x = 3$

Centroid of a Common Region **In Exercises 45–50, find and/or verify the centroid of the common region used in engineering.**

45. Triangle Show that the centroid of the triangle with vertices $(-a, 0)$, $(a, 0)$, and (b, c) is the point of intersection of the medians (see figure).

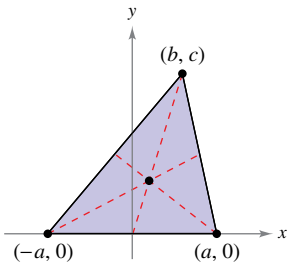


Figure for 45

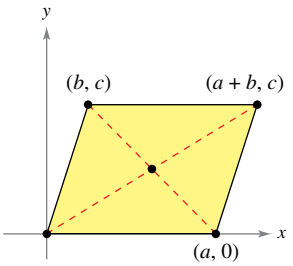

Figure for 46

46. Parallelogram Show that the centroid of the parallelogram with vertices $(0, 0)$, $(a, 0)$, (b, c), and $(a + b, c)$ is the point of intersection of the diagonals (see figure).

47. Trapezoid Find the centroid of the trapezoid with vertices $(0, 0)$, $(0, a)$, (c, b), and $(c, 0)$. Show that it is the intersection of the line connecting the midpoints of the parallel sides and the line connecting the extended parallel sides, as shown in the figure.

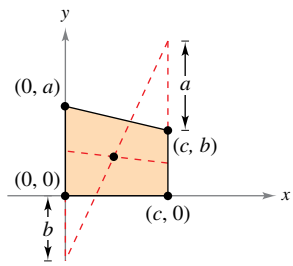

Figure for 47

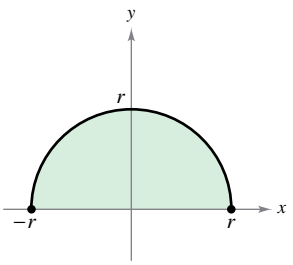

Figure for 48

48. Semicircle Find the centroid of the region bounded by the graphs of

$y = \sqrt{r^2 - x^2}$ and $y = 0$ (see figure).

49. Semiellipse Find the centroid of the region bounded by the graphs of

$y = \frac{b}{a}\sqrt{a^2 - x^2}$ and $y = 0$ (see figure).

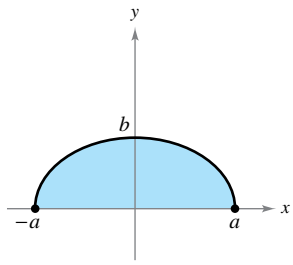

Figure for 49

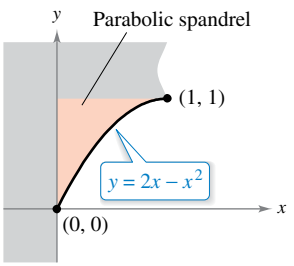

Figure for 50

50. Parabolic Spandrel Find the centroid of the **parabolic spandrel** shown in the figure.

51. Graphical Reasoning Consider the region bounded by the graphs of $y = x^2$ and $y = b$, where $b > 0$.

(a) Sketch a graph of the region.

(b) Set up the integral for finding M_y. Because of the form of the integrand, the value of the integral can be obtained without integrating. What is the form of the integrand? What is the value of the integral and what is the value of $\bar{x}$?

(c) Use the graph in part (a) to determine whether $\bar{y} > \frac{b}{2}$ or $\bar{y} < \frac{b}{2}$. Explain.

(d) Use integration to verify your answer in part (c).

52. Graphical and Numerical Reasoning Consider the region bounded by the graphs of $y = x^{2n}$ and $y = b$, where $b > 0$ and n is a positive integer.

(a) Sketch a graph of the region.

(b) Set up the integral for finding M_y. Because of the form of the integrand, the value of the integral can be obtained without integrating. What is the form of the integrand? What is the value of the integral and what is the value of $\bar{x}$?

(c) Use the graph in part (a) to determine whether $\bar{y} > \frac{b}{2}$ or $\bar{y} < \frac{b}{2}$. Explain.

(d) Use integration to find $\bar{y}$ as a function of n.

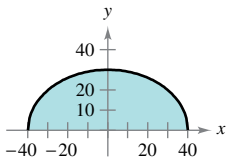
(e) Use the result of part (d) to complete the table.

n	1	2	3	4
$\bar{y}$				

(f) Find $\lim_{n\to\infty} \bar{y}$.

(g) Give a geometric explanation of the result in part (f).

53. Modeling Data The manufacturer of glass for a window in a conversion van needs to approximate the center of mass of the glass. A coordinate system is superimposed on a prototype of the glass (see figure). The measurements (in centimeters) for the right half of the symmetric piece of glass are listed in the table.

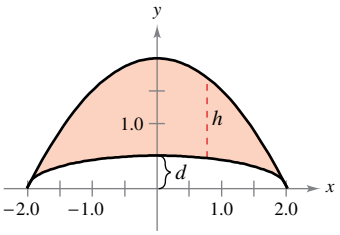


x	0	10	20	30	40
y	30	29	26	20	0

(a) Use the regression capabilities of a graphing utility to find a fourth-degree polynomial model for the glass.

(b) Use the integration capabilities of a graphing utility and the model to approximate the center of mass of the glass.

54. Modeling Data The manufacturer of a boat needs to approximate the center of mass of a section of the hull. A coordinate system is superimposed on a prototype (see figure). The measurements (in feet) for the right half of the symmetric prototype are listed in the table.



x	0	0.5	1.0	1.5	2
h	1.50	1.45	1.30	0.99	0
d	0.50	0.48	0.43	0.33	0

(a) Use the regression capabilities of a graphing utility to find fourth-degree polynomial models for both curves shown in the figure.

(b) Use the integration capabilities of a graphing utility and the models to approximate the center of mass of the hull section.

Second Theorem of Pappus **In Exercises 55 and 56, use the *Second Theorem of Pappus*, which is stated as follows. If a segment of a plane curve C is revolved about an axis that does not intersect the curve (except possibly at its endpoints), then the area S of the resulting surface of revolution is equal to the product of the length of C times the distance d traveled by the centroid of C.**

55. Find the area of the surface formed by revolving the graph of $y = 3 - x$, $0 \le x \le 3$, about the y-axis.

56. A torus is formed by revolving the graph of $(x - 1)^2 + y^2 = 1$ about the y-axis. Find the surface area of the torus.

57. Finding a Centroid Let $n \ge 1$ be constant, and consider the region bounded by $f(x) = x^n$, the x-axis, and $x = 1$. Find the centroid of this region. As $n \to \infty$, what does the region look like, and where is its centroid?

58. Finding a Centroid Consider the functions

$$f(x) = x^n \quad \text{and} \quad g(x) = x^m$$

on the interval $[0, 1]$, where m and n are positive integers and $n > m$. Find the centroid of the region bounded by f and g.

PUTNAM EXAM CHALLENGE

59. Let V be the region in the cartesian plane consisting of all points (x, y) satisfying the simultaneous conditions $|x| \le y \le |x| + 3$ and $y \le 4$. Find the centroid $(\bar{x}, \bar{y})$ of V.

This problem was composed by the Committee on the Putnam Prize Competition.

7.7 Fluid Pressure and Fluid Force

GO DIGITAL

Find fluid pressure and fluid force.

Fluid Pressure and Fluid Force

Swimmers know that the deeper an object is submerged in a fluid, the greater the pressure on the object. **Pressure** is defined as the force per unit of area over the surface of a body. For example, because a column of water that is 10 feet in height and 1 inch square weighs 4.3 pounds, the *fluid pressure* at a depth of 10 feet of water is 4.3 pounds per square inch.* At 20 feet, this would increase to 8.6 pounds per square inch, and in general the pressure is proportional to the depth of the object in the fluid.

BLAISE PASCAL (1623–1662)

Pascal is well known for his work in many areas of mathematics and physics, and also for his influence on Leibniz. Although much of Pascal's work in calculus was intuitive and lacked the rigor of modern mathematics, he nevertheless anticipated many important results.

See LarsonCalculus.com to read more of this biography.

Definition of Fluid Pressure

The **pressure** P on an object at depth h in a liquid is

$$P = wh$$

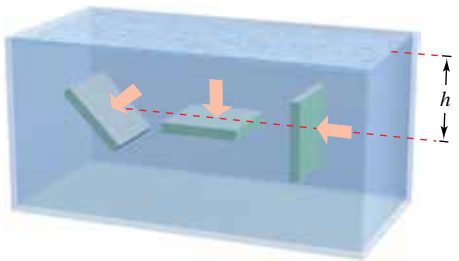
where w is the weight-density of the liquid per unit of volume.

Below are some common weight-densities of fluids in pounds per cubic foot.

Ethyl alcohol	49.4
Gasoline	41.0–43.0
Glycerin	78.6
Kerosene	51.2
Mercury	849.0
Seawater	64.0
Water	62.4

When calculating fluid pressure, you can use an important (and rather surprising) physical law called **Pascal's Principle,** named after the French mathematician Blaise Pascal. Pascal's Principle states that the pressure exerted by a fluid at a depth h is transmitted equally *in all directions.* For example, in Figure 7.65, the pressure at the indicated depth is the same for all three objects. Because fluid pressure is given in terms of force per unit area ($P = F/A$), the fluid force on a *submerged horizontal* surface of area A is

$$\text{Fluid force} = F = PA = (\text{pressure})(\text{area}).$$



The pressure at h is the same for all three objects.
Figure 7.65

* The total pressure on an object in 10 feet of water would also include the pressure due to Earth's atmosphere. At sea level, atmospheric pressure is approximately 14.7 pounds per square inch.

The fluid force on a horizontal metal sheet is equal to the fluid pressure times the area.
Figure 7.66

EXAMPLE 1 Fluid Force on a Submerged Sheet

Find the fluid force on a rectangular metal sheet measuring 3 feet by 4 feet that is submerged in 6 feet of water, as shown in Figure 7.66.

Solution Because the weight-density of water is 62.4 pounds per cubic foot and the sheet is submerged in 6 feet of water, the fluid pressure is

$$P = (62.4)(6) \qquad P = wh$$
$$= 374.4 \text{ pounds per square foot.}$$

Because the total area of the sheet is $A = (3)(4) = 12$ square feet, the fluid force is

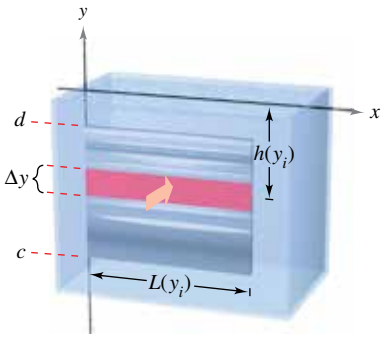
$$F = PA$$
$$= \left(374.4 \frac{\text{pounds}}{\text{square foot}}\right)(12 \text{ square feet})$$
$$= 4492.8 \text{ pounds.}$$

This result is independent of the size of the body of water. The fluid force would be the same in a swimming pool or lake. ■

In Example 1, the fact that the sheet is rectangular and horizontal means that you do not need the methods of calculus to solve the problem. Consider a surface that is submerged vertically in a fluid. This problem is more difficult because the pressure is not constant over the surface.

Consider a vertical plate that is submerged in a fluid of weight-density w (per unit of volume), as shown in Figure 7.67. To determine the total force against *one side* of the region from depth c to depth d, subdivide the interval $[c, d]$ into n subintervals, each of width Δy. Next, consider the representative rectangle of width Δy and length $L(y_i)$, where y_i is in the ith subinterval. The force against this representative rectangle is

$$\Delta F_i = w(\text{depth})(\text{area})$$
$$= wh(y_i)L(y_i)\Delta y.$$



Calculus methods must be used to find the fluid force on a vertical metal plate.
Figure 7.67

The force against n such rectangles is

$$\sum_{i=1}^{n} \Delta F_i = w \sum_{i=1}^{n} h(y_i)L(y_i)\Delta y.$$

Note that w is considered to be constant and is factored out of the summation. So, taking the limit as $\|\Delta\| \to 0$ $(n \to \infty)$ suggests the next definition.

Definition of Force Exerted by a Fluid

The **force F exerted by a fluid** of constant weight-density w (per unit of volume) against a submerged vertical plane region from $y = c$ to $y = d$ is

$$F = w \lim_{\|\Delta\| \to 0} \sum_{i=1}^{n} h(y_i)L(y_i)\Delta y$$
$$= w \int_c^d h(y)L(y)\, dy$$

where $h(y)$ is the depth of the fluid at y and $L(y)$ is the horizontal length of the region at y.

GO DIGITAL

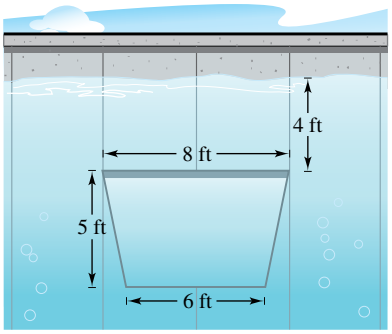
EXAMPLE 2 Fluid Force on a Vertical Surface

See LarsonCalculus.com for an interactive version of this type of example.

A vertical gate in a dam has the shape of an isosceles trapezoid 8 feet across the top and 6 feet across the bottom, with a height of 5 feet, as shown in Figure 7.68(a). What is the fluid force on the gate when the top of the gate is 4 feet below the surface of the water?



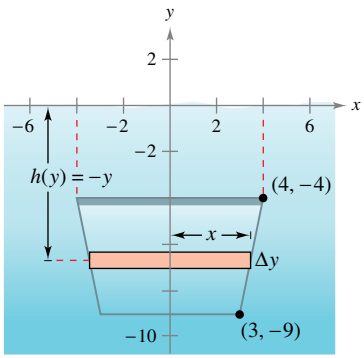
(a) Water gate in a dam

Solution In setting up a mathematical model for this problem, you are at liberty to locate the x- and y-axes in several different ways. A convenient approach is to let the y-axis bisect the gate and place the x-axis at the surface of the water, as shown in Figure 7.68(b). So, the depth of the water at y in feet is

$$\text{Depth} = h(y) = -y.$$

To find the length $L(y)$ of the region at y, find the equation of the line forming the right side of the gate. Because this line passes through the points $(3, -9)$ and $(4, -4)$, its equation is

$$\begin{aligned} y - (-9) &= \frac{-4 - (-9)}{4 - 3}(x - 3) \\ y + 9 &= 5(x - 3) \\ y &= 5x - 24 \\ x &= \frac{y + 24}{5}. \end{aligned}$$



(b) The fluid force against the gate

Figure 7.68

In Figure 7.68(b), notice that the length of the region at y is

$$\text{Length} = 2x = \frac{2}{5}(y + 24) = L(y).$$

Finally, integrate from $y = -9$ to $y = -4$ to calculate the fluid force.

$$\begin{aligned} F &= w\int_c^d h(y)L(y)\,dy && \text{Definition of force exerted by a fluid} \\ &= 62.4\int_{-9}^{-4}(-y)\left(\frac{2}{5}\right)(y + 24)\,dy && \text{Substitute.} \\ &= -62.4\left(\frac{2}{5}\right)\int_{-9}^{-4}(y^2 + 24y)\,dy \\ &= -62.4\left(\frac{2}{5}\right)\left[\frac{y^3}{3} + 12y^2\right]_{-9}^{-4} && \text{Integrate.} \\ &= -62.4\left(\frac{2}{5}\right)\left(\frac{-1675}{3}\right) \\ &= 13{,}936 \text{ pounds} \end{aligned}$$

In Example 2, the x-axis coincided with the surface of the water. This was convenient but arbitrary. In choosing a coordinate system to represent a physical situation, you should consider various possibilities. Often you can simplify the calculations in a problem by locating the coordinate system to take advantage of special characteristics of the problem, such as symmetry.

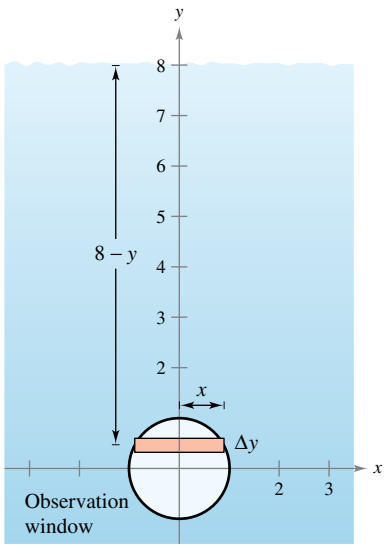
EXAMPLE 3 Fluid Force on a Vertical Surface

A circular observation window at a seawater aquarium has a radius of 1 foot, and the center of the window is 8 feet below water level, as shown in Figure 7.69. What is the fluid force on the window?



The fluid force on the window

Figure 7.69

Solution To take advantage of symmetry, locate a coordinate system such that the origin coincides with the center of the window, as shown in Figure 7.69. The depth at y is then

$$\text{Depth} = h(y) = 8 - y.$$

The horizontal length of the window is $2x$, and you can use the equation for the circle, $x^2 + y^2 = 1$, to solve for x as shown.

$$\text{Length} = 2x = 2\sqrt{1 - y^2} = L(y)$$

Finally, because y ranges from -1 to 1, and using 64 pounds per cubic foot as the weight-density of seawater, you have

$$F = w\int_c^d h(y)L(y)\,dy = 64\int_{-1}^{1}(8 - y)(2)\sqrt{1 - y^2}\,dy.$$

Initially it looks as though this integral would be difficult to solve. However, when you break the integral into two parts and apply symmetry, the solution is simpler.

$$F = 64(16)\int_{-1}^{1}\sqrt{1 - y^2}\,dy - 64(2)\int_{-1}^{1} y\sqrt{1 - y^2}\,dy$$

The second integral is 0 (because the integrand is odd and the limits of integration are symmetric with respect to the origin). Moreover, by recognizing that the first integral represents the area of a semicircle of radius 1, you obtain

$$\begin{aligned} F &= 64(16)\left(\frac{\pi}{2}\right) - 64(2)(0) \\ &= 512\pi \\ &\approx 1608.5 \text{ pounds.} \end{aligned}$$

So, the fluid force on the window is about 1608.5 pounds. ■

Concept Check

1. Describe fluid pressure.
2. Does fluid pressure change with depth? Explain.

Force on a Submerged Sheet **In Exercises 3–6, the area of the top side of a piece of sheet metal is given. The sheet metal is submerged horizontally in 8 feet of water. Find the fluid force on the top side.**

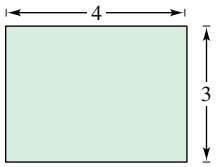
3. 3 square feet
4. 8 square feet
5. 10 square feet
6. 25 square feet

Force on a Submerged Sheet **In Exercises 7 and 8, the area of the top side of a piece of sheet metal is given. The sheet metal is submerged horizontally in 5 feet of ethyl alcohol. Find the fluid force on the top side.**

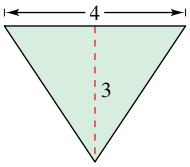
7. 9 square feet
8. 14 square feet

Fluid Force on a Tank Wall **In Exercises 9–14, the figure is the vertical side of a tank filled with water, where the dimensions are given in feet. Find the fluid force on this side of the tank.**

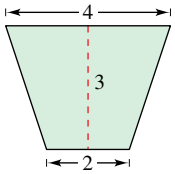
9. Rectangle



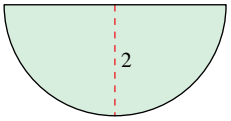
10. Triangle



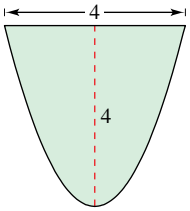
11. Trapezoid



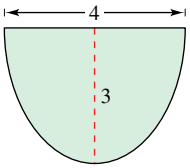
12. Semicircle



13. Parabola, $y = x^2$

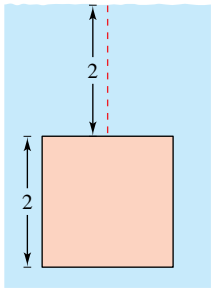


14. Semiellipse, $y = -\frac{1}{2}\sqrt{36 - 9x^2}$

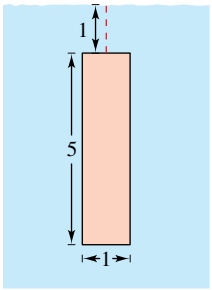


Fluid Force of Water **In Exercises 15–18, find the fluid force on the vertical plate submerged in water, where the dimensions are given in meters and the weight-density of water is 9800 newtons per cubic meter.**

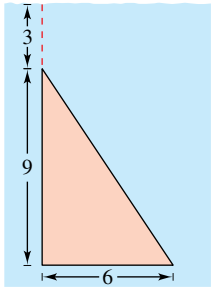
15. Square



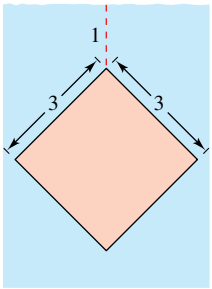
16. Rectangle



17. Triangle

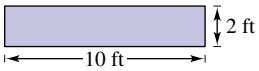


18. Square

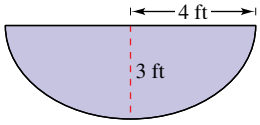


Force on a Concrete Form **In Exercises 19–22, the figure is the vertical side of a form for poured concrete that weighs 140.7 pounds per cubic foot. Determine the force on this part of the concrete form.**

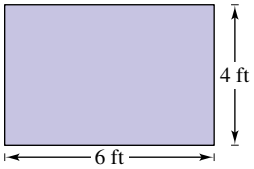
19. Rectangle



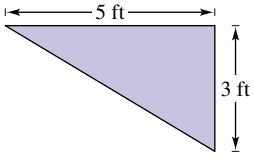
20. Semiellipse, $y = -\frac{3}{4}\sqrt{16 - x^2}$



21. Rectangle



22. Triangle



23. **Fluid Force of Gasoline** A cylindrical gasoline tank is placed so that the axis of the cylinder is horizontal. Find the fluid force on a circular end of the tank when the tank is half full, where the diameter is 3 feet and the gasoline weighs 42 pounds per cubic foot.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

24. Fluid Force of Gasoline Repeat Exercise 23 for a tank that is full. (Evaluate one integral by a geometric formula and the other by observing that the integrand is an odd function.)

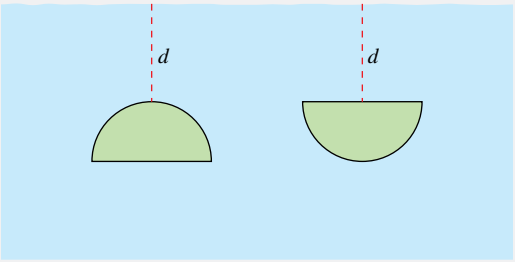
Exploring Concepts

25. Explain why fluid pressure on a surface is calculated using horizontal representative rectangles instead of vertical representative rectangles.

26. Buoyant force is the difference between the fluid forces on the top and bottom sides of a solid. Find an expression for the buoyant force of a rectangular solid submerged in a fluid with its top side parallel to the surface of the fluid.

27. Approximate the depth of the water in the tank in Exercise 9 if the fluid force is one-half as great as when the tank is full. Explain why the answer is not $\frac{3}{2}$.

28. HOW DO YOU SEE IT? Two identical semicircular windows are placed at the same depth in the vertical wall of an aquarium (see figure). Which is subjected to the greater fluid force? Explain.



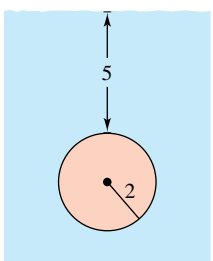
29. Fluid Force on a Circular Plate A circular plate of radius r feet is submerged vertically in a tank of fluid that weighs w pounds per cubic foot. The center of the circle is k feet below the surface of the fluid, where $k > r$. Show that the fluid force on the surface of the plate is

$$F = wk(\pi r^2).$$

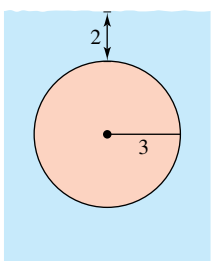
(Evaluate one integral by a geometric formula and the other by observing that the integrand is an odd function.)

30. Fluid Force on a Circular Plate Use the result of Exercise 29 to find the fluid force on the circular plate shown in each figure. Assume that the tank is filled with water and the measurements are given in feet.

(a)



(b)

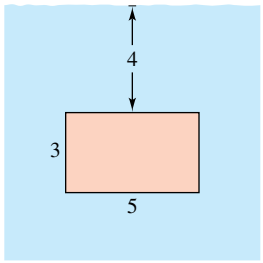


31. Fluid Force on a Rectangular Plate A rectangular plate of height h feet and base b feet is submerged vertically in a tank of fluid that weighs w pounds per cubic foot. The center of the rectangle is k feet below the surface of the fluid, where $k > h/2$. Show that the fluid force on the surface of the plate is

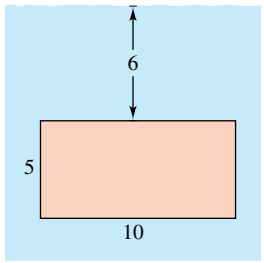
$$F = wkhb.$$

32. Fluid Force on a Rectangular Plate Use the result of Exercise 31 to find the fluid force on the rectangular plate shown in each figure. Assume that the tank is filled with water and the measurements are given in feet.

(a)



(b)

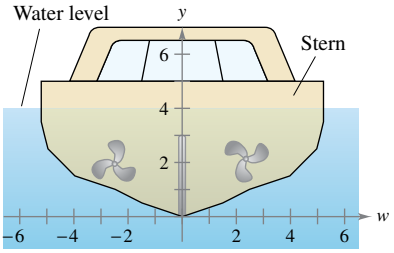


33. Submarine Porthole A square porthole on a vertical side of a submarine (submerged in seawater) has an area of 1 square foot. Find the fluid force on the porthole, assuming that the center of the square is 15 feet below the surface.

34. Submarine Porthole Repeat Exercise 33 for a circular porthole that has a diameter of 1 foot. The center of the circle is 15 feet below the surface.

35. Modeling Data The vertical stern of a boat partially submerged in seawater with a superimposed coordinate system is shown in the figure. The table shows the widths w of the stern (in feet) at indicated values of y. Use the Midpoint Rule with $n = 4$ to approximate the fluid force against the stern.

y	0	1	2	3	4
w	0	5	9	10.25	10.5



36. Irrigation Canal Gate The vertical cross section of an irrigation canal is modeled by

$$f(x) = \frac{5x^2}{x^2 + 4}$$

where x is measured in feet and $x = 0$ corresponds to the center of the canal. Use the integration capabilities of a graphing utility to approximate the fluid force against a vertical gate used to stop the flow of water when the water is 3 feet deep.

Review Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Exploring Concepts

In this chapter, you studied several applications of integration. To develop an integration formula for these applications, you began with a known precalculus formula. Then, using that formula to construct a representative element, you developed an integration formula by summing, or accumulating, these elements. For example, consider how the formula for the area of a region between two curves was developed.

Known Precalculus Formula		Representative Element		New Integration Formula
$A = (\text{height})(\text{width})$	⇨	$\Delta A = [f(x) - g(x)]\Delta x$	⇨	$A = \int_a^b [f(x) - g(x)]\,dx$

1. Identify the precalculus formula and representative element used to develop the integration formula for each application.

(a) Disk method

(b) Washer method

(c) Shell method

(d) Area of a surface of revolution

2. Let f and g be continuous functions on $[a, b]$ and let $g(x) \le f(x)$ for all x in $[a, b]$. Write in words the area given by

$$\int_a^b [f(x) - g(x)]\,dx.$$

Does the area interpretation of this integral change when $f(x) \ge 0$ and $g(x) \le 0$?

3. Determine which value best approximates the area of the region bounded by the graphs of

$f(x) = x + 1$ and $g(x) = (x - 1)^2$.

Make your selection on the basis of a sketch of the region and not by performing any calculations.

(a) -2 (b) 2 (c) 10 (d) 4 (e) 8

4. Determine which value best approximates the volume of the solid generated by revolving the region bounded by the graphs of

$y = \arctan x$, $y = 0$, $x = 0$, and $x = 1$

about the x-axis. Make your selection on the basis of a sketch of the region and not by performing any calculations.

(a) 10 (b) $\frac{3}{4}$ (c) 5 (d) -6 (e) 15

5. Explain why the two integrals are equal.

$$\int_1^e \sqrt{1 + \frac{1}{x^2}}\,dx = \int_0^1 \sqrt{1 + e^{2x}}\,dx$$

Use the integration capabilities of a graphing utility to verify that the integrals are equal.

6. Let the point masses $m_1, m_2, \ldots, m_n$ be located at

$(x_1, y_1), (x_2, y_2), \ldots, (x_n, y_n)$.

Define the center of mass $(\bar{x}, \bar{y})$.

Finding the Area of a Region

In Exercises 7–16, sketch the region bounded by the graphs of the equations and find the area of the region.

7. $y = 6 - \frac{1}{2}x^2$, $y = \frac{3}{4}x$, $x = -2$, $x = 2$

8. $y = \frac{1}{x^2}$, $y = 4$, $x = 5$

9. $y = \frac{1}{x^2 + 1}$, $y = 0$, $x = -1$, $x = 1$

10. $x = y^2 - 2y$, $x = -1$, $y = 0$

11. $y = x$, $y = x^3$

12. $x = y^2 + 1$, $x = y + 3$

13. $y = e^x$, $y = e^2$, $x = 0$

14. $y = \csc x$, $y = 2$, $\frac{\pi}{6} \le x \le \frac{5\pi}{6}$

15. $y = \sin x$, $y = \cos x$, $\frac{\pi}{4} \le x \le \frac{5\pi}{4}$

16. $x = \cos y$, $x = \frac{1}{2}$, $\frac{\pi}{3} \le y \le \frac{7\pi}{3}$

Finding the Area of a Region

In Exercises 17–20, (a) use a graphing utility to graph the region bounded by the graphs of the equations and (b) use the integration capabilities of the graphing utility to approximate the area of the region to four decimal places.

17. $y = x^2 - 8x + 3$, $y = 3 + 8x - x^2$

18. $y = x^2 - 4x + 3$, $y = x^3$, $x = 0$

19. $\sqrt{x} + \sqrt{y} = 1, \quad y = 0, \quad x = 0$

20. $y = x^4 - 2x^2, \quad y = 2x^2$

Integration as an Accumulation Process **In Exercises 21 and 22, find the accumulation function F. Then evaluate F at each value of the independent variable and graphically show the area given by each value of the independent variable.**

21. $F(x) = \int_0^x (3t + 1)\, dt$

(a) $F(0)$ (b) $F(2)$ (c) $F(6)$

22. $F(x) = \int_{-\pi}^x (2 + \sin t)\, dt$

(a) $F(-\pi)$ (b) $F(0)$ (c) $F(2\pi)$

Revenue **In Exercises 23 and 24, two models R_1 and R_2 are given for revenue (in millions of dollars) for a corporation. Both models are estimates of revenues from 2030 through 2035, with $t = 0$ corresponding to 2030. Which model projects the greater revenue? How much more total revenue does that model project over the six-year period?**

23. $R_1 = 2.98 + 0.65t$

$R_2 = 2.98 + 0.56t$

24. $R_1 = 4.87 + 0.55t + 0.01t^2$

$R_2 = 4.87 + 0.61t + 0.07t^2$

Finding the Volume of a Solid **In Exercises 25 and 26, use the disk method to find the volume of the solid generated by revolving the region bounded by the graphs of the equations about the x-axis.**

25. $y = \dfrac{1}{\sqrt{1 + x^2}}, \quad y = 0, \quad x = -1, \quad x = 1$

26. $y = e^{-x}, \quad y = 0, \quad x = 0, \quad x = 1$

Finding the Volume of a Solid **In Exercises 27 and 28, use the shell method to find the volume of the solid generated by revolving the region bounded by the graphs of the equations about the y-axis.**

27. $y = \dfrac{1}{x^4 + 1}, \quad y = 0, \quad x = 0, \quad x = 1$

28. $y = \dfrac{1}{x^2}, \quad y = 0, \quad x = 2, \quad x = 5$

Finding the Volume of a Solid **In Exercises 29 and 30, use the disk method *or* the shell method to find the volumes of the solids generated by revolving the region bounded by the graphs of the equations about the given lines.**

29. $y = x, \quad y = 0, \quad x = 3$

(a) the x-axis

(b) the y-axis

(c) the line $x = 3$

(d) the line $x = 6$

30. $y = \sqrt{x}, \quad y = 2, \quad x = 0$

(a) the x-axis

(b) the line $y = 2$

(c) the y-axis

(d) the line $x = -1$

31. Gasoline Tank A gasoline tank is an oblate spheroid generated by revolving the region bounded by the graph of

$$\frac{x^2}{16} + \frac{y^2}{9} = 1$$

about the y-axis, where x and y are measured in feet. How much gasoline can the tank hold?

32. Using Cross Sections Find the volume of the solid whose base is bounded by the circle $x^2 + y^2 = 9$ and whose cross sections perpendicular to the x-axis are equilateral triangles.

Finding Arc Length **In Exercises 33 and 34, find the arc length of the graph of the function over the indicated interval.**

33. $f(x) = \dfrac{4}{5}x^{5/4}, \quad [0, 4]$

34. $y = \dfrac{1}{3}x^{3/2} - 1, \quad [2, 6]$

Finding the Area of a Surface of Revolution **In Exercises 35 and 36, write and evaluate the definite integral that represents the area of the surface generated by revolving the curve on the indicated interval about the x-axis.**

35. $y = \dfrac{x^3}{18}, \quad 3 \le x \le 6$

36. $y = \sqrt{25 - x^2}, \quad -4 \le x \le 4$

Finding the Area of a Surface of Revolution **In Exercises 37 and 38, write and evaluate the definite integral that represents the area of the surface generated by revolving the curve on the indicated interval about the y-axis.**

37. $y = \dfrac{x^2}{2} + 4, \quad 0 \le x \le 2$

38. $y = \sqrt[3]{x}, \quad 1 \le x \le 2$

39. Hooke's Law A force of 5 pounds stretches a spring 1 inch from its natural position. Find the work done in stretching the spring from its natural length of 10 inches to a length of 15 inches.

40. Hooke's Law A force of 50 pounds stretches a spring 1 inch from its natural position. Find the work done in stretching the spring from its natural length of 10 inches to double that length.

41. Propulsion Neglecting air resistance and the weight of the propellant, determine the work done in propelling a five-ton satellite to a height of 200 miles above Earth.

42. Pumping Water A water well has an 8-inch diameter and is 190 feet deep. The water is 25 feet from the top of the well. Determine the amount of work done in pumping the well dry.

43. Winding a Chain A chain 10 feet long weighs 4 pounds per foot and is hung from a platform 20 feet above the ground. How much work is required to raise the entire chain to the 20-foot level?

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

44. Winding a Cable A 200-foot cable weighing 5 pounds per foot is hanging from a winch 200 feet above ground level. Find the work done in winding up the cable when there is a 300-pound load attached to the end of the cable.

45. Boyle's Law A quantity of gas with an initial volume of 1 cubic foot and a pressure of 500 pounds per square foot expands to a volume of 4 cubic feet. Find the work done by the gas. Assume that the pressure is inversely proportional to the volume.

46. Boyle's Law A quantity of gas with an initial volume of 2 cubic feet and a pressure of 800 pounds per square foot expands to a volume of 3 cubic feet. Find the work done by the gas. Assume that the pressure is inversely proportional to the volume.

47. Center of Mass of a Linear System Find the center of mass of the given system of point masses lying on the x-axis.

$m_1 = 8, \quad m_2 = 12, \quad m_3 = 6, \quad m_4 = 14$

$x_1 = -1, \quad x_2 = 2, \quad x_3 = 5, \quad x_4 = 7$

48. Center of Mass of a Two-Dimensional System Find the center of mass of the given system of point masses.

m_i	3	2	6	9
(x_i, y_i)	$(2, 1)$	$(-3, 2)$	$(4, -1)$	$(6, 5)$

Center of Mass of a Planar Lamina **In Exercises 49 and 50, find M_x, M_y, and $(\bar{x}, \bar{y})$ for the lamina of uniform density ρ bounded by the graphs of the equations.**

49. $y = x^2, \quad y = 2x + 3$

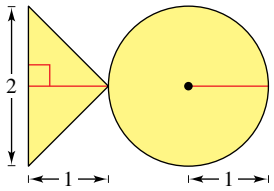
50. $y = x^{2/3}, \quad y = \frac{1}{2}x$

51. Finding Volume Use the Theorem of Pappus to find the volume of the torus formed by revolving the circular region bounded by

$(x - 4)^2 + y^2 = 4$

about the y-axis.

52. Finding the Center of Mass Introduce an appropriate coordinate system and find the center of mass of the planar lamina. (The answer depends on the position of the coordinate system.)



Force on a Submerged Sheet **In Exercises 53 and 54, the area of the top side of a piece of sheet metal is given. The sheet metal is submerged horizontally in 3 feet of water. Find the fluid force on the top side.**

53. 2 square feet

54. 15 square feet

55. Fluid Force of Seawater Find the fluid force on the vertical plate submerged in seawater (see figure).

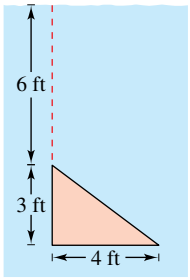


Figure for 55

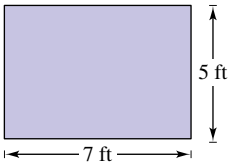

Figure for 56

56. Force on a Concrete Form The vertical side of a form for poured concrete that weighs 140.7 pounds per cubic foot is shown in the figure. Determine the force on this part of the concrete form.

57. Submarine Porthole A circular porthole on a vertical side of a submarine (submerged in seawater) has a diameter of 3 feet. Find the fluid force on the porthole, assuming that the center of the circle is 1600 feet below the surface.

Building on Concepts

58. The graph of $y = f(x)$ passes through the origin. The arc length of the curve from $(0, 0)$ to $(x, f(x))$ is given by

$$s(x) = \int_0^x \sqrt{1 + e^t}\, dt.$$

Identify the function f.

59. Let f be rectifiable on the interval $[a, b]$, and let

$$s(x) = \int_a^x \sqrt{1 + [f'(t)]^2}\, dt.$$

(a) Find ds/dx.

(b) Find ds and $(ds)^2$.

(c) Find $s(x)$ on $[1, 3]$ when $f(t) = t^{3/2}$.

(d) Use the function and interval in part (c) to calculate $s(2)$ and describe what it signifies.

60. Let R be the area of the region in the first quadrant bounded by the parabola $y = x^2$ and the line $y = cx$, $c > 0$, as shown in the figure. Let T be the area of triangle AOB. Find the limit

$$\lim_{c \to 0^+} \frac{T}{R}.$$

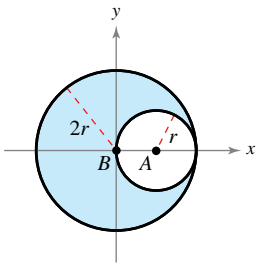
P.S. Problem Solving

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

1. Center of Mass of a Lamina Let L be the lamina of uniform density $\rho = 1$ obtained by removing circle A of radius r from circle B of radius $2r$ (see figure).



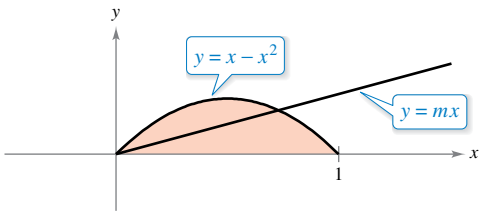
(a) Show that $M_x = 0$ for L.

(b) Show that M_y for L is equal to (M_y for B) $-$ (M_y for A).

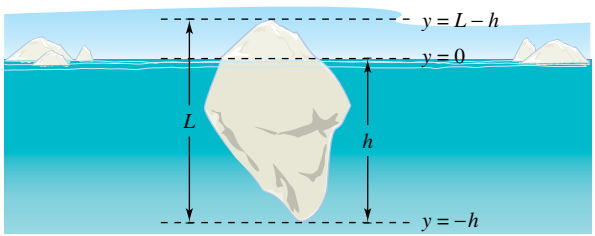
(c) Find M_y for B and M_y for A. Then use part (b) to compute M_y for L.

(d) What is the center of mass of L?

2. Dividing a Region Let R be the region bounded by the parabola $y = x - x^2$ and the x-axis (see figure). Find the equation of the line $y = mx$ that divides this region into two regions of equal area.

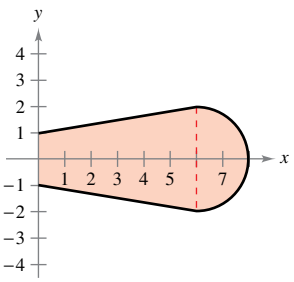


3. Archimedes' Principle **Archimedes' Principle** states that the upward, or buoyant, force on an object within a fluid is equal to the weight of the fluid that the object displaces. For a partially submerged object, you can obtain information about the relative densities of the floating object and the fluid by observing how much of the object is above and below the surface. You can also determine the size of a floating object if you know the amount that is above the surface and the relative densities. You can see the top of a floating iceberg (see figure). The density of ocean water is 1.03×10^3 kilograms per cubic meter, and that of ice is 0.92×10^3 kilograms per cubic meter. What percent of the total iceberg is below the surface?

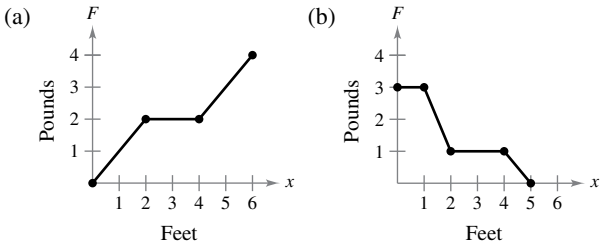


4. Surface Area Graph the curve $8y^2 = x^2(1 - x^2)$. Use a graphing utility to find the surface area of the solid of revolution obtained by revolving the curve about the y-axis.

5. Centroid A blade on an industrial fan has the configuration of a semicircle attached to a trapezoid (see figure). Find the centroid of the blade.



6. Work Find the work done by each force F.



7. Volume A rectangle R of length ℓ and width w is revolved about the line L (see figure). Find the volume of the resulting solid of revolution.

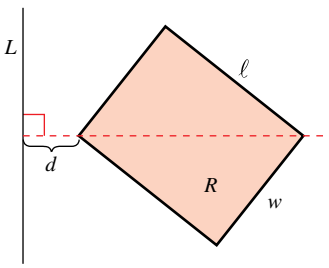


Figure for 7

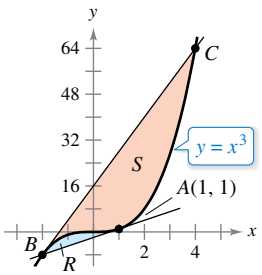

Figure for 8

8. Comparing Areas of Regions

(a) The tangent line to the curve $y = x^3$ at the point $A(1, 1)$ intersects the curve at another point B. Let R be the area of the region bounded by the curve and the tangent line. The tangent line at B intersects the curve at another point C (see figure). Let S be the area of the region bounded by the curve and this second tangent line. How are the areas R and S related?

(b) Repeat the construction in part (a) by selecting an arbitrary point A on the curve $y = x^3$. Show that the two areas R and S are always related in the same way.

8.1 Basic Integration Rules

GO DIGITAL

Review of Basic Integration Rules ($a > 0$)

1. $\int kf(u)\,du = k\int f(u)\,du$
2. $\int [f(u) \pm g(u)]\,du = \int f(u)\,du \pm \int g(u)\,du$
3. $\int du = u + C$
4. $\int u^n\,du = \frac{u^{n+1}}{n+1} + C, \quad n \neq -1$
5. $\int \frac{du}{u} = \ln|u| + C$
6. $\int e^u\,du = e^u + C$
7. $\int a^u\,du = \left(\frac{1}{\ln a}\right)a^u + C$
8. $\int \sin u\,du = -\cos u + C$
9. $\int \cos u\,du = \sin u + C$
10. $\int \tan u\,du = -\ln|\cos u| + C$
11. $\int \cot u\,du = \ln|\sin u| + C$
12. $\int \sec u\,du = \ln|\sec u + \tan u| + C$
13. $\int \csc u\,du = -\ln|\csc u + \cot u| + C$
14. $\int \sec^2 u\,du = \tan u + C$
15. $\int \csc^2 u\,du = -\cot u + C$
16. $\int \sec u \tan u\,du = \sec u + C$
17. $\int \csc u \cot u\,du = -\csc u + C$
18. $\int \frac{du}{\sqrt{a^2 - u^2}} = \arcsin\frac{u}{a} + C$
19. $\int \frac{du}{a^2 + u^2} = \frac{1}{a}\arctan\frac{u}{a} + C$
20. $\int \frac{du}{u\sqrt{u^2 - a^2}} = \frac{1}{a}\operatorname{arcsec}\frac{|u|}{a} + C$

Review procedures for fitting an integrand to one of the basic integration rules.

Fitting Integrands to Basic Integration Rules

In this chapter, you will study several integration techniques that greatly expand the set of integrals to which the basic integration rules can be applied. These rules are reviewed at the left. A major step in solving any integration problem is recognizing which basic integration rule to use.

EXAMPLE 1 A Comparison of Three Similar Integrals

See LarsonCalculus.com for an interactive version of this type of example.

Find each integral.

a. $\int \frac{4}{x^2 + 9}\,dx$ **b.** $\int \frac{4x}{x^2 + 9}\,dx$ **c.** $\int \frac{4x^2}{x^2 + 9}\,dx$

Solution

a. Use the Arctangent Rule and let $u = x$ and $a = 3$.

$$\int \frac{4}{x^2 + 9}\,dx = 4\int \frac{1}{x^2 + 3^2}\,dx \qquad \text{Constant Multiple Rule}$$

$$= 4\left(\frac{1}{3}\arctan\frac{x}{3}\right) + C \qquad \text{Arctangent Rule}$$

$$= \frac{4}{3}\arctan\frac{x}{3} + C \qquad \text{Simplify.}$$

b. The Arctangent Rule does not apply because the numerator contains a factor of x. Consider the Log Rule and let $u = x^2 + 9$. Then $du = 2x\,dx$, and you have

$$\int \frac{4x}{x^2 + 9}\,dx = 2\int \frac{2x\,dx}{x^2 + 9} \qquad \text{Constant Multiple Rule}$$

$$= 2\int \frac{du}{u} \qquad \text{Substitute: } u = x^2 + 9.$$

$$= 2\ln|u| + C \qquad \text{Log Rule}$$

$$= 2\ln(x^2 + 9) + C. \qquad \text{Rewrite as a function of } x.$$

c. Because the degree of the numerator is equal to the degree of the denominator, use long division to rewrite the improper rational function as the sum of a polynomial and a proper rational function.

$$\int \frac{4x^2}{x^2 + 9}\,dx = \int \left(4 + \frac{-36}{x^2 + 9}\right)dx \qquad \text{Rewrite using long division.}$$

$$= \int 4\,dx - 36\int \frac{1}{x^2 + 9}\,dx \qquad \text{Rewrite as two integrals.}$$

$$= 4x - 36\left(\frac{1}{3}\arctan\frac{x}{3}\right) + C \qquad \text{Integrate.}$$

$$= 4x - 12\arctan\frac{x}{3} + C \qquad \text{Simplify.}$$

Note in Example 1(c) that some algebra is required before applying any integration rules, and more than one rule is needed to find the resulting integral.

The area of the region is approximately 1.839.

Figure 8.1

EXAMPLE 2 Using Two Basic Rules to Solve a Single Integral

Evaluate $\int_0^1 \frac{x+3}{\sqrt{4-x^2}}\,dx$.

Solution Begin by writing the integral as the sum of two integrals. Then apply the Power Rule and the Arcsine Rule.

$$\begin{aligned}\int_0^1 \frac{x+3}{\sqrt{4-x^2}}\,dx &= \int_0^1 \frac{x}{\sqrt{4-x^2}}\,dx + \int_0^1 \frac{3}{\sqrt{4-x^2}}\,dx \\ &= -\frac{1}{2}\int_0^1 (4-x^2)^{-1/2}(-2x)\,dx + 3\int_0^1 \frac{1}{\sqrt{2^2-x^2}}\,dx \\ &= \left[-(4-x^2)^{1/2} + 3\arcsin\frac{x}{2}\right]_0^1 \\ &= \left(-\sqrt{3} + \frac{\pi}{2}\right) - (-2+0) \\ &\approx 1.839\end{aligned}$$

See Figure 8.1. ■

TECHNOLOGY The Midpoint Rule can be used to give a good approximation of the value of the integral in Example 2 (for $n = 5$, the approximation is 1.837). When using numerical integration, however, you should be aware that the Midpoint Rule does not always give good approximations when one or both of the limits of integration are near a vertical asymptote. For instance, using the Fundamental Theorem of Calculus, you can obtain

$$\int_0^{1.99} \frac{x+3}{\sqrt{4-x^2}}\,dx \approx 6.213.$$

For $n = 5$, the Midpoint Rule gives an approximation of 5.667.

Rules 18, 19, and 20 of the basic integration rules on the preceding page all have expressions involving the sum or difference of two squares:

$$a^2 - u^2, \quad a^2 + u^2, \quad \text{and} \quad u^2 - a^2.$$

These expressions are often apparent after a u-substitution, as shown in Example 3.

EXAMPLE 3 A Substitution Involving $a^2 - u^2$

Find $\int \frac{x^2}{\sqrt{16-x^6}}\,dx$.

Solution Because the radical in the denominator can be written in the form

$$\sqrt{a^2-u^2} = \sqrt{4^2-(x^3)^2}$$

try the substitution $u = x^3$. Then $du = 3x^2\,dx$, and you have

$$\begin{aligned}\int \frac{x^2}{\sqrt{16-x^6}}\,dx &= \frac{1}{3}\int \frac{3x^2\,dx}{\sqrt{4^2-(x^3)^2}} && \text{Rewrite integral.} \\ &= \frac{1}{3}\int \frac{du}{\sqrt{4^2-u^2}} && \text{Substitute: } u = x^3. \\ &= \frac{1}{3}\arcsin\frac{u}{4} + C && \text{Arcsine Rule} \\ &= \frac{1}{3}\arcsin\frac{x^3}{4} + C. && \text{Rewrite as a function of } x.\end{aligned}$$

■

Exploration

A Comparison of Three Similar Integrals Which, if any, of the integrals listed below can be found using the 20 basic integration rules? For any that can be found, do so. For any that cannot, explain why not.

a. $\int \frac{3}{\sqrt{1-x^2}}\,dx$

b. $\int \frac{3x}{\sqrt{1-x^2}}\,dx$

c. $\int \frac{3x^2}{\sqrt{1-x^2}}\,dx$

GO DIGITAL

Two of the most commonly overlooked integration rules are the Log Rule and the Power Rule. Notice in the next two examples how these two integration rules can be disguised.

EXAMPLE 4 A Disguised Form of the Log Rule

Find $\int \frac{1}{1 + e^x}\,dx$.

Solution The integral does not appear to fit any of the basic rules. The quotient form, however, suggests the Log Rule. If you let $u = 1 + e^x$, then $du = e^x\,dx$. To obtain the required du, add and subtract e^x in the numerator.

$$\int \frac{1}{1 + e^x}\,dx = \int \frac{1 + e^x - e^x}{1 + e^x}\,dx \qquad \text{Add and subtract } e^x \text{ in numerator.}$$

$$= \int \left(\frac{1 + e^x}{1 + e^x} - \frac{e^x}{1 + e^x}\right) dx \qquad \text{Rewrite as two fractions.}$$

$$= \int dx - \int \frac{e^x\,dx}{1 + e^x} \qquad \text{Rewrite as two integrals.}$$

$$= x - \ln(1 + e^x) + C \qquad \text{Integrate.}$$

REMARK Remember that you can separate numerators but not denominators. Watch out for this common error when fitting integrands to basic rules. For instance, you cannot separate denominators in Example 4.

$$\frac{1}{1 + e^x} \neq \frac{1}{1} + \frac{1}{e^x}$$

There is usually more than one way to solve an integration problem. For instance, in Example 4, try integrating by multiplying the numerator and denominator by e^{-x} to obtain an integral of the form $-\int du/u$. Show that this procedure produces the same answer. (Be careful: the answer will appear in a different form.)

EXAMPLE 5 A Disguised Form of the Power Rule

Find $\int (\cot x)[\ln(\sin x)]\,dx$.

Solution Again, the integral does not appear to fit any of the basic rules. However, considering the two primary choices for u

$$u = \cot x \quad \text{or} \quad u = \ln(\sin x)$$

you can determine that the second choice is the appropriate one because

$$u = \ln(\sin x) \quad \text{and} \quad du = \frac{\cos x}{\sin x}\,dx = \cot x\,dx.$$

Using this substitution to find the integral produces

$$\int (\cot x)[\ln(\sin x)]\,dx = \int u\,du \qquad \text{Substitute: } u = \ln(\sin x).$$

$$= \frac{u^2}{2} + C \qquad \text{Integrate.}$$

$$= \frac{1}{2}[\ln(\sin x)]^2 + C. \qquad \text{Rewrite as a function of } x.$$

In Example 5, try checking that the derivative of

$$\frac{1}{2}[\ln(\sin x)]^2 + C$$

is the integrand of the original integral.

Big Ideas of Calculus

How do you find integrals such as

$$\int x^2 \ln x\,dx$$

or

$$\int \sin^3 x \cos^4 x\,dx?$$

When you try using the basic integration techniques you have learned so far, you may discover that they do not work. In this chapter, you will study several advanced integration techniques that you can use to evaluate integrals such as these.

Additionally, you will study how to use limits to evaluate integrals in which either one or both of the limits of integration are infinite or the integrand has a finite number of infinite discontinuities. Such integrals are called improper integrals.

Trigonometric identities can often be used to fit integrals to one of the basic integration rules.

EXAMPLE 6 Using Trigonometric Identities

Find $\int \tan^2 2x\,dx$.

TECHNOLOGY

Use a graphing utility to find the integrals in this section. Compare the *forms* of the antiderivatives given by the utility with the forms obtained in the text. Sometimes the forms will be the same, but often they will differ. For instance, why is the antiderivative $\ln 2x + C$ equivalent to the antiderivative $\ln x + C$?

Solution Note that $\tan^2 u$ is not in the list of basic integration rules. However, $\sec^2 u$ is in the list. This suggests the trigonometric identity $\tan^2 u = \sec^2 u - 1$. If you let $u = 2x$, then $du = 2\,dx$. Using this substitution to find the integral produces

$$\int \tan^2 2x\,dx = \frac{1}{2}\int \tan^2 u\,du \qquad \text{Substitute: } u = 2x.$$

$$= \frac{1}{2}\int (\sec^2 u - 1)\,du \qquad \text{Trigonometric identity}$$

$$= \frac{1}{2}\int \sec^2 u\,du - \frac{1}{2}\int du \qquad \text{Rewrite as two integrals.}$$

$$= \frac{1}{2}\tan u - \frac{u}{2} + C \qquad \text{Integrate.}$$

$$= \frac{1}{2}\tan 2x - x + C. \qquad \text{Rewrite as a function of } x.$$

This section concludes with a summary of the common procedures for fitting integrands to the basic integration rules.

Procedures for Fitting Integrands to Basic Integration Rules

Technique	Example
Expand (numerator).	$(1 + e^x)^2 = 1 + 2e^x + e^{2x}$
Separate numerator.	$\dfrac{1 + x}{x^2 + 1} = \dfrac{1}{x^2 + 1} + \dfrac{x}{x^2 + 1}$
Complete the square.	$\dfrac{1}{\sqrt{2x - x^2}} = \dfrac{1}{\sqrt{1 - (x - 1)^2}}$
Divide improper rational function.	$\dfrac{x^2}{x^2 + 1} = 1 - \dfrac{1}{x^2 + 1}$
Add and subtract terms in numerator.	$\dfrac{2x}{x^2 + 2x + 1} = \dfrac{2x + 2 - 2}{x^2 + 2x + 1} = \dfrac{2x + 2}{x^2 + 2x + 1} - \dfrac{2}{(x + 1)^2}$
Use trigonometric identities.	$\cot^2 x = \csc^2 x - 1$
Multiply and divide by Pythagorean conjugate.	$\dfrac{1}{1 + \sin x} = \left(\dfrac{1}{1 + \sin x}\right)\left(\dfrac{1 - \sin x}{1 - \sin x}\right) = \dfrac{1 - \sin x}{1 - \sin^2 x} = \dfrac{1 - \sin x}{\cos^2 x} = \sec^2 x - \dfrac{\sin x}{\cos^2 x}$

8.1 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Explain how to integrate a rational function with a numerator and denominator of the same degree.
2. State the procedure you should use to fit each integrand to the basic integration rules. Do not integrate.

(a) $\int \frac{2+x}{x^2+9}\,dx$ (b) $\int \cot^2 x\,dx$

Choosing an Antiderivative **In Exercises 3 and 4, select the correct antiderivative.**

3. $\int \frac{x}{\sqrt{x^2+1}}\,dx$

(a) $2\sqrt{x^2+1}+C$ (b) $\sqrt{x^2+1}+C$

(c) $\frac{1}{2}\sqrt{x^2+1}+C$ (d) $\ln(x^2+1)+C$

4. $\int \frac{1}{x^2+1}\,dx$

(a) $\ln\sqrt{x^2+1}+C$ (b) $\frac{2x}{(x^2+1)^2}+C$

(c) $\arctan x+C$ (d) $\ln(x^2+1)+C$

Choosing a Formula **In Exercises 5–14, state the basic integration formula you can use to find the indefinite integral, and identify u and a when appropriate. Do not integrate.**

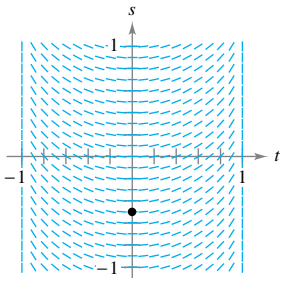
5. $\int (5x-3)^4\,dx$
6. $\int \frac{2t+1}{t^2+t-4}\,dt$
7. $\int \frac{1}{\sqrt{x}(1-2\sqrt{x})}\,dx$
8. $\int \frac{2}{(2t-1)^2+4}\,dt$
9. $\int \frac{3}{\sqrt{1-t^2}}\,dt$
10. $\int \frac{-2x}{\sqrt{x^2-4}}\,dx$
11. $\int t\sin t^2\,dt$
12. $\int \sec 5x\tan 5x\,dx$
13. $\int (\cos x)e^{\sin x}\,dx$
14. $\int \frac{1}{x\sqrt{x^2-4}}\,dx$

Finding an Indefinite Integral **In Exercises 15–46, find the indefinite integral.**

15. $\int 14(x-5)^6\,dx$
16. $\int \frac{5}{(t+6)^3}\,dt$
17. $\int \frac{7}{(z-10)^7}\,dz$
18. $\int t^3\sqrt{t^4+1}\,dt$
19. $\int \left[z^2+\frac{1}{(1-z)^6}\right]dz$
20. $\int \left[4x-\frac{2}{(2x+3)^2}\right]dx$
21. $\int \frac{t^2-3}{-t^3+9t+1}\,dt$
22. $\int \frac{x+1}{\sqrt{3x^2+6x}}\,dx$
23. $\int \frac{x^2}{x-1}\,dx$
24. $\int \frac{3x}{x+4}\,dx$
25. $\int \frac{x+2}{x+1}\,dx$
26. $\int \left(\frac{1}{9z-5}-\frac{1}{9z+5}\right)dz$
27. $\int (5+4x^2)^2\,dx$
28. $\int x\left(3+\frac{2}{x}\right)^2\,dx$
29. $\int x\cos 2\pi x^2\,dx$
30. $\int \csc \pi x\cot \pi x\,dx$
31. $\int \frac{\sin x}{\sqrt{\cos x}}\,dx$
32. $\int \frac{\csc^2 3t}{\cot 3t}\,dt$
33. $\int \frac{2}{e^{-x}+1}\,dx$
34. $\int \frac{4}{3-e^x}\,dx$
35. $\int \frac{\ln x^2}{x}\,dx$
36. $\int (\tan x)[\ln(\cos x)]\,dx$
37. $\int \frac{1+\cos\alpha}{\sin\alpha}\,d\alpha$
38. $\int \frac{1}{\cos\theta-1}\,d\theta$
39. $\int \frac{-1}{\sqrt{1-(4t+1)^2}}\,dt$
40. $\int \frac{1}{25+4x^2}\,dx$
41. $\int \frac{\tan(2/t)}{t^2}\,dt$
42. $\int \frac{e^{-1/t^3}}{t^4}\,dt$
43. $\int \frac{6}{z\sqrt{9z^2-25}}\,dz$
44. $\int \frac{1}{(x-1)\sqrt{4x^2-8x+3}}\,dx$
45. $\int \frac{4}{4x^2+4x+65}\,dx$
46. $\int \frac{1}{x^2-4x+9}\,dx$

Slope Field **In Exercises 47 and 48, a differential equation, a point, and a slope field are given. (a) Sketch two approximate solutions of the differential equation on the slope field, one of which passes through the given point. (To print an enlarged copy of the graph, go to *MathGraphs.com*.) (b) Use integration and the given point to find the particular solution of the differential equation and use a graphing utility to graph the solution. Compare the result with the sketch in part (a) that passes through the given point.**

47. $\frac{ds}{dt}=\frac{t}{\sqrt{1-t^4}}$, $\left(0,-\frac{1}{2}\right)$



48. $\frac{dy}{dx}=\frac{1}{\sqrt{4x-x^2}}$, $\left(2,\frac{1}{2}\right)$

Slope Field **In Exercises 49 and 50, use a graphing utility to graph the slope field for the differential equation and graph the solution satisfying the specified initial condition.**

49. $\frac{dy}{dx} = 0.8y,\ y(0) = 4$

50. $\frac{dy}{dx} = 5 - y,\ y(0) = 1$

Differential Equation **In Exercises 51–56, find the general solution of the differential equation.**

51. $\frac{dy}{dx} = (e^x + 5)^2$

52. $\frac{dy}{dx} = (4 - e^{2x})^2$

53. $\frac{dr}{dt} = \frac{10e^t}{\sqrt{1 - e^{2t}}}$

54. $\frac{dr}{dt} = \frac{(1 + e^t)^2}{e^{3t}}$

55. $(4 + \tan^2 x)y' = \sec^2 x$

56. $y' = \frac{1}{x\sqrt{4x^2 - 9}}$

Evaluating a Definite Integral **In Exercises 57–72, evaluate the definite integral. Use a graphing utility to verify your result.**

57. $\int_{2/3}^{1} (2 - 3t)^4\,dt$

58. $\int_{-1}^{0} \frac{5}{(t + 2)^{11}}\,dt$

59. $\int_{0}^{\pi/4} \cos 2x\,dx$

60. $\int_{0}^{\pi} \sin^2 t \cos t\,dt$

61. $\int_{0}^{1} xe^{-x^2}\,dx$

62. $\int_{1}^{e} \frac{1 - \ln x}{x}\,dx$

63. $\int_{2}^{3} \frac{\ln(x + 1)^3}{x + 1}\,dx$

64. $\int_{-3}^{1} \frac{e^x}{e^{2x} + 2e^x + 1}\,dx$

65. $\int_{0}^{8} \frac{2x}{\sqrt{x^2 + 36}}\,dx$

66. $\int_{1}^{3} \frac{2x^2 + 3x - 2}{x}\,dx$

67. $\int_{3}^{5} \frac{2t}{t^2 - 4t + 4}\,dt$

68. $\int_{2}^{4} \frac{4x^3}{x^4 - 6x^2 + 9}\,dx$

69. $\int_{0}^{2/\sqrt{3}} \frac{1}{4 + 9x^2}\,dx$

70. $\int_{0}^{7} \frac{1}{\sqrt{100 - x^2}}\,dx$

71. $\int_{-4}^{0} 3^{1-x}\,dx$

72. $\int_{0}^{1} 7^{x^2+2x}(x + 1)\,dx$

Finding an Integral Using Technology **In Exercises 73–76, use a graphing utility to find the integral. Use the graphing utility to graph two antiderivatives. Describe the relationship between the graphs of the two antiderivatives.**

73. $\int \frac{1}{x^2 + 4x + 13}\,dx$

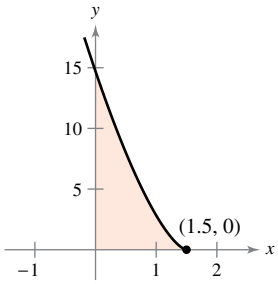
74. $\int \frac{x - 2}{x^2 + 4x + 13}\,dx$

75. $\int \frac{1}{1 + \sin\theta}\,d\theta$

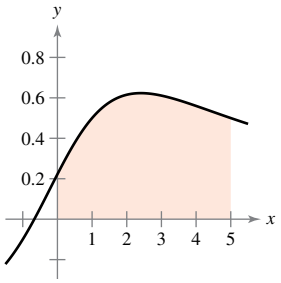
76. $\int \left(\frac{e^x + e^{-x}}{2}\right)^3 dx$

Area **In Exercises 77–80, find the area of the given region.**

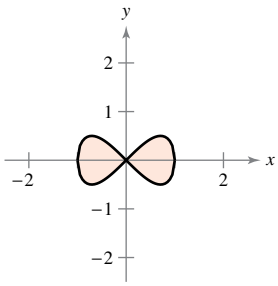
77. $y = (-4x + 6)^{3/2}$



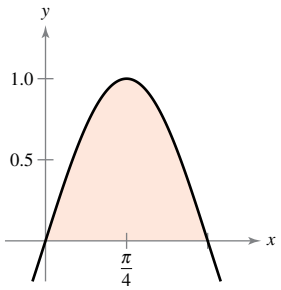
78. $y = \frac{3x + 2}{x^2 + 9}$



79. $y^2 = x^2(1 - x^2)$



80. $y = \sin 2x$



Exploring Concepts

81. When evaluating

$$\int_{-1}^{1} x^2\,dx$$

is it appropriate to substitute

$$u = x^2, \quad x = \sqrt{u}, \quad \text{and} \quad dx = \frac{du}{2\sqrt{u}}$$

to obtain

$$\frac{1}{2}\int_{1}^{1} \sqrt{u}\,du = 0?$$ Explain.

82. Show that

$$\sec x = \frac{\sin x}{\cos x} + \frac{\cos x}{1 + \sin x}.$$

Then use this identity to derive the basic integration rule

$$\int \sec x\,dx = \ln|\sec x + \tan x| + C.$$

83. Finding Constants Determine the constants a and b such that $\sin x + \cos x = a\sin(x + b)$. Use this result to integrate

$$\int \frac{dx}{\sin x + \cos x}.$$

84. Area The graphs of $f(x) = x$ and $g(x) = ax^2$ intersect at the points $(0, 0)$ and $(1/a, 1/a)$. Find a $(a > 0)$ such that the area of the region bounded by the graphs of these two functions is $\frac{2}{3}$.

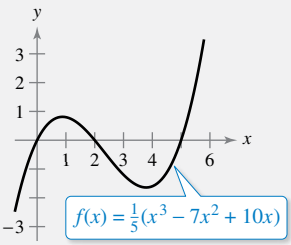
85. Comparing Antiderivatives

(a) Explain why the antiderivative $y_1 = e^{x+C_1}$ is equivalent to the antiderivative $y_2 = Ce^x$.

(b) Explain why the antiderivative $y_1 = \sec^2 x + C_1$ is equivalent to the antiderivative $y_2 = \tan^2 x + C$.

86. HOW DO YOU SEE IT? Using the graph, is $\int_0^5 f(x)\,dx$ positive or negative? Explain.



Approximation **In Exercises 87 and 88, determine which value best approximates the area of the region between the x-axis and the graph of the function over the given interval. Make your selection on the basis of a sketch of the region, not by performing calculations.**

87. $f(x) = \dfrac{4x}{x^2 + 1}$, $[0, 2]$

(a) 3 (b) 1 (c) -8 (d) 8 (e) 10

88. $f(x) = \dfrac{4}{x^2 + 1}$, $[0, 2]$

(a) 3 (b) 1 (c) -4 (d) 4 (e) 10

Interpreting Integrals **In Exercises 89 and 90, (a) sketch the region whose area is given by the integral, (b) sketch the solid whose volume is given by the integral when the disk method is used, and (c) sketch the solid whose volume is given by the integral when the shell method is used. (There is more than one correct answer for each part.)**

89. $\int_0^2 2\pi x^2\,dx$ **90.** $\int_0^4 \pi y\,dy$

91. Volume The region bounded by $y = e^{-x^2}$, $y = 0$, $x = 0$, and $x = b$ $(b > 0)$ is revolved about the y-axis.

(a) Find the volume of the solid generated when $b = 1$.

(b) Find b such that the volume of the solid generated is $\frac{4}{3}$ cubic units.

92. Volume Consider the region bounded by the graphs of $x = 0$, $y = \cos x^2$, $y = \sin x^2$, and $x = \sqrt{x}/2$. Find the volume of the solid generated by revolving the region about the y-axis.

93. Arc Length Find the arc length of the graph of $y = \ln(\sin x)$ from $x = \pi/4$ to $x = \pi/2$.

94. Arc Length Find the arc length of the graph of $y = \ln(\cos x)$ from $x = 0$ to $x = \pi/3$.

95. Surface Area Find the area of the surface formed by revolving the graph of $y = 2\sqrt{x}$ on the interval $[0, 9]$ about the x-axis.

96. Centroid Find the centroid of the region bounded by the graphs of

$$y = \frac{1}{2x + 1}, \quad y = 0, \quad x = 0, \quad \text{and} \quad x = 2.$$

Average Value of a Function **In Exercises 97 and 98, find the average value of the function over the given interval.**

97. $f(x) = \dfrac{1}{1 + x^2}$, $-3 \le x \le 3$

98. $f(x) = \sin nx$, $0 \le x \le \pi/n$, n is a positive integer.

Arc Length **In Exercises 99 and 100, use the integration capabilities of a graphing utility to approximate the arc length of the curve over the given interval.**

99. $y = \tan \pi x$, $\left[0, \frac{1}{4}\right]$ **100.** $y = x^{2/3}$, $[1, 8]$

101. Finding a Pattern

(a) Find $\int \cos^3 x\,dx$.

(b) Find $\int \cos^5 x\,dx$.

(c) Find $\int \cos^7 x\,dx$.

(d) Explain how to find $\int \cos^{15} x\,dx$ without actually integrating.

102. Finding a Pattern

(a) Write $\int \tan^3 x\,dx$ in terms of $\int \tan x\,dx$. Then find $\int \tan^3 x\,dx$.

(b) Write $\int \tan^5 x\,dx$ in terms of $\int \tan^3 x\,dx$.

(c) Write $\int \tan^{2k+1} x\,dx$, where k is a positive integer, in terms of $\int \tan^{2k-1} x\,dx$.

(d) Explain how to find $\int \tan^{15} x\,dx$ without actually integrating.

103. Methods of Integration Show that the following results are equivalent. (You will learn about integration by tables in Section 8.7.)

Integration by tables:

$$\int \sqrt{x^2 + 1}\,dx = \frac{1}{2}\left(x\sqrt{x^2 + 1} + \ln\left|x + \sqrt{x^2 + 1}\right|\right) + C$$

Integration by graphing utility:

$$\int \sqrt{x^2 + 1}\,dx = \frac{1}{2}\left[x\sqrt{x^2 + 1} + \operatorname{arcsinh}(x)\right] + C$$

PUTNAM EXAM CHALLENGE

104. Evaluate $\displaystyle\int_2^4 \frac{\sqrt{\ln(9 - x)}\,dx}{\sqrt{\ln(9 - x)} + \sqrt{\ln(x + 3)}}$.

This problem was composed by the Committee on the Putnam Prize Competition.

8.2 Integration by Parts

Find an antiderivative using integration by parts.

Integration by Parts

In this section, you will study an important integration technique called **integration by parts.** This technique can be applied to a wide variety of functions and is particularly useful for integrands involving *products* of algebraic and transcendental functions. For instance, integration by parts works well with integrals such as

$$\int x \ln x \, dx, \quad \int x^2 e^x \, dx, \quad \text{and} \quad \int e^x \sin x \, dx.$$

Integration by parts is based on the formula for the derivative of a product

$$\frac{d}{dx}[uv] = u\frac{dv}{dx} + v\frac{du}{dx} \qquad \text{Product Rule}$$

$$= uv' + vu' \qquad \text{Rewrite using prime notation.}$$

where both u and v are differentiable functions of x. When u' and v' are continuous, you can integrate each side of this equation to obtain

$$uv = \int uv' \, dx + \int vu' \, dx \qquad \text{Integrate each side.}$$

$$= \int u \, dv + \int v \, du. \qquad \text{Write in differential form.}$$

By rewriting this equation, you obtain the next theorem.

THEOREM 8.1 Integration by Parts

If u and v are functions of x and have continuous derivatives, then

$$\int u \, dv = uv - \int v \, du.$$

This formula expresses the original integral in terms of another integral. Depending on the choices of u and dv, it may be easier to find the second integral than the original one. Because the choices of u and dv are critical in the integration by parts process, the guidelines below are provided.

Guidelines for Integration by Parts

1. Try letting dv be the most complicated portion of the integrand that fits a basic integration rule. Then u will be the remaining portion of the integrand.
2. Try letting u be the portion of the integrand whose derivative is a function simpler than u. Then dv will be the remaining portion of the integrand.

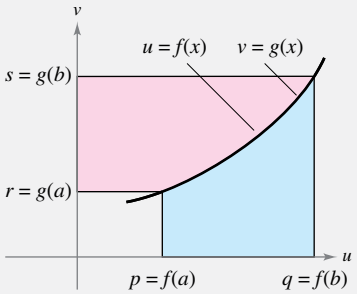
Note that dv always includes the dx of the original integrand.

When using integration by parts, note that you can first choose dv or first choose u. After you choose, however, the choice of the other factor is determined—it must be the remaining portion of the integrand. Also note that dv must contain the differential dx of the original integral.

Exploration

Proof Without Words

Here is a different approach to proving the formula for integration by parts. This approach is from "Proof Without Words: Integration by Parts" by Roger B. Nelsen, *Mathematics Magazine,* 64, No. 2, April 1991, p. 130, by permission of the author.



Area + Area $= qs - pr$

$$\int_r^s u \, dv + \int_q^p v \, du = \Big[uv\Big]_{(p,\,r)}^{(q,\,s)}$$

$$\int_r^s u \, dv = \Big[uv\Big]_{(p,\,r)}^{(q,\,s)} - \int_q^p v \, du$$

Explain how this graph proves the theorem. Which notation in this proof is unfamiliar? What do you think it means?

GO DIGITAL

EXAMPLE 1 Integration by Parts

Find $\int xe^x\,dx$.

Solution To apply integration by parts, you need to write the integral in the form $\int u\,dv$. There are several ways to do this.

$$\int \underbrace{(x)}_{u}\underbrace{(e^x\,dx)}_{dv}, \quad \int \underbrace{(e^x)}_{u}\underbrace{(x\,dx)}_{dv}, \quad \int \underbrace{(1)}_{u}\underbrace{(xe^x\,dx)}_{dv}, \quad \int \underbrace{(xe^x)}_{u}\underbrace{(dx)}_{dv}$$

The guidelines on the preceding page suggest the first option because the derivative of $u = x$ is simpler than x, and $dv = e^x\,dx$ is the most complicated portion of the integrand that fits a basic integration formula.

$$dv = e^x\,dx \quad \Rightarrow \quad v = \int dv = \int e^x\,dx = e^x$$
$$u = x \quad \Rightarrow \quad du = dx$$

Now, integration by parts produces

$$\int u\,dv = uv - \int v\,du \qquad \text{Integration by parts formula}$$
$$\int xe^x\,dx = xe^x - \int e^x\,dx \qquad \text{Substitute.}$$
$$= xe^x - e^x + C. \qquad \text{Integrate.}$$

Use differentiation to check that $xe^x - e^x + C$ is the integrand of the *original* integral.

REMARK In Example 1, note that it is not necessary to include a constant of integration when solving

$$v = \int e^x\,dx = e^x + C_1.$$

To illustrate this, replace $v = e^x$ by $v = e^x + C_1$ and apply integration by parts. Do you obtain the same result?

EXAMPLE 2 Integration by Parts

Find $\int x^2 \ln x\,dx$.

Solution In this case, x^2 is easier to integrate than $\ln x$. Furthermore, the derivative of $\ln x$ is simpler than $\ln x$. So, let $dv = x^2\,dx$ and let $u = \ln x$.

$$dv = x^2\,dx \quad \Rightarrow \quad v = \int x^2\,dx = \frac{x^3}{3}$$
$$u = \ln x \quad \Rightarrow \quad du = \frac{1}{x}\,dx$$

Integration by parts produces

$$\int u\,dv = uv - \int v\,du \qquad \text{Integration by parts formula}$$
$$\int x^2 \ln x\,dx = \frac{x^3}{3}\ln x - \int \left(\frac{x^3}{3}\right)\left(\frac{1}{x}\right)dx \qquad \text{Substitute.}$$
$$= \frac{x^3}{3}\ln x - \frac{1}{3}\int x^2\,dx \qquad \text{Simplify.}$$
$$= \frac{x^3}{3}\ln x - \frac{x^3}{9} + C. \qquad \text{Integrate.}$$

You can check this result by differentiating.

$$\frac{d}{dx}\left[\frac{x^3}{3}\ln x - \frac{x^3}{9} + C\right] = \frac{x^3}{3}\left(\frac{1}{x}\right) + (\ln x)(x^2) - \frac{x^2}{3} = x^2 \ln x$$

TECHNOLOGY Use a graphing utility to graph

$$f(x) = \int x^2 \ln x\,dx$$

and

$$g(x) = \frac{x^3}{3}\ln x - \frac{x^3}{9}$$

in the same viewing window. Does this graph support the solution to Example 2? Explain.

GO DIGITAL

One surprising application of integration by parts involves integrands consisting of single terms, such as

$$\int \ln x\,dx \quad \text{or} \quad \int \arcsin x\,dx.$$

In these cases, try letting $dv = dx$, as shown in the next two examples.

FOR FURTHER INFORMATION To learn how integration by parts is used to prove Stirling's approximation

$$\ln(n!) = n \ln n - n$$

see the article "The Validity of Stirling's Approximation: A Physical Chemistry Project" by A. S. Wallner and K. A. Brandt in *Journal of Chemical Education.*

EXAMPLE 3 An Integrand with a Single Term

Find $\int \ln x\,dx$.

Solution The integrand is not a product, so let $dv = dx$ and let $u = \ln x$.

$$dv = dx \quad \Rightarrow \quad v = \int dx = x$$

$$u = \ln x \quad \Rightarrow \quad du = \frac{1}{x}\,dx$$

Next, apply the integration by parts formula.

$$\int u\,dv = uv - \int v\,du \qquad \text{Integration by parts formula}$$

$$\int \ln x\,dx = (\ln x)(x) - \int x\left(\frac{1}{x}\right) dx \qquad \text{Substitute.}$$

$$= x \ln x - \int dx \qquad \text{Simplify.}$$

$$= x \ln x - x + C \qquad \text{Integrate.}$$

EXAMPLE 4 An Integrand with a Single Term

Evaluate $\int_0^1 \arcsin x\,dx$.

Solution Let $dv = dx$ and let $u = \arcsin x$.

$$dv = dx \quad \Rightarrow \quad v = \int dx = x$$

$$u = \arcsin x \quad \Rightarrow \quad du = \frac{1}{\sqrt{1 - x^2}}\,dx$$

Next, find the antiderivative.

$$\int u\,dv = uv - \int v\,du \qquad \text{Integration by parts formula}$$

$$\int \arcsin x\,dx = x \arcsin x - \int \frac{x}{\sqrt{1 - x^2}}\,dx \qquad \text{Substitute.}$$

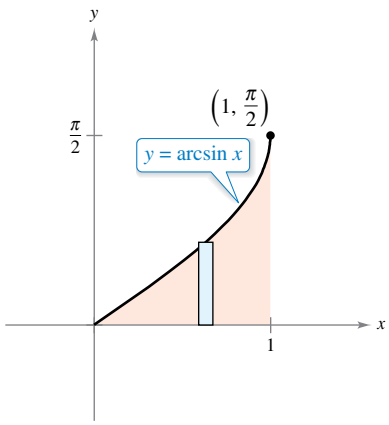
$$= x \arcsin x + \frac{1}{2}\int (1 - x^2)^{-1/2}(-2x)\,dx \qquad \text{Rewrite.}$$

$$= x \arcsin x + \sqrt{1 - x^2} + C \qquad \text{Integrate.}$$

Finally, use this antiderivative to evaluate the definite integral.

$$\int_0^1 \arcsin x\,dx = \left[x \arcsin x + \sqrt{1 - x^2}\right]_0^1 = \frac{\pi}{2} - 1 \approx 0.571$$

The area represented by this definite integral is shown in Figure 8.2.



The area of the region is approximately 0.571.

Figure 8.2

Some integrals require repeated use of the integration by parts formula, as shown in the next example.

EXAMPLE 5 Repeated Use of Integration by Parts

Find $\int x^2 \sin x \, dx$.

Solution The factors x^2 and $\sin x$ are equally easy to integrate. Notice, however, that the derivative of x^2 becomes simpler, whereas the derivative of $\sin x$ does not. So, let $dv = \sin x \, dx$ and let $u = x^2$.

$$dv = \sin x \, dx \quad \Rightarrow \quad v = \int \sin x \, dx = -\cos x$$
$$u = x^2 \quad \Rightarrow \quad du = 2x \, dx$$

Now, integration by parts produces

$$\int x^2 \sin x \, dx = -x^2 \cos x + \int 2x \cos x \, dx. \qquad \text{First use of integration by parts}$$

This first use of integration by parts has succeeded in simplifying the original integral, but the integral on the right still does not fit a basic integration rule. To find that integral, you can apply integration by parts again. This time, let $dv = \cos x \, dx$ and let $u = 2x$.

$$dv = \cos x \, dx \quad \Rightarrow \quad v = \int \cos x \, dx = \sin x$$
$$u = 2x \quad \Rightarrow \quad du = 2 \, dx$$

Now, integration by parts produces

$$\int 2x \cos x \, dx = 2x \sin x - \int 2 \sin x \, dx \qquad \text{Second use of integration by parts}$$
$$= 2x \sin x + 2 \cos x + C.$$

Combining these two results, you have

$$\int x^2 \sin x \, dx = -x^2 \cos x + 2x \sin x + 2 \cos x + C.$$

TECHNOLOGY

Remember that there are several ways to use technology to evaluate a definite integral: (1) use a numerical approximation such as the Midpoint Rule, (2) use a graphing utility to find the antiderivative and then apply the Fundamental Theorem of Calculus, or (3) use the *numerical integration* feature of a graphing utility. These methods, however, have shortcomings. To apply the Fundamental Theorem of Calculus, the graphing utility must be able to find the antiderivative. Often, for the *numerical integration* feature of a graphing utility, you are given no indication of the degree of accuracy of the approximation.

When making repeated applications of integration by parts, you need to be careful not to interchange the substitutions in successive applications. For instance, in Example 5, the first substitution was $u = x^2$ and $dv = \sin x \, dx$. If, in the second application, you had switched the substitution to $u = \cos x$ and $dv = 2x \, dx$, you would have obtained

$$\int x^2 \sin x \, dx = -x^2 \cos x + \int 2x \cos x \, dx$$
$$= -x^2 \cos x + x^2 \cos x + \int x^2 \sin x \, dx$$
$$= \int x^2 \sin x \, dx$$

thereby undoing the previous integration and returning to the *original* integral. When making repeated applications of integration by parts, you should also watch for the appearance of a *constant multiple* of the original integral. For instance, this occurs when you use integration by parts to find $\int e^x \cos 2x \, dx$, and it also occurs in Example 6 on the next page.

The integral in Example 6 is an important one. In Section 8.4 (Example 6), you will learn that it is used to find the arc length of a parabolic segment.

GO DIGITAL

EXAMPLE 6 Integration by Parts

Find $\int \sec^3 x\,dx$.

Solution The most complicated portion of the integrand that can be easily integrated is $\sec^2 x$, so let $dv = \sec^2 x\,dx$ and $u = \sec x$.

$$dv = \sec^2 x\,dx \quad \Rightarrow \quad v = \int \sec^2 x\,dx = \tan x$$

$$u = \sec x \quad \Rightarrow \quad du = \sec x \tan x\,dx$$

Integration by parts produces

$$\int u\,dv = uv - \int v\,du \qquad \text{Integration by parts formula}$$

$$\int \sec^3 x\,dx = \sec x \tan x - \int \sec x \tan^2 x\,dx \qquad \text{Substitute.}$$

$$\int \sec^3 x\,dx = \sec x \tan x - \int (\sec x)(\sec^2 x - 1)\,dx \qquad \text{Trigonometric identity}$$

$$\int \sec^3 x\,dx = \sec x \tan x - \int \sec^3 x\,dx + \int \sec x\,dx \qquad \text{Rewrite.}$$

$$2\int \sec^3 x\,dx = \sec x \tan x + \int \sec x\,dx \qquad \text{Collect like integrals.}$$

$$2\int \sec^3 x\,dx = \sec x \tan x + \ln|\sec x + \tan x| + C \qquad \text{Integrate.}$$

$$\int \sec^3 x\,dx = \frac{1}{2}\sec x \tan x + \frac{1}{2}\ln|\sec x + \tan x| + C. \qquad \text{Divide by 2.}$$

EXAMPLE 7 Finding a Centroid

A machine part is modeled by the region bounded by the graph of $y = \sin x$ and the x-axis, $0 \le x \le \pi/2$, as shown in Figure 8.3. Find the centroid of this region.

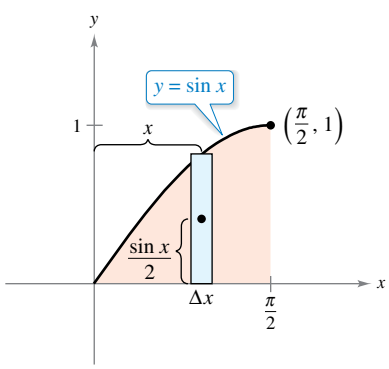

Figure 8.3

Solution Begin by finding the area of the region.

$$A = \int_0^{\pi/2} \sin x\,dx = \Big[-\cos x\Big]_0^{\pi/2} = 1$$

Now, you can find the coordinates of the centroid. To evaluate the integral for $\bar{y}$, first rewrite the integrand using the trigonometric identity $\sin^2 x = (1 - \cos 2x)/2$.

$$\bar{y} = \frac{1}{A}\int_0^{\pi/2} \frac{\sin x}{2}(\sin x)\,dx = \frac{1}{4}\int_0^{\pi/2} (1 - \cos 2x)\,dx = \frac{1}{4}\Big[x - \frac{\sin 2x}{2}\Big]_0^{\pi/2} = \frac{\pi}{8}$$

You can evaluate the integral for $\bar{x}$, $(1/A)\int_0^{\pi/2} x \sin x\,dx$, with integration by parts. To do this, let $dv = \sin x\,dx$ and $u = x$. This produces $v = -\cos x$ and $du = dx$, and you have

$$\int x \sin x\,dx = -x\cos x + \int \cos x\,dx = -x\cos x + \sin x + C.$$

Finally, you can determine $\bar{x}$ to be

$$\bar{x} = \frac{1}{A}\int_0^{\pi/2} x \sin x\,dx = \Big[-x\cos x + \sin x\Big]_0^{\pi/2} = 1.$$

So, the centroid of the region is $(1, \pi/8)$. ■

GO DIGITAL

As you gain experience in using integration by parts, your skill in determining u and dv will increase. The next summary lists several common integrals with suggestions for the choices of u and dv.

REMARK You can use the acronym LIATE as a guideline for choosing u in integration by parts. In order, check the integrand for the following.

Is there a Logarithmic part?

Is there an Inverse trigonometric part?

Is there an Algebraic part?

Is there a Trigonometric part?

Is there an Exponential part?

Common Integrals Using Integration by Parts

1. For integrals of the form

$$\int x^n e^{ax}\,dx, \quad \int x^n \sin ax\,dx, \quad \text{or} \quad \int x^n \cos ax\,dx$$

let $u = x^n$ and let $dv = e^{ax}\,dx$, $\sin ax\,dx$, or $\cos ax\,dx$.

2. For integrals of the form

$$\int x^n \ln x\,dx, \quad \int x^n \arcsin ax\,dx, \quad \text{or} \quad \int x^n \arctan ax\,dx$$

let $u = \ln x$, $\arcsin ax$, or $\arctan ax$ and let $dv = x^n\,dx$.

3. For integrals of the form

$$\int e^{ax} \sin bx\,dx \quad \text{or} \quad \int e^{ax} \cos bx\,dx$$

let $u = \sin bx$ or $\cos bx$ and let $dv = e^{ax}\,dx$.

In problems involving repeated applications of integration by parts, a tabular method can help organize the work, as shown in Example 8. This method works well for integrals of the forms

$$\int x^n \sin ax\,dx, \quad \int x^n \cos ax\,dx, \quad \text{and} \quad \int x^n e^{ax}\,dx.$$

EXAMPLE 8 Using the Tabular Method

See LarsonCalculus.com for an interactive version of this type of example.

Find $\int x^2 \sin 4x\,dx$.

Solution Begin as usual by letting $u = x^2$ and $dv = v'\,dx = \sin 4x\,dx$. Next, create a table consisting of three columns, as shown.

Alternate Signs	u and Its Derivatives	v' and Its Antiderivatives
+	x^2	$\sin 4x$
−	$2x$	$-\frac{1}{4}\cos 4x$
+	2	$-\frac{1}{16}\sin 4x$
−	0	$\frac{1}{64}\cos 4x$

Differentiate until you obtain 0 as a derivative.

To obtain the solution, add the signed products of the diagonal entries.

$$\int x^2 \sin 4x\,dx = x^2\left(-\frac{1}{4}\cos 4x\right) - 2x\left(-\frac{1}{16}\sin 4x\right) + 2\left(\frac{1}{64}\cos 4x\right) + C$$

$$= -\frac{1}{4}x^2 \cos 4x + \frac{1}{8}x \sin 4x + \frac{1}{32}\cos 4x + C$$

FOR FURTHER INFORMATION For more information on the tabular method, see the article "Tabular Integration by Parts" by David Horowitz in *The College Mathematics Journal*, and the article "More on Tabular Integration by Parts" by Leonard Gillman in *The College Mathematics Journal*. Concept Check

1. Integration by parts is based on what formula?
2. Describe how to choose u and dv when using integration by parts.
3. How can you use integration by parts on an integrand with a single term that does not fit any of the basic integration rules?
4. Explain when integrating using the tabular method is useful.

Setting Up Integration by Parts **In Exercises 5–10, identify u and dv for finding the integral using integration by parts. Do not integrate.**

5. $\int xe^{9x}\,dx$
6. $\int x^2e^{2x}\,dx$
7. $\int (\ln x)^2\,dx$
8. $\int \ln 5x\,dx$
9. $\int x\sec^2 x\,dx$
10. $\int x^2\cos x\,dx$

Using Integration by Parts **In Exercises 11–14, find the indefinite integral using integration by parts with the given choices of u and dv.**

11. $\int x^3\ln x\,dx;\ u = \ln x,\ dv = x^3\,dx$
12. $\int (7 - x)e^{x/2}\,dx;\ u = 7 - x,\ dv = e^{x/2}\,dx$
13. $\int (2x + 1)\sin 4x\,dx;\ u = 2x + 1,\ dv = \sin 4x\,dx$
14. $\int x\cos 4x\,dx;\ u = x,\ dv = \cos 4x\,dx$

Finding an Indefinite Integral **In Exercises 15–34, find the indefinite integral. (*Note:* Solve by the most convenient method—not all require integration by parts.)**

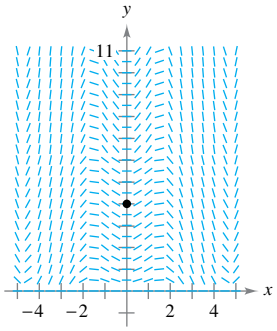
15. $\int xe^{4x}\,dx$
16. $\int \frac{5x}{e^{2x}}\,dx$
17. $\int x^3e^x\,dx$
18. $\int \frac{e^{1/t}}{t^2}\,dt$
19. $\int t\ln(t + 1)\,dt$
20. $\int x^5\ln 3x\,dx$
21. $\int \frac{(\ln x)^2}{x}\,dx$
22. $\int \frac{\ln x}{x^3}\,dx$
23. $\int \frac{xe^{2x}}{(2x + 1)^2}\,dx$
24. $\int \frac{x^3e^{x^2}}{(x^2 + 1)^2}\,dx$
25. $\int x\sqrt{x - 5}\,dx$
26. $\int \frac{2x}{\sqrt{1 - 6x}}\,dx$
27. $\int x\csc^2 x\,dx$
28. $\int t\csc t\cot t\,dt$
29. $\int x^3\sin x\,dx$
30. $\int x^2\cos x\,dx$
31. $\int \arctan x\,dx$
32. $\int 4\arccos x\,dx$
33. $\int e^{-3x}\sin 5x\,dx$
34. $\int e^{4x}\cos 2x\,dx$

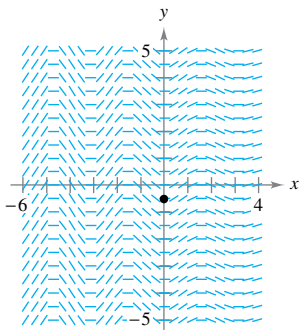
Differential Equation **In Exercises 35–38, find the general solution of the differential equation.**

35. $y' = \ln x$
36. $y' = \arctan\frac{x}{2}$
37. $\frac{dy}{dt} = \frac{t^2}{\sqrt{3 + 5t}}$
38. $\frac{dy}{dx} = x^2\sqrt{x - 3}$

Slope Field **In Exercises 39 and 40, a differential equation, a point, and a slope field are given. (a) Sketch two approximate solutions of the differential equation on the slope field, one of which passes through the given point. (To print an enlarged copy of the graph, go to *MathGraphs.com*.) (b) Use integration and the given point to find the particular solution of the differential equation and use a graphing utility to graph the solution. Compare the result with the sketch in part (a) that passes through the given point.**

39. $\frac{dy}{dx} = x\sqrt{y}\cos x,\ (0, 4)$
40. $\frac{dy}{dx} = e^{-x/3}\sin 2x,\ \left(0, -\frac{18}{37}\right)$





Slope Field **In Exercises 41 and 42, use a graphing utility to graph the slope field for the differential equation and graph the solution satisfying the specified initial condition.**

41. $\frac{dy}{dx} = \frac{x}{y}e^{x/8},\ y(0) = 2$
42. $\frac{dy}{dx} = \frac{x}{y}\sin x,\ y(0) = 4$

Evaluating a Definite Integral **In Exercises 43–52, evaluate the definite integral. Use a graphing utility to verify your result.**

43. $\int_0^3 xe^{x/2}\,dx$
44. $\int_0^2 x^2e^{-2x}\,dx$
45. $\int_0^{\pi/4} x\cos 2x\,dx$
46. $\int_0^{\pi} x\sin 2x\,dx$

47. $\int_0^{1/2} \arccos x\, dx$

48. $\int_0^1 x \arcsin x^2\, dx$

49. $\int_0^1 e^x \sin x\, dx$

50. $\int_0^1 \ln(4 + x^2)\, dx$

51. $\int_2^4 x \operatorname{arcsec} x\, dx$

52. $\int_0^{\pi/8} x \sec^2 2x\, dx$

Using the Tabular Method **In Exercises 53–58, use the tabular method to find the indefinite integral.**

53. $\int x^2 e^{2x}\, dx$

54. $\int (1 - x)(e^{-x} + 1)\, dx$

55. $\int (x + 2)^2 \sin x\, dx$

56. $\int x^3 \cos 2x\, dx$

57. $\int (6 + x)\sqrt{4x + 9}\, dx$

58. $\int x^2(x - 2)^{3/2}\, dx$

Exploring Concepts

59. Write an integral that requires three applications of integration by parts. Explain why three applications are needed.

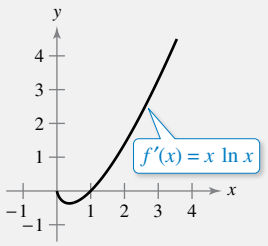
60. When finding $\int x \sin x\, dx$, explain how letting $u = \sin x$ and $dv = x\, dx$ makes the solution more difficult to find.

61. State whether you would use integration by parts to find each integral. If so, identify what you would use for u and dv. Explain your reasoning.

(a) $\int \frac{\ln x}{x}\, dx$ (b) $\int x \ln x\, dx$ (c) $\int x^2 e^{-3x}\, dx$

(d) $\int 2xe^{x^2}\, dx$ (e) $\int \frac{x}{\sqrt{x + 1}}\, dx$ (f) $\int \frac{x}{\sqrt{x^2 + 1}}\, dx$

62. HOW DO YOU SEE IT? Use the graph of f' shown in the figure to answer the following.



(a) Approximate the slope of f at $x = 2$. Explain.

(b) Approximate any open intervals on which the graph of f is increasing and any open intervals on which it is decreasing. Explain.

Using Two Methods Together **In Exercises 63–66, find the indefinite integral by using substitution followed by integration by parts.**

63. $\int \sin\sqrt{x}\, dx$

64. $\int 2x^3 \cos x^2\, dx$

65. $\int x^5 e^{x^2}\, dx$

66. $\int e^{\sqrt{2x}}\, dx$

67. Using Two Methods Integrate $\int \frac{x^3}{\sqrt{4 + x^2}}\, dx$

(a) by parts, letting $dv = \frac{x}{\sqrt{4 + x^2}}\, dx$.

(b) by substitution, letting $u = 4 + x^2$.

68. Using Two Methods Integrate $\int_0^a x^2\sqrt{a - x}\, dx$

(a) by parts, letting $dv = (a - x)^{1/2}\, dx$.

(b) by substitution, letting $u = \sqrt{a - x}$.

Finding a General Rule **In Exercises 69 and 70, use a graphing utility to find the integrals for $n = 0$, 1, 2, and 3. Use the result to obtain a general rule for the integrals for any positive integer n and test your results for $n = 4$.**

69. $\int x^n \ln x\, dx$

70. $\int x^n e^x\, dx$

Proof **In Exercises 71–76, use integration by parts to prove the formula. (For Exercises 71–74, assume that n is a positive integer.)**

71. $\int x^n \sin x\, dx = -x^n \cos x + n \int x^{n-1} \cos x\, dx$

72. $\int x^n \cos x\, dx = x^n \sin x - n \int x^{n-1} \sin x\, dx$

73. $\int x^n \ln x\, dx = \frac{x^{n+1}}{(n + 1)^2}[-1 + (n + 1) \ln x] + C$

74. $\int x^n e^{ax}\, dx = \frac{x^n e^{ax}}{a} - \frac{n}{a} \int x^{n-1} e^{ax}\, dx$

75. $\int e^{ax} \sin bx\, dx = \frac{e^{ax}(a \sin bx - b \cos bx)}{a^2 + b^2} + C$

76. $\int e^{ax} \cos bx\, dx = \frac{e^{ax}(a \cos bx + b \sin bx)}{a^2 + b^2} + C$

Using Formulas **In Exercises 77–82, find the indefinite integral by using the appropriate formula from Exercises 71–76.**

77. $\int x^2 \sin x\, dx$

78. $\int x^2 \cos x\, dx$

79. $\int x^5 \ln x\, dx$

80. $\int x^3 e^{2x}\, dx$

81. $\int e^{-3x} \sin 4x\, dx$

82. $\int e^{2x} \cos 3x\, dx$

Area **In Exercises 83–86, use a graphing utility to graph the region bounded by the graphs of the equations. Then find the area of the region analytically.**

83. $y = 2xe^{-x},\ y = 0,\ x = 3$

84. $y = \frac{1}{10}xe^{3x},\ y = 0,\ x = 0,\ x = 2$

85. $y = e^{-x}\sin \pi x,\ y = 0,\ x = 1$

86. $y = x^3 \ln x,\ y = 0,\ x = 1,\ x = 3$

87. Area, Volume, and Centroid Given the region bounded by the graphs of $y = \ln x$, $y = 0$, and $x = e$, find

(a) the area of the region.

(b) the volume of the solid generated by revolving the region about the x-axis.

(c) the volume of the solid generated by revolving the region about the y-axis.

(d) the centroid of the region.

88. Area, Volume, and Centroid Given the region bounded by the graphs of $y = x \sin x$, $y = 0$, $x = 0$, and $x = \pi$, find

(a) the area of the region.

(b) the volume of the solid generated by revolving the region about the x-axis.

(c) the volume of the solid generated by revolving the region about the y-axis.

(d) the centroid of the region.

89. Centroid Find the centroid of the region bounded by the graphs of $y = \arcsin x$, $x = 0$, and $y = \pi/2$. How is this problem related to Example 7 in this section?

90. Centroid Find the centroid of the region bounded by the graphs of $f(x) = x^2$, $g(x) = 2^x$, $x = 2$, and $x = 4$.

91. Average Displacement A damping force affects the vibration of a spring so that the displacement of the spring is given by

$$y = e^{-4t}(\cos 2t + 5 \sin 2t).$$

Find the average value of y on the interval from $t = 0$ to $t = \pi$.

92. Memory Model

A model for the ability M of a child to memorize, measured on a scale from 0 to 10, is given by

$$M = 1 + 1.6t \ln t, \quad 0 < t \le 4$$

where t is the child's age in years. Find the average value of this model

(a) between the child's first and second birthdays.

(b) between the child's third and fourth birthdays.

TY Lim/Shutterstock.com

Present Value **In Exercises 93 and 94, find the present value P of a continuous income flow of $c(t)$ dollars per year using**

$$P = \int_0^{t_1} c(t)e^{-rt}\,dt$$

where t_1 is the time in years and r is the annual interest rate compounded continuously.

93. $c(t) = 100{,}000 + 4000t,\ r = 5\%,\ t_1 = 10$

94. $c(t) = 1000 + 120t,\ r = 2\%,\ t_1 = 30$

Integrals Used to Find Fourier Coefficients **In Exercises 95 and 96, verify the value of the definite integral, where n is a positive integer.**

95. $$\int_{-\pi}^{\pi} x \sin nx\,dx = \begin{cases} \frac{2\pi}{n}, & n \text{ is odd} \\ -\frac{2\pi}{n}, & n \text{ is even} \end{cases}$$

96. $$\int_{-\pi}^{\pi} x^2 \cos nx\,dx = \frac{(-1)^n 4\pi}{n^2}$$

97. Vibrating String A string stretched between the two points $(0, 0)$ and $(2, 0)$ is plucked by displacing the string h units at its midpoint. The motion of the string is modeled by a **Fourier Sine Series** whose coefficients are given by

$$b_n = h\int_0^1 x \sin\frac{n\pi x}{2}\,dx + h\int_1^2 (-x + 2)\sin\frac{n\pi x}{2}\,dx.$$

Find b_n.

98. Finding a Pattern Find the area bounded by the graphs of $y = x \sin x$ and $y = 0$ over each interval.

(a) $[0, \pi]$ (b) $[\pi, 2\pi]$ (c) $[2\pi, 3\pi]$

Describe any patterns that you notice. What is the area between the graphs of $y = x \sin x$ and $y = 0$ over the interval $[n\pi, (n + 1)\pi]$, where n is any nonnegative integer? Explain.

99. Finding an Error Find the fallacy in the following argument that $0 = 1$.

$$dv = dx \Rightarrow v = \int dx = x$$

$$u = \frac{1}{x} \Rightarrow du = -\frac{1}{x^2}dx$$

$$0 + \int \frac{dx}{x} = \left(\frac{1}{x}\right)(x) - \int\left(-\frac{1}{x^2}\right)(x)\,dx$$

$$= 1 + \int \frac{dx}{x}$$

So, $0 = 1$.

PUTNAM EXAM CHALLENGE

100. Find a real number c and a positive number L for which

$$\lim_{r\to\infty} \frac{r^c \int_0^{\pi/2} x^r \sin x\,dx}{\int_0^{\pi/2} x^r \cos x\,dx} = L.$$

This problem was composed by the Committee on the Putnam Prize Competition.

8.3 Trigonometric Integrals

GO DIGITAL

- **Solve trigonometric integrals involving powers of sine and cosine.**
- **Solve trigonometric integrals involving powers of secant and tangent.**
- **Solve trigonometric integrals involving sines and cosines of two angles.**

SHEILA SCOTT MACINTYRE (1910–1960)

Sheila Scott Macintyre published her first paper on the asymptotic periods of integral functions in 1935. She completed her doctorate work at Aberdeen University, where she taught. In 1958, she accepted a visiting research fellowship at the University of Cincinnati.

See LarsonCalculus.com to read more of this biography.

Integrals Involving Powers of Sine and Cosine

In this section, you will study techniques for finding integrals of the form

$$\int \sin^m x \cos^n x\, dx \quad \text{and} \quad \int \sec^m x \tan^n x\, dx$$

where either m or n is a positive integer. To find antiderivatives for these forms, try to break them into combinations of trigonometric integrals to which you can apply the Power Rule.

For instance, you can find

$$\int \sin^5 x \cos x\, dx$$

with the Power Rule by letting $u = \sin x$. Then, $du = \cos x\, dx$ and you have

$$\int \sin^5 x \cos x\, dx = \int u^5\, du = \frac{u^6}{6} + C = \frac{\sin^6 x}{6} + C.$$

To break up $\int \sin^m x \cos^n x\, dx$ into forms to which you can apply the Power Rule, use the relationships listed below.

$$\sin^2 x + \cos^2 x = 1 \qquad \text{Pythagorean identity}$$

$$\sin^2 x = \frac{1 - \cos 2x}{2} \qquad \text{Power-reducing formula for } \sin^2 x$$

$$\cos^2 x = \frac{1 + \cos 2x}{2} \qquad \text{Power-reducing formula for } \cos^2 x$$

Guidelines for Finding Integrals Involving Powers of Sine and Cosine

1. When the power of the sine is odd and positive, save one sine factor and convert the remaining factors to cosines. Then expand and integrate.

$$\int \sin^{\overbrace{2k+1}^{\text{Odd}}} x \cos^n x\, dx = \int \overbrace{(\sin^2 x)^k}^{\text{Convert to cosines.}} \cos^n x \overbrace{\sin x\, dx}^{\text{Save for } du.} = \int (1 - \cos^2 x)^k \cos^n x \sin x\, dx$$

2. When the power of the cosine is odd and positive, save one cosine factor and convert the remaining factors to sines. Then expand and integrate.

$$\int \sin^m x \cos^{\overbrace{2k+1}^{\text{Odd}}} x\, dx = \int (\sin^m x)\overbrace{(\cos^2 x)^k}^{\text{Convert to sines.}} \overbrace{\cos x\, dx}^{\text{Save for } du.} = \int (\sin^m x)(1 - \sin^2 x)^k \cos x\, dx$$

3. When the powers of both the sine and cosine are even and nonnegative, make repeated use of the formulas

$$\sin^2 x = \frac{1 - \cos 2x}{2} \quad \text{and} \quad \cos^2 x = \frac{1 + \cos 2x}{2}$$

to convert the integrand to odd powers of the cosine. Then proceed as in the second guideline.

GO DIGITAL

EXAMPLE 1 Power of Sine Is Odd and Positive

Find $\int \sin^3 x \cos^4 x \, dx$.

Solution Because you expect to use the Power Rule with $u = \cos x$, *save one sine factor* to form du and convert the remaining sine factors to cosines.

$$\begin{aligned}
\int \sin^3 x \cos^4 x \, dx &= \int (\sin^2 x \cos^4 x)(\sin x) \, dx && \text{Rewrite.} \\
&= \int (1 - \cos^2 x) \cos^4 x \sin x \, dx && \text{Trigonometric identity} \\
&= \int (\cos^4 x - \cos^6 x) \sin x \, dx && \text{Multiply.} \\
&= \int \cos^4 x \sin x \, dx - \int \cos^6 x \sin x \, dx && \text{Rewrite.} \\
&= -\int (\cos^4 x)(-\sin x) \, dx + \int (\cos^6 x)(-\sin x) \, dx \\
&= -\frac{\cos^5 x}{5} + \frac{\cos^7 x}{7} + C && \text{Integrate.}
\end{aligned}$$

TECHNOLOGY A graphing utility used to find the integral in Example 1 yielded

$$\int \sin^3 x \cos^4 x \, dx = (-\cos^5 x)\left(\frac{1}{7}\sin^2 x + \frac{2}{35}\right) + C.$$

Is this equivalent to the result obtained in Example 1?

In Example 1, *both* of the powers m and n happened to be positive integers. This strategy will work as long as either m or n is odd and positive. For instance, in the next example, the power of the cosine is 3, but the power of the sine is $-\frac{1}{2}$.

EXAMPLE 2 Power of Cosine Is Odd and Positive

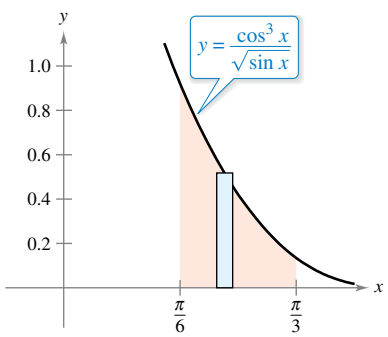
See LarsonCalculus.com for an interactive version of this type of example.

Evaluate $\displaystyle\int_{\pi/6}^{\pi/3} \frac{\cos^3 x}{\sqrt{\sin x}} \, dx$.

Solution Because you expect to use the Power Rule with $u = \sin x$, *save one cosine factor* to form du and convert the remaining cosine factors to sines.

$$\begin{aligned}
\int_{\pi/6}^{\pi/3} \frac{\cos^3 x}{\sqrt{\sin x}} \, dx &= \int_{\pi/6}^{\pi/3} \frac{\cos^2 x \cos x}{\sqrt{\sin x}} \, dx && \text{Rewrite.} \\
&= \int_{\pi/6}^{\pi/3} \frac{(1 - \sin^2 x)(\cos x)}{\sqrt{\sin x}} \, dx && \text{Trigonometric identity} \\
&= \int_{\pi/6}^{\pi/3} \left[(\sin x)^{-1/2} - (\sin x)^{3/2}\right] \cos x \, dx && \text{Divide.} \\
&= \left[\frac{(\sin x)^{1/2}}{1/2} - \frac{(\sin x)^{5/2}}{5/2}\right]_{\pi/6}^{\pi/3} && \text{Integrate.} \\
&= 2\left(\frac{\sqrt{3}}{2}\right)^{1/2} - \frac{2}{5}\left(\frac{\sqrt{3}}{2}\right)^{5/2} - \sqrt{2} + \frac{\sqrt{32}}{80} \\
&\approx 0.239
\end{aligned}$$

Figure 8.4 shows the region whose area is represented by this integral.



The area of the region is approximately 0.239.

Figure 8.4

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

GO DIGITAL

EXAMPLE 3 Power of Cosine Is Even and Nonnegative

Find $\int \cos^4 x\,dx$.

Solution Because m and n are both even and nonnegative ($m = 0$), you can replace $\cos^4 x$ by

$$\left(\frac{1 + \cos 2x}{2}\right)^2.$$

So, you can integrate as shown.

$$\begin{aligned}
\int \cos^4 x\,dx &= \int \left(\frac{1 + \cos 2x}{2}\right)^2 dx && \text{Power-reducing formula} \\
&= \int \left(\frac{1}{4} + \frac{\cos 2x}{2} + \frac{\cos^2 2x}{4}\right) dx && \text{Expand.} \\
&= \int \left[\frac{1}{4} + \frac{\cos 2x}{2} + \frac{1}{4}\left(\frac{1 + \cos 4x}{2}\right)\right] dx && \text{Power-reducing formula} \\
&= \frac{3}{8}\int dx + \frac{1}{4}\int 2\cos 2x\,dx + \frac{1}{32}\int 4\cos 4x\,dx && \text{Rewrite.} \\
&= \frac{3x}{8} + \frac{\sin 2x}{4} + \frac{\sin 4x}{32} + C && \text{Integrate.}
\end{aligned}$$

Use a graphing utility to verify this. Can you simplify the derivative to obtain the original integrand?

In Example 3, when you evaluate the definite integral from 0 to $\pi/2$, you obtain

$$\begin{aligned}
\int_0^{\pi/2} \cos^4 x\,dx &= \left[\frac{3x}{8} + \frac{\sin 2x}{4} + \frac{\sin 4x}{32}\right]_0^{\pi/2} \\
&= \left(\frac{3\pi}{16} + 0 + 0\right) - (0 + 0 + 0) \\
&= \frac{3\pi}{16}.
\end{aligned}$$

Note that the only term that contributes to the solution is

$$\frac{3x}{8}.$$

This observation is generalized in the following formulas developed by John Wallis (1616–1703). Note the restrictions on the positive integer n.

Wallis's Formulas

1. If n is odd ($n \geq 3$), then

$$\int_0^{\pi/2} \cos^n x\,dx = \left(\frac{2}{3}\right)\left(\frac{4}{5}\right)\left(\frac{6}{7}\right)\cdots\left(\frac{n-1}{n}\right).$$

2. If n is even ($n \geq 2$), then

$$\int_0^{\pi/2} \cos^n x\,dx = \left(\frac{1}{2}\right)\left(\frac{3}{4}\right)\left(\frac{5}{6}\right)\cdots\left(\frac{n-1}{n}\right)\left(\frac{\pi}{2}\right).$$

These formulas are also valid when $\cos^n x$ is replaced by $\sin^n x$. (You are asked to prove both formulas in Exercise 87.)

JOHN WALLIS (1616–1703)

Wallis did much of his work in calculus prior to Newton and Leibniz, and he influenced the thinking of both of these men. Wallis is also credited with introducing the present symbol (∞) for infinity.

Integrals Involving Powers of Secant and Tangent

The guidelines below can help you find integrals of the form

$$\int \sec^m x \tan^n x \, dx.$$ Either m or n is a positive integer.

Guidelines for Finding Integrals Involving Powers of Secant and Tangent

1. When the power of the secant is even and positive, save a secant-squared factor and convert the remaining factors to tangents. Then expand and integrate.

$$\int \sec^{\overbrace{2k}^{\text{Even}}} x \tan^n x \, dx = \int \overbrace{(\sec^2 x)^{k-1}}^{\text{Convert to tangents.}} \tan^n x \overbrace{\sec^2 x \, dx}^{\text{Save for } du.} = \int (1 + \tan^2 x)^{k-1} \tan^n x \sec^2 x \, dx$$

2. When the power of the tangent is odd and positive, save a secant-tangent factor and convert the remaining factors to secants. Then expand and integrate.

$$\int \sec^m x \tan^{\overbrace{2k+1}^{\text{Odd}}} x \, dx = \int (\sec^{m-1} x)\overbrace{(\tan^2 x)^k}^{\text{Convert to secants.}} \overbrace{\sec x \tan x \, dx}^{\text{Save for } du.} = \int (\sec^{m-1} x)(\sec^2 x - 1)^k \sec x \tan x \, dx$$

3. When there are no secant factors and the power of the tangent is even and positive, convert a tangent-squared factor to a secant-squared factor, then expand and repeat if necessary.

$$\int \tan^n x \, dx = \int (\tan^{n-2} x)\overbrace{(\tan^2 x)}^{\text{Convert to secants.}} \, dx = \int (\tan^{n-2} x)(\sec^2 x - 1) \, dx$$

4. When the integral is of the form

$$\int \sec^m x \, dx$$

where m is odd and positive, use integration by parts, as illustrated in Example 6 in Section 8.2.

5. When the first four guidelines do not apply, try converting to sines and cosines.

EXAMPLE 4 Power of Tangent Is Odd and Positive

Find $\displaystyle\int \frac{\tan^3 x}{\sqrt{\sec x}} \, dx.$

Solution Because you expect to use the Power Rule with $u = \sec x$, *save a factor of (sec x tan x)* to form du and convert the remaining tangent factors to secants.

$$\begin{aligned}
\int \frac{\tan^3 x}{\sqrt{\sec x}} \, dx &= \int (\sec x)^{-1/2} \tan^3 x \, dx && \text{Rewrite.} \\
&= \int (\sec x)^{-3/2}(\tan^2 x)(\sec x \tan x) \, dx && \text{Rewrite.} \\
&= \int (\sec x)^{-3/2}(\sec^2 x - 1)(\sec x \tan x) \, dx && \text{Trigonometric identity} \\
&= \int [(\sec x)^{1/2} - (\sec x)^{-3/2}](\sec x \tan x) \, dx && \text{Multiply.} \\
&= \frac{2}{3}(\sec x)^{3/2} + 2(\sec x)^{-1/2} + C && \text{Integrate.}
\end{aligned}$$

GO DIGITAL

EXAMPLE 5 Power of Secant Is Even and Positive

Find $\int \sec^4 3x \tan^3 3x\, dx$.

Solution Let $u = \tan 3x$. Then $du = 3 \sec^2 3x\, dx$ and you can write

$$\begin{aligned}
\int \sec^4 3x \tan^3 3x\, dx &= \int (\sec^2 3x \tan^3 3x)(\sec^2 3x)\, dx && \text{Rewrite.}\\
&= \int (1 + \tan^2 3x)(\tan^3 3x)(\sec^2 3x)\, dx && \text{Trigonometric identity}\\
&= \frac{1}{3}\int (\tan^3 3x + \tan^5 3x)(3 \sec^2 3x)\, dx && \text{Multiply.}\\
&= \frac{1}{3}\left(\frac{\tan^4 3x}{4} + \frac{\tan^6 3x}{6}\right) + C && \text{Integrate.}\\
&= \frac{\tan^4 3x}{12} + \frac{\tan^6 3x}{18} + C.
\end{aligned}$$

In Example 5, the power of the tangent is odd and positive. So, you could also find the integral using the procedure described in the second guideline on the preceding page. In Exercises 67 and 68, you are asked to show that the results obtained by these two procedures differ only by a constant.

EXAMPLE 6 Power of Tangent Is Even

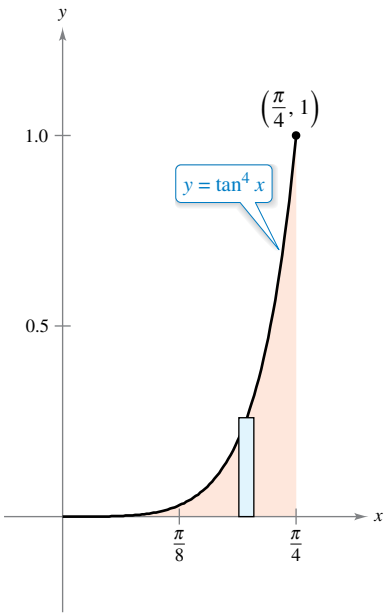
Evaluate $\int_0^{\pi/4} \tan^4 x\, dx$.

Solution Because there are no secant factors, begin by converting a tangent-squared factor to a secant-squared factor.

$$\begin{aligned}
\int \tan^4 x\, dx &= \int (\tan^2 x)(\tan^2 x)\, dx && \text{Rewrite.}\\
&= \int (\tan^2 x)(\sec^2 x - 1)\, dx && \text{Trigonometric identity}\\
&= \int \tan^2 x \sec^2 x\, dx - \int \tan^2 x\, dx && \text{Rewrite.}\\
&= \int \tan^2 x \sec^2 x\, dx - \int (\sec^2 x - 1)\, dx && \text{Trigonometric identity}\\
&= \frac{\tan^3 x}{3} - \tan x + x + C && \text{Integrate.}
\end{aligned}$$

Next, evaluate the definite integral.

$$\begin{aligned}
\int_0^{\pi/4} \tan^4 x\, dx &= \left[\frac{\tan^3 x}{3} - \tan x + x\right]_0^{\pi/4}\\
&= \frac{1}{3} - 1 + \frac{\pi}{4}\\
&\approx 0.119
\end{aligned}$$



The area of the region is approximately 0.119.
Figure 8.5

The area represented by the definite integral is shown in Figure 8.5. Use the Midpoint Rule to approximate this integral. With $n = 15$, you should obtain an approximation that is within 0.001 of the actual value.

For integrals involving powers of cotangents and cosecants, you can follow a strategy similar to that used for powers of tangents and secants. Also, when integrating trigonometric functions, remember that it sometimes helps to convert the entire integrand to powers of sines and cosines.

EXAMPLE 7 Converting to Sines and Cosines

Find $\int \frac{\sec x}{\tan^2 x}\,dx$.

Solution Because the first four guidelines on page 535 do not apply, try converting the integrand to sines and cosines. In this case, you are able to integrate the resulting powers of sine and cosine as shown.

$$\begin{aligned}
\int \frac{\sec x}{\tan^2 x}\,dx &= \int \sec x \cot^2 x\,dx && \text{Trigonometric identity}\\
&= \int \left(\frac{1}{\cos x}\right)\left(\frac{\cos x}{\sin x}\right)^2 dx && \text{Convert to sines and cosines.}\\
&= \int (\sin x)^{-2}(\cos x)\,dx && \text{Rewrite.}\\
&= -(\sin x)^{-1} + C && \text{Integrate.}\\
&= -\csc x + C && \text{Trigonometric identity}
\end{aligned}$$

Integrals Involving Sines and Cosines of Two Angles

Integrals involving the products of sines and cosines of two angles occur in many applications. You can evaluate these integrals using integration by parts. However, you may find it simpler to use the product-to-sum formulas below.

$$\sin mx \sin nx = \frac{1}{2}(\cos[(m-n)x] - \cos[(m+n)x])$$

$$\sin mx \cos nx = \frac{1}{2}(\sin[(m-n)x] + \sin[(m+n)x])$$

$$\cos mx \cos nx = \frac{1}{2}(\cos[(m-n)x] + \cos[(m+n)x])$$

EXAMPLE 8 Using a Product-to-Sum Formula

Find $\int \sin 5x \cos 4x\,dx$.

Solution The integrand has the product form $\sin mx \cos nx$. So, by the second product-to-sum formula above, you can write

$$\begin{aligned}
\int \sin 5x \cos 4x\,dx &= \frac{1}{2}\int (\sin x + \sin 9x)\,dx && \text{Product-to-sum formula}\\
&= \frac{1}{2}\left(-\cos x - \frac{\cos 9x}{9}\right) + C && \text{Integrate.}\\
&= -\frac{\cos x}{2} - \frac{\cos 9x}{18} + C. && \text{Multiply.}
\end{aligned}$$

8.3 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Which integral requires more steps to find? Explain. Do not integrate.

$\int \sin^8 x\,dx$ $\int \sin^8 x \cos x\,dx$

2. Describe the technique for finding $\int \sec^5 x \tan^7 x\,dx$. Do not integrate.

Finding an Indefinite Integral Involving Sine and Cosine

In Exercises 3–14, find the indefinite integral.

3. $\int \cos^5 x \sin x\,dx$
4. $\int \sin^7 2x \cos 2x\,dx$
5. $\int \cos^3 x \sin^4 x\,dx$
6. $\int \sin^3 3x\,dx$
7. $\int \sin^3 x \cos^2 x\,dx$
8. $\int \cos^3 \frac{x}{3}\,dx$
9. $\int \sin^3 2\theta \sqrt{\cos 2\theta}\,d\theta$
10. $\int \frac{\cos^5 t}{\sqrt{\sin t}}\,dt$
11. $\int \cos^2 3x\,dx$
12. $\int \sin^4 6\theta\,d\theta$
13. $\int 8x \cos^2 x\,dx$
14. $\int x^2 \sin^2 x\,dx$

Using Wallis's Formulas

In Exercises 15–20, use Wallis's Formulas to evaluate the integral.

15. $\int_0^{\pi/2} \cos^3 x\,dx$
16. $\int_0^{\pi/2} \cos^6 x\,dx$
17. $\int_0^{\pi/2} \sin^2 x\,dx$
18. $\int_0^{\pi/2} \sin^9 x\,dx$
19. $\int_0^{\pi/2} \sin^{10} x\,dx$
20. $\int_0^{\pi/2} \cos^{11} x\,dx$

Finding an Indefinite Integral Involving Secant and Tangent

In Exercises 21–34, find the indefinite integral.

21. $\int \sec 4x\,dx$
22. $\int \sec^4 x\,dx$
23. $\int \sec^3 \pi x\,dx$
24. $\int \tan^6 3x\,dx$
25. $\int \tan^5 \frac{x}{2}\,dx$
26. $\int \tan^3 \frac{\pi x}{2} \sec^2 \frac{\pi x}{2}\,dx$
27. $\int \tan^3 2t \sec^3 2t\,dt$
28. $\int \tan^5 x \sec^4 x\,dx$
29. $\int \sec^6 4x \tan 4x\,dx$
30. $\int \sec^2 \frac{x}{2} \tan \frac{x}{2}\,dx$
31. $\int \sec^5 x \tan^3 x\,dx$
32. $\int \tan^3 3x\,dx$
33. $\int \frac{\tan^2 x}{\sec x}\,dx$
34. $\int \frac{\tan^2 x}{\sec^5 x}\,dx$

Differential Equation

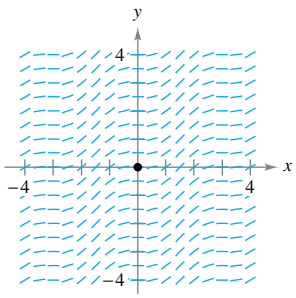
In Exercises 35–38, find the general solution of the differential equation.

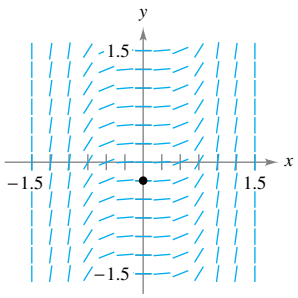
35. $\frac{dr}{d\theta} = \sin^4 \pi\theta$
36. $\frac{ds}{d\alpha} = \sin^2 \frac{\alpha}{2} \cos^2 \frac{\alpha}{2}$
37. $y' = \tan^3 3x \sec 3x$
38. $y' = \sqrt{\tan x} \sec^4 x$

Slope Field

In Exercises 39 and 40, a differential equation, a point, and a slope field are given. (a) Sketch two approximate solutions of the differential equation on the slope field, one of which passes through the given point. (To print an enlarged copy of the graph, go to *MathGraphs.com*.) (b) Use integration and the given point to find the particular solution of the differential equation and use a graphing utility to graph the solution. Compare the result with the sketch in part (a) that passes through the given point.

39. $\frac{dy}{dx} = \sin^2 x,\ (0, 0)$
40. $\frac{dy}{dx} = \sec^2 x \tan^2 x,\ \left(0, -\frac{1}{4}\right)$





Slope Field

In Exercises 41 and 42, use a graphing utility to graph the slope field for the differential equation and graph the solution satisfying the specified initial condition.

41. $\frac{dy}{dx} = \frac{3 \sin x}{y},\ y(0) = 2$
42. $\frac{dy}{dx} = 3\sqrt{y} \tan^2 x,\ y(0) = 3$

Using a Product-to-Sum Formula

In Exercises 43–48, find the indefinite integral.

43. $\int \cos 2x \cos 6x\,dx$
44. $\int \cos 5\theta \cos 3\theta\,d\theta$
45. $\int \sin 2t \cos 9t\,dt$
46. $\int \sin 8x \cos 7x\,dx$
47. $\int \sin \theta \sin 3\theta\,d\theta$
48. $\int \sin 5x \sin 4x\,dx$

Finding an Indefinite Integral **In Exercises 49–58, find the indefinite integral. Use a graphing utility to confirm your result.**

49. $\int \cot^3 2x\,dx$

50. $\int \tan^5 \frac{x}{4} \sec^4 \frac{x}{4}\,dx$

51. $\int \csc^4 3x\,dx$

52. $\int \cot^3 \frac{x}{2} \csc^4 \frac{x}{2}\,dx$

53. $\int \frac{\cot^2 t}{\csc t}\,dt$

54. $\int \frac{\cot^3 t}{\csc t}\,dt$

55. $\int \frac{1}{\sec x \tan x}\,dx$

56. $\int \frac{\sin^2 x - \cos^2 x}{\cos x}\,dx$

57. $\int (\tan^4 t - \sec^4 t)\,dt$

58. $\int \frac{1 - \sec t}{\cos t - 1}\,dt$

Evaluating a Definite Integral **In Exercises 59–66, evaluate the definite integral.**

59. $\int_{-\pi}^{\pi} \sin^2 x\,dx$

60. $\int_{0}^{\pi/3} \tan^2 x\,dx$

61. $\int_{0}^{\pi/4} 6 \tan^3 x\,dx$

62. $\int_{0}^{\pi/3} \sec^{3/2} x \tan x\,dx$

63. $\int_{0}^{\pi/2} \frac{\cot t}{1 + \sin t}\,dt$

64. $\int_{\pi/6}^{\pi/3} \sin 6x \cos 4x\,dx$

65. $\int_{-\pi/2}^{\pi/2} 3 \cos^3 x\,dx$

66. $\int_{0}^{\pi} \sin^5 x\,dx$

Exploring Concepts

In Exercises 67 and 68, (a) find the indefinite integral in two different ways, (b) use a graphing utility to graph the antiderivative (without the constant of integration) obtained by each method to show that the results differ only by a constant, and (c) verify analytically that the results differ only by a constant.

67. $\int \sec^4 3x \tan^3 3x\,dx$

68. $\int \sec^2 x \tan x\,dx$

69. Find the indefinite integral

$$\int \sin x \cos x\,dx$$

using the given method. Explain how your answers differ for each method.

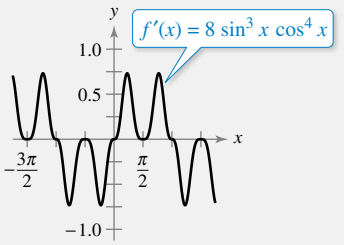
(a) Substitution where $u = \sin x$

(b) Substitution where $u = \cos x$

(c) Integration by parts

(d) Using the identity $\sin 2x = 2 \sin x \cos x$

70. HOW DO YOU SEE IT? Use the graph of f' shown in the figure to answer the following.

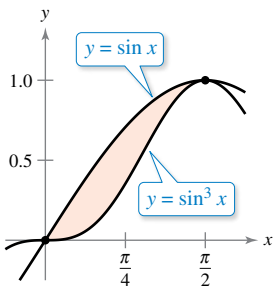


(a) Using the interval shown in the graph, approximate the value(s) of x where f is maximum. Explain.

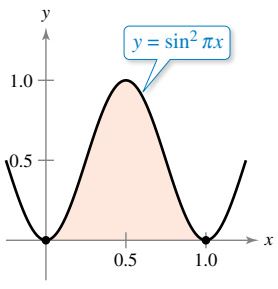
(b) Using the interval shown in the graph, approximate the value(s) of x where f is minimum. Explain.

Area **In Exercises 71 and 72, find the area of the given region.**

71. $y = \sin x,\ y = \sin^3 x$



72. $y = \sin^2 \pi x$



Area **In Exercises 73 and 74, find the area of the region bounded by the graphs of the equations.**

73. $y = \cos^2 x,\quad y = \sin^2 x,\quad x = -\frac{\pi}{4},\quad x = \frac{\pi}{4}$

74. $y = \cos^2 x,\quad y = \sin x \cos x,\quad x = -\frac{\pi}{2},\quad x = \frac{\pi}{4}$

Volume **In Exercises 75 and 76, find the volume of the solid generated by revolving the region bounded by the graphs of the equations about the x-axis.**

75. $y = \tan x,\quad y = 0,\quad x = -\frac{\pi}{4},\quad x = \frac{\pi}{4}$

76. $y = \cos \frac{x}{2},\quad y = \sin \frac{x}{2},\quad x = 0,\quad x = \frac{\pi}{2}$

Volume and Centroid **In Exercises 77 and 78, for the region bounded by the graphs of the equations, find (a) the volume of the solid generated by revolving the region about the x-axis and (b) the centroid of the region.**

77. $y = \sin x,\quad y = 0,\quad x = 0,\quad x = \pi$

78. $y = \cos x,\quad y = 0,\quad x = 0,\quad x = \frac{\pi}{2}$

Verifying a Reduction Formula **In Exercises 79–82, use integration by parts to verify the reduction formula. (A *reduction formula* reduces a given integral to the sum of a function and a simpler integral.)**

79. $\int \sin^n x\,dx = -\frac{\sin^{n-1} x \cos x}{n} + \frac{n-1}{n}\int \sin^{n-2} x\,dx$

80. $\int \cos^n x\,dx = \frac{\cos^{n-1} x \sin x}{n} + \frac{n-1}{n}\int \cos^{n-2} x\,dx$

81. $\int \cos^m x \sin^n x\,dx$

$$= -\frac{\cos^{m+1} x \sin^{n-1} x}{m+n} + \frac{n-1}{m+n}\int \cos^m x \sin^{n-2} x\,dx$$

82. $\int \sec^n x\,dx = \frac{\sec^{n-2} x \tan x}{n-1} + \frac{n-2}{n-1}\int \sec^{n-2} x\,dx$

Using Formulas **In Exercises 83–86, find the indefinite integral by using the appropriate formula from Exercises 79–82.**

83. $\int \sin^5 x\,dx$

84. $\int \cos^4 x\,dx$

85. $\int \cos^2 x \sin^4 x\,dx$

86. $\int \sec^4 \frac{2\pi x}{5}\,dx$

87. Wallis's Formulas Use the result of Exercise 80 to prove the following versions of Wallis's Formulas.

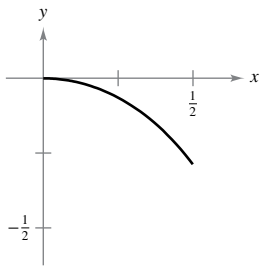
(a) If n is odd $(n \geq 3)$, then

$$\int_0^{\pi/2} \cos^n x\,dx = \left(\frac{2}{3}\right)\left(\frac{4}{5}\right)\left(\frac{6}{7}\right)\cdots\left(\frac{n-1}{n}\right).$$

(b) If n is even $(n \geq 2)$, then

$$\int_0^{\pi/2} \cos^n x\,dx = \left(\frac{1}{2}\right)\left(\frac{3}{4}\right)\left(\frac{5}{6}\right)\cdots\left(\frac{n-1}{n}\right)\left(\frac{\pi}{2}\right).$$

88. Arc Length Find the arc length of the graph of the function $y = \ln(1 - x^2)$ on the interval $0 \leq x \leq \frac{1}{2}$ (see figure).



89. Proof Suppose that $f(a) = f(b) = g(a) = g(b) = 0$ and the second derivatives of f and g are continuous on the closed interval $[a, b]$. Prove that

$$\int_a^b f(x)g''(x)\,dx = \int_a^b f''(x)g(x)\,dx.$$

SECTION PROJECT

The Wallis Product

The formula for π as an infinite product was derived by English mathematician John Wallis in 1655. This product, called the **Wallis Product,** appeared in his book *Arithmetica Infinitorum.*

$$\frac{\pi}{2} = \left(\frac{2 \cdot 2}{1 \cdot 3}\right)\left(\frac{4 \cdot 4}{3 \cdot 5}\right)\left(\frac{6 \cdot 6}{5 \cdot 7}\right)\cdots\left(\frac{(2n) \cdot (2n)}{(2n-1) \cdot (2n+1)}\right)\cdots$$

In 2015, physicists Carl Hagen and Tamar Friedmann (also a mathematician) stumbled upon a connection between quantum mechanics and the Wallis Product when they applied the variational principle to higher energy states of the hydrogen atom. This principle was previously used only on the ground energy state. The Wallis Product appeared naturally in the midst of their calculations involving gamma functions.

Quantum mechanics is the study of matter and light on the atomic and subatomic scale.

Consider Wallis's method of finding a formula for π. Let

$$I(n) = \int_0^{\pi/2} \sin^n x\,dx.$$

From Wallis's Formulas,

$$I(n) = \left(\frac{1}{2}\right)\left(\frac{3}{4}\right)\left(\frac{5}{6}\right)\cdots\left(\frac{n-1}{n}\right)\left(\frac{\pi}{2}\right),\ n \text{ is even } (n \geq 2)$$

or

$$I(n) = \left(\frac{2}{3}\right)\left(\frac{4}{5}\right)\left(\frac{6}{7}\right)\cdots\left(\frac{n-1}{n}\right),\ n \text{ is odd } (n \geq 3).$$

(a) Find $I(n)$ for $n = 2$, 3, 4, and 5. What do you observe?

(b) Show that $I(n+1) \leq I(n)$ for $n \geq 2$.

(c) Show that

$$\lim_{n\to\infty} \frac{I(2n+1)}{I(2n)} = 1.$$

(Hint: Use the Squeeze Theorem.)

(d) Verify the Wallis Product using the limit in part (c).

FOR FURTHER INFORMATION For an alternative proof of the Wallis Product, see the article "An Elementary Proof of the Wallis Product Formula for pi" by Johan Wästlund in *The American Mathematical Monthly*. To view this article, go to *MathArticles.com*.

8.4 Trigonometric Substitution

GO DIGITAL

- **Use trigonometric substitution to find an integral.**
- **Use integrals to model and solve real-life applications.**

Exploration

Finding an Integral Involving a Radical Up to this point in the text, you have not evaluated the integral

$$\int_{-1}^{1} \sqrt{1 - x^2}\, dx.$$

From geometry, you should be able to find the exact value of this integral—what is it? Try finding the exact value using the substitution

$$x = \sin\theta$$

and

$$dx = \cos\theta\, d\theta.$$

Does your answer agree with the value you obtained using geometry?

Trigonometric Substitution

Now that you can find integrals involving powers of trigonometric functions, you can use **trigonometric substitution** to find integrals involving the radicals

$$\sqrt{a^2 - u^2}, \quad \sqrt{a^2 + u^2}, \quad \text{and} \quad \sqrt{u^2 - a^2}.$$

The objective with trigonometric substitution is to eliminate the radical in the integrand. You do this by using the Pythagorean identities.

$$\cos^2\theta = 1 - \sin^2\theta$$
$$\sec^2\theta = 1 + \tan^2\theta$$
$$\tan^2\theta = \sec^2\theta - 1$$

For example, for $a > 0$, let $u = a\sin\theta$, where $-\pi/2 \le \theta \le \pi/2$. Then

$$\begin{aligned}
\sqrt{a^2 - u^2} &= \sqrt{a^2 - a^2\sin^2\theta} && \text{Substitute for } u.\\
&= \sqrt{a^2(1 - \sin^2\theta)} && \text{Factor.}\\
&= \sqrt{a^2\cos^2\theta} && \text{Pythagorean identity}\\
&= a\cos\theta. && \text{Simplify.}
\end{aligned}$$

Note that $\cos\theta \ge 0$, because $-\pi/2 \le \theta \le \pi/2$.

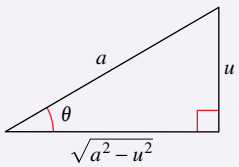
Trigonometric Substitution ($a > 0$)

1. For integrals involving $\sqrt{a^2 - u^2}$, let

$$u = a\sin\theta.$$

Then $\sqrt{a^2 - u^2} = a\cos\theta$, where

$$-\pi/2 \le \theta \le \pi/2.$$

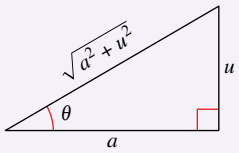


2. For integrals involving $\sqrt{a^2 + u^2}$, let

$$u = a\tan\theta.$$

Then $\sqrt{a^2 + u^2} = a\sec\theta$, where

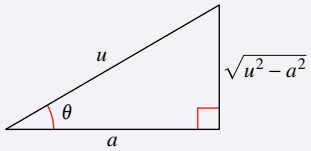
$$-\pi/2 < \theta < \pi/2.$$



3. For integrals involving $\sqrt{u^2 - a^2}$, let

$$u = a\sec\theta.$$

Then



$$\sqrt{u^2 - a^2} = \begin{cases} a\tan\theta \text{ for } u > a, \text{ where } 0 \le \theta < \pi/2 \\ -a\tan\theta \text{ for } u < -a, \text{ where } \pi/2 < \theta \le \pi. \end{cases}$$

The restrictions on θ ensure that the function that defines the substitution is one-to-one. In fact, these are the same intervals over which the arcsine, arctangent, and arcsecant are defined.

GO DIGITAL

EXAMPLE 1 Trigonometric Substitution: $u = a \sin\theta$

Find $\displaystyle\int \frac{dx}{x^2\sqrt{9 - x^2}}$.

Solution First, note that the basic integration rules do not apply. To use trigonometric substitution, notice that

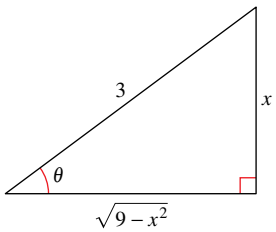
$$\sqrt{9 - x^2}$$

is of the form $\sqrt{a^2 - u^2}$. So, you can use the substitution

$$x = a \sin\theta = 3 \sin\theta.$$

Using differentiation and the right triangle shown in Figure 8.6, you obtain

$$dx = 3\cos\theta\, d\theta, \quad \sqrt{9 - x^2} = 3\cos\theta, \quad \text{and} \quad x^2 = 9\sin^2\theta.$$



$\sin\theta = \frac{x}{3}$, $\cot\theta = \frac{\sqrt{9 - x^2}}{x}$

Figure 8.6

So, trigonometric substitution yields

$$\begin{aligned}
\int \frac{dx}{x^2\sqrt{9 - x^2}} &= \int \frac{3\cos\theta\, d\theta}{(9\sin^2\theta)(3\cos\theta)} && \text{Substitute.}\\
&= \frac{1}{9}\int \frac{d\theta}{\sin^2\theta} && \text{Simplify.}\\
&= \frac{1}{9}\int \csc^2\theta\, d\theta && \text{Trigonometric identity}\\
&= -\frac{1}{9}\cot\theta + C && \text{Apply Cosecant Rule.}\\
&= -\frac{1}{9}\left(\frac{\sqrt{9 - x^2}}{x}\right) + C && \text{Substitute for } \cot\theta.\\
&= -\frac{\sqrt{9 - x^2}}{9x} + C.
\end{aligned}$$

Note that the triangle in Figure 8.6 can be used to convert the θ's back to x's, as shown.

$$\begin{aligned}
\cot\theta &= \frac{\text{adj}}{\text{opp}} && \text{Right triangle definition of cotangent}\\
&= \frac{\sqrt{9 - x^2}}{x} && \text{Substitute.}
\end{aligned}$$

REMARK To review the right triangle definitions of trigonometric functions, see Section P.4.

TECHNOLOGY Use a graphing utility to find each indefinite integral.

$$\int \frac{dx}{\sqrt{9 - x^2}} \qquad \int \frac{dx}{x\sqrt{9 - x^2}}$$

$$\int \frac{dx}{x^2\sqrt{9 - x^2}} \qquad \int \frac{dx}{x^3\sqrt{9 - x^2}}$$

Then use trigonometric substitution to duplicate the results obtained with the graphing utility.

In Chapter 5, inverse hyperbolic functions were used to find integrals of the forms

$$\int \frac{du}{\sqrt{u^2 \pm a^2}}, \quad \int \frac{du}{a^2 - u^2}, \quad \text{and} \quad \int \frac{du}{u\sqrt{a^2 \pm u^2}}.$$

You can also find these integrals using trigonometric substitution. This is shown in the next example.

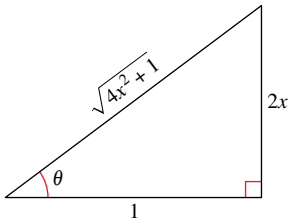
GO DIGITAL



$\tan\theta = 2x$, $\sec\theta = \sqrt{4x^2+1}$

Figure 8.7

EXAMPLE 2 Trigonometric Substitution: $u = a\tan\theta$

Find $\displaystyle\int \frac{dx}{\sqrt{4x^2+1}}$.

Solution Let $u = 2x$, $a = 1$, and $2x = \tan\theta$, as shown in Figure 8.7. Then,

$$dx = \frac{1}{2}\sec^2\theta\,d\theta \quad \text{and} \quad \sqrt{4x^2+1} = \sec\theta.$$

Trigonometric substitution produces

$$\begin{aligned}
\int \frac{dx}{\sqrt{4x^2+1}} &= \frac{1}{2}\int \frac{\sec^2\theta\,d\theta}{\sec\theta} && \text{Substitute.}\\
&= \frac{1}{2}\int \sec\theta\,d\theta && \text{Simplify.}\\
&= \frac{1}{2}\ln|\sec\theta + \tan\theta| + C && \text{Apply Secant Rule.}\\
&= \frac{1}{2}\ln\left|\sqrt{4x^2+1} + 2x\right| + C. && \text{Back-substitute.}
\end{aligned}$$

Use a graphing utility to check this result. Is the result given in this form or in the form of an inverse hyperbolic function? ■

To use trigonometric substitution for integrals involving expressions such as $(a^2 - u^2)^{n/2}$, try writing the expression as $(a^2 - u^2)^{n/2} = \left(\sqrt{a^2 - u^2}\right)^n$.

EXAMPLE 3 Trigonometric Substitution: Rational Powers

See LarsonCalculus.com for an interactive version of this type of example.

Find $\displaystyle\int \frac{dx}{(x^2+1)^{3/2}}$.

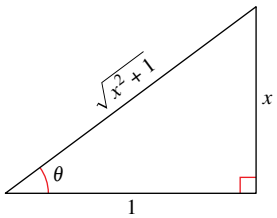
Solution First, write $(x^2+1)^{3/2}$ as $\left(\sqrt{x^2+1}\right)^3$. Then let $a = 1$ and $u = x = \tan\theta$, as shown in Figure 8.8. Using

$$dx = \sec^2\theta\,d\theta \quad \text{and} \quad \sqrt{x^2+1} = \sec\theta$$

you can apply trigonometric substitution, as shown.

$$\begin{aligned}
\int \frac{dx}{(x^2+1)^{3/2}} &= \int \frac{dx}{\left(\sqrt{x^2+1}\right)^3} && \text{Rewrite denominator.}\\
&= \int \frac{\sec^2\theta\,d\theta}{\sec^3\theta} && \text{Substitute.}\\
&= \int \frac{d\theta}{\sec\theta} && \text{Simplify.}\\
&= \int \cos\theta\,d\theta && \text{Trigonometric identity}\\
&= \sin\theta + C && \text{Apply Cosine Rule.}\\
&= \frac{x}{\sqrt{x^2+1}} + C && \text{Back-substitute.}
\end{aligned}$$

■



$\tan\theta = x$, $\sin\theta = \dfrac{x}{\sqrt{x^2+1}}$

Figure 8.8

For definite integrals, it is often convenient to determine integration limits for θ that avoid converting back to x. (See Example 4 on the next page.) You might want to review this procedure in Section 4.5, Examples 8 and 9.

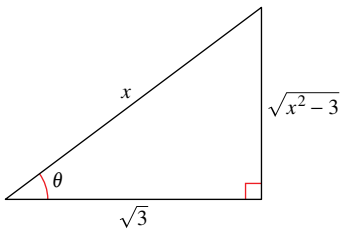
GO DIGITAL



$\sec\theta = \frac{x}{\sqrt{3}}$, $\tan\theta = \frac{\sqrt{x^2-3}}{\sqrt{3}}$

Figure 8.9

EXAMPLE 4 Converting the Limits of Integration

Evaluate $\int_{\sqrt{3}}^{2} \frac{\sqrt{x^2-3}}{x}\,dx$.

Solution Because $\sqrt{x^2-3}$ has the form $\sqrt{u^2-a^2}$, you can consider

$$u = x, \quad a = \sqrt{3}, \quad \text{and} \quad x = \sqrt{3}\sec\theta$$

as shown in Figure 8.9. Then

$$dx = \sqrt{3}\sec\theta\tan\theta\,d\theta \quad \text{and} \quad \sqrt{x^2-3} = \sqrt{3}\tan\theta.$$

To determine the upper and lower limits of integration, use the substitution $x = \sqrt{3}\sec\theta$, as shown.

Lower Limit

When $x = \sqrt{3}$, $\sec\theta = 1$ and $\theta = 0$.

Upper Limit

When $x = 2$, $\sec\theta = \frac{2}{\sqrt{3}}$ and $\theta = \frac{\pi}{6}$.

So, you have

Integration limits for x / Integration limits for θ

$$\begin{aligned}
\int_{\sqrt{3}}^{2} \frac{\sqrt{x^2-3}}{x}\,dx &= \int_{0}^{\pi/6} \frac{(\sqrt{3}\tan\theta)(\sqrt{3}\sec\theta\tan\theta)}{\sqrt{3}\sec\theta}\,d\theta \\
&= \int_{0}^{\pi/6} \sqrt{3}\tan^2\theta\,d\theta \\
&= \sqrt{3}\int_{0}^{\pi/6} (\sec^2\theta - 1)\,d\theta \\
&= \sqrt{3}\Big[\tan\theta - \theta\Big]_{0}^{\pi/6} \\
&= \sqrt{3}\left(\frac{1}{\sqrt{3}} - \frac{\pi}{6}\right) \\
&= 1 - \frac{\sqrt{3}\pi}{6} \\
&\approx 0.0931.
\end{aligned}$$

REMARK In Example 4, convert back to the variable x and evaluate the antiderivative at the original limits of integration. Do you obtain the same result?

When using trigonometric substitution to evaluate definite integrals, you must be careful to check that the values of θ lie in the intervals discussed at the beginning of this section. For instance, if in Example 4 you had been asked to evaluate the definite integral

$$\int_{-2}^{-\sqrt{3}} \frac{\sqrt{x^2-3}}{x}\,dx$$

then using $u = x$ and $a = \sqrt{3}$ in the interval $[-2, -\sqrt{3}]$ would imply that $u < -a$. So, when determining the upper and lower limits of integration, you would have to choose θ such that $\pi/2 < \theta \leq \pi$. In this case, you can rewrite the integral as

$$\int_{-2}^{-\sqrt{3}} \frac{\sqrt{x^2-3}}{x}\,dx = \int_{5\pi/6}^{\pi} \frac{(-\sqrt{3}\tan\theta)(\sqrt{3}\sec\theta\tan\theta)\,d\theta}{\sqrt{3}\sec\theta}.$$

Complete this integration and show that the result is equivalent to the one in Example 4. (See Exercise 66.)

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

REMARK Recall from Chapter 5 that you used completing the square for integrands involving quadratic functions.

Trigonometric substitution can be used with completing the square. For instance, try finding the integral

$$\int \sqrt{x^2 - 2x}\, dx.$$

To begin, you could complete the square for $x^2 - 2x$ and write the integral as

$$\int \sqrt{(x - 1)^2 - 1^2}\, dx.$$

Because the integrand has the form

$$\sqrt{u^2 - a^2}$$

with $u = x - 1$ and $a = 1$, you can now use trigonometric substitution to find the integral.

Trigonometric substitution can be used to find the three integrals listed in the next theorem. These integrals will be encountered several times in the remainder of the text. When this happens, there will be a reference to Theorem 8.2. (In Exercise 65, you are asked to verify the formulas in Theorem 8.2.)

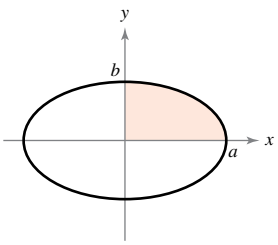
THEOREM 8.2 Special Integration Formulas ($a > 0$)

1. $\displaystyle\int \sqrt{a^2 - u^2}\, du = \frac{1}{2}\left(u\sqrt{a^2 - u^2} + a^2 \arcsin\frac{u}{a}\right) + C$
2. $\displaystyle\int \sqrt{u^2 - a^2}\, du = \frac{1}{2}\left(u\sqrt{u^2 - a^2} - a^2 \ln\left|u + \sqrt{u^2 - a^2}\right|\right) + C$
3. $\displaystyle\int \sqrt{u^2 + a^2}\, du = \frac{1}{2}\left(u\sqrt{u^2 + a^2} + a^2 \ln\left|u + \sqrt{u^2 + a^2}\right|\right) + C$

EXAMPLE 5 Area of an Ellipse

Find the area enclosed by the ellipse

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1.$$



The area bounded by the ellipse in Quadrant I is one-fourth the total area enclosed by the ellipse.
Figure 8.10

Solution The ellipse is symmetric with respect to both axes, so find the area of the region bounded by the ellipse in Quadrant I and multiply by 4 to obtain the total area of the ellipse (see Figure 8.10). In Quadrant I, the equation of the ellipse is

$$y = b\sqrt{1 - \left(\frac{x}{a}\right)^2}, \qquad 0 \le x \le a.$$

So, the total area of the ellipse is

$$\begin{aligned} A &= 4\int_0^a b\sqrt{1 - \left(\frac{x}{a}\right)^2}\, dx \\ &= \frac{4b}{a}\int_0^a \sqrt{a^2 - x^2}\, dx \\ &= \left(\frac{4b}{a}\right)\left(\frac{1}{2}\right)\left[x\sqrt{a^2 - x^2} + a^2 \arcsin\frac{x}{a}\right]_0^a \qquad \text{Apply Theorem 8.2.} \\ &= \left(\frac{2b}{a}\right)\left[a^2\left(\frac{\pi}{2}\right)\right] \\ &= \pi ab. \end{aligned}$$

The arc length of the curve from (0, 0) to $(1, \frac{1}{2})$

Figure 8.11

Applications

EXAMPLE 6 Finding Arc Length

Find the arc length of the graph of $f(x) = \frac{1}{2}x^2$ from $x = 0$ to $x = 1$. (See Figure 8.11.)

Solution Refer to the arc length formula in Section 7.4.

$$s = \int_0^1 \sqrt{1 + [f'(x)]^2}\, dx \qquad \text{Formula for arc length}$$

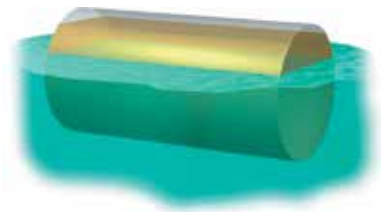
$$= \int_0^1 \sqrt{1 + x^2}\, dx \qquad f'(x) = x$$

$$= \int_0^{\pi/4} \sec^3\theta\, d\theta \qquad \text{Let } a = 1 \text{ and } x = \tan\theta.$$

$$= \frac{1}{2}\Big[\sec\theta\tan\theta + \ln|\sec\theta + \tan\theta|\Big]_0^{\pi/4} \qquad \text{Example 6, Section 8.2}$$

$$= \frac{1}{2}\Big[\sqrt{2} + \ln\big(\sqrt{2} + 1\big)\Big]$$

$$\approx 1.148$$



The barrel is not quite full of oil—the top 0.2 foot of the barrel is empty.

Figure 8.12

EXAMPLE 7 Comparing Two Fluid Forces

A sealed barrel of oil (weighing 48 pounds per cubic foot) is floating in seawater (weighing 64 pounds per cubic foot), as shown in Figures 8.12 and 8.13. (The barrel is not completely full of oil. With the barrel lying on its side, the top 0.2 foot of the barrel is empty.) Compare the fluid forces against one end of the barrel from the inside and from the outside. (Assume the radius of the barrel is 1 foot and, with the barrel lying on its side, the top 0.6 foot of the barrel is above the water.)

Solution In Figure 8.13, locate the coordinate system with the origin at the center of the circle

$$x^2 + y^2 = 1.$$

To find the fluid force against an end of the barrel *from the inside,* integrate between -1 and 0.8 (using a weight of $w = 48$).

$$F = w\int_c^d h(y)L(y)\, dy \qquad \text{General equation (See Section 7.7.)}$$

$$F_{\text{inside}} = 48\int_{-1}^{0.8} (0.8 - y)(2)\sqrt{1 - y^2}\, dy$$

$$= 76.8\int_{-1}^{0.8} \sqrt{1 - y^2}\, dy - 96\int_{-1}^{0.8} y\sqrt{1 - y^2}\, dy$$

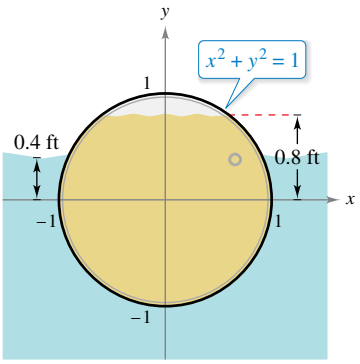


Figure 8.13

To find the fluid force *from the outside,* integrate between -1 and 0.4 (using a weight of $w = 64$).

$$F_{\text{outside}} = 64\int_{-1}^{0.4} (0.4 - y)(2)\sqrt{1 - y^2}\, dy$$

$$= 51.2\int_{-1}^{0.4} \sqrt{1 - y^2}\, dy - 128\int_{-1}^{0.4} y\sqrt{1 - y^2}\, dy$$

The details of integration are left for you to complete in Exercise 64. Intuitively, would you say that the force from the oil (the inside) or the force from the seawater (the outside) is greater? By evaluating these two integrals, you can determine that

$$F_{\text{inside}} \approx 121.3 \text{ pounds} \quad \text{and} \quad F_{\text{outside}} \approx 93.0 \text{ pounds.}$$

8.4 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. State the trigonometric substitution you would use to find the indefinite integral. Do not integrate.

(a) $\int (9 + x^2)^{-2}\,dx$ (b) $\int \sqrt{4 - x^2}\,dx$

(c) $\int \frac{x^2}{\sqrt{25 - x^2}}\,dx$ (d) $\int x^2(x^2 - 25)^{3/2}\,dx$

2. Explain why completing the square is useful when you are considering integration by trigonometric substitution.

Using Trigonometric Substitution In Exercises 3–6, find the indefinite integral using the substitution $x = 4 \sin \theta$.

3. $\int \frac{1}{(16 - x^2)^{3/2}}\,dx$
4. $\int \frac{4}{x^2\sqrt{16 - x^2}}\,dx$
5. $\int \frac{\sqrt{16 - x^2}}{x}\,dx$
6. $\int \frac{x^3}{\sqrt{16 - x^2}}\,dx$

Using Trigonometric Substitution In Exercises 7–10, find the indefinite integral using the substitution $x = 5 \sec \theta$.

7. $\int \frac{1}{\sqrt{x^2 - 25}}\,dx$
8. $\int \frac{\sqrt{x^2 - 25}}{x}\,dx$
9. $\int x^3\sqrt{x^2 - 25}\,dx$
10. $\int \frac{x^3}{\sqrt{x^2 - 25}}\,dx$

Using Trigonometric Substitution In Exercises 11–14, find the indefinite integral using the substitution $x = 2 \tan \theta$.

11. $\int \frac{x}{2}\sqrt{4 + x^2}\,dx$
12. $\int \frac{x^3}{4\sqrt{4 + x^2}}\,dx$
13. $\int \frac{4}{(4 + x^2)^2}\,dx$
14. $\int \frac{2x^2}{(4 + x^2)^2}\,dx$

Special Integration Formulas In Exercises 15–18, use the Special Integration Formulas (Theorem 8.2) to find the indefinite integral.

15. $\int \sqrt{49 - 16x^2}\,dx$
16. $\int \sqrt{5x^2 - 1}\,dx$
17. $\int \sqrt{36 - 5x^2}\,dx$
18. $\int \sqrt{9 + 4x^2}$

Finding an Indefinite Integral In Exercises 19–32, find the indefinite integral.

19. $\int \sqrt{16 - 4x^2}\,dx$
20. $\int \frac{1}{\sqrt{x^2 - 4}}\,dx$
21. $\int \frac{\sqrt{1 - x^2}}{x^4}\,dx$
22. $\int \frac{\sqrt{25x^2 + 4}}{x^4}\,dx$
23. $\int \frac{1}{x\sqrt{4x^2 + 9}}\,dx$
24. $\int \frac{1}{x\sqrt{9x^2 + 1}}\,dx$
25. $\int \frac{-3}{(x^2 + 3)^{3/2}}\,dx$
26. $\int \frac{1}{(x^2 + 5)^{3/2}}\,dx$
27. $\int e^x\sqrt{1 - e^{2x}}\,dx$
28. $\int \frac{\sqrt{1 - x}}{\sqrt{x}}\,dx$
29. $\int \frac{1}{4 + 4x^2 + x^4}\,dx$
30. $\int \frac{x^3 + x + 1}{x^4 + 2x^2 + 1}\,dx$
31. $\int \operatorname{arcsec} 2x\,dx, \quad x > \frac{1}{2}$
32. $\int x \arcsin x\,dx$

Completing the Square In Exercises 33–36, complete the square and find the indefinite integral.

33. $\int \frac{x}{\sqrt{4x - x^2}}\,dx$
34. $\int \frac{x^2}{\sqrt{2x - x^2}}\,dx$
35. $\int \frac{x}{\sqrt{x^2 + 6x + 12}}\,dx$
36. $\int \frac{x}{\sqrt{x^2 - 6x + 5}}\,dx$

Converting the Limits of Integration In Exercises 37–42, evaluate the definite integral using (a) the given integration limits and (b) the limits obtained by trigonometric substitution.

37. $\int_0^{\sqrt{3}/2} \frac{t^2}{(1 - t^2)^{3/2}}\,dt$
38. $\int_0^{\sqrt{3}/2} \frac{1}{(1 - t^2)^{5/2}}\,dt$
39. $\int_0^3 \frac{x^3}{\sqrt{x^2 + 9}}\,dx$
40. $\int_0^{3/5} \sqrt{9 - 25x^2}\,dx$
41. $\int_4^6 \frac{x^2}{\sqrt{x^2 - 9}}\,dx$
42. $\int_4^8 \frac{\sqrt{x^2 - 16}}{x^2}\,dx$

True or False? In Exercises 43–46, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.

43. If $x = \sin \theta$, then
$$\int \frac{dx}{\sqrt{1 - x^2}} = \int d\theta.$$

44. If $x = \sec \theta$, then
$$\int \frac{\sqrt{x^2 - 1}}{x}\,dx = \int \sec \theta \tan \theta\,d\theta.$$

45. If $x = \tan \theta$, then
$$\int_0^{\sqrt{3}} \frac{dx}{(1 + x^2)^{3/2}} = \int_0^{4\pi/3} \cos \theta\,d\theta.$$

46. If $x = \sin \theta$, then
$$\int_{-1}^{1} x^2\sqrt{1 - x^2}\,dx = 2\int_0^{\pi/2} \sin^2 \theta \cos^2 \theta\,d\theta.$$

Exploring Concepts

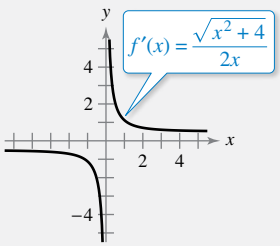
In Exercises 47 and 48, state the method of integration you would use to find each integral. Explain why you chose that method. Do not integrate.

47. $\int x\sqrt{x^2+1}\,dx$ **48.** $\int x^2\sqrt{x^2-1}\,dx$

49. (a) Find the integral $\int \frac{x}{\sqrt{1-x^2}}\,dx$ using u-substitution. Then find the integral using trigonometric substitution. Discuss the results.

(b) Find the integral $\int \frac{x^2}{x^2+9}\,dx$ algebraically using $x^2 = (x^2+9) - 9$. Then find the integral using trigonometric substitution. Discuss the results.

50. HOW DO YOU SEE IT? Use the graph of f' shown in the figure to answer the following.



(a) Identify the open interval(s) on which the graph of f is increasing or decreasing. Explain.

(b) Identify the open interval(s) on which the graph of f is concave upward or concave downward. Explain.

51. Area Find the area enclosed by the ellipse

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

shown in the figure.

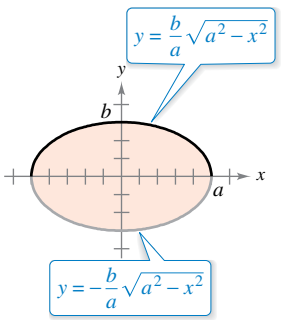


Figure for 51

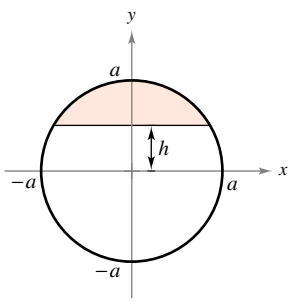

Figure for 52

52. Area Find the area of the shaded region of the circle of radius a when the chord is h units ($0 < h < a$) from the center of the circle (see figure).

Arc Length **In Exercises 53 and 54, find the arc length of the graph of the function over the given interval.**

53. $y = \ln x,\ [1, 5]$ **54.** $y = \frac{x^2}{4} - 2x,\ [4, 8]$

Volume of a Torus **In Exercises 55 and 56, find the volume of the torus generated by revolving the region bounded by the graph of the circle about the y-axis.**

55. $(x-3)^2 + y^2 = 1$

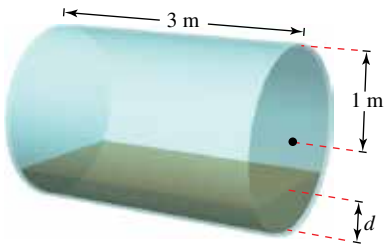
56. $(x-h)^2 + y^2 = r^2,\quad h > r$

Centroid **In Exercises 57 and 58, find the centroid of the region bounded by the graphs of the inequalities.**

57. $y \le \frac{3}{\sqrt{x^2+9}},\ y \ge 0,\ x \ge -4,\ x \le 4$

58. $y \le \frac{1}{4}x^2,\ (x-4)^2 + y^2 \le 16,\ y \ge 0$

59. Volume The axis of a storage tank in the form of a right circular cylinder is horizontal (see figure). The radius and length of the tank are 1 meter and 3 meters, respectively.



(a) Determine the volume of fluid in the tank as a function of its depth d.

(b) Use a graphing utility to graph the function in part (a).

(c) Design a dipstick for the tank with markings of $\frac{1}{4}$, $\frac{1}{2}$, and $\frac{3}{4}$.

(d) Fluid is entering the tank at a rate of $\frac{1}{4}$ cubic meter per minute. Determine the rate of change of the depth of the fluid as a function of its depth d.

(e) Use a graphing utility to graph the function in part (d). When will the rate of change of the depth be minimum? Does this agree with your intuition? Explain.

60. Field Strength The field strength H of a magnet of length $2L$ on a particle r units from the center of the magnet is

$$H = \frac{2mL}{(r^2 + L^2)^{3/2}}$$

where $\pm m$ are the poles of the magnet (see figure). Find the average field strength as the particle moves from 0 to R units from the center by evaluating the integral

$$\frac{1}{R}\int_0^R \frac{2mL}{(r^2 + L^2)^{3/2}}\,dr.$$

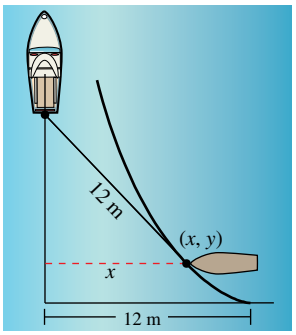
Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

61. Tractrix A tugboat is moving directly away from the shore pulling a fishing boat at the end of a 12-meter rope (see figure). Initially, the fishing boat is located 12 meters away from the tugboat.



(a) Show that the slope of the tangent line of the path of the fishing boat is

$$\frac{dy}{dx} = -\frac{\sqrt{144 - x^2}}{x}.$$

(b) Use the result of part (a) to find the equation of the path of the fishing boat. Use a graphing utility to graph the path and compare it with the figure.

(c) Find any vertical asymptotes of the graphs in part (b).

(d) When the tugboat is 12 meters from the shore, how far has the fishing boat moved?

62. Conjecture

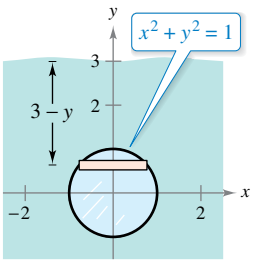
(a) Find formulas for the distances between $(0, 0)$ and (a, a^2), $a > 0$, along the line between these points and along the parabola $y = x^2$.

(b) Use the formulas from part (a) to find the distances for $a = 1$, $a = 10$, and $a = 100$.

(c) Make a conjecture about the difference between the two distances as a increases.

63. Fluid Force

Find the fluid force on a circular observation window of radius 1 foot in a vertical wall of a large water-filled tank at a fish hatchery when the center of the window is (a) 3 feet and (b) d feet ($d > 1$) below the water's surface (see figure). Use trigonometric substitution to evaluate the one integral. Water weighs 62.4 pounds per cubic foot. (Recall that in Section 7.7 in a similar problem, you evaluated one integral by a geometric formula and the other by observing that the integrand was odd.)



64. Fluid Force Evaluate the following two integrals, which yield the fluid forces given in Example 7.

(a) $F_{\text{inside}} = 48\int_{-1}^{0.8} (0.8 - y)(2)\sqrt{1 - y^2}\, dy$

(b) $F_{\text{outside}} = 64\int_{-1}^{0.4} (0.4 - y)(2)\sqrt{1 - y^2}\, dy$

65. Verifying Formulas Use trigonometric substitution to verify the integration formulas given in Theorem 8.2.

66. Finding a Definite Integral Complete the integration shown below (see page 544). Is the result equivalent to the one in Example 4? Explain.

$$\int_{-2}^{-\sqrt{3}} \frac{\sqrt{x^2 - 3}}{x}\, dx = \int_{5\pi/6}^{\pi} \frac{\left(-\sqrt{3}\tan\theta\right)\left(\sqrt{3}\sec\theta\tan\theta\right)}{\sqrt{3}\sec\theta}\, d\theta$$

67. Area of a Lune The crescent-shaped region bounded by two circles forms a *lune* (see figure). Find the area of the lune given that the radius of the smaller circle is 3 and the radius of the larger circle is 5.

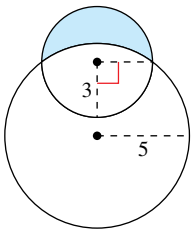


Figure for 67

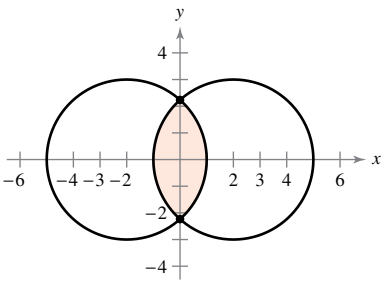

Figure for 68

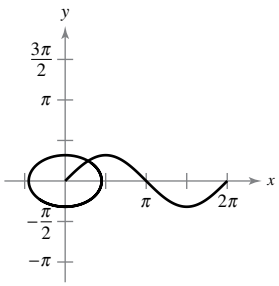
68. Area Two circles of radius 3, with centers at $(-2, 0)$ and $(2, 0)$, intersect (see figure). Find the area of the shaded region.

69. Arc Length Show that the arc length of the graph of $y = \sin x$ on the interval $[0, 2\pi]$ is equal to the circumference of the ellipse

$x^2 + 2y^2 = 2$ (see figure).



PUTNAM EXAM CHALLENGE

70. Evaluate

$$\int_0^1 \frac{\ln(x + 1)}{x^2 + 1}\, dx.$$

8.5 Partial Fractions

GO DIGITAL

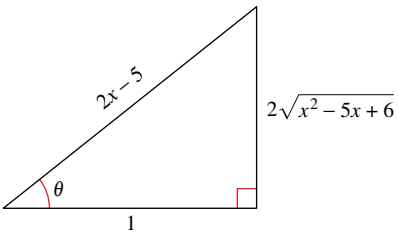
- **Describe the concept of partial fraction decomposition.**
- **Use partial fraction decomposition with linear factors to integrate rational functions.**
- **Use partial fraction decomposition with quadratic factors to integrate rational functions.**

Partial Fractions

This section examines a procedure for decomposing a rational function into simpler rational functions to which you can apply the basic integration formulas. This procedure is called the **method of partial fractions.** To see the benefit of the method of partial fractions, consider the integral

$$\int \frac{1}{x^2 - 5x + 6}\,dx.$$

To find this integral *without* partial fractions, you can complete the square for $x^2 - 5x + 6$ and use trigonometric substitution (see Figure 8.14) to obtain



$\sec\theta = 2x - 5$

Figure 8.14

$$\begin{aligned}
\int \frac{1}{x^2 - 5x + 6}\,dx &= \int \frac{dx}{(x - 5/2)^2 - (1/2)^2} && a = \tfrac{1}{2},\ x - \tfrac{5}{2} = \tfrac{1}{2}\sec\theta \\
&= \int \frac{(1/2)\sec\theta\tan\theta\,d\theta}{(1/4)\tan^2\theta} && dx = \tfrac{1}{2}\sec\theta\tan\theta\,d\theta \\
&= 2\int \csc\theta\,d\theta \\
&= 2\ln\left|\csc\theta - \cot\theta\right| + C \\
&= 2\ln\left|\frac{2x - 5}{2\sqrt{x^2 - 5x + 6}} - \frac{1}{2\sqrt{x^2 - 5x + 6}}\right| + C \\
&= 2\ln\left|\frac{x - 3}{\sqrt{x^2 - 5x + 6}}\right| + C \\
&= \ln\left|\frac{(x - 3)^2}{x^2 - 5x + 6}\right| + C \\
&= \ln\left|\frac{(x - 3)^2}{(x - 2)(x - 3)}\right| + C \\
&= \ln\left|\frac{x - 3}{x - 2}\right| + C \\
&= \ln|x - 3| - \ln|x - 2| + C.
\end{aligned}$$

Now, suppose you had observed that

$$\frac{1}{x^2 - 5x + 6} = \frac{1}{x - 3} - \frac{1}{x - 2}.$$ Partial fraction decomposition

Then you could find the integral, as shown.

$$\int \frac{1}{x^2 - 5x + 6}\,dx = \int \left(\frac{1}{x - 3} - \frac{1}{x - 2}\right)dx = \ln|x - 3| - \ln|x - 2| + C$$

This method is clearly preferable to trigonometric substitution. Its use, however, depends on the ability to factor the denominator, $x^2 - 5x + 6$, and to find the **partial fractions**

$$\frac{1}{x - 3} \quad \text{and} \quad -\frac{1}{x - 2}.$$

In this section, you will study techniques for finding partial fraction decompositions.

JOHN BERNOULLI (1667–1748)

The method of partial fractions was introduced by John Bernoulli, a Swiss mathematician who was instrumental in the early development of calculus. John Bernoulli was a professor at the University of Basel and taught many outstanding students, the most famous of whom was Leonhard Euler. *See LarsonCalculus.com to read more of this biography.*

GO DIGITAL

Recall from algebra that every polynomial with real coefficients can be factored into linear and irreducible quadratic factors.* For instance, the polynomial

$$x^5 + x^4 - x - 1$$

can be written as

$$\begin{aligned} x^5 + x^4 - x - 1 &= x^4(x + 1) - (x + 1) \\ &= (x^4 - 1)(x + 1) \\ &= (x^2 + 1)(x^2 - 1)(x + 1) \\ &= (x^2 + 1)(x + 1)(x - 1)(x + 1) \\ &= (x - 1)(x + 1)^2(x^2 + 1) \end{aligned}$$

where $(x - 1)$ is a linear factor, $(x + 1)^2$ is a repeated linear factor, and $(x^2 + 1)$ is an irreducible quadratic factor. Using this factorization, you can write the partial fraction decomposition of the rational expression

$$\frac{N(x)}{x^5 + x^4 - x - 1}$$

where $N(x)$ is a polynomial of degree less than 5, as shown.

$$\frac{N(x)}{(x - 1)(x + 1)^2(x^2 + 1)} = \frac{A}{x - 1} + \frac{B}{x + 1} + \frac{C}{(x + 1)^2} + \frac{Dx + E}{x^2 + 1}$$

REMARK In precalculus, you learned how to combine fractions such as

$$\frac{1}{x - 2} + \frac{-1}{x + 3} = \frac{5}{(x - 2)(x + 3)}.$$

The method of partial fractions shows you how to reverse this process.

$$\frac{5}{(x - 2)(x + 3)} = \frac{?}{x - 2} + \frac{?}{x + 3}$$

Decomposition of $N(x)/D(x)$ into Partial Fractions

1. **Divide when improper:** When $N(x)/D(x)$ is an improper fraction (that is, when the degree of the numerator is greater than or equal to the degree of the denominator), divide the denominator into the numerator to obtain

   $$\frac{N(x)}{D(x)} = (\text{a polynomial}) + \frac{N_1(x)}{D(x)}$$

   where the degree of $N_1(x)$ is less than the degree of $D(x)$. Then apply Steps 2, 3, and 4 to the proper rational expression

   $$\frac{N_1(x)}{D(x)}.$$

2. **Factor denominator:** Completely factor the denominator into factors of the form

   $$(px + q)^m \quad \text{and} \quad (ax^2 + bx + c)^n$$

   where $ax^2 + bx + c$ is irreducible.

3. **Linear factors:** For each factor of the form $(px + q)^m$, the partial fraction decomposition must include the following sum of m fractions.

   $$\frac{A_1}{(px + q)} + \frac{A_2}{(px + q)^2} + \cdots + \frac{A_m}{(px + q)^m}$$

4. **Quadratic factors:** For each factor of the form $(ax^2 + bx + c)^n$, the partial fraction decomposition must include the following sum of n fractions.

   $$\frac{B_1x + C_1}{ax^2 + bx + c} + \frac{B_2x + C_2}{(ax^2 + bx + c)^2} + \cdots + \frac{B_nx + C_n}{(ax^2 + bx + c)^n}$$

Linear Factors

Algebraic techniques for determining the constants in the numerators of a partial fraction decomposition with linear or repeated linear factors are shown in Examples 1 and 2.

EXAMPLE 1 Distinct Linear Factors

Write the partial fraction decomposition for

$$\frac{1}{x^2 - 5x + 6}.$$

Solution Because the denominator factors as $x^2 - 5x + 6 = (x - 3)(x - 2)$, you should include one partial fraction for each factor and write

$$\frac{1}{x^2 - 5x + 6} = \frac{A}{x - 3} + \frac{B}{x - 2}$$

where A and B are to be determined. Multiplying this equation by the least common denominator $(x - 3)(x - 2)$ yields the **basic equation**

$$1 = A(x - 2) + B(x - 3). \qquad \text{Basic equation}$$

This equation is true for all x, so you can substitute any *convenient* values for x to obtain equations in A and B. The most convenient values are the ones that make particular factors equal to 0. To solve for A, let $x = 3$.

$$\begin{aligned} 1 &= A(3 - 2) + B(3 - 3) && \text{Let } x = 3 \text{ in basic equation.} \\ 1 &= A(1) + B(0) \\ 1 &= A \end{aligned}$$

To solve for B, let $x = 2$.

$$\begin{aligned} 1 &= A(2 - 2) + B(2 - 3) && \text{Let } x = 2 \text{ in basic equation.} \\ 1 &= A(0) + B(-1) \\ -1 &= B \end{aligned}$$

So, the decomposition is

$$\frac{1}{x^2 - 5x + 6} = \frac{1}{x - 3} - \frac{1}{x - 2}$$

as shown at the beginning of this section. ■

REMARK Note that the substitutions for x in Example 1 are chosen for their convenience in determining values for A and B; $x = 3$ is chosen to eliminate the term $B(x - 3)$, and $x = 2$ is chosen to eliminate the term $A(x - 2)$. The goal is to make *convenient* substitutions whenever possible.

FOR FURTHER INFORMATION To learn a different method for finding partial fraction decompositions, called the Heaviside Method, see the article "Calculus to Algebra Connections in Partial Fraction Decomposition" by Joseph Wiener and Will Watkins in *The AMATYC Review*.

Be sure you understand that the method of partial fractions is practical only for integrals of rational functions whose denominators factor "nicely." For instance, when the denominator in Example 1 is changed to

$$x^2 - 5x + 5$$

its factorization as

$$x^2 - 5x + 5 = \left(x - \frac{5 + \sqrt{5}}{2}\right)\left(x - \frac{5 - \sqrt{5}}{2}\right)$$

would be too cumbersome to use with partial fractions. In such cases, you should use completing the square or a graphing utility to perform the integration. When you do this, you should obtain

$$\int \frac{1}{x^2 - 5x + 5}\,dx = \frac{\sqrt{5}}{5}\ln\left|2x - \sqrt{5} - 5\right| - \frac{\sqrt{5}}{5}\ln\left|2x + \sqrt{5} - 5\right| + C.$$

EXAMPLE 2 Repeated Linear Factors

Find $\int \frac{5x^2 + 20x + 6}{x^3 + 2x^2 + x}\,dx$.

Solution Because the denominator factors as

$$x^3 + 2x^2 + x = x(x^2 + 2x + 1) = x(x + 1)^2$$

you should include one partial fraction for *each power* of x and $(x + 1)$ and write

$$\frac{5x^2 + 20x + 6}{x(x + 1)^2} = \frac{A}{x} + \frac{B}{x + 1} + \frac{C}{(x + 1)^2}.$$

Multiplying by the least common denominator $x(x + 1)^2$ yields the basic equation

$$5x^2 + 20x + 6 = A(x + 1)^2 + Bx(x + 1) + Cx. \qquad \text{Basic equation}$$

To solve for A, let $x = 0$. This eliminates the B and C terms and yields

$$\begin{aligned} 5(0)^2 + 20(0) + 6 &= A(0 + 1)^2 + B(0)(0 + 1) + C(0) \\ 6 &= A(1) + 0 + 0 \\ 6 &= A. \end{aligned}$$

To solve for C, let $x = -1$. This eliminates the A and B terms and yields

$$\begin{aligned} 5(-1)^2 + 20(-1) + 6 &= A(-1 + 1)^2 + B(-1)(-1 + 1) + C(-1) \\ 5 - 20 + 6 &= 0 + 0 - C \\ 9 &= C. \end{aligned}$$

The most convenient choices for x have been used. So, to find the value of B, use *any other value* of x along with the calculated values of A and C. Using $x = 1$, $A = 6$, and $C = 9$ produces

$$\begin{aligned} 5(1)^2 + 20(1) + 6 &= 6(1 + 1)^2 + B(1)(1 + 1) + 9(1) \\ 31 &= 6(4) + 2B + 9 \\ -2 &= 2B \\ -1 &= B. \end{aligned}$$

So, the decomposition is

$$\frac{5x^2 + 20x + 6}{x(x + 1)^2} = \frac{6}{x} - \frac{1}{x + 1} + \frac{9}{(x + 1)^2}.$$

Now, use the decomposition to rewrite the original integrand and find the integral.

$$\begin{aligned} \int \frac{5x^2 + 20x + 6}{x(x + 1)^2}\,dx &= \int \left(\frac{6}{x} - \frac{1}{x + 1} + \frac{9}{(x + 1)^2} \right) dx \\ &= 6 \ln|x| - \ln|x + 1| + 9\frac{(x + 1)^{-1}}{-1} + C \\ &= \ln\left| \frac{x^6}{x + 1} \right| - \frac{9}{x + 1} + C \end{aligned}$$

Check this result by differentiating. Include algebra in your check, simplifying the derivative until you have obtained the original integrand. ■

FOR FURTHER INFORMATION For an alternative approach to using partial fractions, see the article "A Shortcut in Partial Fractions" by Xun-Cheng Huang in *The College Mathematics Journal.*

TECHNOLOGY Some graphing utilities can be used to convert a rational function to its partial fraction decomposition. If you have access to such a utility, use it to find the partial fraction decompositions for the fractions in Examples 1 and 2. Then compare the results with those given in the examples.

It is necessary to make as many substitutions for x as there are unknowns $(A, B, C, \ldots)$ to be determined. For instance, in Example 2, three substitutions $(x = 0, x = -1, \text{and } x = 1)$ were made to solve for A, B, and C.

Quadratic Factors

When using the method of partial fractions with *linear* factors, a convenient choice of x immediately yields a value for one of the coefficients. With *quadratic* factors, a system of linear equations usually has to be solved, regardless of the choice of x.

EXAMPLE 3 Distinct Linear and Quadratic Factors

See LarsonCalculus.com for an interactive version of this type of example.

Find $\int \frac{2x^3 - 4x - 8}{(x^2 - x)(x^2 + 4)}\,dx$.

Solution Because the denominator factors as

$$(x^2 - x)(x^2 + 4) = x(x - 1)(x^2 + 4)$$

you should include one partial fraction for each factor and write

$$\frac{2x^3 - 4x - 8}{x(x - 1)(x^2 + 4)} = \frac{A}{x} + \frac{B}{x - 1} + \frac{Cx + D}{x^2 + 4}.$$

Multiplying by the least common denominator $x(x - 1)(x^2 + 4)$ yields the basic equation

$$2x^3 - 4x - 8 = A(x - 1)(x^2 + 4) + Bx(x^2 + 4) + (Cx + D)(x)(x - 1).$$

To solve for A, let $x = 0$ and obtain

$$\begin{aligned} -8 &= A(-1)(4) + B(0)(4) + D(0)(-1) \\ -8 &= -4A + 0 + 0 \\ 2 &= A. \end{aligned}$$

To solve for B, let $x = 1$ and obtain

$$\begin{aligned} -10 &= A(0)(5) + B(5) + (C + D)(1)(0) \\ -10 &= 0 + 5B + 0 \\ -2 &= B. \end{aligned}$$

At this point, C and D are yet to be determined. To find these remaining constants, choose two other values for x and solve the resulting system of linear equations. First, choose $x = -1$. With $A = 2$ and $B = -2$, you can write

$$\begin{aligned} -6 &= (2)(-2)(5) + (-2)(-1)(5) + (-C + D)(-1)(-2) \\ 2 &= -C + D. \end{aligned}$$

Next, choose $x = 2$. With $A = 2$ and $B = -2$, you can write

$$\begin{aligned} 0 &= (2)(1)(8) + (-2)(2)(8) + (2C + D)(2)(1) \\ 8 &= 2C + D. \end{aligned}$$

Solving the linear system by subtracting the first equation from the second

$$\begin{aligned} -C + D &= 2 \\ 2C + D &= 8 \end{aligned}$$

yields $C = 2$. Consequently, $D = 4$, and it follows that

$$\begin{aligned} \int \frac{2x^3 - 4x - 8}{x(x - 1)(x^2 + 4)}\,dx &= \int \left(\frac{2}{x} - \frac{2}{x - 1} + \frac{2x}{x^2 + 4} + \frac{4}{x^2 + 4} \right) dx \\ &= 2\ln|x| - 2\ln|x - 1| + \ln(x^2 + 4) + 2\arctan\frac{x}{2} + C. \end{aligned}$$

GO DIGITAL

In Examples 1, 2, and 3, the solution of the basic equation began with substituting values of x that made the linear factors equal to 0. This method works well when the partial fraction decomposition involves linear factors. When the decomposition involves only quadratic factors, however, an alternative procedure is often more convenient. For instance, try writing the right side of the basic equation in polynomial form and *equating the coefficients* of like terms. This method is shown in Example 4.

EXAMPLE 4 Repeated Quadratic Factors

Find $\int \frac{8x^3 + 13x}{(x^2 + 2)^2}\,dx$.

Solution Include one partial fraction for each power of $(x^2 + 2)$ and write

$$\frac{8x^3 + 13x}{(x^2 + 2)^2} = \frac{Ax + B}{x^2 + 2} + \frac{Cx + D}{(x^2 + 2)^2}.$$

Multiplying by the least common denominator $(x^2 + 2)^2$ yields the basic equation

$$8x^3 + 13x = (Ax + B)(x^2 + 2) + Cx + D. \qquad \text{Basic equation}$$

Next, expand the basic equation and then collect like terms.

$$8x^3 + 13x = Ax^3 + 2Ax + Bx^2 + 2B + Cx + D \qquad \text{Expand.}$$
$$8x^3 + 13x = Ax^3 + Bx^2 + (2A + C)x + (2B + D) \qquad \text{Collect like terms.}$$

Now, equate the coefficients of like terms on opposite sides of the equation.

$$8 = A \qquad 0 = 2B + D$$
$$8x^3 + 0x^2 + 13x + 0 = Ax^3 + Bx^2 + (2A + C)x + (2B + D)$$
$$0 = B$$
$$13 = 2A + C$$

Note that $A = 8$, $B = 0$, $13 = 2A + C$, and $0 = 2B + D$. Use the values for A and B to solve for C and D.

$$13 = 2A + C \Rightarrow 13 = 2(8) + C \Rightarrow -3 = C$$
$$0 = 2B + D \Rightarrow 0 = 2(0) + D \Rightarrow 0 = D$$

Finally, you can conclude that

$$\int \frac{8x^3 + 13x}{(x^2 + 2)^2}\,dx = \int \left(\frac{8x}{x^2 + 2} + \frac{-3x}{(x^2 + 2)^2} \right) dx$$
$$= 4 \ln(x^2 + 2) + \frac{3}{2(x^2 + 2)} + C.$$

TECHNOLOGY You can use a graphing utility to support the decomposition found in Example 4. To do this, graph

$$y_1 = \frac{8x^3 + 13x}{(x^2 + 2)^2}$$

and

$$y_2 = \frac{8x}{x^2 + 2} + \frac{-3x}{(x^2 + 2)^2}$$

in the same viewing window. The graphs should appear to be identical (see figure).

GO DIGITAL

When integrating rational expressions, keep in mind that for *improper* rational expressions such as

$$\frac{N(x)}{D(x)} = \frac{2x^3 + x^2 - 7x + 7}{x^2 + x - 2}$$

you must first divide to obtain

$$\frac{N(x)}{D(x)} = 2x - 1 + \frac{-2x + 5}{x^2 + x - 2}.$$

The proper rational expression is then decomposed into its partial fractions by the usual methods.

Guidelines for solving the basic equation that is obtained in a partial fraction decomposition are given below.

Guidelines for Solving the Basic Equation

Linear Factors

1. Substitute the roots of the distinct linear factors in the basic equation.
2. For repeated linear factors, use the coefficients determined in the first guideline to rewrite the basic equation. Then substitute other convenient values of x and solve for the remaining coefficients.

Quadratic Factors

1. Expand the basic equation.
2. Collect terms according to powers of x.
3. Equate the coefficients of like powers to obtain a system of linear equations involving A, B, C, and so on.
4. Solve the system of linear equations.

FOR FURTHER INFORMATION
To read about another method of evaluating integrals of rational functions, see the article "Alternate Approach to Partial Fractions to Evaluate Integrals of Rational Functions" by N. R. Nandakumar and Michael J. Bossé in *The Pi Mu Epsilon Journal.* To view this article, go to *MathArticles.com.*

Before concluding this section, here are a few things you should remember. First, it is not necessary to use the partial fractions technique on all rational functions. For instance, the next integral is found more easily by the Log Rule.

$$\int \frac{x^2 + 1}{x^3 + 3x - 4}\,dx = \frac{1}{3}\int \frac{3x^2 + 3}{x^3 + 3x - 4}\,dx \qquad \text{Multiply and divide by 3.}$$

$$= \frac{1}{3}\ln|x^3 + 3x - 4| + C \qquad \text{Apply Log Rule.}$$

Second, when the integrand is not in reduced form, reducing it may eliminate the need for partial fractions, as shown in the next integral.

$$\int \frac{x^2 - x - 2}{x^3 - 2x - 4}\,dx = \int \frac{(x + 1)(x - 2)}{(x - 2)(x^2 + 2x + 2)}\,dx \qquad \text{Factor.}$$

$$= \int \frac{x + 1}{x^2 + 2x + 2}\,dx \qquad \text{Divide out common factor.}$$

$$= \frac{1}{2}\ln|x^2 + 2x + 2| + C \qquad \text{Apply Log Rule.}$$

Finally, partial fractions can be used with some quotients involving transcendental functions. For instance, the substitution $u = \sin x$ allows you to write

$$\int \frac{\cos x}{(\sin x)(\sin x - 1)}\,dx = \int \frac{du}{u(u - 1)}. \qquad u = \sin x,\ du = \cos x\,dx$$

8.5 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Write the form of the partial fraction decomposition of each rational expression. Do not solve for the constants.

(a) $\dfrac{4}{x^2 - 8x}$ (b) $\dfrac{2x^2 + 1}{(x - 3)^3}$

(c) $\dfrac{2x - 3}{x^3 + 10x}$ (d) $\dfrac{2x - 1}{x(x^2 + 1)^2}$

2. Explain how to solve a basic equation obtained in a partial fraction decomposition that involves quadratic factors.

Using Partial Fractions **In Exercises 3–20, use partial fractions to find the indefinite integral.**

3. $\displaystyle\int \frac{1}{x^2 - 9}\,dx$

4. $\displaystyle\int \frac{2}{9x^2 - 1}\,dx$

5. $\displaystyle\int \frac{5}{x^2 + 3x - 4}\,dx$

6. $\displaystyle\int \frac{3 - x}{3x^2 - 2x - 1}\,dx$

7. $\displaystyle\int \frac{x^2 + 12x + 12}{x^3 - 4x}\,dx$

8. $\displaystyle\int \frac{x^3 - x + 3}{x^2 + x - 2}\,dx$

9. $\displaystyle\int \frac{2x^3 - 4x^2 - 15x + 5}{x^2 - 2x - 8}\,dx$

10. $\displaystyle\int \frac{x + 2}{x^2 + 5x}\,dx$

11. $\displaystyle\int \frac{4x^2 + 2x - 1}{x^3 + x^2}\,dx$

12. $\displaystyle\int \frac{5x - 2}{(x - 2)^2}\,dx$

13. $\displaystyle\int \frac{x^2 - 6x + 2}{x^3 + 2x^2 + x}\,dx$

14. $\displaystyle\int \frac{8x}{x^3 + x^2 - x - 1}\,dx$

15. $\displaystyle\int \frac{9 - x^2}{7x^3 + x}\,dx$

16. $\displaystyle\int \frac{6x}{x^3 - 8}\,dx$

17. $\displaystyle\int \frac{x^2}{x^4 - 2x^2 - 8}\,dx$

18. $\displaystyle\int \frac{x}{16x^4 - 1}\,dx$

19. $\displaystyle\int \frac{x^2 + 5}{x^3 - x^2 + x + 3}\,dx$

20. $\displaystyle\int \frac{x^2 + 6x + 4}{x^4 + 8x^2 + 16}\,dx$

Evaluating a Definite Integral **In Exercises 21–24, use partial fractions to evaluate the definite integral. Use a graphing utility to verify your result.**

21. $\displaystyle\int_0^2 \frac{3}{4x^2 + 5x + 1}\,dx$

22. $\displaystyle\int_1^5 \frac{x - 1}{x^2(x + 1)}\,dx$

23. $\displaystyle\int_1^2 \frac{x + 1}{x(x^2 + 1)}\,dx$

24. $\displaystyle\int_0^1 \frac{x^2 - x}{x^2 + x + 1}\,dx$

Finding an Indefinite Integral **In Exercises 25–32, use substitution and partial fractions to find the indefinite integral.**

25. $\displaystyle\int \frac{\sin x}{\cos x + \cos^2 x}\,dx$

26. $\displaystyle\int \frac{5\cos x}{\sin^2 x + 3\sin x - 4}\,dx$

27. $\displaystyle\int \frac{\sec^2 x}{\tan^2 x + 5\tan x + 6}\,dx$

28. $\displaystyle\int \frac{\sec^2 x}{(\tan x)(\tan x + 1)}\,dx$

29. $\displaystyle\int \frac{e^x}{(e^x - 1)(e^x + 4)}\,dx$

30. $\displaystyle\int \frac{e^x}{(e^{2x} + 1)(e^x - 1)}\,dx$

31. $\displaystyle\int \frac{\sqrt{x}}{x - 4}\,dx$

32. $\displaystyle\int \frac{1}{x\left(\sqrt{3} - \sqrt{x}\right)}\,dx$

Verifying a Formula **In Exercises 33–36, use the method of partial fractions to verify the integration formula.**

33. $\displaystyle\int \frac{1}{x(a + bx)}\,dx = \frac{1}{a}\ln\left|\frac{x}{a + bx}\right| + C$

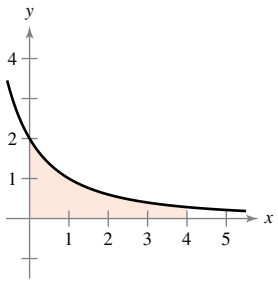
34. $\displaystyle\int \frac{1}{a^2 - x^2}\,dx = \frac{1}{2a}\ln\left|\frac{a + x}{a - x}\right| + C$

35. $\displaystyle\int \frac{x}{(a + bx)^2}\,dx = \frac{1}{b^2}\left(\frac{a}{a + bx} + \ln|a + bx|\right) + C$

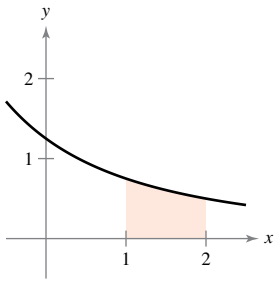
36. $\displaystyle\int \frac{1}{x^2(a + bx)}\,dx = -\frac{1}{ax} - \frac{b}{a^2}\ln\left|\frac{x}{a + bx}\right| + C$

Area **In Exercises 37–40, use partial fractions to find the area of the given region.**

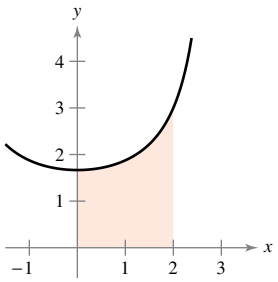
37. $y = \dfrac{12}{x^2 + 5x + 6}$



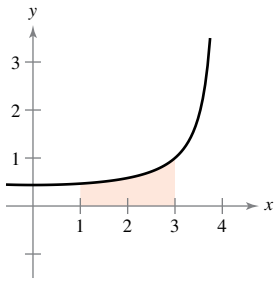
38. $y = \dfrac{15}{x^2 + 7x + 12}$



39. $y = \dfrac{15}{9 - x^2}$



40. $y = \dfrac{7}{16 - x^2}$



Exploring Concepts

In Exercises 41–43, state the method of integration you would use to find each integral. Explain why you chose that method. Do not integrate.

41. $\displaystyle\int \frac{x + 1}{x^2 + 2x - 8}\,dx$

42. $\displaystyle\int \frac{7x + 4}{x^2 + 2x - 8}\,dx$

43. $\displaystyle\int \frac{4}{x^2 + 2x + 5}\,dx$

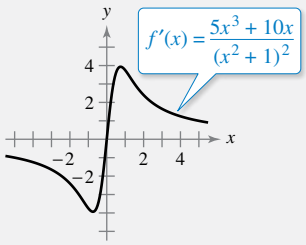
44. HOW DO YOU SEE IT? Use the graph of f' shown in the figure to answer the following.



(a) Is $f(3) - f(2) > 0$? Explain.

(b) Which is greater, the area under the graph of f' from 1 to 2 or the area under the graph of f' from 3 to 4?

45. Modeling Data The predicted cost C (in hundreds of thousands of dollars) for a company to remove $p\%$ of a chemical from its waste water is shown in the table.

P	0	10	20	30	40
C	0	0.7	1.0	1.3	1.7

P	50	60	70	80	90
C	2.0	2.7	3.6	5.5	11.2

A model for the data is given by

$$C = \frac{124p}{(10 + p)(100 - p)}$$

for $0 \le p < 100$. Use the model to find the average cost of removing between 75% and 80% of the chemical.

46. Average Value of a Function Find the average value of

$$f(x) = \frac{1}{4x^2 - 1}$$

from $x = 1$ to $x = 4$.

47. Volume and Centroid Consider the region bounded by the graphs of

$$y = \frac{2x}{x^2 + 1}, \quad y = 0, \quad x = 0, \quad \text{and} \quad x = 3.$$

(a) Find the volume of the solid generated by revolving the region about the x-axis.

(b) Find the centroid of the region.

48. Volume Consider the region bounded by the graph of

$$y^2 = \frac{(2 - x)^2}{(1 + x)^2}$$

on the interval $[0, 1]$. Find the volume of the solid generated by revolving this region about the x-axis.

49. Epidemic Model A single infected individual enters a community of n susceptible individuals. Let x be the number of newly infected individuals at time t. The common epidemic model assumes that the disease spreads at a rate proportional to the product of the total number infected and the number not yet infected. So,

$$\frac{dx}{dt} = k(x + 1)(n - x)$$

and you obtain

$$\int \frac{1}{(x + 1)(n - x)}\,dx = \int k\,dt.$$

Solve for x as a function of t.

50. Chemical Reaction

In a chemical reaction, one unit of compound Y and one unit of compound Z are converted into a single unit of compound X. Let x be the amount of compound X formed. The rate of formation of X is proportional to the product of the amounts of unconverted compounds Y and Z. So, $dx/dt = k(y_0 - x)(z_0 - x)$, where y_0 and z_0 are the initial amounts of compounds Y and Z. From this equation, you obtain

$$\int \frac{1}{(y_0 - x)(z_0 - x)}\,dx = \int k\,dt.$$

(a) Solve for x as a function of t.

(b) Use the result of part (a) to find x as $t \to \infty$ for (1) $y_0 < z_0$, (2) $y_0 > z_0$, and (3) $y_0 = z_0$.

51. Using Two Methods Evaluate

$$\int_0^1 \frac{x}{1 + x^4}\,dx$$

in two different ways, one of which is partial fractions.

PUTNAM EXAM CHALLENGE

52. Prove $\frac{22}{7} - \pi = \int_0^1 \frac{x^4(1 - x)^4}{1 + x^2}\,dx$.

53. Let $p(x)$ be a nonzero polynomial of degree less than 1992 having no nonconstant factor in common with $x^3 - x$. Let

$$\frac{d^{1992}}{dx^{1992}}\left(\frac{p(x)}{x^3 - x}\right) = \frac{f(x)}{g(x)}$$

for polynomials $f(x)$ and $g(x)$. Find the smallest possible degree of $f(x)$.

8.6 Numerical Integration

GO DIGITAL

- Approximate a definite integral using the Trapezoidal Rule.
- Approximate a definite integral using Simpson's Rule.
- Analyze the approximate errors in the Trapezoidal Rule and Simpson's Rule.

The Trapezoidal Rule

Some elementary functions do not have antiderivatives that are elementary functions. For example, consider the functions below. There is no elementary function that has any of these functions as its derivative.

$$\sqrt[3]{x}\sqrt{1-x}, \qquad \sqrt{x}\cos x, \qquad \frac{\cos x}{x}, \qquad \sqrt{1-x^3}, \qquad \sin x^2$$

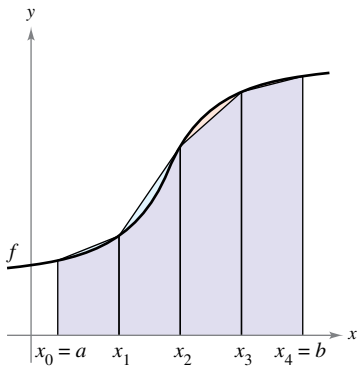
How can you evaluate a definite integral involving a function whose antiderivative cannot be found? While the Fundamental Theorem of Calculus is still true, it cannot be easily applied. In this case, it is easier to resort to an approximation technique, such as the Midpoint Rule (see Section 4.2). Two other techniques are described in this section.

One way to approximate a definite integral is to use n trapezoids, as shown in Figure 8.15. In the development of this method, assume that f is continuous and positive on the interval $[a, b]$. So, the definite integral

$$\int_a^b f(x)\,dx$$

represents the area of the region bounded by the graph of f and the x-axis, from $x = a$ to $x = b$. First, partition the interval $[a, b]$ into n subintervals, each of width $\Delta x = (b - a)/n$, such that

$$a = x_0 < x_1 < x_2 < \cdots < x_n = b.$$



The area of the region can be approximated using four trapezoids.

Figure 8.15

Then form a trapezoid for each subinterval (see Figure 8.16). The area of the ith trapezoid is

$$\text{Area of } i\text{th trapezoid} = \left[\frac{f(x_{i-1}) + f(x_i)}{2}\right]\left(\frac{b-a}{n}\right).$$

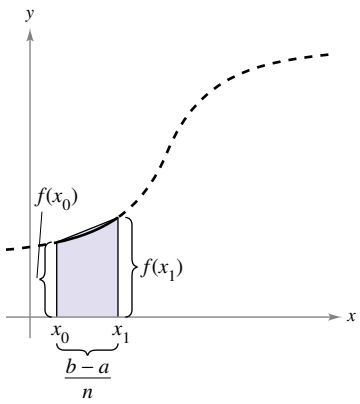
This implies that the sum of the areas of the n trapezoids is

$$\begin{aligned}\text{Area} &= \left(\frac{b-a}{n}\right)\left[\frac{f(x_0)+f(x_1)}{2} + \cdots + \frac{f(x_{n-1})+f(x_n)}{2}\right] \\ &= \left(\frac{b-a}{2n}\right)[f(x_0) + f(x_1) + f(x_1) + f(x_2) + \cdots + f(x_{n-1}) + f(x_n)] \\ &= \left(\frac{b-a}{2n}\right)[f(x_0) + 2f(x_1) + 2f(x_2) + \cdots + 2f(x_{n-1}) + f(x_n)].\end{aligned}$$

Letting $\Delta x = (b - a)/n$, take the limit as $n \to \infty$ to obtain

$$\begin{aligned}&\lim_{n\to\infty}\left(\frac{b-a}{2n}\right)[f(x_0) + 2f(x_1) + \cdots + 2f(x_{n-1}) + f(x_n)] \\ &= \lim_{n\to\infty}\left[\frac{[f(a) - f(b)]\,\Delta x}{2} + \sum_{i=1}^{n} f(x_i)\,\Delta x\right] \\ &= \lim_{n\to\infty}\frac{[f(a) - f(b)](b-a)}{2n} + \lim_{n\to\infty}\sum_{i=1}^{n} f(x_i)\,\Delta x \\ &= 0 + \int_a^b f(x)\,dx.\end{aligned}$$

The result is summarized in the next theorem.



The area of the first trapezoid is $\left[\frac{f(x_0) + f(x_1)}{2}\right]\left(\frac{b-a}{n}\right)$.

GO DIGITAL

THEOREM 8.3 The Trapezoidal Rule

Let a function f be continuous on $[a, b]$. The Trapezoidal Rule for approximating $\int_a^b f(x)\,dx$ is

$$\int_a^b f(x)\,dx \approx \frac{b-a}{2n}[f(x_0) + 2f(x_1) + 2f(x_2) + \cdots + 2f(x_{n-1}) + f(x_n)].$$

Moreover, as $n \to \infty$, the right side approaches $\int_a^b f(x)\,dx$.

REMARK Observe that the coefficients in the Trapezoidal Rule have the pattern shown below.

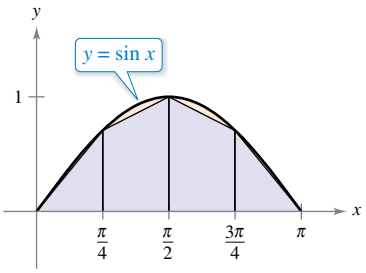
1 2 2 2 . . . 2 2 1

EXAMPLE 1 Approximation with the Trapezoidal Rule

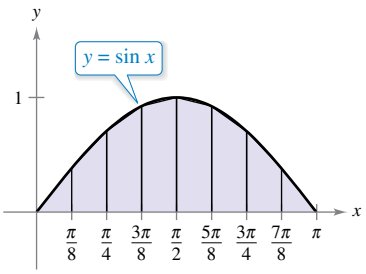
Use the Trapezoidal Rule to approximate

$$\int_0^{\pi} \sin x\,dx.$$

Compare the results for $n = 4$ and $n = 8$, as shown in Figure 8.17.



Four subintervals



Eight subintervals

Trapezoidal approximations

Figure 8.17

Solution When $n = 4$, $\Delta x = \pi/4$, and you obtain

$$\int_0^{\pi} \sin x\,dx \approx \frac{\pi}{8}\left(\sin 0 + 2\sin\frac{\pi}{4} + 2\sin\frac{\pi}{2} + 2\sin\frac{3\pi}{4} + \sin\pi\right)$$

$$= \frac{\pi}{8}\left(0 + \sqrt{2} + 2 + \sqrt{2} + 0\right)$$

$$= \frac{\pi\left(1 + \sqrt{2}\right)}{4}$$

$$\approx 1.896.$$ Approximation using $n = 4$

When $n = 8$, $\Delta x = \pi/8$, and you obtain

$$\int_0^{\pi} \sin x\,dx \approx \frac{\pi}{16}\left(\sin 0 + 2\sin\frac{\pi}{8} + 2\sin\frac{\pi}{4} + 2\sin\frac{3\pi}{8} + 2\sin\frac{\pi}{2} + 2\sin\frac{5\pi}{8} + 2\sin\frac{3\pi}{4} + 2\sin\frac{7\pi}{8} + \sin\pi\right)$$

$$= \frac{\pi}{16}\left(2 + 2\sqrt{2} + 4\sin\frac{\pi}{8} + 4\sin\frac{3\pi}{8}\right)$$

$$\approx 1.974.$$ Approximation using $n = 8$

Of course, for *this particular* integral, you can find an antiderivative and use the Fundamental Theorem of Calculus to find the exact value of the definite integral.

$$\int_0^{\pi} \sin x\,dx = -\cos x\Big]_0^{\pi} = 1 + 1 = 2$$ Exact value

So, the approximation using $n = 8$ is closer to the exact value than the one using $n = 4$.

TECHNOLOGY Most graphing utilities have a *numerical integration* feature for approximating the value of a definite integral. Use this feature to approximate the integral in Example 1. How close is the approximation? When you use this feature, you need to be aware of its limitations. Often, you are given no indication of the degree of accuracy of the approximation.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

It is interesting to compare the Trapezoidal Rule with the Midpoint Rule given in Section 4.2. For the Trapezoidal Rule, you average the function values at the endpoints of the subintervals, but for the Midpoint Rule, you take the function values of the subinterval midpoints.

$$\int_a^b f(x)\,dx \approx \sum_{i=1}^{n} f\left(\frac{x_{i-1} + x_i}{2}\right)\Delta x \qquad \text{Midpoint Rule}$$

$$\int_a^b f(x)\,dx \approx \sum_{i=1}^{n} \left(\frac{f(x_{i-1}) + f(x_i)}{2}\right)\Delta x \qquad \text{Trapezoidal Rule}$$

There are two important points that should be made concerning the Trapezoidal Rule (or the Midpoint Rule). First, the approximation tends to become more accurate as n increases. For instance, in Example 1, when $n = 16$, the Trapezoidal Rule yields an approximation of 1.994. Second, although you could have used the Fundamental Theorem of Calculus to evaluate the integral in Example 1, this theorem cannot be used to evaluate an integral as simple as $\int_0^{\pi} \sin x^2\,dx$ because $\sin x^2$ has no elementary antiderivative. Yet the Trapezoidal Rule can be applied to estimate this integral.

Simpson's Rule

One way to view the trapezoidal approximation of a definite integral is to say that on each subinterval, you approximate f by a *first*-degree polynomial. In Simpson's Rule, named after the English mathematician Thomas Simpson (1710–1761), you take this procedure one step further and approximate f by *second*-degree polynomials.

Before presenting Simpson's Rule, consider the next theorem for evaluating integrals of polynomials of degree 2 (or less).

THEOREM 8.4 Integral of $p(x) = Ax^2 + Bx + C$

If $p(x) = Ax^2 + Bx + C$, then

$$\int_a^b p(x)\,dx = \left(\frac{b-a}{6}\right)\left[p(a) + 4p\left(\frac{a+b}{2}\right) + p(b)\right].$$

Proof

$$\begin{aligned}\int_a^b p(x)\,dx &= \int_a^b (Ax^2 + Bx + C)\,dx \\ &= \left[\frac{Ax^3}{3} + \frac{Bx^2}{2} + Cx\right]_a^b \\ &= \frac{A(b^3 - a^3)}{3} + \frac{B(b^2 - a^2)}{2} + C(b-a) \\ &= \left(\frac{b-a}{6}\right)[2A(a^2 + ab + b^2) + 3B(b+a) + 6C]\end{aligned}$$

By expanding and collecting terms, the expression inside the brackets becomes

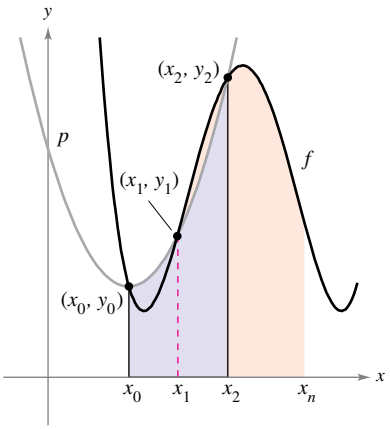
$$\underbrace{(Aa^2 + Ba + C)}_{p(a)} + \underbrace{4\left[A\left(\frac{b+a}{2}\right)^2 + B\left(\frac{b+a}{2}\right) + C\right]}_{4p\left(\frac{a+b}{2}\right)} + \underbrace{(Ab^2 + Bb + C)}_{p(b)}$$

and you can write

$$\int_a^b p(x)\,dx = \left(\frac{b-a}{6}\right)\left[p(a) + 4p\left(\frac{a+b}{2}\right) + p(b)\right].$$

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. WCN 02-200-322

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.



$$\int_{x_0}^{x_2} p(x)\,dx \approx \int_{x_0}^{x_2} f(x)\,dx$$

Figure 8.18

To develop Simpson's Rule for approximating a definite integral, you again partition the interval $[a, b]$ into n subintervals, each of width $\Delta x = (b - a)/n$. This time, however, n is required to be even, and the subintervals are grouped in pairs such that

$$a = \underbrace{x_0 < x_1 < x_2}_{[x_0, x_2]} < \underbrace{x_3 < x_4}_{[x_2, x_4]} < \cdots < \underbrace{x_{n-2} < x_{n-1} < x_n}_{[x_{n-2}, x_n]} = b.$$

On each (double) subinterval $[x_{i-2}, x_i]$, you can approximate f by a polynomial p of degree less than or equal to 2. (See Exercise 47.) For example, on the subinterval $[x_0, x_2]$, choose the polynomial of least degree passing through the points (x_0, y_0), (x_1, y_1), and (x_2, y_2), as shown in Figure 8.18. Now, using p as an approximation of f on this subinterval, you have, by Theorem 8.4,

$$\begin{aligned}\int_{x_0}^{x_2} f(x)\,dx &\approx \int_{x_0}^{x_2} p(x)\,dx \\ &= \frac{x_2 - x_0}{6}\left[p(x_0) + 4p\left(\frac{x_0 + x_2}{2}\right) + p(x_2)\right] \\ &= \frac{2[(b-a)/n]}{6}[p(x_0) + 4p(x_1) + p(x_2)] \\ &= \frac{b-a}{3n}[f(x_0) + 4f(x_1) + f(x_2)].\end{aligned}$$

Repeating this procedure on the entire interval $[a, b]$ produces the next theorem.

REMARK Observe that the coefficients in Simpson's Rule have the pattern shown below.

1 4 2 4 2 4 . . . 4 2 4 1

THEOREM 8.5 Simpson's Rule

Let a function f be continuous on $[a, b]$ and let n be an even integer. Simpson's Rule for approximating $\int_a^b f(x)\,dx$ is

$$\begin{aligned}\int_a^b f(x)\,dx \approx \frac{b-a}{3n}[&f(x_0) + 4f(x_1) + 2f(x_2) + 4f(x_3) + \cdots \\ &+ 2f(x_{n-2}) + 4f(x_{n-1}) + f(x_n)].\end{aligned}$$

Moreover, as $n \to \infty$, the right side approaches $\int_a^b f(x)\,dx$.

In Example 1, the Trapezoidal Rule was used to estimate $\int_0^\pi \sin x\,dx$. In the next example, Simpson's Rule is applied to the same integral.

REMARK In Section 4.2, Example 8, the Midpoint Rule with $n = 4$ approximates this definite integral as 2.052. In Example 1, the Trapezoidal Rule with $n = 4$ gives an approximation of 1.896. In Example 2, Simpson's Rule with $n = 4$ gives an approximation of 2.005. The antiderivative would produce the exact value of 2.

EXAMPLE 2 Approximation with Simpson's Rule

See LarsonCalculus.com for an interactive version of this type of example.

Use Simpson's Rule to approximate

$$\int_0^\pi \sin x\,dx.$$

Compare the results for $n = 4$ and $n = 8$.

Solution When $n = 4$, you have

$$\int_0^\pi \sin x\,dx \approx \frac{\pi}{12}\left(\sin 0 + 4\sin\frac{\pi}{4} + 2\sin\frac{\pi}{2} + 4\sin\frac{3\pi}{4} + \sin\pi\right) \approx 2.005.$$

When $n = 8$, and using a graphing utility, the approximation is 2.0003. As shown in Example 1, the exact value of the definite integral is 2. So, the approximation using $n = 8$ is closer to the exact value than the one using $n = 4$. ■

Error Analysis

It is important to know the accuracy of an approximation. The next theorem, which is listed without proof, gives the formulas for estimating the errors involved in the use of Simpson's Rule and the Trapezoidal Rule. In general, you can think of the error E as the difference between $\int_a^b f(x)\,dx$ and the approximation.

FOR FURTHER INFORMATION
For proofs of the formulas used for estimating the errors involved in the use of the Midpoint Rule and Simpson's Rule, see the article "Elementary Proofs of Error Estimates for the Midpoint and Simpson's Rules" by Edward C. Fazekas, Jr. and Peter R. Mercer in *Mathematics Magazine*. To view this article, go to *MathArticles.com*.

THEOREM 8.6 Errors in the Trapezoidal Rule and Simpson's Rule

If a function f has a continuous second derivative on $[a, b]$, then the error E in approximating $\int_a^b f(x)\,dx$ by the Trapezoidal Rule is

$$|E| \le \frac{(b-a)^3}{12n^2}[\max |f''(x)|], \quad a \le x \le b. \qquad \text{Trapezoidal Rule}$$

Moreover, if f has a continuous fourth derivative on $[a, b]$, then the error E in approximating $\int_a^b f(x)\,dx$ by Simpson's Rule is

$$|E| \le \frac{(b-a)^5}{180n^4}[\max |f^{(4)}(x)|], \quad a \le x \le b. \qquad \text{Simpson's Rule}$$

Theorem 8.6 states that the errors generated by the Trapezoidal Rule and Simpson's Rule have upper bounds dependent on the extreme values of $f''(x)$ and $f^{(4)}(x)$ in the interval $[a, b]$. Furthermore, these errors can be made arbitrarily small by *increasing* n, provided that f'' and $f^{(4)}$ are continuous and therefore bounded on $[a, b]$.

TECHNOLOGY
Use a graphing utility to evaluate the definite integral in Example 3. You should obtain a value equivalent to

$$\frac{1}{2}\left[\sqrt{2} + \ln\left(1 + \sqrt{2}\right)\right] \approx 1.14779.$$

EXAMPLE 3 The Approximate Error in the Trapezoidal Rule

Determine a value of n such that the Trapezoidal Rule will approximate the value of

$$\int_0^1 \sqrt{1 + x^2}\,dx$$

with an error that is less than or equal to 0.01.

Solution Begin by letting $f(x) = \sqrt{1 + x^2} = (1 + x^2)^{1/2}$. The first two derivatives of f are

$$f'(x) = x(1 + x^2)^{-1/2} \quad \text{and} \quad f''(x) = (1 + x^2)^{-3/2}.$$

The maximum value of $|f''(x)|$ on the interval $[0, 1]$ is $|f''(0)| = 1$. So, by Theorem 8.6,

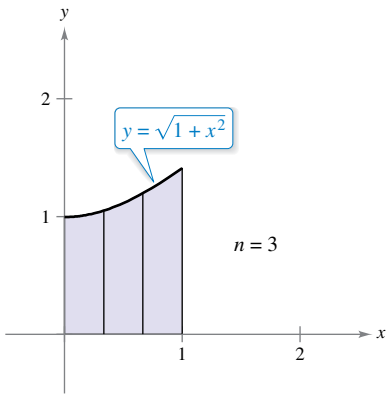
$$|E| \le \frac{(b-a)^3}{12n^2}|f''(0)| = \frac{1}{12n^2}(1) = \frac{1}{12n^2}.$$

To obtain an error E that is less than or equal to 0.01, you must choose n such that $1/(12n^2) \le 1/100$. This implies that $100 \le 12n^2$, or $n \ge \sqrt{100/12} \approx 2.89$. So, you can choose $n = 3$ (because n must be greater than or equal to 2.89) and apply the Trapezoidal Rule, as shown in Figure 8.19, to obtain

$$\int_0^1 \sqrt{1 + x^2}\,dx \approx \frac{1}{6}\left[\sqrt{1 + 0^2} + 2\sqrt{1 + \left(\frac{1}{3}\right)^2} + 2\sqrt{1 + \left(\frac{2}{3}\right)^2} + \sqrt{1 + 1^2}\right] \approx 1.154.$$

By adding and subtracting the error from this estimate, you know that

$$1.144 \le \int_0^1 \sqrt{1 + x^2}\,dx \le 1.164.$$



$1.144 \le \int_0^1 \sqrt{1 + x^2}\,dx \le 1.164$

Concept Check

1. Explain whether you would use numerical integration to evaluate $\int_0^2 (e^x + 5x)\,dx$.
2. Describe how to decrease the error between an approximation and the exact value of an integral using the Trapezoidal Rule and Simpson's Rule.

Using the Trapezoidal Rule and Simpson's Rule **In Exercises 3–14, use the Trapezoidal Rule and Simpson's Rule to approximate the value of the definite integral for the given value of n. Round your answer to four decimal places and compare the results with the exact value of the definite integral.**

3. $\int_0^2 x^2\,dx, \quad n = 4$
4. $\int_1^2 \left(\frac{x^2}{4} + 1\right) dx, \quad n = 4$
5. $\int_3^4 \frac{1}{x-2}\,dx, \quad n = 4$
6. $\int_2^3 \frac{2}{x^2}\,dx, \quad n = 4$
7. $\int_1^3 x^3\,dx, \quad n = 6$
8. $\int_0^8 \sqrt[3]{x}\,dx, \quad n = 8$
9. $\int_4^9 \sqrt{x}\,dx, \quad n = 8$
10. $\int_1^4 (4 - x^2)\,dx, \quad n = 6$
11. $\int_0^1 \frac{2}{(x+2)^2}\,dx, \quad n = 4$
12. $\int_0^2 x\sqrt{x^2+1}\,dx, \quad n = 4$
13. $\int_0^2 xe^{-x}\,dx, \quad n = 4$
14. $\int_0^2 x\ln(x+1)\,dx, \quad n = 4$

Using the Trapezoidal Rule and Simpson's Rule **In Exercises 15–24, approximate the definite integral using the Trapezoidal Rule and Simpson's Rule with $n = 4$. Compare these results with the approximation of the integral using a graphing utility.**

15. $\int_0^2 \sqrt{1+x^3}\,dx$
16. $\int_0^1 \sqrt{x}\sqrt{1-x}\,dx$
17. $\int_0^1 \frac{1}{1+x^2}\,dx$
18. $\int_0^2 \frac{1}{\sqrt{1+x^3}}\,dx$
19. $\int_0^4 \sqrt{x}e^x\,dx$
20. $\int_1^3 \ln x\,dx$
21. $\int_0^{\sqrt{\pi/2}} \sin x^2\,dx$
22. $\int_{\pi/2}^{\pi} \sqrt{x}\sin x\,dx$
23. $\int_0^{\pi/4} x\tan x\,dx$
24. $\int_0^{\pi} f(x)\,dx, \quad f(x) = \begin{cases} \frac{\sin x}{x}, & x > 0 \\ 1, & x = 0 \end{cases}$

Estimating Errors **In Exercises 25–28, use the error formulas in Theorem 8.6 to estimate the errors in approximating the integral, with $n = 4$, using (a) the Trapezoidal Rule and (b) Simpson's Rule.**

25. $\int_0^2 (x^2 + 2x)\,dx$
26. $\int_1^3 2x^3\,dx$
27. $\int_2^4 \frac{1}{(x-1)^2}\,dx$
28. $\int_0^1 e^{x^3}\,dx$

Estimating Errors **In Exercises 29–32, use the error formulas in Theorem 8.6 to find n such that the error in the approximation of the definite integral is less than or equal to 0.00001 using (a) the Trapezoidal Rule and (b) Simpson's Rule.**

29. $\int_1^3 \frac{1}{x}\,dx$
30. $\int_0^1 \frac{1}{1+x}\,dx$
31. $\int_0^2 \sqrt{x+2}\,dx$
32. $\int_1^3 e^{2x}\,dx$

Estimating Errors Using Technology **In Exercises 33 and 34, use a graphing utility and the error formulas to find n such that the error in the approximation of the definite integral is less than or equal to 0.00001 using (a) the Trapezoidal Rule and (b) Simpson's Rule.**

33. $\int_0^1 \tan x^2\,dx$
34. $\int_0^2 (x+1)^{2/3}\,dx$

35. **Finding the Area of a Region** Approximate the area of the shaded region using the Trapezoidal Rule and Simpson's Rule with $n = 4$.

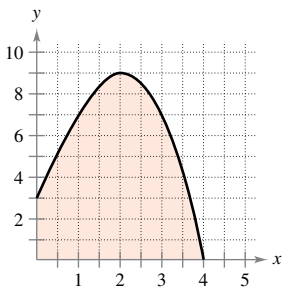

Figure for 35

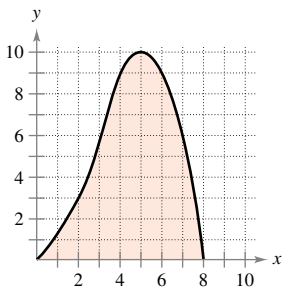

Figure for 36

36. **Finding the Area of a Region** Approximate the area of the shaded region using the Trapezoidal Rule and Simpson's Rule with $n = 8$.
37. **Area** Use Simpson's Rule with $n = 14$ to approximate the area of the region bounded by the graphs of $y = \sqrt{x}\cos x$, $y = 0$, $x = 0$, and $x = \pi/2$.

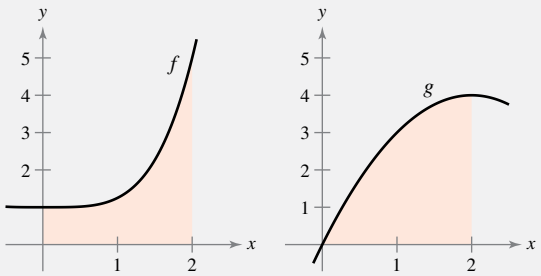
38. HOW DO YOU SEE IT? The function f is concave upward on the interval $[0, 2]$ and the function g is concave downward on the interval $[0, 2]$, as shown in the figure.



(a) Using the Trapezoidal Rule with $n = 4$, which integral would be overestimated, $\int_0^2 f(x)\,dx$ or $\int_0^2 g(x)\,dx$? Which integral would be underestimated? Explain your reasoning.

(b) Which rule would you use for more accurate approximations of $\int_0^2 f(x)\,dx$ and $\int_0^2 g(x)\,dx$, the Trapezoidal Rule or Simpson's Rule? Explain your reasoning.

Exploring Concepts

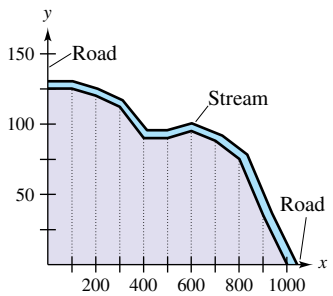
39. Explain how the Trapezoidal Rule is related to the approximations using left and right Riemann sums.

40. Describe the size of the error when the Trapezoidal Rule is used to approximate $\int_a^b f(x)\,dx$ when $f(x)$ is a linear function. Use a graph to explain your answer.

41. Surveying Use the Trapezoidal Rule to estimate the number of square meters of land, where x and y are measured in meters, as shown in the figure. The land is bounded by a stream and two straight roads that meet at right angles.

x	0	100	200	300	400	500
y	125	125	120	112	90	90

x	600	700	800	900	1000
y	95	88	75	35	0



42. Circumference The **elliptic integral**

$$8\sqrt{3}\int_0^{\pi/2}\sqrt{1-\tfrac{2}{3}\sin^2\theta}\,d\theta$$

gives the circumference of an ellipse. Use Simpson's Rule with $n = 8$ to approximate the circumference.

43. Work To determine the size of the motor required to operate a press, a company must know the amount of work done when the press moves an object linearly 5 feet. The variable force to move the object is

$$F(x) = 100x\sqrt{125 - x^3}$$

where F is given in pounds and x gives the position of the unit in feet. Use Simpson's Rule with $n = 12$ to approximate the work W (in foot-pounds) done through one cycle when

$$W = \int_0^5 F(x)\,dx.$$

44. Approximating a Function The table lists several measurements gathered in an experiment to approximate an unknown continuous function $y = f(x)$.

x	0.00	0.25	0.50	0.75	1.00
y	4.32	4.36	4.58	5.79	6.14

x	1.25	1.50	1.75	2.00
y	7.25	7.64	8.08	8.14

(a) Approximate the integral

$$\int_0^2 f(x)\,dx$$

using the Trapezoidal Rule and Simpson's Rule.

(b) Use a graphing utility to find a model of the form $y = ax^3 + bx^2 + cx + d$ for the data. Integrate the resulting polynomial over $[0, 2]$ and compare the result with the integral from part (a).

45. Using Simpson's Rule Use Simpson's Rule with $n = 10$ and a graphing utility to approximate t in the integral equation

$$\int_0^t \sin\sqrt{x}\,dx = 2.$$

46. Proof Prove that Simpson's Rule is exact when approximating the integral of a cubic polynomial function, and demonstrate the result with $n = 4$ for

$$\int_0^1 x^3\,dx.$$

47. Proof Prove that you can find a polynomial

$$p(x) = Ax^2 + Bx + C$$

that passes through any three points (x_1, y_1), (x_2, y_2), and (x_3, y_3), where the x_i's are distinct.

8.7 Integration by Tables and Other Integration Techniques

GO DIGITAL

- **Find an indefinite integral using a table of integrals.**
- **Find an indefinite integral using reduction formulas.**
- **Find an indefinite integral involving fractional expressions of sine and cosine.**

Integration by Tables

So far in this chapter, you have studied several integration techniques that can be used with the basic integration rules. But merely knowing *how* to use the various techniques is not enough. You also need to know *when* to use them. Integration is first and foremost a problem of recognition. That is, you must recognize which rule or technique to apply to obtain an antiderivative. Frequently, a slight alteration of an integrand will require a different integration technique (or produce a function whose antiderivative is not an elementary function), as shown below.

$$\int x \ln x \, dx = \frac{x^2}{2} \ln x - \frac{x^2}{4} + C \qquad \text{Integration by parts}$$

$$\int \frac{\ln x}{x} \, dx = \frac{(\ln x)^2}{2} + C \qquad \text{Power Rule}$$

$$\int \frac{1}{x \ln x} \, dx = \ln|\ln x| + C \qquad \text{Log Rule}$$

$$\int \frac{x}{\ln x} \, dx = ? \qquad \text{Not an elementary function}$$

TECHNOLOGY

A graphing utility that performs symbolic integration consists, in part, of a database of integration formulas. The primary difference between using a graphing utility and using tables of integrals is that the utility searches through the database to find a fit. With integration tables, *you* must do the searching.

Many people find tables of integrals to be a valuable supplement to the integration techniques discussed in this chapter. Tables of common integrals can be found in Appendix B. **Integration by tables** is not a "cure-all" for all of the difficulties that can accompany integration—using tables of integrals requires considerable thought and insight and often involves substitution.

Each integration formula in Appendix B can be developed using one or more of the techniques in this chapter. You should try to verify several of the formulas. For instance, Formula 4

$$\int \frac{u}{(a + bu)^2} \, du = \frac{1}{b^2}\left(\frac{a}{a + bu} + \ln|a + bu|\right) + C \qquad \text{Formula 4}$$

can be verified using the method of partial fractions, Formula 19

$$\int \frac{\sqrt{a + bu}}{u} \, du = 2\sqrt{a + bu} + a \int \frac{1}{u\sqrt{a + bu}} \, du \qquad \text{Formula 19}$$

can be verified using integration by parts, and Formula 84

$$\int \frac{1}{1 + e^u} \, du = u - \ln(1 + e^u) + C \qquad \text{Formula 84}$$

can be verified using substitution. Note that the integrals in Appendix B are classified according to the form of the integrand. Several of the forms are listed below.

u^n	$(a + bu)$
$(a + bu + cu^2)$	$\sqrt{a + bu}$
$(a^2 \pm u^2)$	$\sqrt{u^2 \pm a^2}$
$\sqrt{a^2 - u^2}$	Trigonometric functions
Inverse trigonometric functions	Exponential functions
Logarithmic functions

Exploration

Use the tables of integrals in Appendix B and the substitution

$$u = \sqrt{x - 1}$$

to find the integral in Example 1. When you do this, you should obtain

$$\int \frac{dx}{x\sqrt{x - 1}} = \int \frac{2\,du}{u^2 + 1}.$$

Does this produce the same result as that obtained in Example 1?

GO DIGITAL

EXAMPLE 1 Integration by Tables

Find $\displaystyle\int \frac{dx}{x\sqrt{x - 1}}$.

Solution Because the expression inside the radical is linear, you should consider forms involving $\sqrt{a + bu}$.

$$\int \frac{1}{u\sqrt{a + bu}}\,du = \frac{2}{\sqrt{-a}} \arctan \sqrt{\frac{a + bu}{-a}} + C \qquad \text{Formula 17 } (a < 0)$$

Let $a = -1$, $b = 1$, and $u = x$. Then $du = dx$, and you can write

$$\int \frac{dx}{x\sqrt{x - 1}} = 2 \arctan \sqrt{x - 1} + C.$$

EXAMPLE 2 Integration by Tables

See LarsonCalculus.com for an interactive version of this type of example.

Find $\displaystyle\int x\sqrt{x^4 - 9}\,dx$.

Solution Because the radical has the form $\sqrt{u^2 - a^2}$, you should consider Formula 26.

$$\int \sqrt{u^2 - a^2}\,du = \frac{1}{2}\left(u\sqrt{u^2 - a^2} - a^2 \ln\left|u + \sqrt{u^2 - a^2}\right|\right) + C$$

Let $u = x^2$ and $a = 3$. Then $du = 2x\,dx$, and you have

$$\int x\sqrt{x^4 - 9}\,dx = \frac{1}{2}\int \sqrt{(x^2)^2 - 3^2}(2x)\,dx \qquad \text{Multiply and divide by 2.}$$

$$= \frac{1}{4}\left(x^2\sqrt{x^4 - 9} - 9 \ln\left|x^2 + \sqrt{x^4 - 9}\right|\right) + C.$$

EXAMPLE 3 Integration by Tables

Evaluate $\displaystyle\int_0^2 \frac{x}{1 + e^{-x^2}}\,dx$.

Solution Of the forms involving e^u, consider the formula

$$\int \frac{1}{1 + e^u}\,du = u - \ln(1 + e^u) + C. \qquad \text{Formula 84}$$

Let $u = -x^2$. Then $du = -2x\,dx$, and you have

$$\int \frac{x}{1 + e^{-x^2}}\,dx = -\frac{1}{2}\int \frac{-2x\,dx}{1 + e^{-x^2}} \qquad \text{Multiply and divide by } -2.$$

$$= -\frac{1}{2}\left[-x^2 - \ln\left(1 + e^{-x^2}\right)\right] + C \qquad \text{Apply Formula 84.}$$

$$= \frac{1}{2}\left[x^2 + \ln\left(1 + e^{-x^2}\right)\right] + C. \qquad \text{Simplify.}$$

So, the value of the definite integral is

$$\int_0^2 \frac{x}{1 + e^{-x^2}}\,dx = \frac{1}{2}\left[x^2 + \ln\left(1 + e^{-x^2}\right)\right]_0^2 = \frac{1}{2}[4 + \ln(1 + e^{-4}) - \ln 2] \approx 1.66.$$

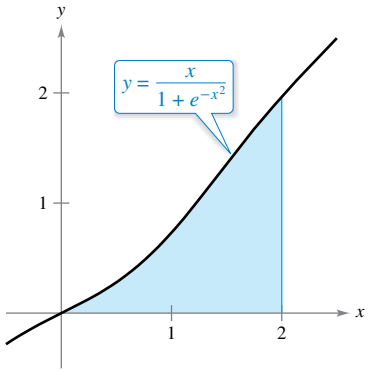

Figure 8.20

Figure 8.20 shows the region whose area is represented by this integral.

GO DIGITAL

Reduction Formulas

Several of the integrals in the integration tables have the form

$$\int f(x)\,dx = g(x) + \int h(x)\,dx.$$

Such integration formulas are called **reduction formulas** because they reduce a given integral to the sum of a function and a simpler integral.

EXAMPLE 4 Using a Reduction Formula

Find $\int x^3 \sin x\,dx$.

Solution Consider the three formulas listed below.

$$\int u \sin u\,du = \sin u - u\cos u + C \qquad \text{Formula 52}$$

$$\int u^n \sin u\,du = -u^n \cos u + n\int u^{n-1}\cos u\,du \qquad \text{Formula 54}$$

$$\int u^n \cos u\,du = u^n \sin u - n\int u^{n-1}\sin u\,du \qquad \text{Formula 55}$$

Using Formula 54, Formula 55, and then Formula 52 produces

$$\begin{aligned}\int x^3 \sin x\,dx &= -x^3\cos x + 3\int x^2\cos x\,dx \\ &= -x^3\cos x + 3\left(x^2\sin x - 2\int x\sin x\,dx\right) \\ &= -x^3\cos x + 3x^2\sin x + 6x\cos x - 6\sin x + C.\end{aligned}$$

REMARK Recall that integrals like the one in Example 4 can be evaluated using the tabular method shown in Example 8 of Section 8.2. Use this method to evaluate the integral in Example 4. Do you obtain the same result?

EXAMPLE 5 Using a Reduction Formula

Find $\int \frac{\sqrt{3-5x}}{2x}\,dx$.

Solution Consider the two formulas listed below.

$$\int \frac{1}{u\sqrt{a+bu}}\,du = \frac{1}{\sqrt{a}}\ln\left|\frac{\sqrt{a+bu}-\sqrt{a}}{\sqrt{a+bu}+\sqrt{a}}\right| + C \qquad \text{Formula 17 } (a>0)$$

$$\int \frac{\sqrt{a+bu}}{u}\,du = 2\sqrt{a+bu} + a\int \frac{1}{u\sqrt{a+bu}}\,du \qquad \text{Formula 19}$$

Using Formula 19, with $a = 3$, $b = -5$, and $u = x$, produces

$$\begin{aligned}\frac{1}{2}\int \frac{\sqrt{3-5x}}{x}\,dx &= \frac{1}{2}\left(2\sqrt{3-5x} + 3\int \frac{dx}{x\sqrt{3-5x}}\right) \\ &= \sqrt{3-5x} + \frac{3}{2}\int \frac{dx}{x\sqrt{3-5x}}.\end{aligned}$$

Using Formula 17, with $a = 3$, $b = -5$, and $u = x$, produces

$$\begin{aligned}\int \frac{\sqrt{3-5x}}{2x}\,dx &= \sqrt{3-5x} + \frac{3}{2}\left(\frac{1}{\sqrt{3}}\ln\left|\frac{\sqrt{3-5x}-\sqrt{3}}{\sqrt{3-5x}+\sqrt{3}}\right|\right) + C \\ &= \sqrt{3-5x} + \frac{\sqrt{3}}{2}\ln\left|\frac{\sqrt{3-5x}-\sqrt{3}}{\sqrt{3-5x}+\sqrt{3}}\right| + C.\end{aligned}$$

Fractional Expressions of Sine and Cosine

EXAMPLE 6 **Integration by Tables**

Find $\int \frac{\sin 2x}{2 + \cos x}\,dx$.

Solution Use the trigonometric identity $\sin 2x = 2 \sin x \cos x$ and the Constant Multiple Rule to rewrite the integral.

$$\int \frac{\sin 2x}{2 + \cos x}\,dx = 2\int \frac{\sin x \cos x}{2 + \cos x}\,dx$$

A check of the forms involving $\sin u$ or $\cos u$ in Appendix B shows that those listed do not apply. So, you can consider forms involving $a + bu$. For example,

$$\int \frac{u}{a + bu}\,du = \frac{1}{b^2}(bu - a \ln|a + bu|) + C. \qquad \text{Formula 3}$$

Let $a = 2$, $b = 1$, and $u = \cos x$. Then $du = -\sin x\,dx$, and you have

$$\begin{aligned} 2\int \frac{\sin x \cos x}{2 + \cos x}\,dx &= -2\int \frac{(\cos x)(-\sin x\,dx)}{2 + \cos x} \qquad \text{Multiply and divide by } -1. \\ &= -2(\cos x - 2 \ln|2 + \cos x|) + C \\ &= -2 \cos x + 4 \ln|2 + \cos x| + C. \end{aligned}$$

Example 6 involves a fractional expression of $\sin x$ and $\cos x$. When you cannot find an integral of this form in the integration tables, try using the following special substitution to convert the trigonometric expression to a standard rational expression.

Substitution for Fractional Expressions of Sine and Cosine

For integrals involving fractional expressions of sine and cosine, the substitution

$$u = \frac{\sin x}{1 + \cos x} = \tan\frac{x}{2}$$

yields

$$\cos x = \frac{1 - u^2}{1 + u^2}, \quad \sin x = \frac{2u}{1 + u^2}, \quad \text{and} \quad dx = \frac{2\,du}{1 + u^2}.$$

Proof From the substitution for u, it follows that

$$u^2 = \frac{\sin^2 x}{(1 + \cos x)^2} = \frac{1 - \cos^2 x}{(1 + \cos x)^2} = \frac{1 - \cos x}{1 + \cos x}.$$

Solving for $\cos x$ produces

$$\cos x = \frac{1 - u^2}{1 + u^2}.$$

To find $\sin x$, write $u = (\sin x)/(1 + \cos x)$ as

$$\sin x = u(1 + \cos x) = u\left(1 + \frac{1 - u^2}{1 + u^2}\right) = \frac{2u}{1 + u^2}.$$

Finally, to find dx, consider $u = \tan(x/2)$. Then you have $\arctan u = x/2$ and

$$dx = \frac{2\,du}{1 + u^2}.$$

8.7 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Which formula from the table of integrals would you use to find the integral below? Explain.

$$\int \frac{\sqrt{5 - 9x^2}}{x^2}\,dx$$

2. Describe what is meant by a reduction formula. Give an example.

Integration by Tables In Exercises 3 and 4, use a table of integrals with forms involving $a + bu$ to find the indefinite integral.

3. $\int \frac{x^2}{5 + x}\,dx$

4. $\int \frac{2}{x^2(4 + 3x)^2}\,dx$

Integration by Tables In Exercises 5 and 6, use a table of integrals with forms involving $\sqrt{a^2 - u^2}$ to find the indefinite integral.

5. $\int \frac{1}{x^2\sqrt{1 - x^2}}\,dx$

6. $\int \frac{\sqrt{64 - x^4}}{x}\,dx$

Integration by Tables In Exercises 7–10, use a table of integrals with forms involving the trigonometric functions to find the indefinite integral.

7. $\int \cos^4 3x\,dx$

8. $\int \frac{\sin^4 \sqrt{x}}{\sqrt{x}}\,dx$

9. $\int \frac{1}{\sqrt{x}(1 - \cos \sqrt{x})}\,dx$

10. $\int \frac{1}{1 + \cot 4x}\,dx$

Integration by Tables In Exercises 11 and 12, use a table of integrals with forms involving e^u to find the indefinite integral.

11. $\int \frac{1}{1 + e^{2x}}\,dx$

12. $\int e^{-4x} \sin 3x\,dx$

Integration by Tables In Exercises 13 and 14, use a table of integrals with forms involving $\ln u$ to find the indefinite integral.

13. $\int x^6 \ln x\,dx$

14. $\int (\ln x)^3\,dx$

Using Two Methods In Exercises 15–18, find the indefinite integral (a) using a table of integrals and (b) using the given method.

	Integral	Method
15.	$\int \ln \frac{x}{3}\,dx$	Integration by parts
16.	$\int \sin^2 3x\,dx$	Power-reducing formula
17.	$\int \frac{1}{x^2(x - 1)}\,dx$	Partial fractions
18.	$\int \frac{dx}{(4 + x^2)^{3/2}}$	Trigonometric substitution

Finding an Indefinite Integral In Exercises 19–40, use a table of integrals to find the indefinite integral.

19. $\int x \operatorname{arccsc}(x^2 + 1)\,dx$

20. $\int \operatorname{arccot}(4x - 5)\,dx$

21. $\int \frac{2}{x^3\sqrt{x^4 - 1}}\,dx$

22. $\int \frac{1}{x^2 + 4x + 8}\,dx$

23. $\int \frac{x}{(7 - 6x)^2}\,dx$

24. $\int \frac{\theta^3}{1 + \sin \theta^4}\,d\theta$

25. $\int e^x \arccos e^x\,dx$

26. $\int \frac{e^x}{1 - \tan e^x}\,dx$

27. $\int \frac{x}{1 - \sec x^2}\,dx$

28. $\int \frac{1}{t[1 + (\ln t)^2]}\,dt$

29. $\int \frac{\cos \theta}{3 + 2 \sin \theta + \sin^2 \theta}\,d\theta$

30. $\int x^2\sqrt{3 + 25x^2}\,dx$

31. $\int \frac{1}{x^2\sqrt{2 + 9x^2}}\,dx$

32. $\int \sqrt{x} \arctan x^{3/2}\,dx$

33. $\int \frac{\ln x}{x(3 + 2 \ln x)}\,dx$

34. $\int \frac{e^x}{(1 - e^{2x})^{3/2}}\,dx$

35. $\int \frac{x}{(x^2 - 6x + 10)^2}\,dx$

36. $\int \sqrt{\frac{5 - x}{5 + x}}\,dx$

37. $\int \frac{x}{\sqrt{x^4 - 6x^2 + 5}}\,dx$

38. $\int \frac{\cos x}{\sqrt{\sin^2 x + 1}}\,dx$

39. $\int \frac{e^{3x}}{(1 + e^x)^3}\,dx$

40. $\int \cot^4 \theta\,d\theta$

Evaluating a Definite Integral In Exercises 41–48, use a table of integrals to evaluate the definite integral.

41. $\int_0^1 \frac{x}{\sqrt{1 + x}}\,dx$

42. $\int_0^1 2x^3e^{x^2}\,dx$

43. $\int_1^2 x^4 \ln x\,dx$

44. $\int_0^{\pi/2} x \sin 2x\,dx$

45. $\int_{-\pi/2}^{\pi/2} \frac{\cos x}{1 + \sin^2 x}\,dx$

46. $\int_0^5 \frac{x^2}{(5 + 2x)^2}\,dx$

47. $\int_0^{\pi/2} t^3 \cos t\,dt$

48. $\int_0^3 \sqrt{x^2 + 16}\,dx$

Verifying a Formula In Exercises 49–54, verify the integration formula.

49. $\int \frac{u^2}{(a + bu)^2}\,du = \frac{1}{b^3}\left(bu - \frac{a^2}{a + bu} - 2a \ln|a + bu|\right) + C$

50. $\int \frac{u^n}{\sqrt{a + bu}}\,du = \frac{2}{(2n + 1)b}\left(u^n\sqrt{a + bu} - na\int \frac{u^{n-1}}{\sqrt{a + bu}}\,du\right)$

51. $\displaystyle\int \frac{1}{(u^2 \pm a^2)^{3/2}}\,du = \frac{\pm u}{a^2\sqrt{u^2 \pm a^2}} + C$

52. $\displaystyle\int u^n \cos u\,du = u^n \sin u - n\int u^{n-1} \sin u\,du$

53. $\displaystyle\int \arctan u\,du = u \arctan u - \ln\sqrt{1+u^2} + C$

54. $\displaystyle\int (\ln u)^n\,du = u(\ln u)^n - n\int (\ln u)^{n-1}\,du$

Finding or Evaluating an Integral **In Exercises 55–62, find or evaluate the integral.**

55. $\displaystyle\int \frac{1}{2 - 3\sin\theta}\,d\theta$

56. $\displaystyle\int \frac{\sin\theta}{1 + \cos^2\theta}\,d\theta$

57. $\displaystyle\int_0^{\pi/2} \frac{1}{1 + \sin\theta + \cos\theta}\,d\theta$

58. $\displaystyle\int_0^{\pi/2} \frac{1}{3 - 2\cos\theta}\,d\theta$

59. $\displaystyle\int \frac{\sin\theta}{3 - 2\cos\theta}\,d\theta$

60. $\displaystyle\int \frac{\cos\theta}{1 + \cos\theta}\,d\theta$

61. $\displaystyle\int \frac{\sin\sqrt{\theta}}{\sqrt{\theta}}\,d\theta$

62. $\displaystyle\int \frac{4}{\csc\theta - \cot\theta}\,d\theta$

Area **In Exercises 63 and 64, find the area of the region bounded by the graphs of the equations.**

63. $y = \dfrac{x}{\sqrt{x+3}}$, $y = 0$, $x = 6$

64. $y = \dfrac{x}{1 + e^{x^2}}$, $y = 0$, $x = 2$

Exploring Concepts

65. (a) Find $\int x^n \ln x\,dx$ for $n = 1$, 2, and 3. Describe any patterns you notice.

(b) Write a general rule for evaluating the integral in part (a) for an integer $n \geq 1$.

(c) Verify your rule from part (b) using integration by parts.

66. State the method or integration formula you would use to find the antiderivative. Explain why you chose that method or formula. Do not integrate.

(a) $\displaystyle\int \frac{e^x}{e^{2x}+1}\,dx$ (b) $\displaystyle\int \frac{e^x}{e^x+1}\,dx$ (c) $\displaystyle\int xe^{x^2}\,dx$

(d) $\displaystyle\int xe^x\,dx$ (e) $\displaystyle\int e^{2x}\sqrt{e^{2x}+1}\,dx$

67. **Work** A hydraulic cylinder on an industrial machine pushes a steel block a distance of x feet ($0 \leq x \leq 5$), where the variable force required is $F(x) = 2000xe^{-x}$ pounds. Find the work done in pushing the block the full 5 feet through the machine.

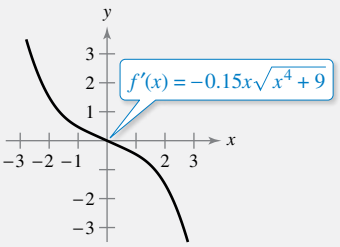
68. **Work** Repeat Exercise 67, using $F(x) = \dfrac{500x}{\sqrt{26 - x^2}}$ pounds.

69. **Population** A population is growing according to the logistic model

$$N = \frac{5000}{1 + e^{4.8 - 1.9t}}$$

where t is the time in days. Find the average population over the interval $[0, 2]$.

70. **HOW DO YOU SEE IT?** Use the graph of f' shown in the figure to answer the following.



(a) Approximate the slope of f at $x = -1$. Explain.

(b) Approximate any open intervals on which the graph of f is increasing and any open intervals on which it is decreasing. Explain.

71. **Volume** Consider the region bounded by the graphs of

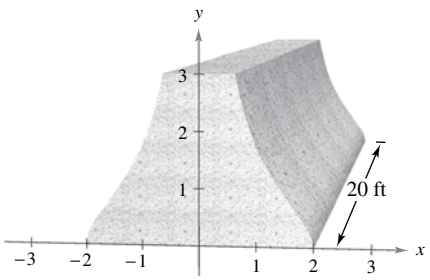
$$y = x\sqrt{16 - x^2},\ y = 0,\ x = 0,\ \text{and}\ x = 4.$$

Find the volume of the solid generated by revolving the region about the y-axis.

72. **Building Design** The cross section of a precast concrete beam for a building is bounded by the graphs of the equations

$$x = \frac{2}{\sqrt{1+y^2}},\ x = \frac{-2}{\sqrt{1+y^2}},\ y = 0,\ \text{and}\ y = 3$$

where x and y are measured in feet. The length of the beam is 20 feet (see figure).



(a) Find the volume V and the weight W of the beam. Assume the concrete weighs 148 pounds per cubic foot.

(b) Find the centroid of a cross section of the beam.

PUTNAM EXAM CHALLENGE

73. Evaluate $\displaystyle\int_0^{\pi/2} \frac{dx}{1 + (\tan x)^{\sqrt{2}}}$.

8.8 Improper Integrals

GO DIGITAL

- Evaluate an improper integral that has an infinite limit of integration.
- Evaluate an improper integral that has an infinite discontinuity.

Improper Integrals with Infinite Limits of Integration

The definition of a definite integral

$$\int_a^b f(x)\,dx$$

requires that the interval $[a, b]$ be finite. Furthermore, the Fundamental Theorem of Calculus, by which you have been evaluating definite integrals, requires that f be continuous on $[a, b]$. In this section, you will study a procedure for evaluating integrals that do not satisfy these requirements—usually because either one or both of the limits of integration are infinite or because f has a finite number of infinite discontinuities in the interval $[a, b]$. Integrals that possess either property are **improper integrals.** Note that a function f is said to have an **infinite discontinuity** at c when, *from the right or left,*

$$\lim_{x\to c} f(x) = \infty \quad \text{or} \quad \lim_{x\to c} f(x) = -\infty.$$

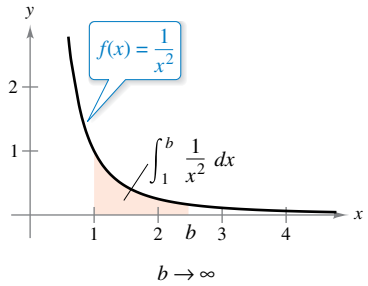
To get an idea of how to evaluate an improper integral, consider the integral

$$\int_1^b \frac{dx}{x^2} = -\frac{1}{x}\Big]_1^b = -\frac{1}{b} + 1 = 1 - \frac{1}{b}$$

which can be interpreted as the area of the shaded region shown in Figure 8.21. Taking the limit as $b \to \infty$ produces

$$\int_1^\infty \frac{dx}{x^2} = \lim_{b\to\infty}\left(\int_1^b \frac{dx}{x^2}\right) = \lim_{b\to\infty}\left(1 - \frac{1}{b}\right) = 1.$$

This improper integral can be interpreted as the area of the *unbounded* region between the graph of $f(x) = 1/x^2$ and the x-axis (to the right of $x = 1$).



The unbounded region has an area of 1.
Figure 8.21

Definition of Improper Integrals with Infinite Integration Limits

1. If a function f is continuous on the interval $[a, \infty)$, then

$$\int_a^\infty f(x)\,dx = \lim_{b\to\infty}\int_a^b f(x)\,dx.$$

2. If a function f is continuous on the interval $(-\infty, b]$, then

$$\int_{-\infty}^b f(x)\,dx = \lim_{a\to-\infty}\int_a^b f(x)\,dx.$$

3. If a function f is continuous on the interval $(-\infty, \infty)$, then

$$\int_{-\infty}^\infty f(x)\,dx = \int_{-\infty}^c f(x)\,dx + \int_c^\infty f(x)\,dx$$

where c is any real number (see Exercise 107).

In the first two cases, the improper integral **converges** when the limit exists—otherwise, the improper integral **diverges**. In the third case, the improper integral on the left diverges when either of the improper integrals on the right diverges.

This unbounded region has an infinite area.

Figure 8.22

EXAMPLE 1 An Improper Integral That Diverges

Evaluate $\int_1^b \frac{dx}{x}$.

Solution

$$\begin{aligned}\int_1^\infty \frac{dx}{x} &= \lim_{b\to\infty} \int_1^b \frac{dx}{x} && \text{Take limit as } b\to\infty.\\ &= \lim_{b\to\infty} \Big[\ln x\Big]_1^b && \text{Apply Log Rule.}\\ &= \lim_{b\to\infty} (\ln b - 0) && \text{Apply Fundamental Theorem of Calculus.}\\ &= \infty && \text{Evaluate limit.}\end{aligned}$$

The limit does not exist. So, you can conclude that the improper integral diverges. See Figure 8.22.

Compare the regions shown in Figures 8.21 and 8.22. They look similar, yet the region in Figure 8.21 has a finite area of 1 and the region in Figure 8.22 has an infinite area.

EXAMPLE 2 Improper Integrals That Converge

Evaluate each improper integral.

a. $\int_0^\infty e^{-x}\,dx$

b. $\int_0^\infty \frac{1}{x^2+1}\,dx$

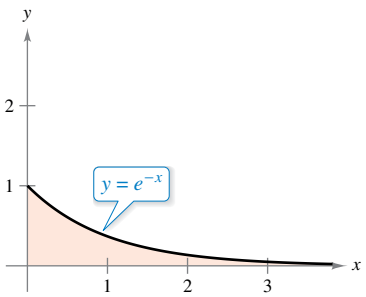
Solution

a. $$\begin{aligned}\int_0^\infty e^{-x}\,dx &= \lim_{b\to\infty} \int_0^b e^{-x}\,dx\\ &= \lim_{b\to\infty} \Big[-e^{-x}\Big]_0^b\\ &= \lim_{b\to\infty} (-e^{-b}+1)\\ &= 1\end{aligned}$$

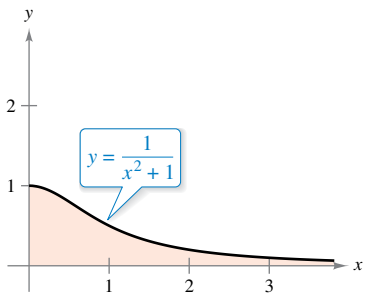
See Figure 8.23(a).

b. $$\begin{aligned}\int_0^\infty \frac{1}{x^2+1}\,dx &= \lim_{b\to\infty} \int_0^b \frac{1}{x^2+1}\,dx\\ &= \lim_{b\to\infty} \Big[\arctan x\Big]_0^b\\ &= \lim_{b\to\infty} \arctan b\\ &= \frac{\pi}{2}\end{aligned}$$

See Figure 8.23(b).



(a) The area of the unbounded region is 1.



(b) The area of the unbounded region is $\pi/2$.

Figure 8.23

In the next example, note how L'Hôpital's Rule can be used to evaluate an improper integral.

EXAMPLE 3 Using L'Hôpital's Rule with an Improper Integral

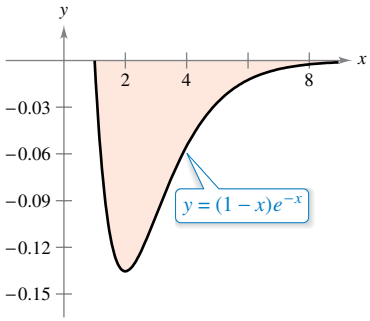
Evaluate $\int_1^\infty (1 - x)e^{-x}\,dx$.

Solution Use integration by parts, with $dv = e^{-x}\,dx$ and $u = (1 - x)$.

$$\begin{aligned}\int (1 - x)e^{-x}\,dx &= -e^{-x}(1 - x) - \int e^{-x}\,dx \\ &= -e^{-x} + xe^{-x} + e^{-x} + C \\ &= xe^{-x} + C\end{aligned}$$

Now, apply the definition of an improper integral.

$$\begin{aligned}\int_1^\infty (1 - x)e^{-x}\,dx &= \lim_{b\to\infty} \left[xe^{-x}\right]_1^b \\ &= \lim_{b\to\infty} \left(\frac{b}{e^b} - \frac{1}{e}\right) \\ &= \lim_{b\to\infty} \frac{b}{e^b} - \lim_{b\to\infty} \frac{1}{e}\end{aligned}$$



The area of the unbounded region is $|-1/e|$.
Figure 8.24

For the first limit, use L'Hôpital's Rule.

$$\lim_{b\to\infty} \frac{b}{e^b} = \lim_{b\to\infty} \frac{1}{e^b} = 0$$

So, you can conclude that

$$\begin{aligned}\int_1^\infty (1 - x)e^{-x}\,dx &= \lim_{b\to\infty} \frac{b}{e^b} - \lim_{b\to\infty} \frac{1}{e} \\ &= 0 - \frac{1}{e} \\ &= -\frac{1}{e}.\end{aligned}$$

See Figure 8.24.

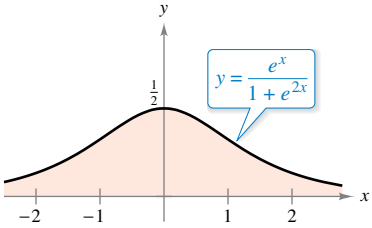
EXAMPLE 4 Infinite Upper and Lower Limits of Integration

Evaluate $\int_{-\infty}^\infty \frac{e^x}{1 + e^{2x}}\,dx$.

Solution Note that the integrand is continuous on $(-\infty, \infty)$. To evaluate the integral, you can break it into two parts, choosing $c = 0$ as a convenient value.

$$\begin{aligned}\int_{-\infty}^\infty \frac{e^x}{1 + e^{2x}}\,dx &= \int_{-\infty}^0 \frac{e^x}{1 + e^{2x}}\,dx + \int_0^\infty \frac{e^x}{1 + e^{2x}}\,dx \\ &= \lim_{a\to-\infty} \left[\arctan e^x\right]_a^0 + \lim_{b\to\infty} \left[\arctan e^x\right]_0^b \\ &= \lim_{a\to-\infty} \left(\frac{\pi}{4} - \arctan e^a\right) + \lim_{b\to\infty} \left(\arctan e^b - \frac{\pi}{4}\right) \\ &= \frac{\pi}{4} - 0 + \frac{\pi}{2} - \frac{\pi}{4} \\ &= \frac{\pi}{2}\end{aligned}$$

See Figure 8.25.



The area of the unbounded region is $\pi/2$.
Figure 8.25

EXAMPLE 5 **Sending a Space Module into Orbit**

In Example 3 in Section 7.5, you found that it would require 10,000 mile-tons of work to propel a 15-ton space module to a height of 800 miles above Earth. How much work is required to propel the module an unlimited distance away from Earth's surface?

Solution At first you might think that an infinite amount of work would be required. But if this were the case, it would be impossible to send rockets into outer space. Because this has been done, the work required must be finite. You can determine the work in the following manner. Using the integral in Example 3, Section 7.5, replace the upper bound of 4800 miles by ∞ and write

$$W = \int_{4000}^{\infty} \frac{240{,}000{,}000}{x^2}\,dx$$

$$= \lim_{b\to\infty} \left[-\frac{240{,}000{,}000}{x} \right]_{4000}^{b} \qquad \text{Integrate.}$$

$$= \lim_{b\to\infty} \left(-\frac{240{,}000{,}000}{b} + \frac{240{,}000{,}000}{4000} \right)$$

$$= 60{,}000 \text{ mile-tons}$$

$$= 6.336 \times 10^{11} \text{ foot-pounds.} \qquad \text{1 mile} = 5280 \text{ feet; 1 ton} = 2000 \text{ pounds}$$

In SI units, using a conversion factor of

$$1 \text{ foot-pound} \approx 1.35582 \text{ joules}$$

the work done is $W \approx 8.59 \times 10^{11}$ joules. ■

Improper Integrals with Infinite Discontinuities

The second basic type of improper integral is one that has an infinite discontinuity *at or between* the limits of integration.

Definition of Improper Integrals with Infinite Discontinuities

1. If a function f is continuous on the interval $[a, b)$ and has an infinite discontinuity at b, then

$$\int_a^b f(x)\,dx = \lim_{c\to b^-} \int_a^c f(x)\,dx.$$

2. If a function f is continuous on the interval $(a, b]$ and has an infinite discontinuity at a, then

$$\int_a^b f(x)\,dx = \lim_{c\to a^+} \int_c^b f(x)\,dx.$$

3. If a function f is continuous on the interval $[a, b]$, except for some c in (a, b) at which f has an infinite discontinuity, then

$$\int_a^b f(x)\,dx = \int_a^c f(x)\,dx + \int_c^b f(x)\,dx.$$

In the first two cases, the improper integral **converges** when the limit exists—otherwise, the improper integral **diverges**. In the third case, the improper integral on the left diverges when either of the improper integrals on the right diverges.

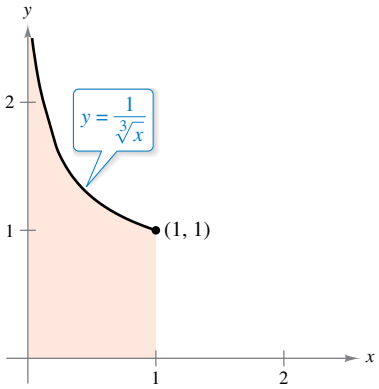
EXAMPLE 6 An Improper Integral with an Infinite Discontinuity

Evaluate $\int_0^1 \frac{dx}{\sqrt[3]{x}}$.

Solution The integrand has an infinite discontinuity at $x = 0$, as shown in the figure at the right. You can evaluate this integral as shown below.

$$\begin{aligned}\int_0^1 x^{-1/3}\,dx &= \lim_{b\to 0^+}\left[\frac{x^{2/3}}{2/3}\right]_b^1 \\ &= \lim_{b\to 0^+}\frac{3}{2}(1 - b^{2/3}) \\ &= \frac{3}{2}\end{aligned}$$



Infinite discontinuity at $x = 0$

EXAMPLE 7 An Improper Integral That Diverges

Evaluate $\int_0^2 \frac{dx}{x^3}$.

Solution Because the integrand has an infinite discontinuity at $x = 0$, you can write

$$\begin{aligned}\int_0^2 \frac{dx}{x^3} &= \lim_{b\to 0^+}\left[-\frac{1}{2x^2}\right]_b^2 \\ &= \lim_{b\to 0^+}\left(-\frac{1}{8} + \frac{1}{2b^2}\right) \\ &= \infty.\end{aligned}$$

So, you can conclude that the improper integral diverges.

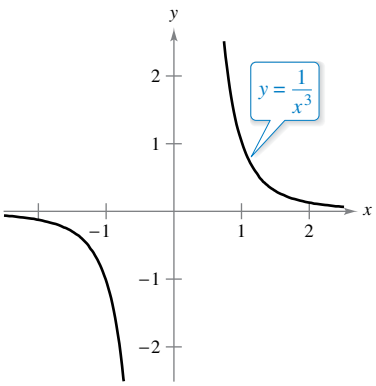
EXAMPLE 8 An Improper Integral with an Interior Discontinuity

Evaluate $\int_{-1}^2 \frac{dx}{x^3}$.

Solution This integral is improper because the integrand has an infinite discontinuity at the interior point $x = 0$, as shown in Figure 8.26. So, you can write

$$\int_{-1}^2 \frac{dx}{x^3} = \int_{-1}^0 \frac{dx}{x^3} + \int_0^2 \frac{dx}{x^3}.$$

From Example 7, you know that the second integral diverges. So, the original improper integral also diverges. ■



The improper integral $\int_{-1}^2 \frac{dx}{x^3}$ diverges.

Figure 8.26

Remember to check for infinite discontinuities at interior points as well as at endpoints when determining whether an integral is improper. For instance, if you had not recognized that the integral in Example 8 was improper, you would have obtained the *incorrect* result

$$\int_{-1}^2 \frac{dx}{x^3} = \frac{-1}{2x^2}\Big]_{-1}^2 = -\frac{1}{8} + \frac{1}{2} = \frac{3}{8}.$$

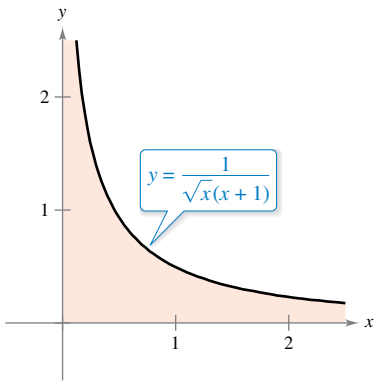
GO DIGITAL

The integral in the next example is improper for *two* reasons. One limit of integration is infinite, and the integrand has an infinite discontinuity at the other limit of integration.

EXAMPLE 9 A Doubly Improper Integral

See LarsonCalculus.com for an interactive version of this type of example.

Evaluate $\int_0^\infty \frac{dx}{\sqrt{x}(x+1)}$.



The area of the unbounded region is π.
Figure 8.27

Solution To evaluate this integral, split it at a convenient point (say, $x = 1$) and write

$$\begin{aligned}\int_0^\infty \frac{dx}{\sqrt{x}(x+1)} &= \int_0^1 \frac{dx}{\sqrt{x}(x+1)} + \int_1^\infty \frac{dx}{\sqrt{x}(x+1)} \\ &= \lim_{b\to 0^+} \left[2\arctan\sqrt{x}\right]_b^1 + \lim_{c\to\infty}\left[2\arctan\sqrt{x}\right]_1^c \\ &= \lim_{b\to 0^+}\left(2\arctan 1 - 2\arctan\sqrt{b}\right) + \lim_{c\to\infty}\left(2\arctan\sqrt{c} - 2\arctan 1\right) \\ &= 2\left(\frac{\pi}{4}\right) - 0 + 2\left(\frac{\pi}{2}\right) - 2\left(\frac{\pi}{4}\right) \\ &= \pi.\end{aligned}$$

See Figure 8.27.

EXAMPLE 10 An Application Involving Arc Length

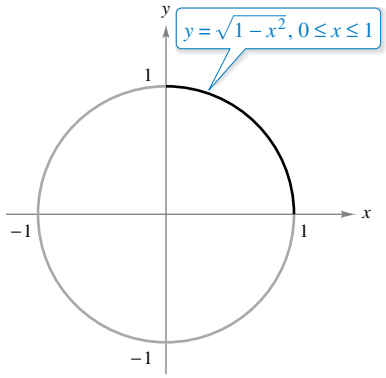
Use the formula for arc length to show that the circumference of the circle $x^2 + y^2 = 1$ is 2π.

Solution To simplify the work, consider the quarter circle given by $y = \sqrt{1 - x^2}$, where $0 \le x \le 1$. The function y is differentiable for any x in this interval except $x = 1$. So, the arc length of the quarter circle is given by the improper integral

$$\begin{aligned}s &= \int_0^1 \sqrt{1 + (y')^2}\,dx \\ &= \int_0^1 \sqrt{1 + \left(\frac{-x}{\sqrt{1-x^2}}\right)^2}\,dx \\ &= \int_0^1 \frac{dx}{\sqrt{1-x^2}}.\end{aligned}$$

This integral is improper because it has an infinite discontinuity at $x = 1$. So, you can write

$$\begin{aligned}s &= \int_0^1 \frac{dx}{\sqrt{1-x^2}} \\ &= \lim_{b\to 1^-}\left[\arcsin x\right]_0^b \\ &= \lim_{b\to 1^-}(\arcsin b - \arcsin 0) \\ &= \frac{\pi}{2} - 0 \\ &= \frac{\pi}{2}.\end{aligned}$$



The circumference of the circle is 2π.
Figure 8.28

Finally, multiplying by 4, you can conclude that the circumference of the circle is $4s = 2\pi$, as shown in Figure 8.28. ■

GO DIGITAL

This section concludes with a useful theorem describing the convergence or divergence of a common type of improper integral. The proof of this theorem is left as an exercise (see Exercise 49).

THEOREM 8.7 A Special Type of Improper Integral

$$\int_1^\infty \frac{dx}{x^p} = \begin{cases} \dfrac{1}{p-1}, & p > 1 \\ \text{diverges}, & p \le 1 \end{cases}$$

EXAMPLE 11 An Application Involving a Solid of Revolution

FOR FURTHER INFORMATION
For further investigation of solids that have finite volumes and infinite surface areas, see the article "Supersolids: Solids Having Finite Volume and Infinite Surfaces" by William P. Love in *Mathematics Teacher*. To view this article, go to *MathArticles.com*.

The solid formed by revolving (about the x-axis) the *unbounded* region lying between the graph of $f(x) = 1/x$ and the x-axis ($x \ge 1$) is called **Gabriel's Horn.** (See Figure 8.29.) Show that this solid has a finite volume and an infinite surface area.

Solution Using the disk method and Theorem 8.7, you can determine that the volume is

$$\begin{aligned} V &= \pi \int_1^\infty \left(\frac{1}{x}\right)^2 dx \qquad \text{Theorem 8.7, } p = 2 > 1 \\ &= \pi\left(\frac{1}{2-1}\right) \\ &= \pi. \end{aligned}$$

The surface area is given by

$$S = 2\pi \int_1^\infty f(x)\sqrt{1 + [f'(x)]^2}\, dx = 2\pi \int_1^\infty \frac{1}{x}\sqrt{1 + \frac{1}{x^4}}\, dx.$$

Because

$$\sqrt{1 + \frac{1}{x^4}} > 1$$

on the interval $[1, \infty)$, and the improper integral

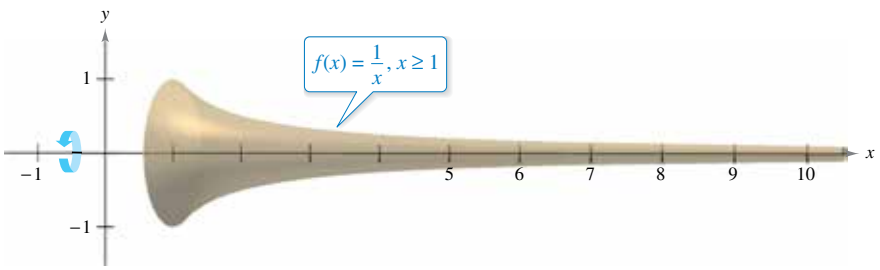
$$\int_1^\infty \frac{1}{x}\, dx$$

diverges, you can conclude that the improper integral

$$\int_1^\infty \frac{1}{x}\sqrt{1 + \frac{1}{x^4}}\, dx$$

also diverges. (See Exercise 52.) So, the surface area is infinite.

FOR FURTHER INFORMATION
To learn about another function that has a finite volume and an infinite surface area, see the article "Gabriel's Wedding Cake" by Julian F. Fleron in *The College Mathematics Journal*. To view this article, go to *MathArticles.com*.



Gabriel's Horn has a finite volume and an infinite surface area.

8.8 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Describe three ways for an integral to be improper.
2. Explain what it means for an improper integral to converge.
3. Explain how to evaluate an improper integral that has an infinite limit of integration.
4. For what values of a is each integral improper? Explain.

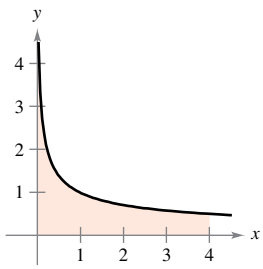
(a) $\int_a^5 \frac{1}{x+2}\,dx$ (b) $\int_a^4 \frac{x}{3x-1}\,dx$

Determining Whether an Integral Is Improper In Exercises 5–12, decide whether the integral is improper. Explain your reasoning.

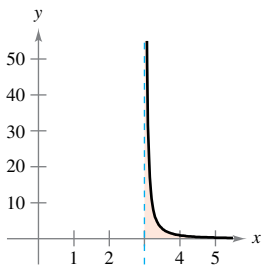
5. $\int_0^1 \frac{dx}{5x-3}$
6. $\int_1^2 \frac{dx}{x^3}$
7. $\int_0^1 \frac{2x-5}{x^2-5x+6}\,dx$
8. $\int_1^\infty \ln x^2\,dx$
9. $\int_0^2 e^{-x}\,dx$
10. $\int_0^\infty \cos x\,dx$
11. $\int_{-\infty}^\infty \frac{\sin x}{4+x^2}\,dx$
12. $\int_0^{\pi/4} \csc x\,dx$

Evaluating an Improper Integral In Exercises 13–16, explain why the integral is improper and determine whether it diverges or converges. Evaluate the integral if it converges.

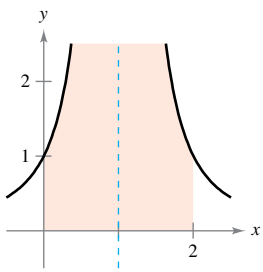
13. $\int_0^4 \frac{1}{\sqrt{x}}\,dx$



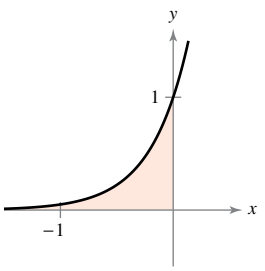
14. $\int_3^4 \frac{1}{(x-3)^{3/2}}\,dx$



15. $\int_0^2 \frac{1}{(x-1)^2}\,dx$



16. $\int_{-\infty}^0 e^{3x}\,dx$



Evaluating an Improper Integral In Exercises 17–32, determine whether the improper integral diverges or converges. Evaluate the integral if it converges.

17. $\int_2^\infty \frac{1}{x^3}\,dx$
18. $\int_3^\infty \frac{1}{(x-1)^4}\,dx$
19. $\int_1^\infty \frac{3}{\sqrt[3]{x}}\,dx$
20. $\int_1^\infty \frac{4}{\sqrt[4]{x}}\,dx$
21. $\int_0^\infty e^{x/3}\,dx$
22. $\int_{-\infty}^0 xe^{-4x}\,dx$
23. $\int_0^\infty x^2e^{-x}\,dx$
24. $\int_0^\infty e^{-x}\cos x\,dx$
25. $\int_4^\infty \frac{1}{x(\ln x)^3}\,dx$
26. $\int_1^\infty \frac{\ln x}{x}\,dx$
27. $\int_{-\infty}^\infty \frac{4}{16+x^2}\,dx$
28. $\int_0^\infty \frac{x^3}{(x^2+1)^2}\,dx$
29. $\int_0^\infty \frac{1}{e^x+e^{-x}}\,dx$
30. $\int_0^\infty \frac{e^x}{1+e^x}\,dx$
31. $\int_0^\infty \cos \pi x\,dx$
32. $\int_0^\infty \sin \frac{x}{2}\,dx$

Evaluating an Improper Integral In Exercises 33–48, determine whether the improper integral diverges or converges. Evaluate the integral if it converges, and check your results with the results obtained by using the integration capabilities of a graphing utility.

33. $\int_0^1 \frac{1}{x^2}\,dx$
34. $\int_0^5 \frac{10}{x}\,dx$
35. $\int_0^2 \frac{1}{\sqrt[3]{x-1}}\,dx$
36. $\int_0^8 \frac{3}{\sqrt{8-x}}\,dx$
37. $\int_0^1 x\ln x\,dx$
38. $\int_0^e \ln x^2\,dx$
39. $\int_0^{\pi/2} \tan\theta\,d\theta$
40. $\int_0^{\pi/2} \sec\theta\,d\theta$
41. $\int_2^4 \frac{2}{x\sqrt{x^2-4}}\,dx$
42. $\int_3^6 \frac{1}{\sqrt{36-x^2}}\,dx$
43. $\int_3^5 \frac{1}{\sqrt{x^2-9}}\,dx$
44. $\int_0^5 \frac{1}{25-x^2}\,dx$
45. $\int_3^\infty \frac{1}{x\sqrt{x^2-9}}\,dx$
46. $\int_4^\infty \frac{\sqrt{x^2-16}}{x^2}\,dx$
47. $\int_0^\infty \frac{4}{\sqrt{x}(x+6)}\,dx$
48. $\int_1^\infty \frac{1}{x\ln x}\,dx$

Finding Values **In Exercises 49 and 50, determine all values of p for which the improper integral converges.**

49. $\int_1^\infty \frac{1}{x^p}\,dx$ **50.** $\int_0^1 \frac{1}{x^p}\,dx$

51. Mathematical Induction Use mathematical induction to verify that the following integral converges for any positive integer n.

$$\int_0^\infty x^n e^{-x}\,dx$$

52. Comparison Test for Improper Integrals In some cases, it is impossible to find the exact value of an improper integral, but it is important to determine whether the integral converges or diverges. Suppose the functions f and g are continuous and $0 \le g(x) \le f(x)$ on the interval $[a, \infty)$. It can be shown that if $\int_a^\infty f(x)\,dx$ converges, then $\int_a^\infty g(x)\,dx$ also converges, and if $\int_a^\infty g(x)\,dx$ diverges, then $\int_a^\infty f(x)\,dx$ also diverges. This is known as the Comparison Test for improper integrals.

(a) Use the Comparison Test to determine whether $\int_1^\infty e^{-x^2}\,dx$ converges or diverges. (*Hint:* Use the fact that $e^{-x^2} \le e^{-x}$ for $x \ge 1$.)

(b) Use the Comparison Test to determine whether $\int_1^\infty \frac{1}{x^5+1}\,dx$ converges or diverges. (*Hint:* Use the fact that $\frac{1}{x^5+1} \le \frac{1}{x^5}$ for $x \ge 1$.)

Convergence or Divergence **In Exercises 53–60, use the results of Exercises 49–52 to determine whether the improper integral converges or diverges.**

53. $\int_0^1 \frac{1}{\sqrt[6]{x}}\,dx$ **54.** $\int_0^1 \frac{1}{x^9}\,dx$

55. $\int_1^\infty \frac{1}{x^5}\,dx$ **56.** $\int_0^\infty x^4 e^{-x}\,dx$

57. $\int_1^\infty \frac{1}{x^2+5}\,dx$ **58.** $\int_2^\infty \frac{1}{\sqrt{x-1}}\,dx$

59. $\int_1^\infty \frac{1-\sin x}{x^2}\,dx$ **60.** $\int_0^\infty \frac{1}{e^x+x}\,dx$

Exploring Concepts

61. Explain why $\int_{-1}^1 \frac{1}{x^3}\,dx \ne 0$.

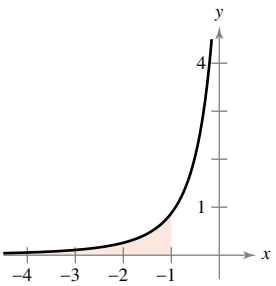
62. Consider the integral

$$\int_0^3 \frac{10}{x^2-2x}\,dx.$$

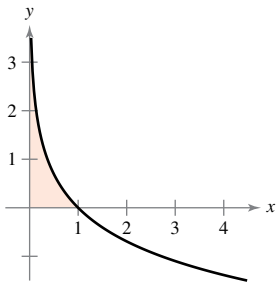
To determine the convergence or divergence of the integral, how many improper integrals must be analyzed? What must be true of each of these integrals for the given integral to converge?

Area **In Exercises 63–66, find the area of the unbounded shaded region.**

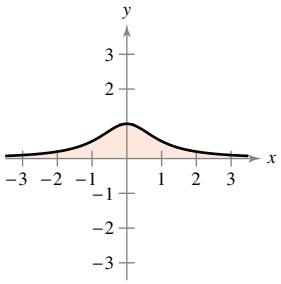
63. $y = -\frac{7}{(x-1)^3}$, $-\infty < x \le -1$



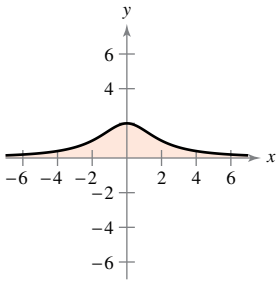
64. $y = -\ln x$



65. Witch of Agnesi: $y = \frac{1}{x^2+1}$



66. Witch of Agnesi: $y = \frac{8}{x^2+4}$



Area and Volume **In Exercises 67 and 68, consider the region satisfying the inequalities. (a) Find the area of the region. (b) Find the volume of the solid generated by revolving the region about the x-axis. (c) Find the volume of the solid generated by revolving the region about the y-axis.**

67. $y \le e^{-x}$, $y \ge 0$, $x \ge 0$

68. $y \le \frac{1}{x^2}$, $y \ge 0$, $x \ge 1$

69. Arc Length Find the arc length of the graph of $y = \sqrt{16-x^2}$ over the interval $[0, 4]$.

70. Surface Area Find the area of the surface formed by revolving the graph of $y = 2e^{-x}$ on the interval $[0, \infty)$ about the x-axis.

Propulsion **In Exercises 71 and 72, use the weight of the rocket to answer each question. (Use 4000 miles as the radius of Earth and do not consider the effect of air resistance.)**

(a) How much work is required to propel the rocket an unlimited distance away from Earth's surface?

(b) How far has the rocket traveled when half of the total work has occurred?

71. 5-ton rocket

72. 10-ton rocket

Probability **A nonnegative function f is called a *probability density function* if**

$$\int_{-\infty}^{\infty} f(t)\,dt = 1.$$

The probability that x lies between a and b is given by

$$P(a \le x \le b) = \int_a^b f(t)\,dt.$$

In Exercises 73 and 74, (a) show that the nonnegative function is a probability density function, and (b) find $P(0 \le x \le 6)$.

73. $f(t) = \begin{cases} \frac{1}{9}e^{-t/9}, & t \ge 0 \\ 0, & t < 0 \end{cases}$

74. $f(t) = \begin{cases} \frac{5}{6}e^{-5t/6}, & t \ge 0 \\ 0, & t < 0 \end{cases}$

75. Normal Probability The mean height of American men between 20 and 29 years old is 69 inches, and the standard deviation is 3 inches. A 20- to 29-year-old man is chosen at random from the population. The probability that he is 6 feet tall or taller is

$$P(72 \le x < \infty) = \int_{72}^{\infty} \frac{1}{3\sqrt{2\pi}} e^{-(x-69)^2/18}\,dx.$$

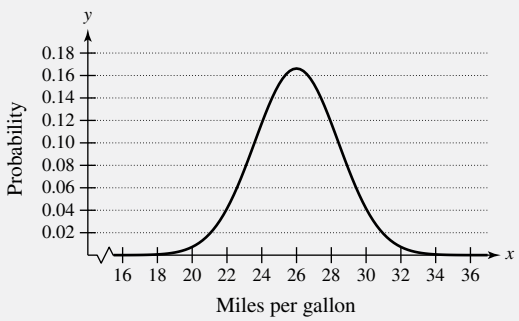
(*Source: National Center for Health Statistics*)

(a) Use a graphing utility to graph the integrand. Use the graphing utility to convince yourself that the area between the x-axis and the integrand is 1.

(b) Use a graphing utility to approximate $P(72 \le x < \infty)$.

(c) Approximate $0.5 - P(69 \le x \le 72)$ using a graphing utility. Use the graph in part (a) to explain why this result is the same as the answer in part (b).

76. HOW DO YOU SEE IT? The graph shows the probability density function for a car brand that has a mean fuel efficiency of 26 miles per gallon and a standard deviation of 2.4 miles per gallon.



(a) Which is greater, the probability of choosing a car at random that gets between 26 and 28 miles per gallon or the probability of choosing a car at random that gets between 22 and 24 miles per gallon?

(b) Which is greater, the probability of choosing a car at random that gets between 20 and 22 miles per gallon or the probability of choosing a car at random that gets at least 30 miles per gallon?

Capitalized Cost **In Exercises 77 and 78, find the capitalized cost C of an asset (a) for $n = 5$ years, (b) for $n = 10$ years, and (c) forever. The capitalized cost is given by**

$$C = C_0 + \int_0^n c(t)e^{-rt}\,dt$$

where C_0 is the original investment, t is the time in years, r is the annual interest rate compounded continuously, and $c(t)$ is the annual cost of maintenance.

77. $C_0 = \$700{,}000$
$c(t) = \$25{,}000$
$r = 0.06$

78. $C_0 = \$700{,}000$
$c(t) = \$25{,}000(1 + 0.08t)$
$r = 0.06$

79. Electromagnetic Theory The magnetic potential P at a point on the axis of a circular coil is given by

$$P = \frac{2\pi NIr}{k} \int_c^{\infty} \frac{1}{(r^2 + x^2)^{3/2}}\,dx$$

where N, I, r, k, and c are constants. Find P.

80. Gravitational Force A "semi-infinite" uniform rod occupies the nonnegative x-axis. The rod has a linear density δ, which means that a segment of length dx has a mass of $\delta\,dx$. A particle of mass M is located at the point $(-a, 0)$. The gravitational force F that the rod exerts on the mass is given by

$$F = \int_0^{\infty} \frac{GM\delta}{(a + x)^2}\,dx$$

where G is the gravitational constant. Find F.

True or False? **In Exercises 81–86, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

81. If f is continuous on $[0, \infty)$ and $\lim_{x\to\infty} f(x) = 0$, then $\int_0^{\infty} f(x)\,dx$ converges.

82. If f is continuous on $[0, \infty)$ and $\int_0^{\infty} f(x)\,dx$ diverges, then $\lim_{x\to\infty} f(x) \ne 0$.

83. If f' is continuous on $[0, \infty)$ and $\lim_{x\to\infty} f(x) = 0$, then

$$\int_0^{\infty} f'(x)\,dx = -f(0).$$

84. If the graph of f is symmetric with respect to the origin or the y-axis, then $\int_0^{\infty} f(x)\,dx$ converges if and only if $\int_{-\infty}^{\infty} f(x)\,dx$ converges.

85. $\int_0^{\infty} e^{ax}\,dx$ converges for $a < 0$.

86. If $\lim_{x\to\infty} f(x) = L$, then $\int_0^{\infty} f(x)\,dx$ converges.

87. Comparing Integrals

(a) Show that $\int_{-\infty}^{\infty} \sin x\,dx$ diverges.

(b) Show that $\lim_{a\to\infty} \int_{-a}^{a} \sin x\,dx = 0$.

(c) What do parts (a) and (b) show about the definition of improper integrals?

88. Exploration Consider the integral

$$\int_0^{\pi/2} \frac{4}{1 + (\tan x)^n}\,dx$$

where n is a positive integer.

(a) Is the integral improper? Explain.

(b) Use a graphing utility to graph the integrand for $n = 2$, 4, 8, and 12.

(c) Use the graphs to approximate the integral as $n \to \infty$.

(d) Use a graphing utility to evaluate the integral for the values of n in part (b). Make a conjecture about the value of the integral for any positive integer n. Compare your results with your answer in part (c).

89. Comparing Integrals Let f be continuous on the interval $[a, \infty)$. Show that if the improper integral $\int_a^\infty |f(x)|\,dx$ converges, then the improper integral $\int_a^\infty f(x)\,dx$ also converges.

90. Writing

(a) The improper integrals

$$\int_1^\infty \frac{1}{x}\,dx \quad \text{and} \quad \int_1^\infty \frac{1}{x^2}\,dx$$

diverge and converge, respectively. Describe the essential difference between the integrands that cause one integral to converge and the other to diverge.

(b) Use a graphing utility to graph the function $y = (\sin x)/x$ over the interval $(1, \infty)$. Use your knowledge of the definite integral to make an inference as to whether the integral

$$\int_1^\infty \frac{\sin x}{x}\,dx$$

converges. Give reasons for your answer.

(c) Use one application of integration by parts and the result of Exercise 89 to determine the divergence or convergence of the integral in part (b).

Laplace Transforms **Let $f(t)$ be a function defined for all positive values of t. The Laplace Transform of $f(t)$ is defined by**

$$F(s) = \int_0^\infty e^{-st} f(t)\,dt$$

when the improper integral exists. Laplace Transforms are used to solve differential equations. In Exercises 91–98, find the Laplace Transform of the function.

91. $f(t) = 1$

92. $f(t) = t$

93. $f(t) = t^2$

94. $f(t) = e^{at}$

95. $f(t) = \cos at$

96. $f(t) = \sin at$

97. $f(t) = \cosh at$

98. $f(t) = \sinh at$

99. The Gamma Function The gamma function $\Gamma(n)$ is defined by

$$\Gamma(n) = \int_0^\infty x^{n-1} e^{-x}\,dx, \quad n > 0.$$

(a) Find $\Gamma(1)$, $\Gamma(2)$, and $\Gamma(3)$.

(b) Use integration by parts to show that $\Gamma(n + 1) = n\Gamma(n)$.

(c) Write $\Gamma(n)$ using factorial notation where n is a positive integer.

100. Proof Prove that $I_n = \left(\frac{n-1}{n+2}\right) I_{n-1}$, where

$$I_n = \int_0^\infty \frac{x^{2n-1}}{(x^2 + 1)^{n+3}}\,dx, \quad n \geq 1.$$

Then evaluate each integral.

(a) $\displaystyle\int_0^\infty \frac{x}{(x^2 + 1)^4}\,dx$

(b) $\displaystyle\int_0^\infty \frac{x^3}{(x^2 + 1)^5}\,dx$

(c) $\displaystyle\int_0^\infty \frac{x^5}{(x^2 + 1)^6}\,dx$

101. Finding a Value For what value of c does the integral

$$\int_0^\infty \left(\frac{1}{\sqrt{x^2 + 1}} - \frac{c}{x + 1}\right) dx$$

converge? Evaluate the integral for this value of c.

102. Finding a Value For what value of c does the integral

$$\int_1^\infty \left(\frac{cx}{x^2 + 2} - \frac{1}{3x}\right) dx$$

converge? Evaluate the integral for this value of c.

103. Volume Find the volume of the solid generated by revolving the region bounded by the graph of f about the x-axis.

$$f(x) = \begin{cases} x \ln x, & 0 < x \leq 2 \\ 0, & x = 0 \end{cases}$$

104. Volume Find the volume of the solid generated by revolving the unbounded region lying between $y = -\ln x$ and the y-axis ($y \geq 0$) about the x-axis.

***u*-Substitution** **In Exercises 105 and 106, rewrite the improper integral as a proper integral using the given u-substitution. Then use the Trapezoidal Rule with $n = 5$ to approximate the integral.**

105. $\displaystyle\int_0^1 \frac{\sin x}{\sqrt{x}}\,dx, \quad u = \sqrt{x}$

106. $\displaystyle\int_0^1 \frac{\cos x}{\sqrt{1 - x}}\,dx, \quad u = \sqrt{1 - x}$

107. Rewriting an Integral Let $\int_{-\infty}^\infty f(x)\,dx$ be convergent, and let a and b be real numbers where $a \neq b$. Show that

$$\int_{-\infty}^a f(x)\,dx + \int_a^\infty f(x)\,dx = \int_{-\infty}^b f(x)\,dx + \int_b^\infty f(x)\,dx.$$

Exploring Concepts

You can apply the integration techniques that you learned in this chapter to a wide variety of functions. For instance, integration by parts is particularly useful for integrands involving products of algebraic and transcendental functions. It can even be useful for integrands consisting of single terms! This technique was developed from the product rule for derivatives.

Product Rule (derivatives)	**Integration by parts**
$\frac{d}{dx}[uv] = uv' + vu'$	$\int u\,dv = uv - \int v\,du$

It is important that you learn how to recognize when to use advanced integration techniques.

Technique	**Comment**
Trigonometric substitution	Use with the Power Rule to find trigonometric integrals.
Partial fractions	Decompose a rational function into simpler rational functions to which you can apply basic integration techniques.
Numerical integration	Use the Trapezoidal Rule or Simpson's Rule for integrals of elementary functions that do not have antiderivatives that are elementary functions.
Improper integrals	Use a limit to determine whether an improper integral converges or diverges.

1. Describe how you would find each integral using (i) integration by parts and (ii) substitution. Perform each integration. Are the results equivalent?

(a) $\int 2x\sqrt{2x-3}\,dx$

(b) $\int x\sqrt{9+x}\,dx$

2. Is letting $u = \cos x$ and $dv = x\,dx$ a good choice for finding

$$\int x\cos x\,dx?$$

Explain your reasoning.

3. Describe how you would integrate $\int \sin^m x\cos^n x\,dx$ for each condition.

(a) m is positive and odd.

(b) n is positive and odd.

(c) m and n are both positive and even.

4. Describe how you would integrate $\int \sec^m x\tan^n x\,dx$ for each condition.

(a) m is positive and even.

(b) n is positive and odd.

(c) n is positive and even, and there is no secant function.

(d) m is positive and odd, and there is no tangent function.

5. Describe geometrically how the Trapezoidal Rule is used to approximate a definite integral.

6. Explain why the evaluation of each integral shown below is incorrect. Use the integration capabilities of a graphing utility to attempt to evaluate the integral. Determine whether the utility gives the correct answer.

(a) $\int_{-1}^{1}\frac{1}{x^2}dx = -2$ ✗

(b) $\int_{0}^{\infty}\sec x\,dx = 0$ ✗

Using Basic Integration Rules

In Exercises 7–14, use the basic integration rules to find or evaluate the integral.

7. $\int x^2\sqrt{x^3-27}\,dx$

8. $\int xe^{5-x^2}\,dx$

9. $\int \csc^2\left(\frac{x+8}{4}\right)dx$

10. $\int \frac{x}{\sqrt[3]{4-x^2}}\,dx$

11. $\int_{1}^{e}\frac{\ln 2x}{x}\,dx$

12. $\int_{3/2}^{2} 2x\sqrt{2x-3}\,dx$

13. $\int \frac{100}{\sqrt{100-x^2}}\,dx$

14. $\int \frac{2x}{x-3}\,dx$

Using Integration by Parts

In Exercises 15–22, use integration by parts to find the indefinite integral.

15. $\int x\,e^{1-x}\,dx$

16. $\int x^2e^{x/2}\,dx$

17. $\int e^{2x}\sin 3x\,dx$

18. $\int x\sqrt{x-1}\,dx$

19. $\int x\sec^2 x\,dx$

20. $\int \ln\sqrt{x^2-4}\,dx$

21. $\int x\arcsin 2x\,dx$

22. $\int \arctan 2x\,dx$

Finding a Trigonometric Integral **In Exercises 23–32, find the trigonometric integral.**

23. $\int \sin x \cos^4 x \, dx$

24. $\int \sin^2 x \cos^3 x \, dx$

25. $\int \cos^3(\pi x - 1) \, dx$

26. $\int \sin^2 \frac{\pi x}{2} \, dx$

27. $\int \sec^4 \frac{x}{2} \, dx$

28. $\int \tan \theta \sec^4 \theta \, d\theta$

29. $\int x \tan^4 x^2 \, dx$

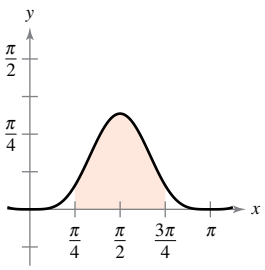
30. $\int \frac{\tan^2 x}{\sec^3 x} \, dx$

31. $\int \frac{1}{1 - \sin \theta} \, d\theta$

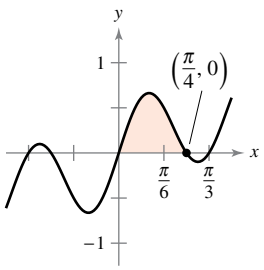
32. $\int (\cos 2\theta)(\sin \theta + \cos \theta)^2 \, d\theta$

Area **In Exercises 33 and 34, find the area of the given region.**

33. $y = \sin^4 x$



34. $y = \sin 3x \cos 2x$



Using Trigonometric Substitution **In Exercises 35–40, use trigonometric substitution to find or evaluate the integral.**

35. $\int \frac{-12}{x^2\sqrt{4 - x^2}} \, dx$

36. $\int \frac{\sqrt{x^2 - 9}}{x} \, dx$

37. $\int \frac{x^3}{\sqrt{4 + x^2}} \, dx$

38. $\int \sqrt{25 - 9x^2} \, dx$

39. $\int_0^1 \frac{6x^3}{\sqrt{16 + x^2}} \, dx$

40. $\int_3^4 x^3 \sqrt{x^2 - 9} \, dx$

Using Different Methods **In Exercises 41 and 42, find the indefinite integral using each method.**

41. $\int \frac{x^3}{\sqrt{4 + x^2}} \, dx$

(a) Trigonometric substitution

(b) Substitution: $u^2 = 4 + x^2$

(c) Integration by parts: $dv = \frac{x}{\sqrt{4 + x^2}} \, dx$

42. $\int x\sqrt{4 + x} \, dx$

(a) Trigonometric substitution

(b) Substitution: $u^2 = 4 + x$

(c) Substitution: $u = 4 + x$

(d) Integration by parts: $dv = \sqrt{4 + x} \, dx$

Using Partial Fractions **In Exercises 43–50, use partial fractions to find the indefinite integral.**

43. $\int \frac{x - 8}{x^2 - x - 6} \, dx$

44. $\int \frac{5x - 2}{x^2 - x} \, dx$

45. $\int \frac{x^2 + 2x}{x^3 - x^2 + x - 1} \, dx$

46. $\int \frac{4x - 2}{3(x - 1)^2} \, dx$

47. $\int \frac{x^2}{x^2 - 2x + 1} \, dx$

48. $\int \frac{x^3 + 4}{x^2 - 4x} \, dx$

49. $\int \frac{4e^x}{(e^{2x} - 1)(e^x + 3)} \, dx$

50. $\int \frac{\sec^2 \theta}{(\tan \theta)(\tan \theta - 1)} \, d\theta$

Using the Trapezoidal Rule and Simpson's Rule **In Exercises 51–54, approximate the definite integral using the Trapezoidal Rule and Simpson's Rule with $n = 4$. Compare these results with the approximation of the integral using a graphing utility.**

51. $\int_2^3 \frac{2}{1 + x^2} \, dx$

52. $\int_0^1 \frac{x^{3/2}}{3 - x^2} \, dx$

53. $\int_0^{\pi/2} \sqrt{x} \cos x \, dx$

54. $\int_0^{\pi} \sqrt{1 + \sin^2 x} \, dx$

Integration by Tables **In Exercises 55–62, use integration tables to find or evaluate the integral.**

55. $\int \frac{x}{(4 + 5x)^2} \, dx$

56. $\int \frac{x}{\sqrt{4 + 5x}} \, dx$

57. $\int_0^{\sqrt{\pi}/2} \frac{x}{1 + \sin x^2} \, dx$

58. $\int_0^1 \frac{x}{1 + e^{x^2}} \, dx$

59. $\int \frac{x}{x^2 + 4x + 8} \, dx$

60. $\int \frac{3}{2x\sqrt{9x^2 - 1}} \, dx, \quad x > \frac{1}{3}$

61. $\int \frac{1}{\sin \pi x \cos \pi x} \, dx$

62. $\int \frac{1}{1 + \tan \pi x} \, dx$

Finding an Indefinite Integral **In Exercises 63–70, find the indefinite integral using any method.**

63. $\int \theta \sin \theta \cos \theta \, d\theta$

64. $\int \frac{\csc \sqrt{2x}}{\sqrt{x}} \, dx$

65. $\int \frac{x^{1/4}}{1 + x^{1/2}} \, dx$

66. $\int \sqrt{1 + \sqrt{x}} \, dx$

67. $\int \sqrt{1 + \cos x} \, dx$

68. $\int \frac{3x^3 + 4x}{(x^2 + 1)^2} \, dx$

69. $\int \cos x \ln(\sin x) \, dx$

70. $\int (\sin \theta + \cos \theta)^2 \, d\theta$

Differential Equation **In Exercises 71–74, find the general solution of the differential equation using any method.**

71. $\frac{dy}{dx} = \frac{25}{x^2 - 25}$

72. $\frac{dy}{dx} = \frac{\sqrt{4 - x^2}}{2x}$

73. $y' = \ln(x^2 + x)$

74. $y' = \sqrt{1 - \cos \theta}$

Evaluating a Definite Integral **In Exercises 75–80, evaluate the definite integral using any method. Use a graphing utility to verify your result.**

75. $\int_2^{\sqrt{5}} x(x^2 - 4)^{3/2}\,dx$

76. $\int_0^1 \frac{x}{(x-2)(x-4)}\,dx$

77. $\int_1^4 \frac{\ln x}{x}\,dx$

78. $\int_0^2 xe^{3x}\,dx$

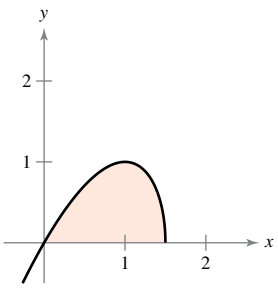
79. $\int_2^{\pi} (x^2 - 4)\sin x\,dx$

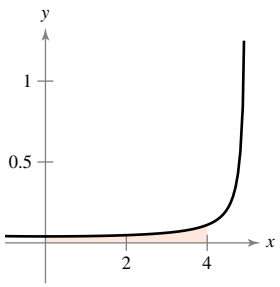
80. $\int_0^5 \frac{x}{\sqrt{4+x}}\,dx$

Area **In Exercises 81 and 82, find the area of the given region using any method.**

81. $y = x\sqrt{3 - 2x}$

82. $y = \frac{1}{25 - x^2}$





Centroid **In Exercises 83 and 84, find the centroid of the region bounded by the graphs of the equations using any method.**

83. $y = \sqrt{1 - x^2}, \quad y = 0$

84. $(x - 1)^2 + y^2 = 1, \quad (x - 4)^2 + y^2 = 4$

Evaluating an Improper Integral **In Exercises 85–92, determine whether the improper integral diverges or converges. Evaluate the integral if it converges.**

85. $\int_0^{16} \frac{1}{\sqrt[4]{x}}\,dx$

86. $\int_0^2 \frac{7}{x - 2}\,dx$

87. $\int_1^{\infty} x^2 \ln x\,dx$

88. $\int_0^{\infty} \frac{e^{-1/x}}{x^2}\,dx$

89. $\int_1^{\infty} \frac{\ln x}{x^2}\,dx$

90. $\int_1^{\infty} \frac{1}{\sqrt[4]{x}}\,dx$

91. $\int_2^{\infty} \frac{1}{x\sqrt{x^2 - 4}}\,dx$

92. $\int_0^{\infty} \frac{2}{\sqrt{x}(x + 4)}\,dx$

93. **Present Value** The board of directors of a corporation is calculating the price to pay for a business that is forecast to yield a continuous flow of profit of \$500,000 per year. The money will earn a nominal rate of 5% per year compounded continuously. The present value of the business for t_0 years is

$$\text{Present value} = \int_0^{t_0} 500{,}000e^{-0.05t}\,dt.$$

(a) Find the present value of the business for 20 years.

(b) Find the present value of the business in perpetuity (forever).

94. **Volume** Find the volume of the solid generated by revolving the region bounded by the graphs of $y \le xe^{-x}$, $y \ge 0$, and $x \ge 0$ about the x-axis.

95. **Probability** The average lengths (from beak to tail) of different species of warblers in the eastern United States are approximately normally distributed with a mean of 12.9 centimeters and a standard deviation of 0.95 centimeter. The probability that a randomly selected warbler has a length between a and b centimeters is

$$P(a \le x \le b) = \frac{1}{0.95\sqrt{2\pi}} \int_a^b e^{-(x-12.9)^2/1.805}\,dx.$$

Use a graphing utility to approximate the probability that a randomly selected warbler has a length of (a) 13 centimeters or greater and (b) 15 centimeters or greater. (*Source: Peterson's Field Guide: Eastern Birds*)

Building on Concepts

96. (a) Sketch the semicircle given by $y = \sqrt{4 - x^2}$.

(b) Explain why

$$\int_{-2}^{2} \frac{2}{\sqrt{4 - x^2}}\,dx = \int_{-2}^{2} \sqrt{4 - x^2}\,dx$$

without evaluating either integral.

97. The **inner product** of two functions f and g on $[a, b]$ is given by

$$\langle f, g \rangle = \int_a^b f(x)g(x)\,dx.$$

Two distinct functions f and g are said to be **orthogonal** if $\langle f, g \rangle = 0$. Show that the set of functions below is orthogonal on $[-\pi, \pi]$.

$\{\sin x, \sin 2x, \sin 3x, \ldots, \cos x, \cos 2x, \cos 3x, \ldots\}$

98. The sum below is a *finite Fourier series*.

$$f(x) = \sum_{i=1}^{N} a_i \sin ix$$
$$= a_1 \sin x + a_2 \sin 2x + a_3 \sin 3x + \cdots + a_N \sin Nx$$

(a) Use Exercise 97 to show that the nth coefficient a_n is

$$a_n = \frac{1}{\pi}\int_{-\pi}^{\pi} f(x)\sin nx\,dx.$$

(b) Let $f(x) = x$. Find a_1, a_2, and a_3.

99. Consider the two integrals

$$\int \frac{e^x}{x}\,dx \quad \text{and} \quad \int \frac{1}{\ln x}\,dx.$$

Joseph Liouville proved that the first integral does not have an elementary antiderivative. Use this fact to prove that the second integral does not have an elementary antiderivative.

P.S. Problem Solving

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

1. Wallis's Formulas

(a) Evaluate the integrals

$$\int_{-1}^{1} (1 - x^2)\,dx \quad \text{and} \quad \int_{-1}^{1} (1 - x^2)^2\,dx.$$

(b) Use Wallis's Formulas to prove that

$$\int_{-1}^{1} (1 - x^2)^n\,dx = \frac{2^{2n+1}(n!)^2}{(2n + 1)!}$$

for all positive integers n.

2. Proof

(a) Evaluate the integrals

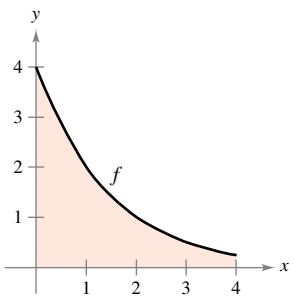
$$\int_{0}^{1} \ln x\,dx \quad \text{and} \quad \int_{0}^{1} (\ln x)^2\,dx.$$

(b) Prove that

$$\int_{0}^{1} (\ln x)^n\,dx = (-1)^n\,n!$$

for all positive integers n.

3. Comparing Methods Let $I = \int_0^4 f(x)\,dx$, where f is shown in the figure. Let $L(n)$ and $R(n)$ represent the Riemann sums using the left-hand endpoints and right-hand endpoints of n subintervals of equal width. (Assume n is even.) Let $T(n)$ and $S(n)$ be the corresponding values of the Trapezoidal Rule and Simpson's Rule.



(a) For any n, list $L(n)$, $R(n)$, $T(n)$, and I in increasing order.

(b) Approximate $S(4)$.

4. Area Consider the problem of finding the area of the region bounded by the x-axis, the line $x = 4$, and the curve

$$y = \frac{x^2}{(x^2 + 9)^{3/2}}.$$

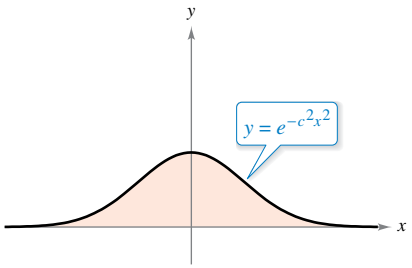
(a) Use a graphing utility to graph the region and approximate its area.

(b) Use an appropriate trigonometric substitution to find the exact area.

(c) Use the substitution $x = 3 \sinh u$ to find the exact area and verify that you obtain the same answer as in part (b).

5. Centroid Find the centroid of the region bounded by the x-axis and the curve $y = e^{-c^2x^2}$, where c is a positive constant (see figure).

$$\left(\textit{Hint: Show that } \int_0^\infty e^{-c^2x^2}\,dx = \frac{1}{c}\int_0^\infty e^{-x^2}\,dx.\right)$$



6. Proof Prove the following generalization of the Mean Value Theorem. If f is twice differentiable on the closed interval $[a, b]$, then

$$f(b) - f(a) = f'(a)(b - a) - \int_a^b f''(t)(t - b)\,dt.$$

7. Partial Fraction Decomposition Suppose the denominator of a rational function can be factored into distinct linear factors

$$D(x) = (x - c_1)(x - c_2) \cdot \cdot \cdot (x - c_n)$$

for a positive integer n and distinct real numbers c_1, $c_2, \ldots, c_n$. If N is a polynomial of degree less than n, show that

$$\frac{N(x)}{D(x)} = \frac{P_1}{x - c_1} + \frac{P_2}{x - c_2} + \cdots + \frac{P_n}{x - c_n}$$

where $P_k = N(c_k)/D'(c_k)$ for $k = 1, 2, \ldots, n$. Note that this is the partial fraction decomposition of $N(x)/D(x)$.

8. Partial Fraction Decomposition Use the result of Exercise 7 to find the partial fraction decomposition of

$$\frac{x^3 - 3x^2 + 1}{x^4 - 13x^2 + 12x}.$$

9. Rocket The velocity v (in feet per second) of a rocket whose initial mass (including fuel) is m is given by

$$v = -gt + u \ln \frac{m}{m - rt}, \quad t < \frac{m}{r}$$

where u is the expulsion speed of the fuel, r is the rate at which the fuel is consumed, and $g = 32$ feet per second per second is the acceleration due to gravity. Find the position equation for a rocket for which $m = 50{,}000$ pounds, $u = 12{,}000$ feet per second, and $r = 400$ pounds per second. What is the height of the rocket when $t = 100$ seconds? (Assume that the rocket was fired from ground level and is moving straight upward.)

9.1 Sequences

GO DIGITAL

- Write the terms of a sequence.
- Use a limit to determine whether a sequence converges or diverges.
- Find a pattern and write a formula for the *n*th term of a sequence.
- Use properties of monotonic sequences and bounded sequences.

Exploration

Finding Patterns Describe a pattern for each of the sequences listed below. Then use your description to write a formula for the nth term of each sequence. As n increases, do the terms appear to be approaching a limit? Explain your reasoning.

a. $1, \frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \frac{1}{16}, \ldots$

b. $1, \frac{1}{2}, \frac{1}{6}, \frac{1}{24}, \frac{1}{120}, \ldots$

c. $10, \frac{10}{3}, \frac{10}{6}, \frac{10}{10}, \frac{10}{15}, \ldots$

d. $\frac{1}{4}, \frac{4}{9}, \frac{9}{16}, \frac{16}{25}, \frac{25}{36}, \ldots$

e. $\frac{3}{7}, \frac{5}{10}, \frac{7}{13}, \frac{9}{16}, \frac{11}{19}, \ldots$

Sequences

In mathematics, the word "sequence" is used in much the same way as it is in ordinary English. Saying that a collection of objects or events is *in sequence* usually means that the collection is ordered in such a way that it has an identified first member, second member, third member, and so on.

Mathematically, a **sequence** is defined as a function whose domain is the set of positive integers. Although a sequence is a function, it is common to represent sequences by subscript notation rather than by the standard function notation. For instance, in the sequence

$$\begin{array}{ccccccccc} 1, & 2, & 3, & 4, & \ldots, & n, & \ldots & & \text{Sequence} \\ \downarrow & \downarrow & \downarrow & \downarrow & \downarrow & \downarrow & \downarrow & & \\ a_1, & a_2, & a_3, & a_4, & \ldots, & a_n, & \ldots & & \end{array}$$

1 is mapped onto a_1, 2 is mapped onto a_2, and so on. The numbers

$$a_1, a_2, a_3, \ldots, a_n, \ldots$$

are the **terms** of the sequence. The number a_n is the ***n*th term** of the sequence, and the entire sequence is denoted by $\{a_n\}$. Occasionally, it is convenient to begin a sequence with a_0 so that the terms of the sequence become $a_0, a_1, a_2, a_3, \ldots, a_n, \ldots$ and the domain is the set of nonnegative integers.

EXAMPLE 1 Writing the Terms of a Sequence

a. The terms of the sequence $\{a_n\} = \{3 + (-1)^n\}$ are

$$\begin{array}{cccccc} 3 + (-1)^1, & 3 + (-1)^2, & 3 + (-1)^3, & 3 + (-1)^4, & \ldots \\ 2, & 4, & 2, & 4, & \ldots \end{array}$$

b. The terms of the sequence $\{b_n\} = \left\{\frac{n}{1 - 2n}\right\}$ are

$$\begin{array}{cccccc} \frac{1}{1 - 2 \cdot 1}, & \frac{2}{1 - 2 \cdot 2}, & \frac{3}{1 - 2 \cdot 3}, & \frac{4}{1 - 2 \cdot 4}, & \ldots \\ -1, & -\frac{2}{3}, & -\frac{3}{5}, & -\frac{4}{7}, & \ldots \end{array}$$

c. The terms of the sequence $\{c_n\} = \left\{\frac{n^2}{2^n - 1}\right\}$ are

$$\begin{array}{cccccc} \frac{1^2}{2^1 - 1}, & \frac{2^2}{2^2 - 1}, & \frac{3^2}{2^3 - 1}, & \frac{4^2}{2^4 - 1}, & \ldots \\ \frac{1}{1}, & \frac{4}{3}, & \frac{9}{7}, & \frac{16}{15}, & \ldots \end{array}$$

d. The terms of the **recursively defined** sequence $\{d_n\}$, where $d_1 = 25$ and $d_{n+1} = d_n - 5$, are

$$25, \quad 25 - 5 = 20, \quad 20 - 5 = 15, \quad 15 - 5 = 10, \ldots$$

REMARK Some sequences are defined recursively. To define a sequence recursively, you need to be given one or more of the first few terms. All other terms of the sequence are then defined using previous terms, as shown in Example 1(d).

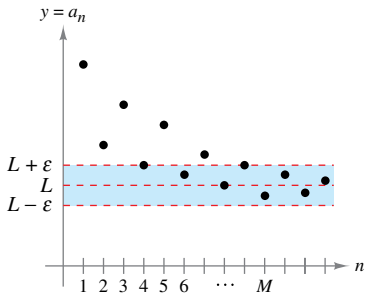
Limit of a Sequence

The primary focus of this chapter concerns sequences whose terms approach limiting values. Such sequences are said to **converge**. For instance, the sequence $\{1/2^n\}$

$$\frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \frac{1}{16}, \frac{1}{32}, \ldots$$

converges to 0, as indicated in the next definition.



For $n > M$, the terms of the sequence all lie within ε units of L.
Figure 9.1

Definition of the Limit of a Sequence

Let L be a real number. The **limit** of a sequence $\{a_n\}$ is L, written as

$$\lim_{n\to\infty} a_n = L$$

if for each $\varepsilon > 0$, there exists $M > 0$ such that $|a_n - L| < \varepsilon$ whenever $n > M$. If the limit L of a sequence exists, then the sequence **converges** to L. If the limit of a sequence does not exist, then the sequence **diverges.**

Graphically, this definition says that eventually (for $n > M$ and $\varepsilon > 0$), the terms of a sequence that converges to L will lie within the band between the lines $y = L + \varepsilon$ and $y = L - \varepsilon$, as shown in Figure 9.1.

If a sequence $\{a_n\}$ agrees with a function f at every positive integer, and if $f(x)$ approaches a limit L as $x \to \infty$, then the sequence must converge to the same limit L.

REMARK The converse of Theorem 9.1 is not true (see Exercise 82).

THEOREM 9.1 Limit of a Sequence

Let L be a real number. Let f be a function of a real variable such that

$$\lim_{x\to\infty} f(x) = L.$$

If $\{a_n\}$ is a sequence such that $f(n) = a_n$ for every positive integer n, then

$$\lim_{n\to\infty} a_n = L.$$

EXAMPLE 2 Finding the Limit of a Sequence

Find the limit of the sequence whose nth term is $a_n = \left(1 + \frac{1}{n}\right)^n$.

Solution In Example 5, Section 5.6, you learned that

$$\lim_{x\to\infty} \left(1 + \frac{1}{x}\right)^x = e.$$

So, you can apply Theorem 9.1 to conclude that

$$\lim_{n\to\infty} a_n = \lim_{n\to\infty} \left(1 + \frac{1}{n}\right)^n = e.$$

There are different ways in which a sequence can fail to have a limit. One way is that the terms of the sequence increase without bound or decrease without bound. These cases are written symbolically, as shown below.

Terms increase without bound: $\lim_{n\to\infty} a_n = \infty$

Terms decrease without bound: $\lim_{n\to\infty} a_n = -\infty$

GO DIGITAL

The properties of limits of sequences listed in the next theorem parallel those given for limits of functions of a real variable in Section 1.3.

THEOREM 9.2 Properties of Limits of Sequences

Let $\lim_{n\to\infty} a_n = L$ and $\lim_{n\to\infty} b_n = K$.

1. Scalar multiple: $\lim_{n\to\infty} (ca_n) = cL$, c is any real number.
2. Sum or difference: $\lim_{n\to\infty} (a_n \pm b_n) = L \pm K$
3. Product: $\lim_{n\to\infty} (a_n b_n) = LK$
4. Quotient: $\lim_{n\to\infty} \frac{a_n}{b_n} = \frac{L}{K}$, $b_n \neq 0$ and $K \neq 0$

Big Ideas of Calculus

To a great extent, mathematics is the study of patterns. In no other branch of mathematics is this more evident than in the study of sequences and series. The study of infinite sequences and series has been a part of calculus from its inception. The representation of a function by an infinite series was part of Newton's early development of calculus. For example, a series representation of $\ln x$ is

$$\sum_{n=0}^{\infty} (-1)^n \frac{(x-1)^{n+1}}{n+1}.$$

Today, sequences and series continue to be a vital part of mathematics. In fact, with computers, sequences and series have become even more useful. For example, in computing, a string is a finite sequence of characters from a finite set (such as an alphabet).

EXAMPLE 3 Determining Convergence or Divergence

See LarsonCalculus.com for an interactive version of this type of example.

a. Because the sequence $\{a_n\} = \{3 + (-1)^n\}$ has terms

$$2, 4, 2, 4, \ldots$$ See Example 1(a).

that alternate between 2 and 4, the limit

$$\lim_{n\to\infty} a_n$$

does not exist. So, the sequence diverges.

b. For $\{b_n\} = \left\{\frac{n}{1-2n}\right\}$, divide the numerator and denominator by n to obtain

$$\lim_{n\to\infty} \frac{n}{1-2n} = \lim_{n\to\infty} \frac{1}{(1/n)-2} = -\frac{1}{2}$$ See Example 1(b).

which implies that the sequence converges to $-\frac{1}{2}$.

EXAMPLE 4 Using L'Hôpital's Rule to Determine Convergence

Show that the sequence whose nth term is $a_n = \frac{n^2}{2^n - 1}$ converges.

Solution Consider the function of a real variable

$$f(x) = \frac{x^2}{2^x - 1}.$$

Applying L'Hôpital's Rule twice produces

$$\lim_{x\to\infty} \frac{x^2}{2^x - 1} = \lim_{x\to\infty} \frac{2x}{(\ln 2)2^x} = \lim_{x\to\infty} \frac{2}{(\ln 2)^2 2^x} = 0.$$

Because $f(n) = a_n$ for every positive integer n, you can apply Theorem 9.1 to conclude that

$$\lim_{n\to\infty} \frac{n^2}{2^n - 1} = 0.$$ See Example 1(c).

So, the sequence converges to 0. ■

TECHNOLOGY

Use a graphing utility to graph the function in Example 4. Notice that as x approaches infinity, the value of the function gets closer and closer to 0. If you have access to a graphing utility that can generate terms of a sequence, use it to calculate the first 20 terms of the sequence in Example 4. Then view the terms to observe numerically that the sequence converges to 0.

GO DIGITAL

The symbol $n!$ (read "n factorial") is used to simplify some of the formulas developed in this chapter. Let n be a positive integer; then ***n* factorial** is defined as

$$n! = 1 \cdot 2 \cdot 3 \cdot 4 \cdot \cdots \cdot (n-1) \cdot n.$$

As a special case, **zero factorial** is defined as $0! = 1$. From this definition, you can conclude that $1! = 1$, $2! = 1 \cdot 2 = 2$, $3! = 1 \cdot 2 \cdot 3 = 6$, and so on. Factorials follow the same conventions for order of operations as exponents. That is, just as $2x^3$ and $(2x)^3$ imply different orders of operations, $2n!$ and $(2n)!$ imply the orders

$$2n! = 2(n!) = 2(1 \cdot 2 \cdot 3 \cdot 4 \cdot \cdots \cdot n)$$

and

$$(2n)! = 1 \cdot 2 \cdot 3 \cdot 4 \cdot \cdots \cdot n \cdot (n+1) \cdot \cdots \cdot 2n$$

respectively.

Another useful limit theorem that can be rewritten for sequences is the Squeeze Theorem from Section 1.3.

THEOREM 9.3 Squeeze Theorem for Sequences

If $\lim_{n\to\infty} a_n = L = \lim_{n\to\infty} b_n$ and there exists an integer N such that $a_n \le c_n \le b_n$ for all $n > N$, then $\lim_{n\to\infty} c_n = L$.

EXAMPLE 5 Using the Squeeze Theorem

Show that the sequence $\{c_n\} = \left\{(-1)^n \frac{1}{n!}\right\}$ converges, and find its limit.

Solution To apply the Squeeze Theorem, you must find two convergent sequences that can be related to $\{c_n\}$. Two possibilities are $a_n = -1/2^n$ and $b_n = 1/2^n$, both of which converge to 0. By comparing the term $n!$ with 2^n, you can see that

$$n! = 1 \cdot 2 \cdot 3 \cdot 4 \cdot 5 \cdot 6 \cdot \cdots \cdot n = 24 \cdot \underbrace{5 \cdot 6 \cdot \cdots \cdot n}_{n-4 \text{ factors}} \qquad (n \ge 4)$$

and

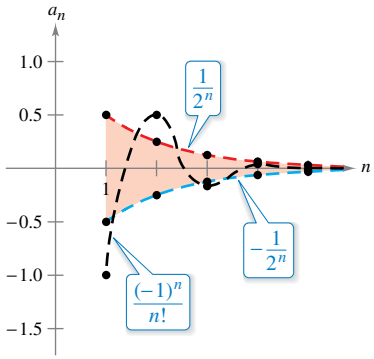
$$2^n = 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 \cdot \cdots \cdot 2 = 16 \cdot \underbrace{2 \cdot 2 \cdot \cdots \cdot 2}_{n-4 \text{ factors}}. \qquad (n \ge 4)$$

For $n \ge 4$, this implies that $2^n < n!$, and you have

$$\frac{-1}{2^n} \le (-1)^n \frac{1}{n!} \le \frac{1}{2^n}, \quad n \ge 4$$

as shown in Figure 9.2. So, by the Squeeze Theorem, it follows that

$$\lim_{n\to\infty} (-1)^n \frac{1}{n!} = 0.$$



For $n \ge 4$, $(-1)^n/n!$ is squeezed between $-1/2^n$ and $1/2^n$.

Figure 9.2

Example 5 suggests something about the rate at which $n!$ increases as $n \to \infty$. As Figure 9.2 suggests, both $1/2^n$ and $1/n!$ approach 0 as $n \to \infty$. Yet $1/n!$ approaches 0 so much faster than $1/2^n$ does that

$$\lim_{n\to\infty} \frac{1/n!}{1/2^n} = \lim_{n\to\infty} \frac{2^n}{n!} = 0.$$

In fact, it can be shown that for any fixed number k, $\lim_{n\to\infty} (k^n/n!) = 0$. This means that *the factorial function grows faster than any exponential function.*

GO DIGITAL

In Example 5, the sequence $\{c_n\}$ has both positive and negative terms. For this sequence, it happens that the sequence of absolute values, $\{|c_n|\}$, also converges to 0. You can show this by the Squeeze Theorem using the inequality

$$0 \le \frac{1}{n!} \le \frac{1}{2^n}, \quad n \ge 4.$$

In such cases, it is often convenient to consider the sequence of absolute values and then apply Theorem 9.4, which states that if the absolute value sequence converges to 0, then the original signed sequence also converges to 0.

THEOREM 9.4 Absolute Value Theorem

For the sequence $\{a_n\}$, if

$$\lim_{n\to\infty} |a_n| = 0 \quad \text{then} \quad \lim_{n\to\infty} a_n = 0.$$

Proof Consider the two sequences $\{|a_n|\}$ and $\{-|a_n|\}$. Because both of these sequences converge to 0 and

$$-|a_n| \le a_n \le |a_n|$$

you can use the Squeeze Theorem to conclude that $\{a_n\}$ converges to 0. ∎

Pattern Recognition for Sequences

Sometimes the terms of a sequence are generated by some rule that does not explicitly identify the nth term of the sequence. In such cases, you may be required to discover a *pattern* in the sequence and to describe the nth term. Once the nth term has been specified, you can investigate the convergence or divergence of the sequence.

EXAMPLE 6 Finding the *n*th Term of a Sequence

Find a sequence $\{a_n\}$ whose first five terms are

$$\frac{1}{2}, \frac{3}{4}, \frac{5}{8}, \frac{7}{16}, \frac{9}{32}, \ldots$$

and then determine whether the sequence converges or diverges.

Solution First, note that the numerators form the sequence of positive odd integers, and the denominators are successive powers of 2. Comparing a_n with n produces the pattern below.

$$\frac{1}{2^1}, \frac{3}{2^2}, \frac{5}{2^3}, \frac{7}{2^4}, \frac{9}{2^5}, \ldots, \frac{2n-1}{2^n}, \ldots$$

Consider the function of a real variable $f(x) = (2x - 1)/2^x$. Applying L'Hôpital's Rule produces

$$\lim_{x\to\infty} \frac{2x-1}{2^x} = \lim_{x\to\infty} \frac{2}{2^x(\ln x)} = 0.$$

Next, apply Theorem 9.1 to conclude that

$$\lim_{n\to\infty} \frac{2n-1}{2^n} = 0.$$

So, the sequence $a_n = (2n - 1)/2^n$ converges to 0. ∎

GO DIGITAL

Without a specific rule for generating the terms of a sequence or some knowledge of the context in which the terms of the sequence are obtained, it is not possible to determine the convergence or divergence of the sequence merely from its first several terms. For instance, although the first three terms of the four sequences shown below are identical, the first two sequences converge to 0, the third sequence converges to $\frac{1}{9}$, and the fourth sequence diverges.

$$\{a_n\}: \frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \frac{1}{16}, \ldots, \frac{1}{2n}, \ldots$$

$$\{b_n\}: \frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \frac{1}{15}, \ldots, \frac{6}{(n+1)(n^2-n+6)}, \ldots$$

$$\{c_n\}: \frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \frac{7}{62}, \ldots, \frac{n^2-3n+3}{9n^2-25n+18}, \ldots$$

$$\{d_n\}: \frac{1}{2}, \frac{1}{4}, \frac{1}{8}, 0, \ldots, \frac{-n(n+1)(n-4)}{6(n^2+3n-2)}, \ldots$$

The process of determining an nth term from the pattern observed in the first several terms of a sequence is an example of *inductive reasoning*.

EXAMPLE 7 Finding the nth Term of a Sequence

Determine the nth term for a sequence whose first five terms are

$$-\frac{2}{1}, \frac{8}{2}, -\frac{26}{6}, \frac{80}{24}, -\frac{242}{120}, \ldots$$

and then decide whether the sequence converges or diverges.

Solution Note that the numerators are 1 less than 3^n.

$$3^1 - 1 = 2 \quad 3^2 - 1 = 8 \quad 3^3 - 1 = 26 \quad 3^4 - 1 = 80 \quad 3^5 - 1 = 242$$

So, you can reason that the numerators are given by the rule

$$3^n - 1.$$

Factoring the denominators produces

$$1 = 1 \qquad \text{Factor denominator of 1st term.}$$
$$2 = 1 \cdot 2 \qquad \text{Factor denominator of 2nd term.}$$
$$6 = 1 \cdot 2 \cdot 3 \qquad \text{Factor denominator of 3rd term.}$$
$$24 = 1 \cdot 2 \cdot 3 \cdot 4 \qquad \text{Factor denominator of 4th term.}$$

and

$$120 = 1 \cdot 2 \cdot 3 \cdot 4 \cdot 5. \qquad \text{Factor denominator of 5th term.}$$

This suggests that the denominators are represented by $n!$. Finally, because the signs alternate, you can write the nth term as

$$a_n = (-1)^n \left(\frac{3^n - 1}{n!} \right). \qquad n\text{th term}$$

From the discussion about the growth of $n!$ after Example 5 on page 591, it follows that

$$\lim_{n \to \infty} |a_n| = \lim_{n \to \infty} \frac{3^n - 1}{n!} = 0.$$

Applying Theorem 9.4, you can conclude that

$$\lim_{n \to \infty} a_n = 0.$$

So, the sequence $\{a_n\}$ converges to 0. ■

Monotonic Sequences and Bounded Sequences

So far, you have determined the convergence of a sequence by finding its limit. Even when you cannot determine the limit of a particular sequence, it still may be useful to know whether the sequence converges. Theorem 9.5 (on the next page) provides a test for convergence of sequences without determining the limit. First, some preliminary definitions are given.

Definition of Monotonic Sequence

A sequence $\{a_n\}$ is **monotonic** when its terms are nondecreasing

$$a_1 \leq a_2 \leq a_3 \leq \cdots \leq a_n \leq \cdots$$

or when its terms are nonincreasing

$$a_1 \geq a_2 \geq a_3 \geq \cdots \geq a_n \geq \cdots.$$

EXAMPLE 8 Determining Whether a Sequence Is Monotonic

Determine whether each sequence having the given nth term is monotonic.

a. $a_n = 3 + (-1)^n$ **b.** $b_n = \dfrac{2n}{1+n}$ **c.** $c_n = \dfrac{n^2}{2^n - 1}$

Solution

a. This sequence alternates between 2 and 4. So, the sequence is not monotonic. [See Figure 9.3(a).]

b. This sequence is monotonic because each successive term is greater than its predecessor. To see this, compare the terms b_n and b_{n+1}. [Note that, because n is positive, you can multiply each side of the inequality by $(1 + n)$ and $(2 + n)$ without reversing the inequality sign.]

$$b_n = \frac{2n}{1+n} \overset{?}{<} \frac{2(n+1)}{1+(n+1)} = b_{n+1} \qquad \text{Write inequality relating } b_n \text{ and } b_{n+1}.$$

$$2n(2+n) \overset{?}{<} (1+n)(2n+2) \qquad \text{Multiply each side by } (1+n)(2+n).$$

$$4n + 2n^2 \overset{?}{<} 2 + 4n + 2n^2 \qquad \text{Expand each side.}$$

$$0 < 2 \qquad \text{Subtract } (4n + 2n^2) \text{ from each side.}$$

Starting with the final inequality, which is valid, you can reverse the steps to conclude that the original inequality is also valid. [See Figure 9.3(b).]

c. This sequence is not monotonic because the second term is greater than the first and third terms. [See Figure 9.3(c).]

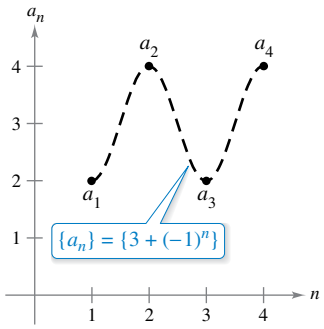
$$c_2 = \frac{4}{3} > 1 = c_1 \quad \text{and} \quad c_2 = \frac{4}{3} > \frac{9}{7} = c_3 \qquad c_2 > c_1 \text{ and } c_2 > c_3$$

(Note that when you drop the first term, the remaining sequence $c_2, c_3, c_4, \ldots$ is monotonic.)

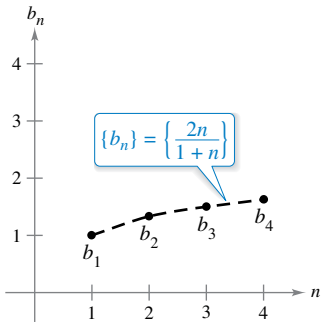
In Example 8(b), another way to show that the sequence is monotonic is to note that the derivative of the corresponding differentiable function

$$f(x) = \frac{2x}{1+x}$$

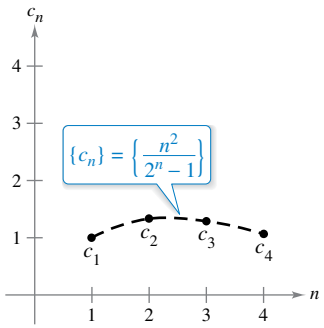
is positive for all x. This implies that f is increasing, which in turn implies that $\{b_n\}$ is increasing.



(a) Not monotonic



(b) Monotonic



(c) Not monotonic

Definition of Bounded Sequence

1. A sequence $\{a_n\}$ is **bounded above** when there is a real number M such that $a_n \leq M$ for all n. The number M is called an **upper bound** of the sequence.
2. A sequence $\{a_n\}$ is **bounded below** when there is a real number N such that $N \leq a_n$ for all n. The number N is called a **lower bound** of the sequence.
3. A sequence $\{a_n\}$ is **bounded** when it is bounded above and bounded below.

Note that all three sequences in Example 8 (and shown in Figure 9.3) are bounded. To see this, note that

$$2 \leq a_n \leq 4, \quad 1 \leq b_n \leq 2, \quad \text{and} \quad 0 \leq c_n \leq \frac{4}{3}.$$

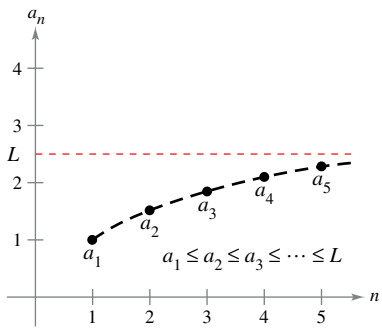
One important property of the real numbers is that they are **complete.** Informally, this means that there are no holes or gaps on the real number line. (The set of rational numbers does not have the completeness property.) The completeness axiom for real numbers can be used to conclude that if a sequence has an upper bound, then it must have a **least upper bound** (an upper bound that is less than all other upper bounds for the sequence). For example, the least upper bound of the sequence $\{a_n\} = \{n/(n+1)\}$,

$$\frac{1}{2}, \frac{2}{3}, \frac{3}{4}, \frac{4}{5}, \ldots, \frac{n}{n+1}, \ldots$$

is 1. The completeness axiom is used in the proof of Theorem 9.5.

THEOREM 9.5 Bounded Monotonic Sequences

If a sequence $\{a_n\}$ is bounded and monotonic, then it converges.



Every bounded, nondecreasing sequence converges.
Figure 9.4

Proof Assume that the sequence is nondecreasing, as shown in Figure 9.4. For simplicity, also assume that each term in the sequence is positive. Because the sequence is bounded, there must exist an upper bound M such that

$$a_1 \leq a_2 \leq a_3 \leq \cdots \leq a_n \leq \cdots \leq M.$$

From the completeness axiom, it follows that there is a least upper bound L such that

$$a_1 \leq a_2 \leq a_3 \leq \cdots \leq a_n \leq \cdots \leq L.$$

For $\varepsilon > 0$, it follows that $L - \varepsilon < L$, and so $L - \varepsilon$ cannot be an upper bound for the sequence. Consequently, at least one term of $\{a_n\}$ is greater than $L - \varepsilon$. That is, $L - \varepsilon < a_N$ for some positive integer N. Because the terms of $\{a_n\}$ are nondecreasing, it follows that $a_N \leq a_n$ for $n > N$. You now know that $L - \varepsilon < a_N \leq a_n \leq L < L + \varepsilon$, for every $n > N$. It follows that $|a_n - L| < \varepsilon$ for $n > N$, which by definition means that $\{a_n\}$ converges to L. The proof for a nonincreasing sequence is similar (see Exercise 89). ■

EXAMPLE 9 Bounded and Monotonic Sequences

a. The sequence $\{a_n\} = \{1/n\}$ is both bounded and monotonic. So, by Theorem 9.5, it must converge.

b. The divergent sequence $\{b_n\} = \{n^2/(n+1)\}$ is monotonic but not bounded. (It is bounded below.)

c. The divergent sequence $\{c_n\} = \{(-1)^n\}$ is bounded but not monotonic. ■

9.1 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Explain what it means for a sequence to be defined recursively.
2. Find the value of L.
$\lim_{n\to\infty} a_n = L, \quad \lim_{n\to\infty} b_n = 8, \quad \text{and} \quad \lim_{n\to\infty} (a_n b_n) = 24$
3. Determine which function grows faster as n approaches infinity. Explain.
$f(n) = 7^n \qquad g(n) = (n-1)!$
4. A sequence $\{a_n\}$ is bounded below and nonincreasing. Does $\{a_n\}$ converge or diverge? Use a graph to support your conclusion.

Writing the Terms of a Sequence In Exercises 5–10, write the first five terms of the sequence with the given nth term.

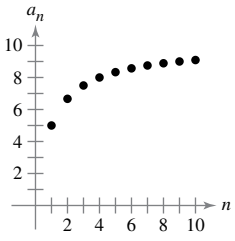
5. $a_n = 3^n$
6. $a_n = \left(-\frac{2}{5}\right)^n$
7. $a_n = \sin\frac{n\pi}{2}$
8. $a_n = \frac{3n}{n+4}$
9. $a_n = (-1)^{n+1}\left(\frac{2}{n}\right)$
10. $a_n = 2 + \frac{2}{n} - \frac{1}{n^2}$

Writing the Terms of a Sequence In Exercises 11 and 12, write the first five terms of the recursively defined sequence.

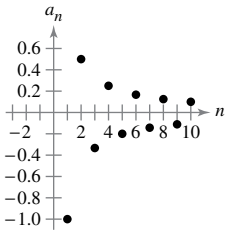
11. $a_1 = 3, a_{k+1} = 2(a_k - 1)$
12. $a_1 = 6, a_{k+1} = \frac{1}{3}a_k^2$

Matching In Exercises 13–16, match the sequence with the given nth term with its graph. [The graphs are labeled (a), (b), (c), and (d).]

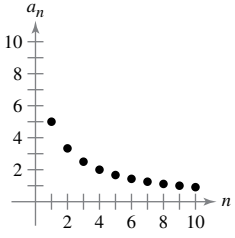
(a)



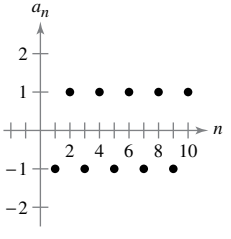
(b)



(c)



(d)



13. $a_n = \frac{10}{n+1}$
14. $a_n = \frac{10n}{n+1}$
15. $a_n = (-1)^n$
16. $a_n = \frac{(-1)^n}{n}$

Simplifying Factorials In Exercises 17–20, simplify the ratio of factorials.

17. $\frac{(n+1)!}{(n-1)!}$
18. $\frac{(3n+1)!}{(3n)!}$
19. $\frac{n!}{(n-3)!}$
20. $\frac{(4n+1)!}{(4n+3)!}$

Finding the Limit of a Sequence In Exercises 21–24, find the limit of the sequence with the given nth term.

21. $a_n = \frac{n+1}{n}$
22. $a_n = 6 + \frac{2}{n^2}$
23. $a_n = \frac{2n}{\sqrt{n^2+1}}$
24. $a_n = \cos\frac{2}{n}$

Finding the Limit of a Sequence In Exercises 25–28, use a graphing utility to graph the first 10 terms of the sequence with the given nth term. Use the graph to make an inference about the convergence or divergence of the sequence. Verify your inference analytically and, if the sequence converges, find its limit.

25. $a_n = \frac{4n+1}{n}$
26. $a_n = \frac{1}{n^{3/2}}$
27. $a_n = \sin\frac{n\pi}{2}$
28. $a_n = 2 - \frac{1}{4^n}$

Determining Convergence or Divergence In Exercises 29–44, determine the convergence or divergence of the sequence with the given nth term. If the sequence converges, find its limit.

29. $a_n = \frac{5}{n+2}$
30. $a_n = n - \frac{1}{n!}$
31. $a_n = (-1)^n\left(\frac{n}{n+1}\right)$
32. $a_n = \frac{1+(-1)^n}{n^2}$
33. $a_n = \frac{3n+\sqrt{n}}{4n}$
34. $a_n = \frac{\sqrt[3]{n}}{\sqrt[3]{n}+1}$
35. $a_n = \frac{\ln(n^3)}{2n}$
36. $a_n = \frac{e^n}{4^n}$
37. $a_n = \frac{(n+1)!}{n!}$
38. $a_n = \frac{(n-2)!}{n!}$
39. $a_n = \frac{n^p}{e^n}, \; p > 0$
40. $a_n = n\sin\frac{1}{n}$
41. $a_n = 2^{1/n}$
42. $a_n = -3^{-n}$
43. $a_n = \frac{\sin n}{n}$
44. $a_n = \frac{\cos 2n}{3^n}$

Finding the nth Term of a Sequence In Exercises 45–52, find the nth term, a_n, of the sequence and then determine whether the sequence you have chosen converges or diverges. (There is more than one correct answer.)

45. $2, 8, 14, 20, \ldots$
46. $1, \frac{1}{2}, \frac{1}{6}, \frac{1}{24}, \frac{1}{120}, \ldots$
47. $-2, 1, 6, 13, 22, \ldots$
48. $1, -\frac{1}{4}, \frac{1}{9}, -\frac{1}{16}, \ldots$
49. $\frac{2}{3}, \frac{3}{4}, \frac{4}{5}, \frac{5}{6}, \ldots$

50. 2, 24, 720, 40,320, 3,628,800, . . .

51. $2, 1 + \frac{1}{2}, 1 + \frac{1}{3}, 1 + \frac{1}{4}, 1 + \frac{1}{5}, \ldots$

52. $\frac{1}{2 \cdot 3}, \frac{2}{3 \cdot 4}, \frac{3}{4 \cdot 5}, \frac{4}{5 \cdot 6}, \ldots$

Monotonic and Bounded Sequences **In Exercises 53–60, determine whether the sequence with the given *n*th term is monotonic and whether it is bounded. Use a graphing utility to confirm your results.**

53. $a_n = 4 - \frac{1}{n}$

54. $a_n = \frac{3n}{n + 2}$

55. $a_n = ne^{-n/2}$

56. $a_n = \left(-\frac{2}{3}\right)^n$

57. $a_n = \left(\frac{2}{3}\right)^n$

58. $a_n = \left(\frac{3}{2}\right)^n$

59. $a_n = \sin\frac{n\pi}{6}$

60. $a_n = \frac{\cos n}{n}$

Using a Theorem **In Exercises 61–64, (a) use Theorem 9.5 to show that the sequence with the given *n*th term converges and (b) use a graphing utility to graph the first 10 terms of the sequence and find its limit.**

61. $a_n = 7 + \frac{1}{n}$

62. $a_n = 5 - \frac{2}{n}$

63. $a_n = \frac{1}{3}\left(1 - \frac{1}{3^n}\right)$

64. $a_n = 2 + \frac{1}{5^n}$

Exploring Concepts

65. Give an example of a sequence satisfying the condition.

(a) A monotonically increasing sequence that converges to 10

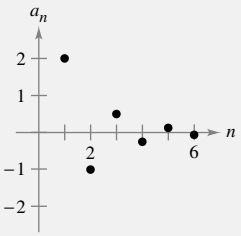
(b) A sequence that converges to $\frac{3}{4}$

66. Give an example of a bounded sequence that has a limit and an example of a bounded sequence that does not have a limit.

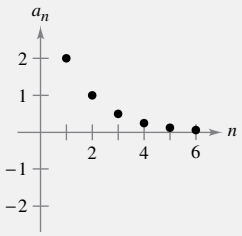
67. Let $\{a_n\}$ be a monotonic sequence such that $a_n \leq 1$. Discuss the convergence of $\{a_n\}$. When $\{a_n\}$ converges, what can you conclude about its limit?

68. **HOW DO YOU SEE IT?** The graphs of two sequences are shown in the figures. Which graph represents the sequence with alternating signs? Explain.

(a)



(b)



Lucky-photographer/Shutterstock.com

69. Compound Interest Consider the sequence $\{A_n\}$ whose *n*th term is given by

$$A_n = P\left(1 + \frac{r}{12}\right)^n$$

where P is the principal, A_n is the account balance after n months, and r is the interest rate compounded annually.

(a) Is $\{A_n\}$ a convergent sequence? Explain.

(b) Find the first 10 terms of the sequence when $P = \$10{,}000$ and $r = 0.055$.

70. Compound Interest A deposit of \$100 is made in an account at the beginning of each month at an annual interest rate of 3% compounded monthly. The balance in the account after n months is $A_n = 100(401)[(1.0025)^n - 1]$.

(a) Compute the first six terms of the sequence $\{A_n\}$.

(b) Find the balance in the account after 5 years by computing the 60th term of the sequence.

(c) Find the balance in the account after 20 years by computing the 240th term of the sequence.

71. Inflation When the rate of inflation is $4\frac{1}{2}\%$ per year and the average price of a car is currently \$25,000, the average price after n years is $P_n = \$25{,}000(1.045)^n$. Compute the average prices for the next 5 years.

72. Government Expenditures

A government program that currently costs taxpayers \$4.5 billion per year is cut back by 6% per year.

(a) Write an expression for the amount budgeted for this program after n years.

(b) Compute the budgets for the first 4 years.

(c) Determine the convergence or divergence of the sequence of reduced budgets. If the sequence converges, find its limit.

True or False? **In Exercises 73–76, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

73. Sequences that diverge approach either ∞ or $-\infty$.

74. If $\{a_n\}$ converges, then $\lim_{n\to\infty}(a_n - a_{n+1}) = 0$.

75. If $\{a_n\}$ converges, then $\{a_n/n\}$ converges to 0.

76. If $\{a_n\}$ diverges and $\{b_n\}$ diverges, then $\{a_n + b_n\}$ diverges.

77. Using a Sequence Compute the first six terms of the sequence $\{a_n\} = \{\sqrt[n]{n}\}$. If the sequence converges, find its limit.

78. Using a Sequence Compute the first six terms of the sequence

$$\{a_n\} = \left\{\sqrt{n}\ln\left(1 + \frac{1}{n}\right)\right\}.$$

If the sequence converges, find its limit.

79. Proof Prove that if $\{s_n\}$ converges to L and $L > 0$, then there exists a number N such that $s_n > 0$ for $n > N$.

80. Population

The populations a_n (in millions) of Zimbabwe from 2005 through 2020 are given below as ordered pairs of the form (n, a_n), where n represents the year, with $n = 5$ corresponding to 2005. *(Source: U.S. Census Bureau)*

(5, 12.3), (6, 12.3), (7, 12.4), (8, 12.5), (9, 12.6), (10, 12.7), (11, 12.8), (12, 13.0), (13, 13.1), (14, 13.3), (15, 13.4), (16, 13.6), (17, 13.8), (18, 14.0), (19, 14.3), (20, 14.5)

(a) Use the regression capabilities of a graphing utility to find a model of the form

$$a_n = bn^4 + cn^3 + dn^2 + en + f, \quad n = 5, 6, \ldots, 20$$

for the data. Use the graphing utility to plot the points and graph the model.

(b) Use the model to predict the population of Zimbabwe in 2025.

81. Fibonacci Sequence In a study of the progeny of rabbits, Fibonacci (ca. 1170–ca. 1240) encountered the sequence now bearing his name. The sequence is defined recursively as

$$a_{n+2} = a_n + a_{n+1}$$

where $a_1 = 1$ and $a_2 = 1$.

(a) Write the first 12 terms of the sequence.

(b) Write the first 10 terms of the sequence defined by

$$b_n = \frac{a_{n+1}}{a_n}, \quad n \geq 1.$$

(c) Using the definition in part (b), show that $b_n = 1 + \dfrac{1}{b_{n-1}}$.

(d) The **golden ratio** ρ can be defined by $\lim_{n\to\infty} b_n = \rho$. Show that $\rho = 1 + (1/\rho)$ and solve this equation for ρ.

82. Using a Theorem Show that the converse of Theorem 9.1 is not true. [*Hint:* Find a function $f(x)$ such that $f(n) = a_n$ converges, but $\lim_{x\to\infty} f(x)$ does not exist.]

83. Using a Sequence Consider the sequence

$$\sqrt{2}, \sqrt{2 + \sqrt{2}}, \sqrt{2 + \sqrt{2 + \sqrt{2}}}, \ldots$$

(a) Compute the first five terms of this sequence.

(b) Write a recursion formula for a_n, for $n \geq 2$.

(c) Find $\lim_{n\to\infty} a_n$.

84. Using a Sequence Consider the sequence $\{a_n\}$, where $a_1 = \sqrt{k}$, $a_{n+1} = \sqrt{k + a_n}$, and $k > 0$.

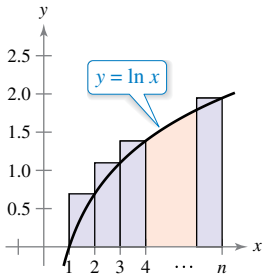
(a) Show that $\{a_n\}$ is increasing and bounded.

(b) Prove that $\lim_{n\to\infty} a_n$ exists.

(c) Find $\lim_{n\to\infty} a_n$.

85. Squeeze Theorem

(a) Show that $\int_1^n \ln x\, dx < \ln(n!)$ for $n \geq 2$.



(b) Draw a graph similar to the one above that shows

$$\ln(n!) < \int_1^{n+1} \ln x\, dx.$$

(c) Use the results of parts (a) and (b) to show that

$$\frac{n^n}{e^{n-1}} < n! < \frac{(n+1)^{n+1}}{e^n} \quad \text{for} \quad n > 1.$$

(d) Use the Squeeze Theorem for Sequences and the result of part (c) to show that

$$\lim_{n\to\infty} \left(\sqrt[n]{n!}/n\right) = 1/e.$$

(e) Test the result of part (d) for $n = 20$, 50, and 100.

86. Proof Prove, using the definition of the limit of a sequence, that

$$\lim_{n\to\infty} \frac{1}{n^3} = 0.$$

87. Proof Prove, using the definition of the limit of a sequence, that $\lim_{n\to\infty} r^n = 0$ for $-1 < r < 1$.

88. Zipper Theorem Prove the **Zipper Theorem.** That is, if

$$\lim_{n\to\infty} a_n = \lim_{n\to\infty} b_n = L$$

then the sequence

$$\{a_1, b_1, a_2, b_2, \ldots, a_n, b_n, \ldots\}$$

converges to L.

89. Proof Prove Theorem 9.5 for a nonincreasing sequence.

PUTNAM EXAM CHALLENGE

90. Let $\{x_n\}$, $n \geq 0$, be a sequence of nonzero real numbers such that $x_n^2 - x_{n-1}x_{n+1} = 1$ for $n = 1, 2, 3, \ldots$. Prove there exists a real number a such that $x_{n+1} = ax_n - x_{n-1}$ for all $n \geq 1$.

91. Let $T_0 = 2$, $T_1 = 3$, $T_2 = 6$, and for $n \geq 3$,

$$T_n = (n + 4)T_{n-1} - 4nT_{n-2} + (4n - 8)T_{n-3}.$$

The first few terms are

2, 3, 6, 14, 40, 152, 784, 5168, 40576.

Find, with proof, a formula for T_n of the form $T_n = A_n + B_n$, where $\{A_n\}$ and $\{B_n\}$ are well-known sequences.

9.2 Series and Convergence

GO DIGITAL

- **Determine the convergence or divergence of an infinite series.**
- **Determine the convergence or divergence of a geometric series.**
- **Use the *n*th-Term Test for Divergence of an infinite series.**

Infinite Series

One important application of infinite sequences is in representing "infinite summations." Informally, if $\{a_n\}$ is an infinite sequence, then

$$\sum_{n=1}^{\infty} a_n = a_1 + a_2 + a_3 + \cdots + a_n + \cdots$$ Infinite series

is an **infinite series** (or simply a **series**). The numbers a_1, a_2, a_3, and so on are the **terms** of the series. For some series, it is convenient to begin the index at $n = 0$ (or some other integer). Note that it is common to represent an infinite series as $\Sigma\, a_n$. In such cases, the starting value for the index must be taken from the context of the statement.

To find the sum of an infinite series, consider the **sequence of partial sums** listed below.

$S_1 = a_1$ 1st partial sum
$S_2 = a_1 + a_2$ 2nd partial sum
$S_3 = a_1 + a_2 + a_3$ 3rd partial sum
$S_4 = a_1 + a_2 + a_3 + a_4$ 4th partial sum
$S_5 = a_1 + a_2 + a_3 + a_4 + a_5$ 5th partial sum
$\vdots$
$S_n = a_1 + a_2 + a_3 + a_4 + a_5 + \cdots + a_n$ nth partial sum

If this sequence of partial sums converges, then the series is said to converge and has the sum indicated in the next definition.

REMARK As you study this chapter, it is important to distinguish between an infinite series and a sequence. A sequence is an ordered collection of numbers

$a_1, a_2, a_3, \ldots, a_n, \ldots$

whereas a series is an infinite sum of terms from a sequence

$a_1 + a_2 + a_3 + \cdots + a_n + \cdots$.

INFINITE SERIES

The study of infinite series was considered a novelty in the fourteenth century. Logician Richard Suiseth, whose nickname was Calculator, solved this problem.

If throughout the first half of a given time interval a variation continues at a certain intensity, throughout the next quarter of the interval at double the intensity, throughout the following eighth at triple the intensity and so ad infinitum, then the average intensity for the whole interval will be the intensity of the variation during the second subinterval (or double the intensity).

This is the same as saying that the sum of the infinite series

$$\frac{1}{2} + \frac{2}{4} + \frac{3}{8} + \cdots + \frac{n}{2^n} + \cdots$$

is 2.

Definitions of Convergent and Divergent Series

For the infinite series $\sum_{n=1}^{\infty} a_n$, the ***n*th partial sum** is

$$S_n = a_1 + a_2 + \cdots + a_n.$$

If the sequence of partial sums $\{S_n\}$ converges to S, then the series $\sum_{n=1}^{\infty} a_n$ **converges.** The limit S is called the **sum of the series.**

$$S = a_1 + a_2 + \cdots + a_n + \cdots \qquad S = \sum_{n=1}^{\infty} a_n$$

If $\{S_n\}$ diverges, then the series **diverges.**

As you study this chapter, you will learn that there are two basic questions involving infinite series.

- Does a series converge or does it diverge?
- When a series converges, what is its sum?

These questions are not always easy to answer, especially the second one.

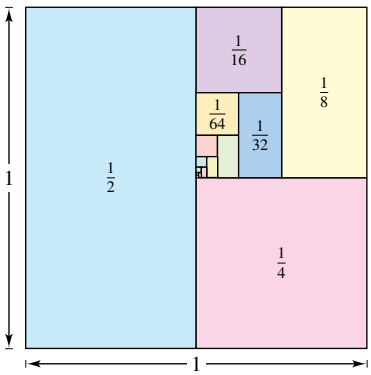
GO DIGITAL



You can determine the partial sums of the series in Example 1(a) geometrically using this figure.
Figure 9.5

EXAMPLE 1 Convergent and Divergent Series

a. The series

$$\sum_{n=1}^{\infty} \frac{1}{2^n} = \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \cdots$$

has the partial sums listed below.

$$S_1 = \frac{1}{2}$$ 1st partial sum

$$S_2 = \frac{1}{2} + \frac{1}{4} = \frac{3}{4}$$ 2nd partial sum

$$S_3 = \frac{1}{2} + \frac{1}{4} + \frac{1}{8} = \frac{7}{8}$$ 3rd partial sum

$$\vdots$$

$$S_n = \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \cdots + \frac{1}{2^n} = \frac{2^n - 1}{2^n}$$ nth partial sum

Because

$$\lim_{n\to\infty} \frac{2^n - 1}{2^n} = 1$$

it follows that the series converges and its sum is 1. (You can also determine the partial sums of the series geometrically, as shown in Figure 9.5.)

b. The nth partial sum of the series

$$\sum_{n=1}^{\infty} \left(\frac{1}{n} - \frac{1}{n+1}\right) = \left(1 - \frac{1}{2}\right) + \left(\frac{1}{2} - \frac{1}{3}\right) + \left(\frac{1}{3} - \frac{1}{4}\right) + \cdots$$

is

$$S_n = 1 - \frac{1}{n+1}.$$ nth partial sum

Because the limit of S_n is 1, the series converges and its sum is 1.

c. The series

$$\sum_{n=1}^{\infty} 1 = 1 + 1 + 1 + 1 + \cdots$$

diverges because $S_n = n$ and the sequence of partial sums diverges. ■

The series in Example 1(b) is a **telescoping series** of the form

$$(b_1 - b_2) + (b_2 - b_3) + (b_3 - b_4) + (b_4 - b_5) + \cdots.$$ Telescoping series

Note that b_2 is canceled by the second term, b_3 is canceled by the third term, and so on. Because the nth partial sum of this series is

$$S_n = b_1 - b_{n+1}$$

it follows that a telescoping series will converge if and only if b_n approaches a finite number as $n \to \infty$. Moreover, if the series converges, then its sum is

$$S = b_1 - \lim_{n\to\infty} b_{n+1}.$$

FOR FURTHER INFORMATION
To learn more about the partial sums of infinite series, see the article "Six Ways to Sum a Series" by Dan Kalman in *The College Mathematics Journal*. To view this article, go to *MathArticles.com*.

GO DIGITAL

EXAMPLE 2 **Writing a Series in Telescoping Form**

Find the sum of the series $\sum_{n=1}^{\infty} \frac{2}{4n^2 - 1}$.

Solution

Using partial fractions, you can write

$$a_n = \frac{2}{4n^2 - 1} = \frac{2}{(2n - 1)(2n + 1)} = \frac{1}{2n - 1} - \frac{1}{2n + 1}.$$

From this telescoping form, you can determine that the nth partial sum is

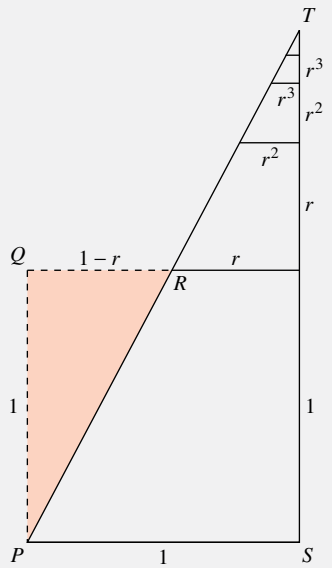
$$S_n = \left(\frac{1}{1} - \frac{1}{3}\right) + \left(\frac{1}{3} - \frac{1}{5}\right) + \cdots + \left(\frac{1}{2n - 1} - \frac{1}{2n + 1}\right) = 1 - \frac{1}{2n + 1}.$$

So, the series converges and its sum is 1. That is,

$$\sum_{n=1}^{\infty} \frac{2}{4n^2 - 1} = \lim_{n\to\infty} S_n = \lim_{n\to\infty} \left(1 - \frac{1}{2n + 1}\right) = 1.$$

Exploration

In "Proof Without Words," by Benjamin G. Klein and Irl C. Bivens, the authors present the diagram below. Explain why the second statement after the diagram is valid. How is this result related to Theorem 9.6?



$\Delta PQR \sim \Delta TSP$

$$1 + r + r^2 + r^3 + \cdots = \frac{1}{1 - r}$$

Exercise taken from "Proof Without Words" by Benjamin G. Klein and Irl C. Bivens, *Mathematics Magazine*, 61, No. 4, October 1988, p. 219, by permission of the authors.

Geometric Series

The series in Example 1(a) is a **geometric series.** In general, the series

$$\sum_{n=0}^{\infty} ar^n = a + ar + ar^2 + \cdots + ar^n + \cdots, \quad a \neq 0$$ Geometric series

is a **geometric series** with ratio r, $r \neq 0$.

THEOREM 9.6 Convergence of a Geometric Series

A geometric series with ratio r diverges when $|r| \geq 1$. If $|r| < 1$, then the series converges to the sum

$$\sum_{n=0}^{\infty} ar^n = \frac{a}{1 - r}, \quad |r| < 1.$$

Proof It is easy to see that the series diverges when $r = \pm 1$. If $r \neq \pm 1$, then

$$S_n = a + ar + ar^2 + \cdots + ar^{n-1}.$$

Multiplication by r yields

$$rS_n = ar + ar^2 + ar^3 + \cdots + ar^n.$$

Subtracting the second equation from the first produces $S_n - rS_n = a - ar^n$. So, $S_n(1 - r) = a(1 - r^n)$, and the nth partial sum is

$$S_n = \frac{a}{1 - r}(1 - r^n).$$

When $|r| < 1$, it follows that $r^n \to 0$ as $n \to \infty$, and you obtain

$$\lim_{n\to\infty} S_n = \lim_{n\to\infty} \left[\frac{a}{1 - r}(1 - r^n)\right] = \frac{a}{1 - r}\left[\lim_{n\to\infty} (1 - r^n)\right] = \frac{a}{1 - r}$$

which means that the series *converges* and its sum is $a/(1 - r)$. It is left to you to show that the series diverges when $|r| > 1$.

TECHNOLOGY

Figure 9.6 shows the first 20 partial sums of the infinite series in Example 3(a). Notice how the values appear to approach the line $y = 6$. Using a graphing utility to sum the first 20 terms, you should obtain a sum of about 5.999994.

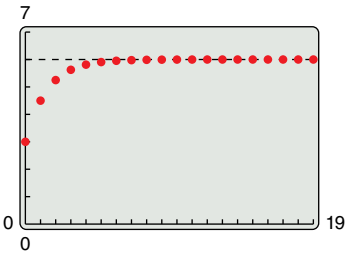

Figure 9.6

GO DIGITAL

EXAMPLE 3 Convergent and Divergent Geometric Series

a. The geometric series

$$\sum_{n=0}^{\infty} \frac{3}{2^n} = \sum_{n=0}^{\infty} 3\left(\frac{1}{2}\right)^n = 3(1) + 3\left(\frac{1}{2}\right) + 3\left(\frac{1}{2}\right)^2 + \cdots$$

has a ratio of $r = \frac{1}{2}$ with $a = 3$. Because $|r| < 1$, the series converges and its sum is

$$S = \frac{a}{1-r} = \frac{3}{1-(1/2)} = 6.$$ See Figure 9.6.

b. The geometric series

$$\sum_{n=0}^{\infty} \left(\frac{3}{2}\right)^n = 1 + \frac{3}{2} + \frac{9}{4} + \frac{27}{8} + \cdots$$

has a ratio of $r = \frac{3}{2}$. Because $|r| \geq 1$, the series diverges. ■

The formula for the sum of a geometric series can be used to write a repeating decimal as the ratio of two integers, as demonstrated in the next example.

EXAMPLE 4 A Geometric Series for a Repeating Decimal

See LarsonCalculus.com for an interactive version of this type of example.

Use a geometric series to write $0.\overline{08}$ as the ratio of two integers.

Solution For the repeating decimal $0.\overline{08}$, you can write

$$0.080808\ldots = \frac{8}{10^2} + \frac{8}{10^4} + \frac{8}{10^6} + \frac{8}{10^8} + \cdots$$
$$= \sum_{n=0}^{\infty} \left(\frac{8}{10^2}\right)\left(\frac{1}{10^2}\right)^n.$$

For this series, you have $a = 8/10^2$ and $r = 1/10^2$. So,

$$0.080808\ldots = \frac{a}{1-r} = \frac{8/10^2}{1-(1/10^2)} = \frac{8}{99}.$$

Try dividing 8 by 99 on a calculator to see that it produces $0.\overline{08}$. ■

REMARK In words, Theorem 9.6 states that "the sum of a convergent geometric series is the first term of the series divided by the difference of 1 and the ratio r." For the series

$$\sum_{n=4}^{\infty} \left(\frac{1}{2}\right)^n$$

note that the first term is $(1/2)^4$ and $r = 1/2$. So, the sum is

$$S = \frac{(1/2)^4}{1-(1/2)} = \frac{1}{8}.$$

The convergence of a series is not affected by the removal of a finite number of terms from the beginning of the series. For instance, the geometric series

$$\sum_{n=4}^{\infty} \left(\frac{1}{2}\right)^n \quad \text{and} \quad \sum_{n=0}^{\infty} \left(\frac{1}{2}\right)^n$$

both converge. Furthermore, because the sum of the second series is

$$\frac{a}{1-r} = \frac{1}{1-(1/2)} = 2$$

you can conclude that the sum of the first series is

$$S = 2 - \left[\left(\frac{1}{2}\right)^0 + \left(\frac{1}{2}\right)^1 + \left(\frac{1}{2}\right)^2 + \left(\frac{1}{2}\right)^3\right]$$
$$= 2 - \frac{15}{8}$$
$$= \frac{1}{8}.$$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

The properties in the next theorem are direct consequences of the corresponding properties of limits of sequences.

THEOREM 9.7 Properties of Infinite Series

Let Σa_n and Σb_n be convergent series, and let A, B, and c be real numbers. If $\Sigma a_n = A$ and $\Sigma b_n = B$, then the following series converge to the indicated sums.

1. $\sum_{n=1}^{\infty} ca_n = cA$
2. $\sum_{n=1}^{\infty} (a_n + b_n) = A + B$
3. $\sum_{n=1}^{\infty} (a_n - b_n) = A - B$

*n*th-Term Test for Divergence

The next theorem states that when a series converges, the limit of its nth term must be 0.

THEOREM 9.8 Limit of the *n*th Term of a Convergent Series

If $\sum_{n=1}^{\infty} a_n$ converges, then $\lim_{n\to\infty} a_n = 0$.

REMARK The converse of Theorem 9.8 is generally not true. That is, if the sequence $\{a_n\}$ converges to 0, then the series Σa_n may either converge or diverge.

Proof Assume that

$$\sum_{n=1}^{\infty} a_n = \lim_{n\to\infty} S_n = L.$$

Then, because $S_n = S_{n-1} + a_n$ and

$$\lim_{n\to\infty} S_n = \lim_{n\to\infty} S_{n-1} = L$$

it follows that

$$\begin{aligned} L &= \lim_{n\to\infty} S_n \\ &= \lim_{n\to\infty} (S_{n-1} + a_n) \\ &= \lim_{n\to\infty} S_{n-1} + \lim_{n\to\infty} a_n \\ &= L + \lim_{n\to\infty} a_n \end{aligned}$$

which implies that $\{a_n\}$ converges to 0. ∎

The contrapositive of Theorem 9.8 provides a useful test for *divergence*. This ***n*th-Term Test for Divergence** (also known as the **Divergence Test**) states that if the limit of the nth term of a series does *not* converge to 0, then the series must diverge.

THEOREM 9.9 *n*th-Term Test for Divergence

If $\lim_{n\to\infty} a_n \neq 0$ then $\sum_{n=1}^{\infty} a_n$ diverges.

GO DIGITAL

EXAMPLE 5 Using the *n*th-Term Test for Divergence

a. For the series $\sum_{n=0}^{\infty} 2^n$, you have

$$\lim_{n\to\infty} 2^n = \infty.$$

So, the limit of the nth term is not 0, and the series diverges.

b. For the series $\sum_{n=1}^{\infty} \frac{n!}{2n! + 1}$, you have

$$\lim_{n\to\infty} \frac{n!}{2n! + 1} = \lim_{n\to\infty} \frac{1}{2 + (1/n!)} = \frac{1}{2}.$$

So, the limit of the nth term is not 0, and the series diverges.

c. For the series $\sum_{n=1}^{\infty} \frac{1}{n}$, you have

$$\lim_{n\to\infty} \frac{1}{n} = 0.$$

Because the limit of the nth term is 0, the nth-Term Test for Divergence does *not* apply and you can draw no conclusions about convergence or divergence. (In the next section, you will learn that this particular series diverges.)

REMARK The series in Example 5(c) will play an important role in this chapter.

$$\sum_{n=1}^{\infty} \frac{1}{n} = 1 + \frac{1}{2} + \frac{1}{3} + \cdots$$

In the next section, you will learn that this series diverges even though the nth term approaches 0 as n approaches ∞.

EXAMPLE 6 Bouncing Ball Problem

A ball is dropped from a height of 6 feet and begins bouncing, as shown in Figure 9.7. The height of each bounce is three-fourths the height of the previous bounce. Find the total vertical distance traveled by the ball.

Solution When the ball hits the ground for the first time, it has traveled a distance of $D_1 = 6$ feet. For subsequent bounces, let D_i be the distance traveled up and down. For example, D_2 and D_3 are

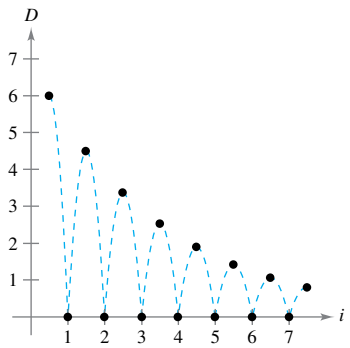
$$D_2 = \underbrace{6\left(\frac{3}{4}\right)}_{\text{Up}} + \underbrace{6\left(\frac{3}{4}\right)}_{\text{Down}} = 12\left(\frac{3}{4}\right)$$

and

$$D_3 = \underbrace{6\left(\frac{3}{4}\right)\left(\frac{3}{4}\right)}_{\text{Up}} + \underbrace{6\left(\frac{3}{4}\right)\left(\frac{3}{4}\right)}_{\text{Down}} = 12\left(\frac{3}{4}\right)^2.$$

By continuing this process, it can be determined that the total vertical distance is

$$\begin{aligned} D &= 6 + 12\left(\frac{3}{4}\right) + 12\left(\frac{3}{4}\right)^2 + 12\left(\frac{3}{4}\right)^3 + \cdots \\ &= 6 + 12\sum_{n=0}^{\infty}\left(\frac{3}{4}\right)^{n+1} \\ &= 6 + 12\left(\frac{3}{4}\right)\sum_{n=0}^{\infty}\left(\frac{3}{4}\right)^n \\ &= 6 + 9\left[\frac{1}{1 - (3/4)}\right] \\ &= 6 + 9(4) \\ &= 42 \text{ feet.} \end{aligned}$$



The height of each bounce is three-fourths the height of the preceding bounce.

Concept Check

1. Describe the difference between $\lim_{n\to\infty} a_n = 5$ and $\sum_{n=1}^{\infty} a_n = 5$.
2. Define a geometric series, state when it converges, and give the formula for the sum of a convergent geometric series.
3. The limit of the nth term of a series converges to 0. What can you conclude about the convergence or divergence of the series?
4. The limit of the nth term of a series does not converge to 0. What can you conclude about the convergence or divergence of the series?

Finding Partial Sums In Exercises 5–10, find the sequence of partial sums S_1, S_2, S_3, S_4, and S_5.

5. $1 + \frac{1}{4} + \frac{1}{9} + \frac{1}{16} + \frac{1}{25} + \cdots$
6. $\frac{1}{2 \cdot 3} + \frac{2}{3 \cdot 4} + \frac{3}{4 \cdot 5} + \frac{4}{5 \cdot 6} + \frac{5}{6 \cdot 7} + \cdots$
7. $3 - \frac{9}{2} + \frac{27}{4} - \frac{81}{8} + \frac{243}{16} - \cdots$
8. $1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{6} + \frac{1}{8} + \frac{1}{10} + \cdots$
9. $\sum_{n=1}^{\infty} \frac{3}{2^{n-1}}$
10. $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n!}$

Verifying Divergence In Exercises 11–18, verify that the infinite series diverges.

11. $\sum_{n=0}^{\infty} 5\left(\frac{5}{2}\right)^n$
12. $\sum_{n=0}^{\infty} 4(-1.05)^n$
13. $\sum_{n=1}^{\infty} \frac{n}{n+1}$
14. $\sum_{n=1}^{\infty} \frac{n}{2n+3}$
15. $\sum_{n=1}^{\infty} \frac{n^3+1}{n^3+n^2}$
16. $\sum_{n=1}^{\infty} \frac{2n}{\sqrt{n^2+1}}$
17. $\sum_{n=1}^{\infty} \frac{4^n+3}{4^{n+1}}$
18. $\sum_{n=1}^{\infty} \frac{(n+1)!}{5n!}$

Verifying Convergence In Exercises 19–24, verify that the infinite series converges.

19. $\sum_{n=0}^{\infty} \left(\frac{5}{6}\right)^n$
20. $\sum_{n=1}^{\infty} 2\left(-\frac{1}{2}\right)^n$
21. $\sum_{n=0}^{\infty} (0.9)^n = 1 + 0.9 + 0.81 + 0.729 + \cdots$
22. $\sum_{n=0}^{\infty} (-0.2)^n = 1 - 0.2 + 0.04 - 0.008 + \cdots$
23. $\sum_{n=1}^{\infty} \frac{1}{n(n+1)}$ (*Hint:* Use partial fractions.)
24. $\sum_{n=1}^{\infty} \frac{1}{n(n+2)}$ (*Hint:* Use partial fractions.)

Numerical, Graphical, and Analytic Analysis In Exercises 25–28, (a) find the sum of the series, (b) use a graphing utility to find the indicated partial sum S_n and complete the table, (c) use a graphing utility to graph the first 10 terms of the sequence of partial sums and a horizontal line representing the sum, and (d) explain the relationship between the magnitudes of the terms of the series and the rate at which the sequence of partial sums approaches the sum of the series.

S_n					

25. $\sum_{n=1}^{\infty} \frac{6}{n(n+3)}$
26. $\sum_{n=1}^{\infty} \frac{4}{n(n+4)}$
27. $\sum_{n=1}^{\infty} 2(0.9)^{n-1}$
28. $\sum_{n=1}^{\infty} 10\left(-\frac{1}{4}\right)^{n-1}$

Finding the Sum of a Convergent Series In Exercises 29–38, find the sum of the convergent series.

29. $\sum_{n=0}^{\infty} 5\left(\frac{2}{3}\right)^n$
30. $\sum_{n=0}^{\infty} \left(-\frac{1}{5}\right)^n$
31. $\sum_{n=1}^{\infty} \frac{4}{n(n+2)}$
32. $\sum_{n=1}^{\infty} \frac{1}{(2n+1)(2n+3)}$
33. $8 + 6 + \frac{9}{2} + \frac{27}{8} + \cdots$
34. $9 - 3 + 1 - \frac{1}{3} + \cdots$
35. $\sum_{n=0}^{\infty} \left(\frac{1}{2^n} - \frac{1}{3^n}\right)$
36. $\sum_{n=0}^{\infty} [(0.3)^n + (0.8)^n]$
37. $\sum_{n=1}^{\infty} (\sin 1)^n$
38. $\sum_{n=1}^{\infty} \frac{1}{9n^2+3n-2}$

Using a Geometric Series In Exercises 39–44, (a) write the repeating decimal as a geometric series and (b) write the sum of the series as the ratio of two integers.

39. $0.\overline{4}$
40. $0.\overline{63}$
41. $0.1\overline{2}$
42. $0.0\overline{1}$
43. $0.0\overline{75}$
44. $0.2\overline{15}$

Determining Convergence or Divergence In Exercises 45–58, determine the convergence or divergence of the series.

45. $\sum_{n=0}^{\infty} (1.075)^n$
46. $\sum_{n=0}^{\infty} \frac{6^n}{n+1}$
47. $\sum_{n=1}^{\infty} \frac{n+1}{2n-1}$
48. $\sum_{n=1}^{\infty} \frac{4n+1}{3n-1}$
49. $\sum_{n=1}^{\infty} \left(\frac{1}{n} - \frac{1}{n+2}\right)$
50. $\sum_{n=1}^{\infty} \left(\frac{1}{n+1} - \frac{1}{n+2}\right)$
51. $\sum_{n=1}^{\infty} \frac{3^n}{n^3}$
52. $\sum_{n=0}^{\infty} \frac{7}{5^n}$

53. $\sum_{n=2}^{\infty} \frac{n}{\ln n}$

54. $\sum_{n=1}^{\infty} \ln \frac{1}{n}$

55. $\sum_{n=1}^{\infty} \left(1 + \frac{k}{n}\right)^n$

56. $\sum_{n=1}^{\infty} e^{-n}$

57. $\sum_{n=1}^{\infty} \arctan n$

58. $\sum_{n=1}^{\infty} \ln\left(\frac{n+1}{n}\right)$

Exploring Concepts

59. A finite number of terms are deleted from a divergent series. Determine whether the new series will still diverge. Explain your reasoning.

60. A finite number of terms are added to a convergent series. Determine whether the new series will still converge. Explain your reasoning.

Making a Series Converge **In Exercises 61–66, find all values of x for which the series converges. For these values of x, write the sum of the series as a function of x.**

61. $\sum_{n=1}^{\infty} (3x)^n$

62. $\sum_{n=0}^{\infty} \left(\frac{2}{x}\right)^n$

63. $\sum_{n=1}^{\infty} (x-1)^n$

64. $\sum_{n=0}^{\infty} 5\left(\frac{x-2}{3}\right)^n$

65. $\sum_{n=0}^{\infty} (-1)^n x^n$

66. $\sum_{n=0}^{\infty} (-1)^n x^{2n}$

Using a Geometric Series **In Exercises 67 and 68, (a) find the common ratio of the geometric series, (b) write the function that gives the sum of the series, and (c) use a graphing utility to graph the function and the partial sums S_3 and S_5. What do you notice?**

67. $1 + x + x^2 + x^3 + \cdots$

68. $1 - \frac{x}{2} + \frac{x^2}{4} - \frac{x^3}{8} + \cdots$

Writing **In Exercises 69 and 70, use a graphing utility to determine the first term that is less than 0.0001 in each of the convergent series. Note that the answers are very different. Explain how this will affect the rate at which the series converges.**

69. $\sum_{n=1}^{\infty} \frac{1}{n(n+1)}, \quad \sum_{n=1}^{\infty} \left(\frac{1}{8}\right)^n$

70. $\sum_{n=1}^{\infty} \frac{1}{2^n}, \quad \sum_{n=1}^{\infty} (0.01)^n$

71. Marketing An electronic games manufacturer producing a new product estimates the annual sales to be 8000 units. Each year, 5% of the units that have been sold will become inoperative. So, 8000 units will be in use after 1 year, $[8000 + 0.95(8000)]$ units will be in use after 2 years, and so on. How many units will be in use after n years?

72. Depreciation A company buys a machine for $475,000 that depreciates at a rate of 30% per year. Find a formula for the value of the machine after n years. What is its value after 5 years?

73. Distance A ball is dropped from a height of 16 feet. Each time it drops h feet, it rebounds $0.81h$ feet. Find the total distance traveled by the ball.

74. Time The ball in Exercise 73 takes the following times for each fall.

$s_1 = -16t^2 + 16$, $s_1 = 0$ when $t = 1$

$s_2 = -16t^2 + 16(0.81)$, $s_2 = 0$ when $t = 0.9$

$s_3 = -16t^2 + 16(0.81)^2$, $s_3 = 0$ when $t = (0.9)^2$

$s_4 = -16t^2 + 16(0.81)^3$, $s_4 = 0$ when $t = (0.9)^3$

$\vdots$ $\vdots$

$s_n = -16t^2 + 16(0.81)^{n-1}$, $s_n = 0$ when $t = (0.9)^{n-1}$

Beginning with s_2, the ball takes the same amount of time to bounce up as it does to fall, so the total time elapsed before it comes to rest is given by $t = 1 + 2\sum_{n=1}^{\infty} (0.9)^n$. Find this total time.

75. Multiplier Effect

The total annual spending by tourists in a resort city is $200 million. Approximately 75% of that revenue is again spent in the resort city, and of that amount approximately 75% is again spent in the same city, and so on. Write the geometric series that gives the total amount of spending generated by the $200 million and find the sum of the series.

76. Multiplier Effect Repeat Exercise 75 when the percent of the revenue that is spent again in the city decreases to 60%.

Probability **In Exercises 77 and 78, the random variable n represents the number of units of a product sold per day in a store. The probability distribution of n is given by $P(n)$. Find the probability that two units are sold in a given day $[P(2)]$ and show that $P(0) + P(1) + P(2) + P(3) + \cdots = 1$.**

77. $P(n) = \frac{1}{2}\left(\frac{1}{2}\right)^n$

78. $P(n) = \frac{1}{3}\left(\frac{2}{3}\right)^n$

79. Probability A fair coin is tossed repeatedly. The probability that the first head occurs on the nth toss is given by $P(n) = \left(\frac{1}{2}\right)^n$, where $n \geq 1$.

(a) Show that $\sum_{n=1}^{\infty} \left(\frac{1}{2}\right)^n = 1$.

(b) The expected number of tosses required until the first head occurs in the experiment is given by

$$\sum_{n=1}^{\infty} n\left(\frac{1}{2}\right)^n.$$

Is this series geometric?

(c) Use a graphing utility to find the sum in part (b).

80. Probability In an experiment, three people toss a fair coin one at a time until one of them tosses a head. Determine, for each person, the probability that he or she tosses the first head. Verify that the sum of the three probabilities is 1.

81. Area The sides of a square are 16 inches in length. A new square is formed by connecting the midpoints of the sides of the original square, and two of the triangles outside the second square are shaded (see figure). Determine the area of the shaded regions (a) when this process is continued five more times and (b) when this pattern of shading is continued infinitely.

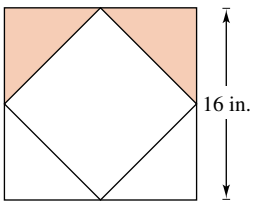

Figure for 81

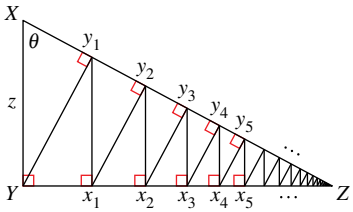

Figure for 82

82. Length A right triangle XYZ is shown above where $|XY| = z$ and $\angle X = \theta$. Line segments are continually drawn to be perpendicular to the triangle, as shown in the figure.

(a) Find the total length of the perpendicular line segments $|Yy_1| + |x_1y_1| + |x_1y_2| + \cdots$ in terms of z and θ.

(b) Find the total length of the perpendicular line segments when $z = 1$ and $\theta = \pi/6$.

Using a Geometric Series **In Exercises 83–86, use the formula for the *n*th partial sum of a geometric series**

$$\sum_{i=0}^{n-1} ar^i = \frac{a(1 - r^n)}{1 - r}.$$

83. Present Value The winner of a $2,000,000 sweepstakes will be paid $100,000 per year for 20 years. The money earns 6% interest per year. The present value of the winnings is $\sum_{n=1}^{20} 100{,}000\left(\frac{1}{1.06}\right)^n$. Compute the present value and interpret its meaning.

84. Annuities When an employee receives a paycheck at the end of each month, P dollars is invested in a retirement account. These deposits are made each month for t years and the account earns interest at the annual percentage rate r. When the interest is compounded monthly, the amount A in the account at the end of t years is

$$A = P + P\left(1 + \frac{r}{12}\right) + \cdots + P\left(1 + \frac{r}{12}\right)^{12t-1}$$
$$= P\left(\frac{12}{r}\right)\left[\left(1 + \frac{r}{12}\right)^{12t} - 1\right].$$

When the interest is compounded continuously, the amount A in the account after t years is

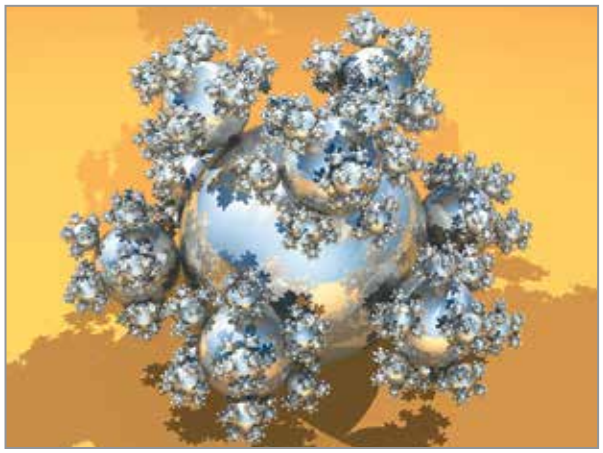
$$A = P + Pe^{r/12} + Pe^{2r/12} + \cdots + Pe^{(12t-1)r/12}$$
$$= \frac{P(e^{rt} - 1)}{e^{r/12} - 1}.$$

Verify the formulas for the sums given above.

85. Salary You go to work at a company that pays $0.01 for the first day, $0.02 for the second day, $0.04 for the third day, and so on. If the daily wage keeps doubling, what would your total income be for working (a) 29 days, (b) 30 days, and (c) 31 days?

86. Sphereflake

The sphereflake shown below is a computer-generated fractal that was created by Eric Haines. The radius of the large sphere is 1. To the large sphere, nine spheres of radius $\frac{1}{3}$ are attached. To each of these, nine spheres of radius $\frac{1}{9}$ are attached. This process is continued infinitely. Prove that the sphereflake has an infinite surface area.



LoByteSo/Deviant Art

Annuities **In Exercises 87–90, consider making monthly deposits of P dollars in a savings account at an annual interest rate r. Use the results of Exercise 84 to find the balance A in the account after t years when the interest is compounded (a) monthly and (b) continuously.**

87. $P = \$50$, $r = 2\%$, $t = 20$ years

88. $P = \$200$, $r = 5.5\%$, $t = 25$ years

89. $P = \$1050$, $r = 0.9\%$, $t = 35$ years

90. $P = \$175$, $r = 4\%$, $t = 50$ years

True or False? **In Exercises 91–94, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

91. If $|r| < 1$, then $\sum_{n=1}^{\infty} ar^n = \frac{a}{1 - r}$.

92. If $\sum_{n=1}^{\infty} a_n = L$, then $\sum_{n=0}^{\infty} a_n = L + a_0$.

93. $0.75 = 0.749999\ldots$

94. The series $\sum_{n=1}^{\infty} \frac{n}{1000(n + 1)}$ diverges.

95. Using Divergent Series Find two divergent series Σa_n and Σb_n such that $\Sigma(a_n + b_n)$ converges.

96. Remainder Let Σa_n be a convergent series, and let

$$R_N = a_{N+1} + a_{N+2} + \cdots$$

be the remainder of the series after the first N terms. Prove that $\lim_{N\to\infty} R_N = 0$.

97. Proof Prove that $\frac{1}{r} + \frac{1}{r^2} + \frac{1}{r^3} + \cdots = \frac{1}{r - 1}$ for $|r| > 1$.

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

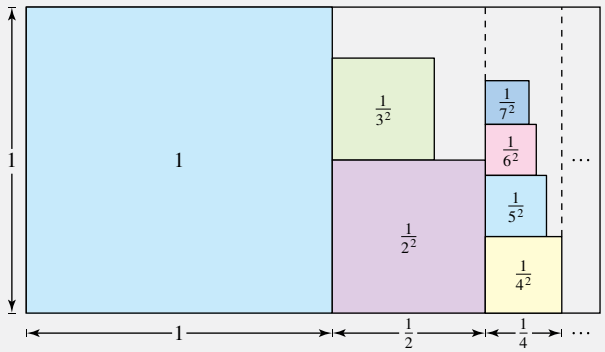
98. Proof Given two infinite series Σa_n and Σb_n such that Σa_n converges and Σb_n diverges, prove that $\Sigma(a_n + b_n)$ diverges.

99. Fibonacci Sequence The Fibonacci sequence is defined recursively by $a_{n+2} = a_n + a_{n+1}$, where $a_1 = 1$ and $a_2 = 1$.

(a) Show that $\dfrac{1}{a_{n+1}a_{n+3}} = \dfrac{1}{a_{n+1}a_{n+2}} - \dfrac{1}{a_{n+2}a_{n+3}}$.

(b) Show that $\displaystyle\sum_{n=0}^{\infty} \frac{1}{a_{n+1}a_{n+3}} = 1$.

100. HOW DO YOU SEE IT? The figure below represents an informal way of showing that $\displaystyle\sum_{n=1}^{\infty} \frac{1}{n^2} < 2$. Explain how the figure implies this conclusion.



FOR FURTHER INFORMATION For more on this exercise, see the article "Convergence with Pictures" by P. J. Rippon in *American Mathematical Monthly.*

PUTNAM EXAM CHALLENGE

101. Express $\displaystyle\sum_{k=1}^{\infty} \frac{6^k}{(3^{k+1} - 2^{k+1})(3^k - 2^k)}$ as a rational number.

102. Let $f(n)$ be the sum of the first n terms of the sequence $0, 1, 1, 2, 2, 3, 3, 4, \ldots$, where the nth term is given by

$$a_n = \begin{cases} n/2, & \text{if } n \text{ is even} \\ (n-1)/2, & \text{if } n \text{ is odd} \end{cases}.$$

Show that if x and y are positive integers and $x > y$ then $xy = f(x + y) - f(x - y)$.

103. Let $x_0, x_1, x_2, \ldots$ be the sequence such that $x_0 = 1$ and for $n \geq 0$,

$$x_{n+1} = \ln(e^{x_n} - x_n)$$

(as usual, the function ln is the natural logarithm). Show that the infinite series

$$x_0 + x_1 + x_2 + \cdots$$

converges and find its sum.

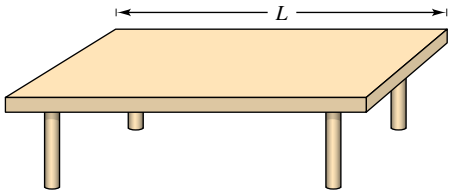
SECTION PROJECT

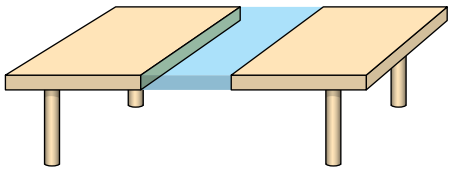
Cantor's Disappearing Table

The following procedure shows how to make a table disappear by removing only half of the table!

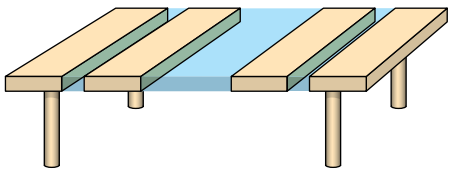
(a) Original table has a length of L.



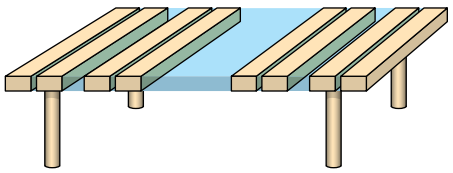
(b) Remove $\frac{1}{4}$ of the table centered at the midpoint. Each remaining piece has a length that is less than $\frac{1}{2}L$.



(c) Remove $\frac{1}{8}$ of the table by taking sections of length $\frac{1}{16}L$ from the centers of each of the two remaining pieces. Now you have removed $\frac{1}{4} + \frac{1}{8}$ of the table. Each remaining piece has a length that is less than $\frac{1}{4}L$.



(d) Remove $\frac{1}{16}$ of the table by taking sections of length $\frac{1}{64}L$ from the centers of each of the four remaining pieces. Now you have removed $\frac{1}{4} + \frac{1}{8} + \frac{1}{16}$ of the table. Each remaining piece has a length that is less than $\frac{1}{8}L$.



Will continuing this process cause the table to disappear, even though you have removed only half of the table? Why?

9.3 The Integral Test and *p*-Series

GO DIGITAL

- **Use the Integral Test to determine whether an infinite series converges or diverges.**
- **Determine the convergence or divergence of *p*-series and harmonic series.**

The Integral Test

In this and the next section, you will study several convergence tests that apply to series with *positive* terms.

THEOREM 9.10 The Integral Test

If f is positive, continuous, and decreasing for $x \geq 1$ and $a_n = f(n)$, then

$$\sum_{n=1}^{\infty} a_n \quad \text{and} \quad \int_1^{\infty} f(x)\,dx$$

either both converge or both diverge.

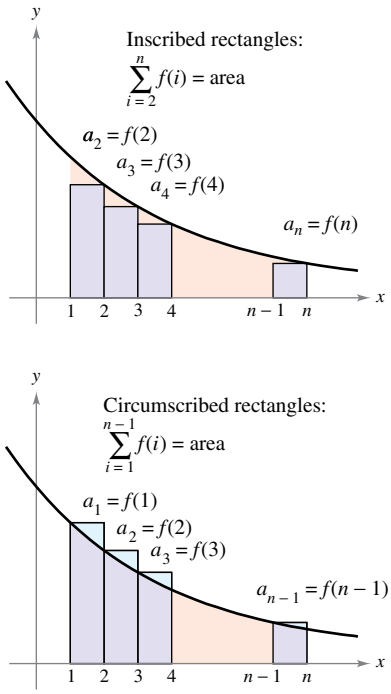

Figure 9.8

Proof Begin by partitioning the interval $[1, n]$ into $(n - 1)$ unit intervals, as shown in Figure 9.8. The total areas of the inscribed rectangles and the circumscribed rectangles are

$$\sum_{i=2}^{n} f(i) = f(2) + f(3) + \cdots + f(n) \qquad \text{Inscribed area}$$

and

$$\sum_{i=1}^{n-1} f(i) = f(1) + f(2) + \cdots + f(n-1). \qquad \text{Circumscribed area}$$

The exact area under the graph of f from $x = 1$ to $x = n$ lies between the inscribed and circumscribed areas.

$$\sum_{i=2}^{n} f(i) \leq \int_1^n f(x)\,dx \leq \sum_{i=1}^{n-1} f(i)$$

Use the nth partial sum

$$S_n = f(1) + f(2) + \cdots + f(n)$$

to write this inequality as

$$S_n - f(1) \leq \int_1^n f(x)\,dx \leq S_{n-1}.$$

Now, assuming that $\int_1^{\infty} f(x)\,dx$ converges to L, it follows that for $n \geq 1$,

$$S_n - f(1) \leq L \quad \Rightarrow \quad S_n \leq L + f(1).$$

Consequently, $\{S_n\}$ is bounded and monotonic, and by Theorem 9.5 it converges. So, Σa_n converges. For the other direction of the proof, assume that the improper integral diverges. Then $\int_1^n f(x)\,dx$ approaches infinity as $n \to \infty$, and the inequality $S_{n-1} \geq \int_1^n f(x)\,dx$ implies that $\{S_n\}$ diverges. So, Σa_n diverges. ∎

Remember that the convergence or divergence of Σa_n is not affected by deleting the first N terms. Similarly, when the conditions for the Integral Test are satisfied for all $x \geq N > 1$, use the integral $\int_N^{\infty} f(x)\,dx$ to test for convergence or divergence. (This is illustrated in Example 4.)

GO DIGITAL

REMARK Before applying the Integral Test, be sure to check that the function is positive, continuous, and decreasing for $x \geq 1$. When the function fails to satisfy one or more of these conditions, you cannot apply the Integral Test.

EXAMPLE 1 Using the Integral Test

Apply the Integral Test to the series $\sum_{n=1}^{\infty} \frac{n}{n^2 + 1}$.

Solution The function $f(x) = x/(x^2 + 1)$ is positive and continuous for $x \geq 1$. To determine whether f is decreasing, find the derivative.

$$f'(x) = \frac{(x^2 + 1)(1) - x(2x)}{(x^2 + 1)^2} = \frac{-x^2 + 1}{(x^2 + 1)^2}$$

So, $f'(x) < 0$ for $x > 1$ and it follows that f satisfies the conditions for the Integral Test. Next, integrate to obtain

$$\begin{aligned}
\int_1^{\infty} \frac{x}{x^2 + 1}\,dx &= \frac{1}{2}\int_1^{\infty} \frac{2x}{x^2 + 1}\,dx && \text{Multiply and divide by 2.} \\
&= \frac{1}{2}\lim_{b\to\infty} \int_1^{b} \frac{2x}{x^2 + 1}\,dx && \text{Definition of improper integral} \\
&= \frac{1}{2}\lim_{b\to\infty} \Big[\ln(x^2 + 1)\Big]_1^{b} && \text{Apply Log Rule.} \\
&= \frac{1}{2}\lim_{b\to\infty} [\ln(b^2 + 1) - \ln 2] && \text{Apply Fundamental Theorem of Calculus.} \\
&= \infty. && \text{Evaluate limit.}
\end{aligned}$$

The integral *diverges*, so by the Integral Test, the series *diverges*.

EXAMPLE 2 Using the Integral Test

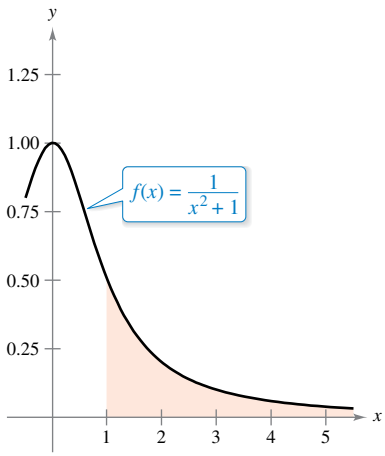
See LarsonCalculus.com for an interactive version of this type of example.

Apply the Integral Test to the series $\sum_{n=1}^{\infty} \frac{1}{n^2 + 1}$.

Solution Because $f(x) = 1/(x^2 + 1)$ satisfies the conditions for the Integral Test (check this), integrate to obtain

$$\begin{aligned}
\int_1^{\infty} \frac{1}{x^2 + 1}\,dx &= \lim_{b\to\infty} \int_1^{b} \frac{1}{x^2 + 1}\,dx && \text{Definition of improper integral} \\
&= \lim_{b\to\infty} \Big[\arctan x\Big]_1^{b} && \text{Apply Arctan Rule.} \\
&= \lim_{b\to\infty} (\arctan b - \arctan 1) && \text{Apply Fundamental Theorem of Calculus.} \\
&= \frac{\pi}{2} - \frac{\pi}{4} && \text{Evaluate limit.} \\
&= \frac{\pi}{4}. && \text{Simplify.}
\end{aligned}$$

The integral *converges*, so by the Integral Test, the series *converges* (see Figure 9.9).



Because the improper integral converges, the infinite series also converges.
Figure 9.9

In Example 2, the fact that the improper integral converges to $\pi/4$ does not imply that the infinite series converges to $\pi/4$. To approximate the sum of the series, you can use the inequality

$$\sum_{n=1}^{N} \frac{1}{n^2 + 1} \leq \sum_{n=1}^{\infty} \frac{1}{n^2 + 1} \leq \sum_{n=1}^{N} \frac{1}{n^2 + 1} + \int_N^{\infty} \frac{1}{x^2 + 1}\,dx.$$

(See Exercise 52.) The larger the value of N, the better the approximation. For instance, using $N = 200$ produces $1.072 \leq \Sigma\,[1/(n^2 + 1)] \leq 1.077$.

GO DIGITAL

p-Series and Harmonic Series

In the remainder of this section, you will investigate a second type of series that has a simple arithmetic test for convergence or divergence. A series of the form

$$\sum_{n=1}^{\infty} \frac{1}{n^p} = \frac{1}{1^p} + \frac{1}{2^p} + \frac{1}{3^p} + \cdots \qquad p\text{-series}$$

is a ***p*-series,** where p is a positive constant. For $p = 1$, the series

$$\sum_{n=1}^{\infty} \frac{1}{n} = 1 + \frac{1}{2} + \frac{1}{3} + \cdots \qquad \text{Harmonic series}$$

is the **harmonic series.** A **general harmonic series** is of the form $\Sigma\,[1/(an + b)]$. In music, strings of the same material, diameter, and tension, and whose lengths form a harmonic series, produce harmonic tones.

HARMONIC SERIES

Pythagoras and his students paid close attention to the development of music as an abstract science. This led to the discovery of the relationship between the tone and the length of a vibrating string. It was observed that the most beautiful musical harmonies corresponded to the simplest ratios of whole numbers. Later mathematicians developed this idea into the harmonic series, where the terms in the harmonic series correspond to the nodes on a vibrating string that produce multiples of the fundamental frequency. For example, $\frac{1}{2}$ is twice the fundamental frequency, $\frac{1}{3}$ is three times the fundamental frequency, and so on.

The Integral Test is convenient for establishing the convergence or divergence of p-series. This is shown in the proof of Theorem 9.11.

THEOREM 9.11 Convergence of *p*-Series

The p-series

$$\sum_{n=1}^{\infty} \frac{1}{n^p} = \frac{1}{1^p} + \frac{1}{2^p} + \frac{1}{3^p} + \frac{1}{4^p} + \cdots$$

converges for $p > 1$ and diverges for $0 < p \leq 1$.

Proof The proof follows from the Integral Test and from Theorem 8.7, which states that

$$\int_1^{\infty} \frac{1}{x^p}\,dx$$

converges for $p > 1$ and diverges for $0 < p \leq 1$. ■

EXAMPLE 3 Convergent and Divergent *p*-Series

Discuss the convergence or divergence of (a) the harmonic series and (b) the p-series with $p = 2$.

Solution

a. From Theorem 9.11, it follows that the harmonic series

$$\sum_{n=1}^{\infty} \frac{1}{n} = \frac{1}{1} + \frac{1}{2} + \frac{1}{3} + \cdots \qquad p = 1$$

diverges.

b. From Theorem 9.11, it follows that the p-series

$$\sum_{n=1}^{\infty} \frac{1}{n^2} = \frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \cdots \qquad p = 2$$

converges. ■

FOR FURTHER INFORMATION

To read about a proof of the sum of the series in Example 3(b), see the article "A Short Elementary Proof of $\Sigma 1/k^2 = \pi^2/6$" by Daniel Daners in *Mathematics Magazine*. To view this article, go to *MathArticles.com*.

GO DIGITAL

The sum of the series in Example 3(b) can be shown to be $\pi^2/6$. (This was proved by Leonhard Euler, but the proof is too difficult to present here.) Be sure you understand that the Integral Test does not tell you that the sum of the series is equal to the value of the integral. For instance, the sum of the series in Example 3(b) is

$$\sum_{n=1}^{\infty} \frac{1}{n^2} = \frac{\pi^2}{6} \approx 1.645$$

whereas the value of the corresponding improper integral is

$$\int_1^{\infty} \frac{1}{x^2}\,dx = 1.$$

REMARK You are asked to prove this result in Chapter 14. (See Exercise 5 on page 1041.)

EXAMPLE 4 Testing a Series for Convergence

Determine whether the series $\sum_{n=2}^{\infty} \frac{1}{n \ln n}$ converges or diverges.

Solution This series is similar to the divergent harmonic series. If its terms were greater than those of the harmonic series, you would expect it to diverge. However, because its terms are less than those of the harmonic series, you are not sure what to expect. The function

$$f(x) = \frac{1}{x \ln x}$$

is positive and continuous for $x \geq 2$. To determine whether f is decreasing, first rewrite f as

$$f(x) = (x \ln x)^{-1}$$ Rewrite using negative exponent.

and then find its derivative.

$$f'(x) = (-1)(x \ln x)^{-2}(1 + \ln x) = -\frac{1 + \ln x}{x^2(\ln x)^2}$$

So, $f'(x) < 0$ for $x > 2$ and it follows that f satisfies the conditions for the Integral Test.

$$\begin{aligned}
\int_2^{\infty} \frac{1}{x \ln x}\,dx &= \int_2^{\infty} \frac{1/x}{\ln x}\,dx && \text{Rewrite integrand.} \\
&= \lim_{b\to\infty} \int_2^{b} \frac{1/x}{\ln x}\,dx && \text{Definition of improper integral} \\
&= \lim_{b\to\infty} \Big[\ln(\ln x)\Big]_2^{b} && \text{Apply Log Rule.} \\
&= \lim_{b\to\infty} [\ln(\ln b) - \ln(\ln 2)] && \text{Apply Fundamental Theorem of Calculus.} \\
&= \infty && \text{Evaluate limit.}
\end{aligned}$$

The integral *diverges*, so by the Integral Test, the series diverges. ■

Note that the infinite series in Example 4 diverges very slowly. For instance, as shown in the table, the sum of the first 10 terms is approximately 1.6878196, whereas the sum of the first 100 terms is slightly greater: 2.3250871. In fact, the sum of the first 10,000 terms is approximately 3.0150217. So, although the infinite series "adds up to infinity," it does so very slowly.

n	11	101	1001	10,001	100,001
S_n	1.6878	2.3251	2.7275	3.0150	3.2382

9.3 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Give the conditions that must be satisfied to use the Integral Test.
2. Determine whether each series is a p-series.

(a) $\sum_{n=1}^{\infty} \frac{1}{n^{1.4}}$ (b) $\sum_{n=1}^{\infty} \frac{1}{n^{-2}}$ (c) $\sum_{n=1}^{\infty} \frac{1}{n^3}$

Using the Integral Test In Exercises 3–22, confirm that the Integral Test can be applied to the series. Then use the Integral Test to determine the convergence or divergence of the series.

3. $\sum_{n=1}^{\infty} \frac{1}{n+3}$
4. $\sum_{n=1}^{\infty} \frac{2}{3n+5}$
5. $\sum_{n=1}^{\infty} \frac{1}{2^n}$
6. $\sum_{n=1}^{\infty} 3^{-n}$
7. $\sum_{n=1}^{\infty} e^{-n}$
8. $\sum_{n=1}^{\infty} ne^{-n/2}$
9. $\frac{\ln 2}{2} + \frac{\ln 3}{3} + \frac{\ln 4}{4} + \frac{\ln 5}{5} + \frac{\ln 6}{6} + \cdots$
10. $\frac{\ln 2}{\sqrt{2}} + \frac{\ln 3}{\sqrt{3}} + \frac{\ln 4}{\sqrt{4}} + \frac{\ln 5}{\sqrt{5}} + \frac{\ln 6}{\sqrt{6}} + \cdots$
11. $\frac{1}{3} + \frac{1}{5} + \frac{1}{7} + \frac{1}{9} + \frac{1}{11} + \cdots$
12. $\frac{1}{4} + \frac{2}{7} + \frac{3}{12} + \frac{4}{19} + \frac{5}{28} + \cdots$
13. $\sum_{n=1}^{\infty} \frac{\arctan n}{n^2+1}$
14. $\sum_{n=2}^{\infty} \frac{\ln n}{n^3}$
15. $\sum_{n=1}^{\infty} \frac{\ln n}{n^2}$
16. $\sum_{n=2}^{\infty} \frac{1}{n\sqrt{\ln n}}$
17. $\sum_{n=1}^{\infty} \frac{1}{(2n+3)^3}$
18. $\sum_{n=1}^{\infty} \frac{n+2}{n+1}$
19. $\sum_{n=1}^{\infty} \frac{4n}{2n^2+1}$
20. $\sum_{n=1}^{\infty} \frac{1}{\sqrt[3]{n+9}}$
21. $\sum_{n=1}^{\infty} \frac{n}{n^4+1}$
22. $\sum_{n=1}^{\infty} \frac{n}{n^4+2n^2+1}$

Using the Integral Test In Exercises 23 and 24, use the Integral Test to determine the convergence or divergence of the series, where k is a positive integer.

23. $\sum_{n=1}^{\infty} \frac{n^{k-1}}{n^k+c}$
24. $\sum_{n=1}^{\infty} n^k e^{-n}$

Conditions of the Integral Test In Exercises 25–28, explain why the Integral Test does not apply to the series.

25. $\sum_{n=1}^{\infty} \frac{(-1)^n}{n}$
26. $\sum_{n=1}^{\infty} e^{-n}\cos n$
27. $\sum_{n=1}^{\infty} \frac{2+\sin n}{n}$
28. $\sum_{n=1}^{\infty} \left(\frac{\sin n}{n}\right)^2$

Using the Integral Test In Exercises 29–32, use the Integral Test to determine the convergence or divergence of the p-series.

29. $\sum_{n=1}^{\infty} \frac{1}{n^7}$
30. $\sum_{n=1}^{\infty} \frac{1}{n^{1/2}}$
31. $\sum_{n=1}^{\infty} \frac{1}{n^{0.9}}$
32. $\sum_{n=1}^{\infty} \frac{1}{n^{1.001}}$

Using a p-Series In Exercises 33–38, use Theorem 9.11 to determine the convergence or divergence of the p-series.

33. $\sum_{n=1}^{\infty} \frac{1}{\sqrt[5]{n}}$
34. $\sum_{n=1}^{\infty} \frac{3}{n^{5/3}}$
35. $1 + \frac{1}{2\sqrt{2}} + \frac{1}{3\sqrt{3}} + \frac{1}{4\sqrt{4}} + \frac{1}{5\sqrt{5}} + \cdots$
36. $1 + \frac{1}{\sqrt[3]{4}} + \frac{1}{\sqrt[3]{9}} + \frac{1}{\sqrt[3]{16}} + \frac{1}{\sqrt[3]{25}} + \cdots$
37. $\sum_{n=1}^{\infty} \frac{1}{n^{1.03}}$
38. $\sum_{n=1}^{\infty} \frac{1}{n^{\pi}}$

39. **Numerical and Graphical Analysis** Use a graphing utility to find the indicated partial sum S_n and complete the table. Then use a graphing utility to graph the first 10 terms of the sequence of partial sums. For each series, compare the rate at which the sequence of partial sums approaches the sum of the series.

n	5	10	20	50	100
S_n					

(a) $\sum_{n=1}^{\infty} 3\left(\frac{1}{5}\right)^{n-1} = \frac{15}{4}$

(b) $\sum_{n=1}^{\infty} \frac{1}{n^2} = \frac{\pi^2}{6}$

40. **Numerical Reasoning** Because the harmonic series diverges, it follows that for any positive real number M, there exists a positive integer N such that the partial sum

$$\sum_{n=1}^{N} \frac{1}{n} > M.$$

(a) Use a graphing utility to complete the table.

M	2	4	6	8
N				

(b) As the real number M increases in equal increments, does the number N increase in equal increments? Explain.

Exploring Concepts

41. Without performing any calculations, determine whether the following series converges. Explain.

$$\frac{1}{10{,}000} + \frac{1}{10{,}001} + \frac{1}{10{,}002} + \cdots$$

42. Let f be a positive, continuous, and decreasing function for $x \geq 1$, such that $a_n = f(n)$. Use a graph to rank the following quantities in decreasing order. Explain your reasoning.

(a) $\sum_{n=2}^{7} a_n$ (b) $\int_1^7 f(x)\,dx$ (c) $\sum_{n=1}^{6} a_n$

43. Use a graph to show that the inequality is true. What can you conclude about the convergence or divergence of the series? Explain.

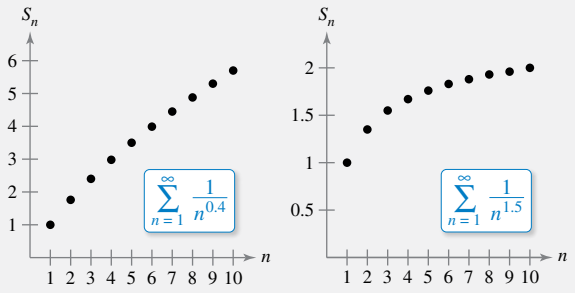
(a) $\sum_{n=1}^{\infty} \frac{1}{\sqrt{n}} > \int_1^{\infty} \frac{1}{\sqrt{x}}\,dx$

(b) $\sum_{n=2}^{\infty} \frac{1}{n^2} < \int_1^{\infty} \frac{1}{x^2}\,dx$

44. HOW DO YOU SEE IT? The graphs show the sequences of partial sums of the p-series

$$\sum_{n=1}^{\infty} \frac{1}{n^{0.4}} \quad \text{and} \quad \sum_{n=1}^{\infty} \frac{1}{n^{1.5}}.$$

Using Theorem 9.11, the first series diverges and the second series converges. Explain how the graphs show this.



Finding Values

In Exercises 45–50, find the positive values of p for which the series converges.

45. $\sum_{n=2}^{\infty} \frac{1}{n(\ln n)^p}$

46. $\sum_{n=2}^{\infty} \frac{\ln n}{n^p}$

47. $\sum_{n=1}^{\infty} \frac{n}{(1+n^2)^p}$

48. $\sum_{n=1}^{\infty} n(1+n^2)^p$

49. $\sum_{n=1}^{\infty} \left(\frac{3}{p}\right)^n$

50. $\sum_{n=3}^{\infty} \frac{1}{n(\ln n)[\ln(\ln n)]^p}$

51. Proof Let f be a positive, continuous, and decreasing function for $x \geq 1$, such that $a_n = f(n)$. Prove that if the series

$$\sum_{n=1}^{\infty} a_n$$

converges to S, then the remainder $R_N = S - S_N$ is bounded by

$$0 \leq R_N \leq \int_N^{\infty} f(x)\,dx.$$

52. Using a Remainder Show that the result of Exercise 51 can be written as

$$\sum_{n=1}^{N} a_n \leq \sum_{n=1}^{\infty} a_n \leq \sum_{n=1}^{N} a_n + \int_N^{\infty} f(x)\,dx.$$

Approximating a Sum

In Exercises 53–58, use the result of Exercise 51 to approximate the sum of the convergent series using the indicated number of terms. Include an estimate of the maximum error for your approximation.

53. $\sum_{n=1}^{\infty} \frac{1}{n^4}$, three terms

54. $\sum_{n=1}^{\infty} \frac{1}{(n+1)^3}$, six terms

55. $\sum_{n=1}^{\infty} \frac{1}{n^2+1}$, eight terms

56. $\sum_{n=1}^{\infty} \frac{1}{(n+1)[\ln(n+1)]^3}$, ten terms

57. $\sum_{n=1}^{\infty} ne^{-n^2}$, four terms

58. $\sum_{n=1}^{\infty} e^{-2n}$, five terms

Finding a Value

In Exercises 59–62, use the result of Exercise 51 to find N such that $R_N \leq 0.001$ for the convergent series.

59. $\sum_{n=1}^{\infty} \frac{1}{n^4}$

60. $\sum_{n=1}^{\infty} \frac{1}{n^{3/2}}$

61. $\sum_{n=1}^{\infty} e^{-n/2}$

62. $\sum_{n=1}^{\infty} \frac{1}{n^2+1}$

63. Comparing Series

(a) Show that $\sum_{n=2}^{\infty} \frac{1}{n^{1.1}}$ converges and $\sum_{n=2}^{\infty} \frac{1}{n \ln n}$ diverges.

(b) Compare the first five terms of each series in part (a).

(c) Find $n > 3$ such that $\frac{1}{n^{1.1}} < \frac{1}{n \ln n}$.

64. Using a p-Series

Ten terms are used to approximate a convergent p-series. So, the remainder is a function of p and is

$$0 \leq R_{10}(p) \leq \int_{10}^{\infty} \frac{1}{x^p}\,dx, \quad p > 1.$$

(a) Perform the integration in the inequality.

(b) Use a graphing utility to represent the inequality graphically.

(c) Identify any asymptotes of the remainder function and interpret their meaning.

65. Euler's Constant Let

$$S_n = \sum_{k=1}^{n} \frac{1}{k} = 1 + \frac{1}{2} + \cdots + \frac{1}{n}.$$

(a) Show that $\ln(n+1) \le S_n \le 1 + \ln n$.

(b) Show that the sequence $\{a_n\} = \{S_n - \ln n\}$ is bounded.

(c) Show that the sequence $\{a_n\}$ is decreasing.

(d) Show that the sequence $\{a_n\}$ converges to a limit γ (called Euler's constant).

(e) Approximate γ using a_{100}.

66. Finding a Sum Find the sum of the series

$$\sum_{n=2}^{\infty} \ln\left(1 - \frac{1}{n^2}\right).$$

67. Using a Series Consider the series $\sum_{n=2}^{\infty} x^{\ln n}$.

(a) Determine the convergence or divergence of the series for $x = 1$.

(b) Determine the convergence or divergence of the series for $x = 1/e$.

(c) Find the positive values of x for which the series converges.

68. Riemann Zeta Function The **Riemann zeta function** for real numbers is defined for all x for which the series $\zeta(x) = \sum_{n=1}^{\infty} n^{-x}$ converges. Find the domain of the function.

Review **In Exercises 69–80, determine the convergence or divergence of the series.**

69. $\sum_{n=1}^{\infty} \frac{1}{3n-2}$

70. $\sum_{n=2}^{\infty} \frac{1}{n\sqrt{n^2-1}}$

71. $\sum_{n=1}^{\infty} \frac{1}{n\sqrt[4]{n}}$

72. $3\sum_{n=1}^{\infty} \frac{1}{n^{0.95}}$

73. $\sum_{n=0}^{\infty} \left(\frac{2}{3}\right)^n$

74. $\sum_{n=0}^{\infty} \left(\frac{7}{5}\right)^n$

75. $\sum_{n=1}^{\infty} \frac{n}{\sqrt{3n^2+3}}$

76. $\sum_{n=1}^{\infty} \left(\frac{1}{n^2} - \frac{1}{n^3}\right)$

77. $\sum_{n=1}^{\infty} \left(1 + \frac{1}{n}\right)^n$

78. $\sum_{n=4}^{\infty} \ln \frac{n}{2}$

79. $\sum_{n=2}^{\infty} \frac{1}{n(\ln n)^3}$

80. $\sum_{n=3}^{\infty} \frac{1}{n(\ln n)[\ln(\ln n)]^4}$

81. Harmonic Series Verify the equation

$$\frac{1}{n} + \frac{1}{n+1} = \frac{1}{(n+1)/2} + \frac{1}{n(n+1)}.$$

Then use it to show that the harmonic series diverges.

SECTION PROJECT

The Harmonic Series

The harmonic series

$$\sum_{n=1}^{\infty} \frac{1}{n} = 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \cdots + \frac{1}{n} + \cdots$$

is one of the most important series in this chapter. Even though its terms tend to zero as n increases,

$$\lim_{n\to\infty} \frac{1}{n} = 0$$

the harmonic series diverges. In other words, even though the terms are getting smaller and smaller, the sum "adds up to infinity."

(a) One way to show that the harmonic series diverges is attributed to James Bernoulli. He grouped the terms of the harmonic series as follows:

$$1 + \frac{1}{2} + \underbrace{\frac{1}{3} + \frac{1}{4}}_{> \frac{1}{2}} + \underbrace{\frac{1}{5} + \cdots + \frac{1}{8}}_{> \frac{1}{2}} + \underbrace{\frac{1}{9} + \cdots + \frac{1}{16}}_{> \frac{1}{2}} +$$

$$\underbrace{\frac{1}{17} + \cdots + \frac{1}{32}}_{> \frac{1}{2}} + \cdots$$

Write a short paragraph explaining how you can use this grouping to show that the harmonic series diverges.

(b) Use the proof of the Integral Test, Theorem 9.10, to show that

$$\ln(n+1) \le 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \cdots + \frac{1}{n} \le 1 + \ln n.$$

(c) Use part (b) to determine how many terms M you would need so that

$$\sum_{n=1}^{M} \frac{1}{n} > 50.$$

(d) Show that the sum of the first million terms of the harmonic series is less than 15.

(e) Show that the following inequalities are valid.

$$\ln \frac{21}{10} \le \frac{1}{10} + \frac{1}{11} + \cdots + \frac{1}{20} \le \ln \frac{20}{9}$$

$$\ln \frac{201}{100} \le \frac{1}{100} + \frac{1}{101} + \cdots + \frac{1}{200} \le \ln \frac{200}{99}$$

(f) Use the inequalities in part (e) to find the limit

$$\lim_{m\to\infty} \sum_{n=m}^{2m} \frac{1}{n}.$$

9.4 Comparisons of Series

GO DIGITAL

- **Use the Direct Comparison Test to determine whether a series converges or diverges.**
- **Use the Limit Comparison Test to determine whether a series converges or diverges.**

Direct Comparison Test

For the convergence tests developed so far, the terms of the series have to be fairly simple and the series must have special characteristics for the convergence tests to be applied. A slight deviation from these special characteristics can make a test inapplicable. For example, in the pairs listed below, the second series cannot be tested by the same convergence test as the first series, even though it is similar to the first.

1. $\sum_{n=0}^{\infty} \frac{1}{2^n}$ is geometric, but $\sum_{n=0}^{\infty} \frac{n}{2^n}$ is not.
2. $\sum_{n=1}^{\infty} \frac{1}{n^3}$ is a p-series, but $\sum_{n=1}^{\infty} \frac{1}{n^3 + 1}$ is not.
3. $a_n = \frac{n}{(n^2 + 3)^2}$ is easily integrated, but $b_n = \frac{n^2}{(n^2 + 3)^2}$ is not.

In this section, you will study two additional tests for positive-term series. These two tests greatly expand the variety of series you are able to test for convergence or divergence. They allow you to *compare* a series having complicated terms with a simpler series whose convergence or divergence is known.

REMARK As stated, the Direct Comparison Test requires that $0 < a_n \leq b_n$ for all n. Because the convergence of a series is not dependent on its first several terms, you could modify the test to require only that $0 < a_n \leq b_n$ for all n greater than some integer N.

THEOREM 9.12 Direct Comparison Test

Let $0 < a_n \leq b_n$ for all n.

1. If $\sum_{n=1}^{\infty} b_n$ converges, then $\sum_{n=1}^{\infty} a_n$ converges.
2. If $\sum_{n=1}^{\infty} a_n$ diverges, then $\sum_{n=1}^{\infty} b_n$ diverges.

Proof To prove the first property, let $L = \sum_{n=1}^{\infty} b_n$ and let

$$S_n = a_1 + a_2 + \cdots + a_n.$$

Because $0 < a_n \leq b_n$, the sequence $S_1, S_2, S_3, \ldots$ is nondecreasing and bounded above by L. So, it must converge. Because

$$\lim_{n\to\infty} S_n = \sum_{n=1}^{\infty} a_n$$

it follows that $\sum_{n=1}^{\infty} a_n$ converges. The second property is logically equivalent to the first. ∎

FOR FURTHER INFORMATION Is the Direct Comparison Test just for nonnegative series? To read about the generalization of this test to real series, see the article "The Comparison Test—Not Just for Nonnegative Series" by Michele Longo and Vincenzo Valori in *Mathematics Magazine*. To view this article, go to *MathArticles.com*.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

For the given series in Example 1, the sequence of partial sums is less than the sequence of partial sums of the indicated convergent geometric series.
Figure 9.10

EXAMPLE 1 Using the Direct Comparison Test

Determine the convergence or divergence of

$$\sum_{n=1}^{\infty} \frac{1}{2 + 3^n}.$$

Solution This series resembles

$$\sum_{n=1}^{\infty} \frac{1}{3^n}.$$ Convergent geometric series

Term-by-term comparison yields

$$a_n = \frac{1}{2 + 3^n} < \frac{1}{3^n} = b_n, \quad n \geq 1.$$

So, by the Direct Comparison Test, the given series converges. This conclusion is supported by Figure 9.10, which shows that the sequence of partial sums of $\Sigma\, a_n$ is less than the sequence of partial sums of the convergent geometric series $\Sigma\, b_n$.

EXAMPLE 2 Using the Direct Comparison Test

See LarsonCalculus.com for an interactive version of this type of example.

Determine the convergence or divergence of

$$\sum_{n=1}^{\infty} \frac{1}{2 + \sqrt{n}}.$$

Solution This series resembles

$$\sum_{n=1}^{\infty} \frac{1}{n^{1/2}}.$$ Divergent p-series

Term-by-term comparison yields

$$\frac{1}{2 + \sqrt{n}} \leq \frac{1}{\sqrt{n}}, \quad n \geq 1$$

which *does not* meet the requirements for divergence. (Remember that when term-by-term comparison reveals a series that is *less* than a divergent series, the Direct Comparison Test tells you nothing.) Still expecting the series to diverge, you can compare the series with

$$\sum_{n=1}^{\infty} \frac{1}{n}.$$ Divergent harmonic series

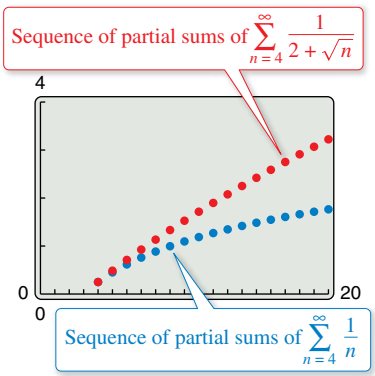
In this case, term-by-term comparison yields

$$a_n = \frac{1}{n} \leq \frac{1}{2 + \sqrt{n}} = b_n, \quad n \geq 4$$

and, by the Direct Comparison Test, the given series diverges (see Figure 9.11). To verify the last inequality, show that

$$2 + \sqrt{n} \leq n$$

whenever $n \geq 4$. ■



For the given series in Example 2, the sequence of partial sums is greater than the sequence of partial sums of the divergent harmonic series.
Figure 9.11

Remember that both parts of the Direct Comparison Test require that $0 < a_n \leq b_n$. Informally, the test says the following about the two series with nonnegative terms.

1. If the "larger" series converges, then the "smaller" series must also converge.
2. If the "smaller" series diverges, then the "larger" series must also diverge.

GO DIGITAL

Limit Comparison Test

Sometimes a series closely resembles a p-series or a geometric series, yet you cannot establish the term-by-term comparison necessary to apply the Direct Comparison Test. Under these circumstances, you may be able to apply a second comparison test, called the **Limit Comparison Test.**

REMARK As with the Direct Comparison Test, the Limit Comparison Test could be modified to require only that a_n and b_n be positive for all n greater than some integer N.

THEOREM 9.13 Limit Comparison Test

If $a_n > 0$, $b_n > 0$, and

$$\lim_{n\to\infty} \frac{a_n}{b_n} = L$$

where L is *finite and positive*, then

$$\sum_{n=1}^{\infty} a_n \quad \text{and} \quad \sum_{n=1}^{\infty} b_n$$

either both converge or both diverge.

Proof Because $a_n > 0$, $b_n > 0$, and

$$\lim_{n\to\infty} \frac{a_n}{b_n} = L$$

there exists $N > 0$ such that

$$0 < \frac{a_n}{b_n} < L + 1, \quad \text{for } n \geq N.$$

This implies that

$$0 < a_n < (L + 1)b_n.$$

So, by the Direct Comparison Test, the convergence of $\Sigma\, b_n$ implies the convergence of $\Sigma\, a_n$. Similarly, the fact that

$$\lim_{n\to\infty} \frac{b_n}{a_n} = \frac{1}{L}$$

can be used to show that the convergence of $\Sigma\, a_n$ implies the convergence of $\Sigma\, b_n$. ■

EXAMPLE 3 Using the Limit Comparison Test

Show that the general harmonic series below diverges.

$$\sum_{n=1}^{\infty} \frac{1}{an + b}, \quad a > 0, \quad b > 0$$

Solution By comparison with

$$\sum_{n=1}^{\infty} \frac{1}{n}$$ Divergent harmonic series

you have

$$\lim_{n\to\infty} \frac{1/(an + b)}{1/n} = \lim_{n\to\infty} \frac{n}{an + b} = \frac{1}{a}.$$

Because this limit is greater than 0, you can conclude from the Limit Comparison Test that the series diverges. ■

The Limit Comparison Test works well for comparing a "messy" algebraic series with a p-series. In choosing an appropriate p-series, you must choose one with an nth term of the same magnitude as the nth term of the given series.

Given Series	Comparison Series	Conclusion
$\sum_{n=1}^{\infty} \frac{1}{3n^2 - 4n + 5}$	$\sum_{n=1}^{\infty} \frac{1}{n^2}$	Both series converge.
$\sum_{n=1}^{\infty} \frac{1}{\sqrt{3n - 2}}$	$\sum_{n=1}^{\infty} \frac{1}{\sqrt{n}}$	Both series diverge.
$\sum_{n=1}^{\infty} \frac{n^2 - 10}{4n^5 + n^3}$	$\sum_{n=1}^{\infty} \frac{n^2}{n^5} = \sum_{n=1}^{\infty} \frac{1}{n^3}$	Both series converge.

In other words, when choosing a series for comparison, you can disregard all but the *highest powers of n* in both the numerator and the denominator.

EXAMPLE 4 Using the Limit Comparison Test

Determine the convergence or divergence of

$$\sum_{n=1}^{\infty} \frac{\sqrt{n}}{n^2 + 1}.$$

Solution Disregarding all but the highest powers of n in the numerator and the denominator, you can compare the series with

$$\sum_{n=1}^{\infty} \frac{\sqrt{n}}{n^2} = \sum_{n=1}^{\infty} \frac{1}{n^{3/2}}.$$ Convergent p-series

Because

$$\lim_{n\to\infty} \frac{a_n}{b_n} = \lim_{n\to\infty} \left(\frac{\sqrt{n}}{n^2 + 1}\right)\left(\frac{n^{3/2}}{1}\right)$$
$$= \lim_{n\to\infty} \frac{n^2}{n^2 + 1}$$
$$= 1$$

you can conclude by the Limit Comparison Test that the series converges.

REMARK Recall when finding limits at $\pm\infty$ of a rational function that if the degree of the numerator is equal to the degree of the denominator, then the limit of the rational function is the ratio of the leading coefficients.

EXAMPLE 5 Using the Limit Comparison Test

Determine the convergence or divergence of

$$\sum_{n=1}^{\infty} \frac{n2^n}{4n^3 + 1}.$$

Solution A reasonable comparison would be with the series

$$\sum_{n=1}^{\infty} \frac{2^n}{n^2}.$$ Divergent series

Note that this series diverges by the nth-Term Test. From the limit

$$\lim_{n\to\infty} \frac{a_n}{b_n} = \lim_{n\to\infty} \left(\frac{n2^n}{4n^3 + 1}\right)\left(\frac{n^2}{2^n}\right)$$
$$= \lim_{n\to\infty} \frac{n^3}{4n^3 + 1}$$
$$= \frac{1}{4}$$

you can conclude by the Limit Comparison Test that the series diverges.

9.4 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. You want to compare the series Σa_n and Σb_n, where $a_n > 0$, $b_n > 0$, and Σb_n converges. For $1 \le n \le 5$, $a_n > b_n$, and for $n \ge 6$, $a_n < b_n$. Explain whether the Direct Comparison Test can be used to compare the two series.
2. When using the Limit Comparison Test, describe how to choose a series for comparison.

Graphical Analysis **In Exercises 3 and 4, the figures show the graphs of the first 10 terms, and the graphs of the first 10 terms of the sequence of partial sums, of each series.**

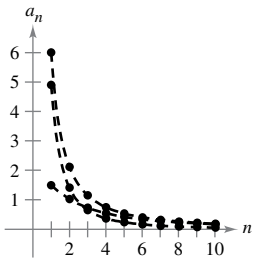
(a) Identify the series in each figure.

(b) Which series is a *p*-series? Does it converge or diverge?

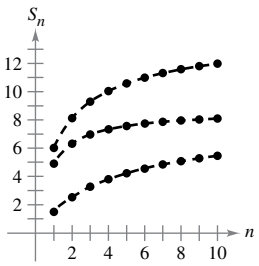
(c) For the series that are not *p*-series, how do the magnitudes of the terms compare with the magnitudes of the terms of the *p*-series? What conclusion can you draw about the convergence or divergence of the series?

(d) Explain the relationship between the magnitudes of the terms of the series and the magnitudes of the terms of the partial sums.

3. $\sum_{n=1}^{\infty} \frac{6}{n^{3/2}}$, $\sum_{n=1}^{\infty} \frac{6}{n^{3/2}+3}$, and $\sum_{n=1}^{\infty} \frac{6}{n\sqrt{n^2+0.5}}$

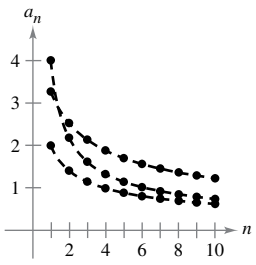


Graphs of terms

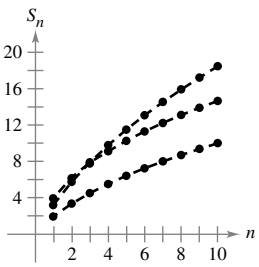


Graphs of partial sums

4. $\sum_{n=1}^{\infty} \frac{2}{\sqrt{n}}$, $\sum_{n=1}^{\infty} \frac{2}{\sqrt{n}-0.5}$, and $\sum_{n=1}^{\infty} \frac{4}{\sqrt{n}+0.5}$



Graphs of terms



Graphs of partial sums

Using the Direct Comparison Test **In Exercises 5–16, use the Direct Comparison Test to determine the convergence or divergence of the series.**

5. $\sum_{n=1}^{\infty} \frac{1}{2n-1}$
6. $\sum_{n=1}^{\infty} \frac{1}{3n^2+2}$
7. $\sum_{n=2}^{\infty} \frac{1}{\sqrt{n}-1}$
8. $\sum_{n=0}^{\infty} \frac{4^n}{5^n+3}$
9. $\sum_{n=2}^{\infty} \frac{\ln n}{n+1}$
10. $\sum_{n=1}^{\infty} \frac{1}{\sqrt{n^3+1}}$
11. $\sum_{n=0}^{\infty} \frac{1}{n!}$
12. $\sum_{n=1}^{\infty} \frac{1}{4\sqrt[3]{n}-1}$
13. $\sum_{n=0}^{\infty} e^{-n^2}$
14. $\sum_{n=1}^{\infty} \frac{6^n+n}{5^n-1}$
15. $\sum_{n=1}^{\infty} \frac{\sin^2 n}{n^3}$
16. $\sum_{n=1}^{\infty} \frac{\cos n + 2}{\sqrt{n}}$

Using the Limit Comparison Test **In Exercises 17–26, use the Limit Comparison Test to determine the convergence or divergence of the series.**

17. $\sum_{n=1}^{\infty} \frac{n}{n^2+1}$
18. $\sum_{n=1}^{\infty} \frac{5}{4^n+1}$
19. $\sum_{n=0}^{\infty} \frac{1}{\sqrt{n^2+1}}$
20. $\sum_{n=1}^{\infty} \frac{2^n+1}{5^n+1}$
21. $\sum_{n=1}^{\infty} \frac{2n^2-1}{3n^5+2n+1}$
22. $\sum_{n=1}^{\infty} \frac{1}{n^2(n^2+4)}$
23. $\sum_{n=1}^{\infty} \frac{1}{n\sqrt{n^2+1}}$
24. $\sum_{n=1}^{\infty} \frac{n}{(n+1)2^{n-1}}$
25. $\sum_{n=1}^{\infty} \frac{n^{k-1}}{n^k+1}$, $k > 2$
26. $\sum_{n=1}^{\infty} \sin\frac{1}{n}$

Determining Convergence or Divergence **In Exercises 27–34, test for convergence or divergence, using each test at least once. Identify which test was used.**

(a) *n*th-Term Test

(b) Geometric Series Test

(c) *p*-Series Test

(d) Telescoping Series Test

(e) Integral Test

(f) Direct Comparison Test

(g) Limit Comparison Test

27. $\sum_{n=1}^{\infty} \frac{\sqrt[3]{n}}{n}$
28. $\sum_{n=0}^{\infty} 5\left(-\frac{4}{3}\right)^n$
29. $\sum_{n=1}^{\infty} \frac{1}{5^n+1}$
30. $\sum_{n=3}^{\infty} \frac{1}{n^3-8}$
31. $\sum_{n=1}^{\infty} \frac{2n}{3n-2}$
32. $\sum_{n=1}^{\infty} \left(\frac{1}{n+1} - \frac{1}{n+2}\right)$
33. $\sum_{n=1}^{\infty} \frac{n}{(n^2+1)^2}$
34. $\sum_{n=1}^{\infty} \frac{3}{n(n+3)}$

35. Using the Limit Comparison Test Use the Limit Comparison Test with the harmonic series to show that the series Σa_n (where $0 < a_n < a_{n-1}$) diverges when $\lim_{n\to\infty} na_n$ is finite and nonzero.

36. Proof Prove that, if $P(n)$ and $Q(n)$ are polynomials of degree j and k, respectively, then the series

$$\sum_{n=1}^{\infty} \frac{P(n)}{Q(n)}$$

converges if $j < k - 1$ and diverges if $j \geq k - 1$.

Determining Convergence or Divergence **In Exercises 37–40, use the polynomial test given in Exercise 36 to determine whether the series converges or diverges.**

37. $\frac{1}{2} + \frac{2}{5} + \frac{3}{10} + \frac{4}{17} + \frac{5}{26} + \cdots$

38. $\frac{1}{3} + \frac{1}{8} + \frac{1}{15} + \frac{1}{24} + \frac{1}{35} + \cdots$

39. $\sum_{n=1}^{\infty} \frac{1}{n^3 + 1}$

40. $\sum_{n=1}^{\infty} \frac{4n^5 + n^2 + 1}{n^4}$

Verifying Divergence **In Exercises 41 and 42, use the divergence test given in Exercise 35 to show that the series diverges.**

41. $\sum_{n=1}^{\infty} \frac{n^3}{5n^4 + 3}$

42. $\sum_{n=1}^{\infty} \frac{3n^2 + 1}{4n^3 + 2}$

Determining Convergence or Divergence **In Exercises 43–46, determine the convergence or divergence of the series.**

43. $\frac{1}{200} + \frac{1}{400} + \frac{1}{600} + \frac{1}{800} + \cdots$

44. $\frac{1}{200} + \frac{1}{208} + \frac{1}{216} + \frac{1}{224} + \cdots$

45. $\frac{1}{201} + \frac{1}{204} + \frac{1}{209} + \frac{1}{216} + \cdots$

46. $\frac{1}{201} + \frac{1}{208} + \frac{1}{227} + \frac{1}{264} + \cdots$

Exploring Concepts

47. Review the results of Exercises 43–46. Explain why careful analysis is required to determine the convergence or divergence of a series and why considering only the magnitudes of the terms of a series could be misleading.

48. It appears that the terms of the series

$$\frac{1}{1000} + \frac{1}{1001} + \frac{1}{1002} + \frac{1}{1003} + \cdots$$

are less than the corresponding terms of the convergent series

$$1 + \frac{1}{4} + \frac{1}{9} + \frac{1}{16} + \cdots.$$

If the statement above is correct, then the first series converges. Is this correct? Why or why not? Make a statement about how the divergence or convergence of a series is affected by the inclusion or exclusion of the first finite number of terms.

49. Using a Series Consider the series $\sum_{n=1}^{\infty} \frac{1}{(2n-1)^2}$.

(a) Verify that the series converges.

(b) Use a graphing utility to complete the table.

n	5	10	20	50	100
S_n					

(c) The sum of the series is $\pi^2/8$. Find the sum of the series

$$\sum_{n=3}^{\infty} \frac{1}{(2n-1)^2}.$$

(d) Use a graphing utility to find the sum of the series

$$\sum_{n=10}^{\infty} \frac{1}{(2n-1)^2}.$$

50. Using a Series Consider the series $\sum_{n=1}^{\infty} \frac{1}{(n+2)^2}$.

(a) Verify that the series converges.

(b) Use a graphing utility to complete the table.

n	5	10	20	50	100
S_n					

(c) The sum of the series is $(\pi^2/6) - (5/4)$. Find the sum of the series

$$\sum_{n=6}^{\infty} \frac{1}{(n+2)^2}.$$

(d) Use a graphing utility to find the sum of the series

$$\sum_{n=15}^{\infty} \frac{1}{(n+2)^2}.$$

51. Decimal Representation of a Number Show that the series

$$\frac{x_1}{10} + \frac{x_2}{10^2} + \frac{x_3}{10^3} + \frac{x_4}{10^4} + \cdots$$

converges, where x_i is one of the numbers 0, 1, 2, . . ., 9.

52. HOW DO YOU SEE IT? The figure shows the first 20 terms of the series Σc_n using squares and the first 20 terms of the series Σd_n using circles. If Σd_n converges, can you determine anything about the convergence or divergence of Σc_n? Explain.

True or False? **In Exercises 53–57, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

53. If $0 < a_n \le b_n$ and $\sum_{n=1}^{\infty} a_n$ converges, then $\sum_{n=1}^{\infty} b_n$ diverges.

54. If $0 < a_{n+10} \le b_n$ and $\sum_{n=1}^{\infty} b_n$ converges, then $\sum_{n=1}^{\infty} a_n$ converges.

55. If $a_n + b_n \le c_n$ and $\sum_{n=1}^{\infty} c_n$ converges, then the series $\sum_{n=1}^{\infty} a_n$ and $\sum_{n=1}^{\infty} b_n$ both converge. (Assume that the terms of all three series are positive.)

56. If $a_n \le b_n + c_n$ and $\sum_{n=1}^{\infty} a_n$ diverges, then the series $\sum_{n=1}^{\infty} b_n$ and $\sum_{n=1}^{\infty} c_n$ both diverge. (Assume that the terms of all three series are positive.)

57. If $0 < a_n \le b_n$ and $\sum_{n=1}^{\infty} a_n$ diverges, then $\sum_{n=1}^{\infty} b_n$ diverges.

58. Proof Prove that the series

$$\sum_{n=1}^{\infty} \frac{1}{1 + 2 + 3 + \cdots + n}$$

converges.

59. Proof Prove that if the nonnegative series

$$\sum_{n=1}^{\infty} a_n \quad \text{and} \quad \sum_{n=1}^{\infty} b_n$$

converge, then so does the series $\sum_{n=1}^{\infty} a_n b_n$.

60. Proof Use the result of Exercise 59 to prove that if the nonnegative series

$$\sum_{n=1}^{\infty} a_n$$

converges, then so does the series $\sum_{n=1}^{\infty} {a_n}^2$.

61. Finding Series Find two series that demonstrate the result of Exercise 59.

62. Finding Series Find two series that demonstrate the result of Exercise 60.

63. Proof Let Σa_n and Σb_n be series with positive terms. Prove that if

$$\lim_{n\to\infty} \frac{a_n}{b_n} = 0$$

and Σb_n converges, then Σa_n also converges.

64. Proof Let Σa_n and Σb_n be series with positive terms. Prove that if

$$\lim_{n\to\infty} \frac{a_n}{b_n} = \infty$$

and Σb_n diverges, then Σa_n also diverges.

65. Verifying Convergence Use the result of Exercise 63 to show that each series converges.

(a) $\sum_{n=1}^{\infty} \frac{1}{(n+1)^3}$

(b) $\sum_{n=1}^{\infty} \frac{1}{\sqrt{n}\pi^n}$

(c) $\sum_{n=2}^{\infty} \frac{\ln n}{n^3}$

(d) $\sum_{n=1}^{\infty} \frac{n^2+1}{e^n}$

66. Verifying Divergence Use the result of Exercise 64 to show that each series diverges.

(a) $\sum_{n=1}^{\infty} (n+2)^2$

(b) $\sum_{n=1}^{\infty} \frac{\ln n}{n}$

(c) $\sum_{n=2}^{\infty} \frac{1}{\ln n}$

(d) $\sum_{n=1}^{\infty} \frac{e^n}{\sqrt{n}}$

67. Proof Let Σa_n be a series with positive terms. Prove that if Σa_n converges, then $\Sigma \sin a_n$ also converges.

68. Determining Convergence or Divergence Determine whether the every-other-term harmonic series

$$1 + \frac{1}{3} + \frac{1}{5} + \frac{1}{7} + \cdots$$

converges or diverges.

69. Comparing Series Show that

$$\sum_{n=1}^{\infty} \frac{\ln n}{n\sqrt{n}}$$

converges by comparison with

$$\sum_{n=1}^{\infty} \frac{1}{n^{5/4}}.$$

70. Determining Convergence or Divergence Determine the convergence or divergence of the series

$$\sum_{n=1}^{\infty} \left(\sin \frac{1}{2n} - \sin \frac{1}{2n+1} \right).$$

PUTNAM EXAM CHALLENGE

71. Is the infinite series

$$\sum_{n=1}^{\infty} \frac{1}{n^{(n+1)/n}}$$

convergent? Prove your statement.

72. Prove that if $\sum_{n=1}^{\infty} a_n$ is a convergent series of positive real numbers, then so is

$$\sum_{n=1}^{\infty} (a_n)^{n/(n+1)}.$$

9.5 Alternating Series

GO DIGITAL

- **Use the Alternating Series Test to determine whether an infinite series converges.**
- **Use the Alternating Series Remainder to approximate the sum of an alternating series.**
- **Classify a convergent series as absolutely or conditionally convergent.**
- **Rearrange an infinite series to obtain a different sum.**

Alternating Series Test

So far, most series you have studied have had positive terms. In this section and the next section, you will study series that contain both positive and negative terms. The simplest such series is an **alternating series,** whose terms alternate in sign. For example, the geometric series

$$\sum_{n=0}^{\infty}\left(-\frac{1}{2}\right)^n = \sum_{n=0}^{\infty}(-1)^n\frac{1}{2^n} = 1 - \frac{1}{2} + \frac{1}{4} - \frac{1}{8} + \frac{1}{16} - \cdots$$

is an *alternating geometric series* with $r = -\frac{1}{2}$. Alternating series occur in two ways: either the odd terms are negative or the even terms are negative.

THEOREM 9.14 Alternating Series Test

Let $a_n > 0$. The alternating series

$$\sum_{n=1}^{\infty}(-1)^n a_n \quad \text{and} \quad \sum_{n=1}^{\infty}(-1)^{n+1} a_n$$

converge when these two conditions are met.

1. $\lim_{n\to\infty} a_n = 0$ **2.** $a_{n+1} \le a_n$, for all n

REMARK The second condition in the Alternating Series Test can be modified to require only that $0 < a_{n+1} \le a_n$ for all n greater than some integer N.

Proof Consider the alternating series

$$\sum_{n=1}^{\infty}(-1)^{n+1}a_n$$

where $a_n > 0$. For this series, the partial sum (where $2n$ is even)

$$S_{2n} = (a_1 - a_2) + (a_3 - a_4) + (a_5 - a_6) + \cdots + (a_{2n-1} - a_{2n})$$

has all nonnegative terms, and therefore $\{S_{2n}\}$ is a nondecreasing sequence. But you can also write this partial sum as

$$S_{2n} = a_1 - (a_2 - a_3) - (a_4 - a_5) - \cdots - (a_{2n-2} - a_{2n-1}) - a_{2n}$$

which implies that $S_{2n} \le a_1$ for every integer n. So, $\{S_{2n}\}$ is a bounded, nondecreasing sequence that converges to some value L. Because $S_{2n-1} - a_{2n} = S_{2n}$ and $a_{2n} \to 0$,

$$\begin{aligned}\lim_{n\to\infty} S_{2n-1} &= \lim_{n\to\infty}(S_{2n} + a_{2n}) && S_{2n-1} = S_{2n} + a_{2n}\\ &= \lim_{n\to\infty} S_{2n} + \lim_{n\to\infty} a_{2n} && \text{Property of limits}\\ &= L + \lim_{n\to\infty} a_{2n}\\ &= L.\end{aligned}$$

Because both S_{2n} and S_{2n-1} converge to the same limit L, it follows that $\{S_n\}$ also converges to L. Consequently, the given alternating series converges. A similar proof can be made for $\sum_{n=1}^{\infty}(-1)^n a_n$. ∎

EXAMPLE 1 Using the Alternating Series Test

REMARK The series in Example 1 is called the *alternating harmonic series*. More is said about this series in Example 8.

Determine the convergence or divergence of

$$\sum_{n=1}^{\infty} (-1)^{n+1} \frac{1}{n}.$$

Solution Note that $\lim_{x\to\infty} a_n = \lim_{n\to\infty} (1/n) = 0$. So, the first condition of Theorem 9.14 is satisfied. Also note that the second condition of Theorem 9.14 is satisfied because

$$a_{n+1} = \frac{1}{n+1} \leq \frac{1}{n} = a_n$$

for all n. So, by the Alternating Series Test, the series converges.

EXAMPLE 2 Using the Alternating Series Test

Determine the convergence or divergence of

$$\sum_{n=1}^{\infty} \frac{n}{(-2)^{n-1}}.$$

Solution To apply the Alternating Series Test, note that, for $n \geq 1$,

$$\begin{aligned} \frac{1}{2} &\leq \frac{n}{n+1} \\ \frac{2^{n-1}}{2^n} &\leq \frac{n}{n+1} \\ (n+1)2^{n-1} &\leq n2^n \\ \frac{n+1}{2^n} &\leq \frac{n}{2^{n-1}}. \end{aligned}$$

So, $a_{n+1} = (n+1)/2^n \leq n/2^{n-1} = a_n$ for all n. Furthermore, by L'Hôpital's Rule,

$$\lim_{x\to\infty} \frac{x}{2^{x-1}} = \lim_{x\to\infty} \frac{1}{2^{x-1}(\ln 2)} = 0 \quad \Rightarrow \quad \lim_{n\to\infty} \frac{n}{2^{n-1}} = 0.$$

Therefore, by the Alternating Series Test, the series converges.

EXAMPLE 3 When the Alternating Series Test Does Not Apply

REMARK In Example 3(a), remember that whenever a series does not satisfy the first condition of the Alternating Series Test, you can use the nth-Term Test for Divergence to conclude that the series diverges.

a. The alternating series

$$\sum_{n=1}^{\infty} \frac{(-1)^{n+1}(n+1)}{n} = \frac{2}{1} - \frac{3}{2} + \frac{4}{3} - \frac{5}{4} + \frac{6}{5} - \cdots$$

satisfies the second condition of the Alternating Series Test because $a_{n+1} \leq a_n$ for all n. You cannot apply the Alternating Series Test, however, because the series does not satisfy the first condition. In fact, the series diverges.

b. The alternating series

$$\frac{2}{1} - \frac{1}{1} + \frac{2}{2} - \frac{1}{2} + \frac{2}{3} - \frac{1}{3} + \frac{2}{4} - \frac{1}{4} + \cdots$$

satisfies the first condition because a_n approaches 0 as $n \to \infty$. You cannot apply the Alternating Series Test, however, because the series does not satisfy the second condition. To conclude that the series diverges, you can argue that S_{2N} equals the Nth partial sum of the divergent harmonic series. This implies that the sequence of partial sums diverges. So, the series diverges. ■

Alternating Series Remainder

For a convergent alternating series, the partial sum S_N can be a useful approximation for the sum S of the series. The error involved in using $S \approx S_N$ is the remainder $R_N = S - S_N$.

THEOREM 9.15 Alternating Series Remainder

If a convergent alternating series satisfies the condition $a_{n+1} \leq a_n$, then the absolute value of the remainder R_N involved in approximating the sum S by S_N is less than (or equal to) the first neglected term. That is,

$$|S - S_N| = |R_N| \leq a_{N+1}.$$

A proof of this theorem is given in Appendix A.

EXAMPLE 4 Approximating the Sum of an Alternating Series

See LarsonCalculus.com for an interactive version of this type of example.

Approximate the sum of the series by its first six terms.

$$\sum_{n=1}^{\infty} (-1)^{n+1}\left(\frac{1}{n!}\right) = \frac{1}{1!} - \frac{1}{2!} + \frac{1}{3!} - \frac{1}{4!} + \frac{1}{5!} - \frac{1}{6!} + \cdots$$

Solution The series converges by the Alternating Series Test because

$$\frac{1}{(n+1)!} \leq \frac{1}{n!} \quad \text{and} \quad \lim_{n\to\infty} \frac{1}{n!} = 0.$$

The sum of the first six terms is

$$S_6 = 1 - \frac{1}{2} + \frac{1}{6} - \frac{1}{24} + \frac{1}{120} - \frac{1}{720} = \frac{91}{144} \approx 0.63194$$

and, by the Alternating Series Remainder, you have

$$|S - S_6| = |R_6| \leq a_7 = \frac{1}{5040} \approx 0.0002.$$

So, the sum S lies between $0.63194 - 0.0002$ and $0.63194 + 0.0002$, and you have $0.63174 \leq S \leq 0.63214$.

TECHNOLOGY

Later, using the techniques in Section 9.10, you will be able to show that the series in Example 4 converges to

$$\frac{e-1}{e} \approx 0.63212.$$

(See Section 9.10, Exercise 58.) For now, try using a graphing utility to obtain an approximation of the sum of the series. How many terms do you need to obtain an approximation that is within 0.00001 of the actual sum?

EXAMPLE 5 Finding the Number of Terms

Determine the number of terms required to approximate the sum of the series with an error of less than 0.001.

$$\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n^4}$$

Solution By Theorem 9.15, you know that

$$|R_N| \leq a_{N+1} = \frac{1}{(N+1)^4}.$$

For an error of less than 0.001, N must satisfy the inequality $1/(N+1)^4 < 0.001$.

$$\frac{1}{(N+1)^4} < 0.001 \quad \Rightarrow \quad (N+1)^4 > 1000 \quad \Rightarrow \quad N > \sqrt[4]{1000} - 1 \approx 4.6$$

So, you will need at least five terms. Using five terms, the sum is $S \approx S_5 \approx 0.94754$, which has an error of less than 0.001.

Absolute and Conditional Convergence

Occasionally, a series may have both positive and negative terms and not be an alternating series. For instance, the series

$$\sum_{n=1}^{\infty} \frac{\sin n}{n^2} = \frac{\sin 1}{1} + \frac{\sin 2}{4} + \frac{\sin 3}{9} + \cdots$$

has both positive and negative terms, yet it is not an alternating series. One way to obtain some information about the convergence of this series is to investigate the convergence of the series

$$\sum_{n=1}^{\infty} \left| \frac{\sin n}{n^2} \right|.$$

By direct comparison, you have $|\sin n| \leq 1$ for all n, so

$$\left| \frac{\sin n}{n^2} \right| \leq \frac{1}{n^2}, \quad n \geq 1.$$

Therefore, by the Direct Comparison Test, the series $\Sigma\, |(\sin n)/n^2|$ converges. The next theorem tells you that the original series also converges.

THEOREM 9.16 Absolute Convergence

If the series $\Sigma\, |a_n|$ converges, then the series $\Sigma\, a_n$ also converges.

Proof Because $0 \leq a_n + |a_n| \leq 2|a_n|$ for all n, the series

$$\sum_{n=1}^{\infty} (a_n + |a_n|)$$

converges by comparison with the convergent series

$$\sum_{n=1}^{\infty} 2|a_n|.$$

Furthermore, because $a_n = (a_n + |a_n|) - |a_n|$, you can write

$$\sum_{n=1}^{\infty} a_n = \sum_{n=1}^{\infty} (a_n + |a_n|) - \sum_{n=1}^{\infty} |a_n|$$

where both series on the right converge. So, it follows that $\Sigma\, a_n$ converges. ∎

The converse of Theorem 9.16 is not true. For instance, the **alternating harmonic series**

$$\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n} = \frac{1}{1} - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \cdots$$

converges by the Alternating Series Test. Yet the harmonic series diverges. This type of convergence is called **conditional.**

Definitions of Absolute and Conditional Convergence

1. The series $\Sigma\, a_n$ is **absolutely convergent** when $\Sigma\, |a_n|$ converges.
2. The series $\Sigma\, a_n$ is **conditionally convergent** when $\Sigma\, a_n$ converges but $\Sigma\, |a_n|$ diverges.

GO DIGITAL

EXAMPLE 6 Absolute and Conditional Convergence

Determine whether each of the series is convergent or divergent. Classify any convergent series as absolutely or conditionally convergent.

a. $\displaystyle\sum_{n=0}^{\infty} \frac{(-1)^n n!}{2^n} = \frac{0!}{2^0} - \frac{1!}{2^1} + \frac{2!}{2^2} - \frac{3!}{2^3} + \cdots$

b. $\displaystyle\sum_{n=1}^{\infty} \frac{(-1)^n}{\sqrt{n}} = -\frac{1}{\sqrt{1}} + \frac{1}{\sqrt{2}} - \frac{1}{\sqrt{3}} + \frac{1}{\sqrt{4}} - \cdots$

Solution

a. This is an alternating series, but the Alternating Series Test does not apply because the limit of the nth term is not zero. By the nth-Term Test for Divergence, however, you can conclude that this series diverges.

b. This series can be shown to be convergent by the Alternating Series Test. Moreover, because the p-series

$$\sum_{n=1}^{\infty} \left|\frac{(-1)^n}{\sqrt{n}}\right| = \frac{1}{\sqrt{1}} + \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{3}} + \frac{1}{\sqrt{4}} + \cdots$$

diverges, the given series is *conditionally* convergent.

EXAMPLE 7 Absolute and Conditional Convergence

Determine whether each of the series is convergent or divergent. Classify any convergent series as absolutely or conditionally convergent.

a. $\displaystyle\sum_{n=1}^{\infty} \frac{(-1)^{n(n+1)/2}}{3^n} = -\frac{1}{3} - \frac{1}{9} + \frac{1}{27} + \frac{1}{81} - \cdots$

b. $\displaystyle\sum_{n=1}^{\infty} \frac{(-1)^n}{\ln(n+1)} = -\frac{1}{\ln 2} + \frac{1}{\ln 3} - \frac{1}{\ln 4} + \frac{1}{\ln 5} - \cdots$

Solution

a. This is *not* an alternating series (the signs change in pairs). However, note that

$$\sum_{n=1}^{\infty} \left|\frac{(-1)^{n(n+1)/2}}{3^n}\right| = \sum_{n=1}^{\infty} \frac{1}{3^n}$$

is a convergent geometric series, with

$$r = \frac{1}{3}.$$

Consequently, by Theorem 9.16, you can conclude that the given series is *absolutely* convergent (and therefore convergent).

b. In this case, the Alternating Series Test indicates that the series converges. However, the series

$$\sum_{n=1}^{\infty} \left|\frac{(-1)^n}{\ln(n+1)}\right| = \frac{1}{\ln 2} + \frac{1}{\ln 3} + \frac{1}{\ln 4} + \cdots$$

diverges by direct comparison with the terms of the harmonic series. Therefore, the given series is *conditionally* convergent. ■

■ **FOR FURTHER INFORMATION** To read more about the convergence of alternating harmonic series, see the article "Almost Alternating Harmonic Series" by Curtis Feist and Ramin Naimi in *The College Mathematics Journal*. To view this article, go to *MathArticles.com*.

Rearrangement of Series

A finite sum such as

$$1 + 3 - 2 + 5 - 4$$

can be rearranged without changing the value of the sum. This is not necessarily true of an infinite series—it depends on whether the series is absolutely convergent or conditionally convergent.

1. If a series is *absolutely convergent,* then its terms can be rearranged in any order without changing the sum of the series.
2. If a series is *conditionally convergent,* then its terms can be rearranged to give a different sum.

The second case is illustrated in Example 8.

EXAMPLE 8 **Rearrangement of a Series**

FOR FURTHER INFORMATION Georg Friedrich Bernhard Riemann (1826–1866) proved that if $\Sigma\, a_n$ is conditionally convergent and S is any real number, then the terms of the series can be rearranged to converge to S. For more on this topic, see the article "Riemann's Rearrangement Theorem" by Stewart Galanor in *Mathematics Teacher.* To view this article, go to *MathArticles.com.*

The alternating harmonic series converges to ln 2. That is,

$$\sum_{n=1}^{\infty} (-1)^{n+1}\frac{1}{n} = \frac{1}{1} - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \cdots = \ln 2.$$

See Exercise 55, Section 9.10.

Rearrange the terms of the series to produce a different sum.

Solution Consider the rearrangement below.

$$\begin{aligned}
&1 - \frac{1}{2} - \frac{1}{4} + \frac{1}{3} - \frac{1}{6} - \frac{1}{8} + \frac{1}{5} - \frac{1}{10} - \frac{1}{12} + \frac{1}{7} - \frac{1}{14} - \cdots \\
&= \left(1 - \frac{1}{2}\right) - \frac{1}{4} + \left(\frac{1}{3} - \frac{1}{6}\right) - \frac{1}{8} + \left(\frac{1}{5} - \frac{1}{10}\right) - \frac{1}{12} + \left(\frac{1}{7} - \frac{1}{14}\right) - \cdots \\
&= \frac{1}{2} - \frac{1}{4} + \frac{1}{6} - \frac{1}{8} + \frac{1}{10} - \frac{1}{12} + \frac{1}{14} - \cdots \\
&= \frac{1}{2}\left(1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \frac{1}{6} + \frac{1}{7} - \cdots\right) \\
&= \frac{1}{2}(\ln 2)
\end{aligned}$$

By rearranging the terms, you obtain a sum that is half the original sum. ■

Exploration

In Example 8, you learned that the alternating harmonic series

$$\sum_{n=1}^{\infty} (-1)^{n+1}\frac{1}{n} = 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \frac{1}{6} + \cdots$$

converges to $\ln 2 \approx 0.693$. Rearrangement of the terms of the series produces a different sum, $\frac{1}{2}\ln 2 \approx 0.347$.

Below, the terms of the alternating harmonic series have been rearranged in such a way that two positive terms follow each negative term.

$$1 - \frac{1}{2} + \frac{1}{3} + \frac{1}{5} - \frac{1}{4} + \frac{1}{7} + \frac{1}{9} - \frac{1}{6} + \frac{1}{11} + \cdots$$

Calculate the partial sums S_4, S_7, S_{10}, S_{13}, S_{16}, and S_{19}. Then estimate the sum of this series to three decimal places.

GO DIGITAL

Concept Check

1. An alternating series does not meet the first condition of the Alternating Series Test. What can you conclude about the convergence or divergence of the series? Explain.
2. What is the remainder of a convergent alternating series whose sum is approximated by the first N terms?
3. Describe the difference between absolute and conditional convergence of an alternating series.
4. Explain whether rearranging the terms of a convergent series changes the sum of the series.

Numerical and Graphical Analysis **In Exercises 5–8, explore the Alternating Series Remainder.**

(a) Use a graphing utility to find the indicated partial sum S_n and complete the table.

n	1	2	3	4	5	6	7	8	9	10
S_n										

(b) Use a graphing utility to graph the first 10 terms of the sequence of partial sums and a horizontal line representing the sum.

(c) What pattern exists between the plot of the successive points in part (b) relative to the horizontal line representing the sum of the series? Do the distances between the successive points and the horizontal line increase or decrease?

(d) Discuss the relationship between the answers in part (c) and the Alternating Series Remainder as given in Theorem 9.15.

5. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n-1}}{2n-1}=\frac{\pi}{4}$

6. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n-1}}{(n-1)!}=\frac{1}{e}$

7. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n-1}}{n^2}=\frac{\pi^2}{12}$

8. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n-1}}{(2n-1)!}=\sin 1$

Determining Convergence or Divergence **In Exercises 9–30, determine the convergence or divergence of the series.**

9. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n+1}}{n+1}$

10. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n+1}\,n}{3n+2}$

11. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n}}{3^n}$

12. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n}}{e^n}$

13. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n}(5n-1)}{4n+1}$

14. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n+1}\,n}{n^2+5}$

15. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n}\,n}{\ln(n+1)}$

16. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n}}{\ln(n+1)}$

17. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n}}{\sqrt{n}}$

18. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n+1}\,n^2}{n^2+4}$

19. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n+1}(n+1)}{\ln(n+1)}$

20. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n+1}\ln(n+1)}{n+1}$

21. $\displaystyle\sum_{n=1}^{\infty}\sin\frac{(2n-1)\pi}{2}$

22. $\displaystyle\sum_{n=1}^{\infty}\frac{1}{n}\cos n\pi$

23. $\displaystyle\sum_{n=0}^{\infty}\frac{(-1)^{n}}{n!}$

24. $\displaystyle\sum_{n=0}^{\infty}\frac{(-1)^{n}}{(2n+1)!}$

25. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n+1}\sqrt{n}}{n+2}$

26. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n+1}\sqrt{n}}{\sqrt[3]{n}}$

27. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n+1}\,n!}{1\cdot 3\cdot 5\cdot\cdots\cdot(2n-1)}$

28. $\displaystyle\sum_{n=1}^{\infty}(-1)^{n+1}\frac{1\cdot 3\cdot 5\cdot\cdots\cdot(2n-1)}{1\cdot 4\cdot 7\cdot\cdots\cdot(3n-2)}$

29. $\displaystyle\sum_{n=1}^{\infty}\frac{2(-1)^{n+1}}{e^n-e^{-n}}=\sum_{n=1}^{\infty}(-1)^{n+1}\operatorname{csch} n$

30. $\displaystyle\sum_{n=1}^{\infty}\frac{2(-1)^{n+1}}{e^n+e^{-n}}=\sum_{n=1}^{\infty}(-1)^{n+1}\operatorname{sech} n$

Approximating the Sum of an Alternating Series **In Exercises 31–34, approximate the sum of the series by using the first six terms. (See Example 4.)**

31. $\displaystyle\sum_{n=0}^{\infty}\frac{(-1)^{n}\,5}{n!}$

32. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n+1}\,4}{\ln(n+1)}$

33. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n+1}\,2}{n^3}$

34. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n+1}\,n}{3^n}$

Finding the Number of Terms **In Exercises 35–40, use Theorem 9.15 to determine the number of terms required to approximate the sum of the series with an error of less than 0.001.**

35. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n+1}}{n^3}$

36. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n+1}}{n^2}$

37. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n+1}}{2n^3-1}$

38. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n+1}}{n^5}$

39. $\displaystyle\sum_{n=0}^{\infty}\frac{(-1)^{n}}{n!}$

40. $\displaystyle\sum_{n=0}^{\infty}\frac{(-1)^{n}}{(2n)!}$

Determining Absolute and Conditional Convergence **In Exercises 41–58, determine whether the series converges absolutely or conditionally, or diverges.**

41. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n}}{2^n}$

42. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n+1}}{n^2}$

43. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n}}{n!}$

44. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n+1}}{n+3}$

45. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n+1}}{\sqrt{n}}$

46. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n+1}}{n\sqrt{n}}$

47. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n+1}\,n^2}{(n+1)^2}$

48. $\displaystyle\sum_{n=1}^{\infty}\frac{(-1)^{n+1}n}{5n+1}$

49. $\displaystyle\sum_{n=2}^{\infty}\frac{(-1)^{n}}{n\ln n}$

50. $\displaystyle\sum_{n=0}^{\infty}(-1)^{n}\,e^{-n^2}$

58. $\sum_{n=1}^{\infty} \frac{\sin[(2n-1)\pi/2]}{n}$

Exploring Concepts

59. Determine whether S_{50} is an underestimate or an overestimate of the sum of the alternating series below. Explain.

$$\sum_{n=1}^{\infty} \frac{(-1)^n}{n}$$

60. Give an example of convergent alternating series Σa_n and Σb_n such that $\Sigma a_n b_n$ diverges.

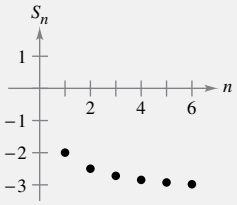
61. Do you agree with the following statements? Why or why not?

(a) If both Σa_n and $\Sigma(-a_n)$ converge, then $\Sigma |a_n|$ converges.

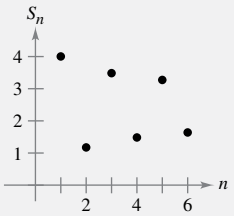
(b) If Σa_n diverges, then $\Sigma |a_n|$ diverges.

62. HOW DO YOU SEE IT? The graphs of the sequences of partial sums of two series are shown in the figures. Which graph represents the partial sums of an alternating series? Explain.

(a)



(b)



Finding Values **In Exercises 63 and 64, find the values of p for which the series converges.**

63. $\sum_{n=1}^{\infty} (-1)^n \left(\frac{1}{n^p}\right)$

64. $\sum_{n=1}^{\infty} (-1)^n \left(\frac{1}{n+p}\right)$

65. Proof Prove that if $\Sigma |a_n|$ converges, then Σa_n^2 converges. Is the converse true? If not, give an example that shows it is false.

66. Finding a Series Use the result of Exercise 63 to give an example of an alternating p-series that converges but whose corresponding p-series diverges.

67. Finding Values Find all values of x for which the series

$$\sum_{n=1}^{\infty} \frac{x^n}{n}$$

(a) converges absolutely and (b) converges conditionally.

68. Using a Series Use the series for $\ln 2$ in Example 8 to show that

$$2 = \frac{e^1}{e^{1/2}} \cdot \frac{e^{1/3}}{e^{1/4}} \cdot \frac{e^{1/5}}{e^{1/6}} \cdot \frac{e^{1/7}}{e^{1/8}} \cdot \cdots$$

Using a Series **In Exercises 69 and 70, use the given series.**

(a) Does the series meet the conditions of Theorem 9.14? Explain why or why not.

(b) Does the series converge? If so, what is the sum?

69. $\frac{1}{2} - \frac{1}{3} + \frac{1}{4} - \frac{1}{9} + \frac{1}{8} - \frac{1}{27} + \cdots + \frac{1}{2^n} - \frac{1}{3^n} + \cdots$

70. $\sum_{n=1}^{\infty} (-1)^{n+1} a_n,\ a_n = \begin{cases} \frac{1}{\sqrt{n}}, & \text{if } n \text{ is odd} \\ \frac{1}{n^3}, & \text{if } n \text{ is even} \end{cases}$

Review **In Exercises 71–80, determine the convergence or divergence of the series and identify the test used.**

71. $\sum_{n=1}^{\infty} \frac{8}{\sqrt[3]{n}}$

72. $\sum_{n=1}^{\infty} \frac{3n+5}{n^3 + 2n^2 + 4}$

73. $\sum_{n=1}^{\infty} \frac{3^n}{n^2}$

74. $\sum_{n=1}^{\infty} \frac{1}{6^n - 5}$

75. $\sum_{n=1}^{\infty} \left(\frac{9}{8}\right)^n$

76. $\sum_{n=1}^{\infty} \frac{2n^2}{(n+1)^2}$

77. $\sum_{n=1}^{\infty} 100e^{-n/2}$

78. $\sum_{n=0}^{\infty} \frac{(-1)^n}{n+4}$

79. $\sum_{n=1}^{\infty} \frac{(-1)^{n+1} 4}{3n^2 - 1}$

80. $\sum_{n=2}^{\infty} \frac{\ln n}{n}$

81. Describing an Error The following argument, that $0 = 1$, is *incorrect*. Describe the error.

$$\begin{aligned} 0 &= 0 + 0 + 0 + \cdots \\ &= (1 - 1) + (1 - 1) + (1 - 1) + \cdots \\ &= 1 + (-1 + 1) + (-1 + 1) + \cdots \\ &= 1 + 0 + 0 + \cdots \\ &= 1 \end{aligned}$$

PUTNAM EXAM CHALLENGE

82. Assume as known the (true) fact that the alternating harmonic series

(1) $1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \frac{1}{6} + \frac{1}{7} - \frac{1}{8} + \cdots$

is convergent, and denote its sum by s. Rearrange the series (1) as follows:

(2) $1 + \frac{1}{3} - \frac{1}{2} + \frac{1}{5} + \frac{1}{7} - \frac{1}{4} + \frac{1}{9} + \frac{1}{11} - \frac{1}{6} + \cdots$.

Assume as known the (true) fact that the series (2) is also convergent, and denote its sum by S. Denote by s_k, S_k the kth partial sum of the series (1) and (2), respectively. Prove the following statements.

(i) $S_{3n} = s_{4n} + \frac{1}{2}s_{2n}$, (ii) $S \neq s$

9.6 The Ratio and Root Tests

GO DIGITAL

- Use the Ratio Test to determine whether a series converges or diverges.
- Use the Root Test to determine whether a series converges or diverges.
- Apply the guidelines for testing a series for convergence or divergence.

The Ratio Test

This section begins with a test for absolute convergence—the **Ratio Test.**

THEOREM 9.17 Ratio Test

Let Σa_n be a series with nonzero terms.

1. The series Σa_n converges absolutely when $\lim_{n\to\infty} \left|\frac{a_{n+1}}{a_n}\right| < 1$.
2. The series Σa_n diverges when $\lim_{n\to\infty} \left|\frac{a_{n+1}}{a_n}\right| > 1$ or $\lim_{n\to\infty} \left|\frac{a_{n+1}}{a_n}\right| = \infty$.
3. The Ratio Test is inconclusive when $\lim_{n\to\infty} \left|\frac{a_{n+1}}{a_n}\right| = 1$.

REMARK The Ratio Test is always inconclusive for any p-series.

Proof To prove Property 1, assume that

$$\lim_{n\to\infty} \left|\frac{a_{n+1}}{a_n}\right| = r < 1$$

and choose R such that $0 \le r < R < 1$. By the definition of the limit of a sequence, there exists some $N > 0$ such that $|a_{n+1}/a_n| < R$ for all $n > N$. Therefore,

$$|a_{N+1}| < |a_N|R$$
$$|a_{N+2}| < |a_{N+1}|R < |a_N|R^2$$
$$|a_{N+3}| < |a_{N+2}|R < |a_{N+1}|R^2 < |a_N|R^3$$

and so on. The geometric series

$$\sum_{n=1}^{\infty} |a_N|R^n = |a_N|R + |a_N|R^2 + |a_N|R^3 + \cdots + |a_N|R^n + \cdots$$

converges, and so, by the Direct Comparison Test, the series

$$\sum_{n=1}^{\infty} |a_{N+n}| = |a_{N+1}| + |a_{N+2}| + |a_{N+3}| + \cdots + |a_{N+n}| + \cdots$$

also converges. This in turn implies that the series $\Sigma |a_n|$ converges, because discarding a finite number of terms $(n = N - 1)$ does not affect convergence. Consequently, by Theorem 9.16, the series Σa_n converges absolutely. The proof of Property 2 is similar and is left as an exercise (see Exercise 97).

When applying the Ratio Test, note that when the limit of $|a_{n+1}/a_n|$ as $n \to \infty$ is 1, the test is inconclusive. For example, consider the two series $\Sigma (1/n)$ and $\Sigma (1/n^2)$. The first series diverges and the second one converges, but in both cases

$$\lim_{n\to\infty} \left|\frac{a_{n+1}}{a_n}\right| = 1.$$ Limit is 1. Ratio Test is inconclusive.

GO DIGITAL

Although the Ratio Test is not a cure for all ills related to testing for convergence, it is particularly useful for series that *converge rapidly*. Series involving factorials or exponentials are frequently of this type.

EXAMPLE 1 Using the Ratio Test

Determine the convergence or divergence of $\sum_{n=0}^{\infty} \frac{2^n}{n!}$.

Solution Recall from Section 9.1 that the factorial function grows faster than any exponential function. So, you expect this series to converge. Note that the series has nonzero terms. So, you can apply the Ratio Test with

$$a_n = \frac{2^n}{n!} \quad \text{and} \quad a_{n+1} = \frac{2^{n+1}}{(n+1)!}$$

to obtain

$$\begin{aligned}
\lim_{n\to\infty} \left|\frac{a_{n+1}}{a_n}\right| &= \lim_{n\to\infty} \left[\frac{2^{n+1}}{(n+1)!} \div \frac{2^n}{n!}\right] \\
&= \lim_{n\to\infty} \left[\frac{2^{n+1}}{(n+1)!} \cdot \frac{n!}{2^n}\right] && \text{Invert and multiply.} \\
&= \lim_{n\to\infty} \frac{2}{n+1} \\
&= 0. && \text{Limit is less than 1. The series converges.}
\end{aligned}$$

The limit is less than 1, so by the Ratio Test, the series converges.

REMARK Although the Ratio Test is listed with an index that begins with $n = 1$, it can be applied to an infinite series that begins with any other nonnegative integer, such as $n = 0$.

REMARK A step frequently used in applications of the Ratio Test involves simplifying quotients of factorials. In Example 1, for instance, notice that

$$\frac{n!}{(n+1)!} = \frac{n!}{(n+1)n!} = \frac{1}{n+1}.$$

EXAMPLE 2 Using the Ratio Test

Determine whether each series converges or diverges.

a. $\sum_{n=0}^{\infty} \frac{n^2\, 2^{n+1}}{3^n}$ **b.** $\sum_{n=1}^{\infty} \frac{n^n}{n!}$

Solution

a. This series converges because the limit of $|a_{n+1}/a_n|$ as $n \to \infty$ is less than 1.

$$\begin{aligned}
\lim_{n\to\infty} \left|\frac{a_{n+1}}{a_n}\right| &= \lim_{n\to\infty} \left[(n+1)^2 \left(\frac{2^{n+2}}{3^{n+1}}\right)\left(\frac{3^n}{n^2\, 2^{n+1}}\right)\right] \\
&= \lim_{n\to\infty} \frac{2(n+1)^2}{3n^2} \\
&= \frac{2}{3} && \text{Limit is less than 1. The series converges.}
\end{aligned}$$

b. This series diverges because the limit of $|a_{n+1}/a_n|$ as $n \to \infty$ is greater than 1.

$$\begin{aligned}
\lim_{n\to\infty} \left|\frac{a_{n+1}}{a_n}\right| &= \lim_{n\to\infty} \left[\frac{(n+1)^{n+1}}{(n+1)!}\left(\frac{n!}{n^n}\right)\right] \\
&= \lim_{n\to\infty} \left[\frac{(n+1)^{n+1}}{(n+1)}\left(\frac{1}{n^n}\right)\right] \\
&= \lim_{n\to\infty} \frac{(n+1)^n}{n^n} \\
&= \lim_{n\to\infty} \left(1 + \frac{1}{n}\right)^n \\
&= e && \text{Limit is greater than 1. The series diverges.}
\end{aligned}$$

GO DIGITAL

EXAMPLE 3 A Failure of the Ratio Test

See LarsonCalculus.com for an interactive version of this type of example.

Determine the convergence or divergence of

$$\sum_{n=1}^{\infty} (-1)^n \frac{\sqrt{n}}{n+1}.$$

Solution The limit of $|a_{n+1}/a_n|$ as $n \to \infty$ is equal to 1.

$$\begin{aligned}\lim_{n\to\infty} \left|\frac{a_{n+1}}{a_n}\right| &= \lim_{n\to\infty} \left[\left(\frac{\sqrt{n+1}}{n+2}\right)\left(\frac{n+1}{\sqrt{n}}\right)\right] \\ &= \lim_{n\to\infty} \left[\sqrt{\frac{n+1}{n}}\left(\frac{n+1}{n+2}\right)\right] \\ &= \sqrt{1}\,(1) \\ &= 1\end{aligned}$$

The limit is 1, so the Ratio Test is inconclusive. To determine whether the series converges or diverges, you need to try a different test. In this case, you can apply the Alternating Series Test. To show that $a_{n+1} \le a_n$, let

$$f(x) = \frac{\sqrt{x}}{x+1}.$$

Then the derivative is

$$f'(x) = \frac{-x+1}{2\sqrt{x}(x+1)^2}.$$

The derivative is negative for $x > 1$, so f is a decreasing function. Also, by L'Hôpital's Rule,

$$\begin{aligned}\lim_{x\to\infty} \frac{\sqrt{x}}{x+1} &= \lim_{x\to\infty} \frac{1/(2\sqrt{x})}{1} \\ &= \lim_{x\to\infty} \frac{1}{2\sqrt{x}} \\ &= 0.\end{aligned}$$

Therefore, by the Alternating Series Test, the series converges. ■

The series in Example 3 is *conditionally convergent.* This follows from the fact that the series

$$\sum_{n=1}^{\infty} \left|(-1)^n \frac{\sqrt{n}}{n+1}\right| = \frac{1}{2} + \frac{\sqrt{2}}{3} + \frac{\sqrt{3}}{4} + \frac{\sqrt{4}}{5} + \frac{\sqrt{5}}{6} + \cdots \qquad \Sigma|a_n|$$

diverges (by the Limit Comparison Test with $\Sigma\, 1/\sqrt{n}$), but the series

$$\sum_{n=1}^{\infty} (-1)^n \frac{\sqrt{n}}{n+1} = -\frac{1}{2} + \frac{\sqrt{2}}{3} - \frac{\sqrt{3}}{4} + \frac{\sqrt{4}}{5} - \frac{\sqrt{5}}{6} + \cdots \qquad \Sigma\, a_n$$

converges.

TECHNOLOGY A graphing utility can reinforce the conclusion that the series in Example 3 converges *conditionally*. By adding the first 100 terms of the series, you obtain a sum of about -0.2. (The sum of the first 100 terms of the series $\Sigma\, |a_n|$ is about 16.9.)

The Root Test

The next test for convergence or divergence of series works especially well for series involving nth powers. The proof of this theorem is similar to the proof given for the Ratio Test and is left as an exercise (see Exercise 98).

REMARK The Root Test is always inconclusive for any p-series.

THEOREM 9.18 Root Test

1. The series Σa_n converges absolutely when $\lim_{n\to\infty} \sqrt[n]{|a_n|} < 1$.
2. The series Σa_n diverges when $\lim_{n\to\infty} \sqrt[n]{|a_n|} > 1$ or $\lim_{n\to\infty} \sqrt[n]{|a_n|} = \infty$.
3. The Root Test is inconclusive when $\lim_{n\to\infty} \sqrt[n]{|a_n|} = 1$.

EXAMPLE 4 Using the Root Test

Determine the convergence or divergence of

$$\sum_{n=1}^{\infty} \frac{e^{2n}}{n^n}.$$

Solution Apply the Root Test with $a_n = e^{2n}/n^n$.

$$\begin{aligned}\lim_{n\to\infty} \sqrt[n]{|a_n|} &= \lim_{n\to\infty} \sqrt[n]{\frac{e^{2n}}{n^n}} \\ &= \lim_{n\to\infty} \frac{e^{2n/n}}{n^{n/n}} \\ &= \lim_{n\to\infty} \frac{e^2}{n} \\ &= 0\end{aligned}$$

Because this limit is less than 1, you can conclude that the series converges absolutely (and therefore converges). ■

To appreciate the usefulness of the Root Test for the series in Example 4, consider applying the Ratio Test to that series. When you do this, you obtain

$$\begin{aligned}\lim_{n\to\infty} \left|\frac{a_{n+1}}{a_n}\right| &= \lim_{n\to\infty} \left[\frac{e^{2(n+1)}}{(n+1)^{n+1}} \div \frac{e^{2n}}{n^n}\right] \\ &= \lim_{n\to\infty} \left[\frac{e^{2(n+1)}}{(n+1)^{n+1}} \cdot \frac{n^n}{e^{2n}}\right] \qquad \text{Invert and multiply.} \\ &= \lim_{n\to\infty} e^2 \frac{n^n}{(n+1)^{n+1}} \\ &= \lim_{n\to\infty} e^2 \left(\frac{n}{n+1}\right)^n \left(\frac{1}{n+1}\right) \\ &= 0.\end{aligned}$$

Note that this limit is not as easily evaluated as the limit obtained by the Root Test in Example 4.

■ **FOR FURTHER INFORMATION** For more information on the usefulness of the Root Test, see the article "$N!$ and the Root Test" by Charles C. Mumma II in *The American Mathematical Monthly*. To view this article, go to *MathArticles.com*.

Guidelines for Testing Series

You have studied 10 tests for determining the convergence or divergence of an infinite series. (See the summary in the table on the next page.) Skill in choosing and applying the various tests will come only with practice. Below is a set of guidelines for choosing an appropriate test.

Guidelines for Testing a Series for Convergence or Divergence

1. Does the nth term approach 0? If not, the series diverges.
2. Is the series one of the special types—geometric, p-series, telescoping, or alternating?
3. Can the Integral Test, the Root Test, or the Ratio Test be applied?
4. Can the series be compared favorably to one of the special types?

In some instances, more than one test is applicable. Your objective, however, should be to choose the most efficient test.

EXAMPLE 5 Applying the Guidelines for Testing Series

Determine the convergence or divergence of each series.

a. $\sum_{n=1}^{\infty} \frac{n+1}{3n+1}$ **b.** $\sum_{n=1}^{\infty} \left(\frac{\pi}{6}\right)^n$ **c.** $\sum_{n=1}^{\infty} ne^{-n^2}$

d. $\sum_{n=1}^{\infty} \frac{1}{3n+1}$ **e.** $\sum_{n=1}^{\infty} (-1)^n \frac{3}{4n+1}$ **f.** $\sum_{n=1}^{\infty} \frac{n!}{10^n}$

g. $\sum_{n=1}^{\infty} \left(\frac{n+1}{2n+1}\right)^n$

Solution

a. For this series, the limit of the nth term is not 0 $\left(a_n \to \frac{1}{3} \text{ as } n \to \infty\right)$. So, by the nth-Term Test, the series diverges.

b. This series is geometric. Moreover, because the ratio of the terms

$$r = \frac{\pi}{6}$$

is less than 1 in absolute value, you can conclude that the series converges.

c. Because the function

$$f(x) = xe^{-x^2}$$

is easily integrated, you can use the Integral Test to conclude that the series converges.

d. The nth term of this series can be compared to the nth term of the harmonic series. After using the Limit Comparison Test, you can conclude that the series diverges.

e. This is an alternating series whose nth term approaches 0. Because $a_{n+1} \leq a_n$, you can use the Alternating Series Test to conclude that the series converges.

f. The nth term of this series involves a factorial, which indicates that the Ratio Test may work well. After applying the Ratio Test, you can conclude that the series diverges.

g. The nth term of this series involves a variable that is raised to the nth power, which indicates that the Root Test may work well. After applying the Root Test, you can conclude that the series converges. ■

Summary of Tests for Series

Test	Series	Condition(s) of Convergence	Condition(s) of Divergence	Comment
nth-Term	$\sum_{n=1}^{\infty} a_n$		$\lim_{n\to\infty} a_n \neq 0$	This test cannot be used to show convergence.
Geometric Series ($r \neq 0$)	$\sum_{n=0}^{\infty} ar^n$	$\lvert r\rvert < 1$	$\lvert r\rvert \geq 1$	Sum: $S = \frac{a}{1-r}$
Telescoping Series	$\sum_{n=1}^{\infty} (b_n - b_{n+1})$	$\lim_{n\to\infty} b_n = L$		Sum: $S = b_1 - L$
p-Series	$\sum_{n=1}^{\infty} \frac{1}{n^p}$	$p > 1$	$0 < p \leq 1$	
Alternating Series ($a_n > 0$)	$\sum_{n=1}^{\infty} (-1)^{n-1} a_n$	$a_{n+1} \leq a_n$ and $\lim_{n\to\infty} a_n = 0$		Remainder: $\lvert R_N\rvert \leq a_{N+1}$
Integral (f is continuous, positive, and decreasing)	$\sum_{n=1}^{\infty} a_n$, $a_n = f(n) \geq 0$	$\int_1^{\infty} f(x)\,dx$ converges	$\int_1^{\infty} f(x)\,dx$ diverges	Remainder: $0 < R_N < \int_N^{\infty} f(x)\,dx$
Root	$\sum_{n=1}^{\infty} a_n$	$\lim_{n\to\infty} \sqrt[n]{\lvert a_n\rvert} < 1$	$\lim_{n\to\infty} \sqrt[n]{\lvert a_n\rvert} > 1$ or $= \infty$	Test is inconclusive when $\lim_{n\to\infty} \sqrt[n]{\lvert a_n\rvert} = 1$.
Ratio	$\sum_{n=1}^{\infty} a_n$	$\lim_{n\to\infty} \left\lvert \frac{a_{n+1}}{a_n} \right\rvert < 1$	$\lim_{n\to\infty} \left\lvert \frac{a_{n+1}}{a_n} \right\rvert > 1$ or $= \infty$	Test is inconclusive when $\lim_{n\to\infty} \left\lvert \frac{a_{n+1}}{a_n} \right\rvert = 1$.
Direct Comparison ($a_n, b_n > 0$)	$\sum_{n=1}^{\infty} a_n$	$0 < a_n \leq b_n$ and $\sum_{n=1}^{\infty} b_n$ converges	$0 < b_n \leq a_n$ and $\sum_{n=1}^{\infty} b_n$ diverges	
Limit Comparison ($a_n, b_n > 0$)	$\sum_{n=1}^{\infty} a_n$	$\lim_{n\to\infty} \frac{a_n}{b_n} = L > 0$ and $\sum_{n=1}^{\infty} b_n$ converges	$\lim_{n\to\infty} \frac{a_n}{b_n} = L > 0$ and $\sum_{n=1}^{\infty} b_n$ diverges

GO DIGITAL

Concept Check

In Exercises 1–6, what can you conclude about the convergence or divergence of $\sum a_n$?

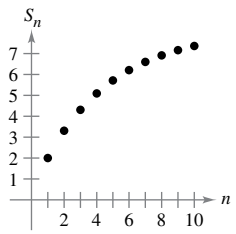
1. $\lim_{n\to\infty} \left|\frac{a_{n+1}}{a_n}\right| = 0$
2. $\lim_{n\to\infty} \left|\frac{a_{n+1}}{a_n}\right| = 1$
3. $\lim_{n\to\infty} \left|\frac{a_{n+1}}{a_n}\right| = \frac{3}{2}$
4. $\lim_{n\to\infty} \sqrt[n]{|a_n|} = 2$
5. $\lim_{n\to\infty} \sqrt[n]{|a_n|} = 1$
6. $\lim_{n\to\infty} \sqrt[n]{|a_n|} = e$

Verifying a Formula **In Exercises 7 and 8, verify the formula.**

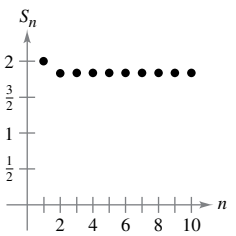
7. $\frac{9^{n+1}(n-1)!}{9^n(n-2)!} = 9(n-1)$
8. $\frac{(2k-2)!}{(2k)!} = \frac{1}{(2k)(2k-1)}$

Matching **In Exercises 9–14, match the series with the graph of its sequence of partial sums. [The graphs are labeled (a), (b), (c), (d), (e), and (f).]**

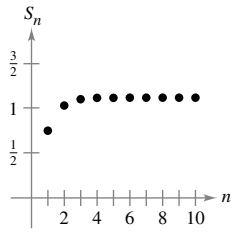
(a)



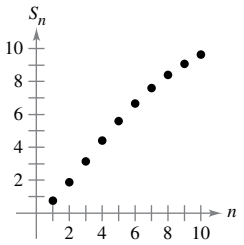
(b)



(c)



(d)



(e)

9. $\sum_{n=1}^{\infty} n\left(\frac{3}{4}\right)^n$
10. $\sum_{n=1}^{\infty} \left(\frac{3}{4}\right)^n\left(\frac{1}{n!}\right)$
11. $\sum_{n=1}^{\infty} \frac{(-3)^{n+1}}{n!}$
12. $\sum_{n=1}^{\infty} \frac{(-1)^{n-1}\,4}{(2n)!}$
13. $\sum_{n=1}^{\infty} \left(\frac{4n}{5n-3}\right)^n$
14. $\sum_{n=0}^{\infty} 4e^{-n}$

Numerical, Graphical, and Analytic Analysis **In Exercises 15 and 16, (a) use the Ratio Test to verify that the series converges, (b) use a graphing utility to find the indicated partial sum S_n and complete the table, (c) use a graphing utility to graph the first 10 terms of the sequence of partial sums, (d) use the table to estimate the sum of the series, and (e) explain the relationship between the magnitudes of the terms of the series and the rate at which the sequence of partial sums approaches the sum of the series.**

n	5	10	15	20	25
S_n					

15. $\sum_{n=1}^{\infty} n^3\left(\frac{1}{2}\right)^n$
16. $\sum_{n=1}^{\infty} \frac{n^2+1}{n!}$

Using the Ratio Test **In Exercises 17–38, use the Ratio Test to determine the convergence or divergence of the series. If the Ratio Test is inconclusive, determine the convergence or divergence of the series using other methods.**

17. $\sum_{n=1}^{\infty} \frac{1}{8^n}$
18. $\sum_{n=1}^{\infty} \frac{5}{n!}$
19. $\sum_{n=1}^{\infty} \frac{(n-1)!}{4^n}$
20. $\sum_{n=0}^{\infty} \frac{2^n}{(n+2)!}$
21. $\sum_{n=0}^{\infty} (n+2)\left(\frac{9}{7}\right)^{n+1}$
22. $\sum_{n=1}^{\infty} n^2\left(\frac{5}{6}\right)^n$
23. $\sum_{n=1}^{\infty} \frac{9^n}{n^5}$
24. $\sum_{n=0}^{\infty} \frac{6^n}{(n+1)^3}$
25. $\sum_{n=1}^{\infty} \frac{n^3}{3^n}$
26. $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}(n+2)}{n(n+1)}$
27. $\sum_{n=0}^{\infty} \frac{(-1)^n\,2^n}{n!}$
28. $\sum_{n=1}^{\infty} \frac{(-1)^{n-1}(3/2)^n}{n^2}$
29. $\sum_{n=1}^{\infty} \frac{n^2}{(n+1)(n^2+2)}$
30. $\sum_{n=1}^{\infty} \frac{(2n)!}{n^5}$
31. $\sum_{n=0}^{\infty} \frac{e^n}{n!}$
32. $\sum_{n=1}^{\infty} \frac{n!}{n^n}$
33. $\sum_{n=0}^{\infty} \frac{6^n}{(n+1)^n}$
34. $\sum_{n=0}^{\infty} \frac{(n!)^2}{(3n)!}$
35. $\sum_{n=0}^{\infty} \frac{5^n}{2^n+1}$
36. $\sum_{n=0}^{\infty} \frac{(-1)^n 2^{4n}}{(2n+1)!}$
37. $\sum_{n=0}^{\infty} \frac{(-1)^{n+1}n!}{1\cdot 3\cdot 5\cdot\cdots\cdot(2n+1)}$
38. $\sum_{n=1}^{\infty} \frac{(-1)^n[2\cdot 4\cdot 6\cdot\cdots\cdot(2n)]}{2\cdot 5\cdot 8\cdot\cdots\cdot(3n-1)}$

Using the Root Test **In Exercises 39–52, use the Root Test to determine the convergence or divergence of the series.**

39. $\sum_{n=1}^{\infty} \left(\frac{n}{2n+1}\right)^n$
40. $\sum_{n=1}^{\infty} \frac{1}{n^n}$
41. $\sum_{n=1}^{\infty} \left(\frac{3n+2}{n+3}\right)^n$
42. $\sum_{n=1}^{\infty} \left(\frac{n-2}{5n+1}\right)^n$
43. $\sum_{n=2}^{\infty} \frac{(-1)^n}{(\ln n)^n}$
44. $\sum_{n=1}^{\infty} \left(\frac{-3n}{2n+1}\right)^{3n}$
45. $\sum_{n=1}^{\infty} \left(2\sqrt[n]{n}+1\right)^n$
46. $\sum_{n=0}^{\infty} e^{-3n}$
47. $\sum_{n=1}^{\infty} \frac{n}{3^n}$
48. $\sum_{n=1}^{\infty} \left(\frac{n}{500}\right)^n$
49. $\sum_{n=1}^{\infty} \left(\frac{1}{n}-\frac{1}{n^2}\right)^n$
50. $\sum_{n=1}^{\infty} \left(\frac{\ln n}{n}\right)^n$
51. $\sum_{n=2}^{\infty} \frac{n}{(\ln n)^n}$
52. $\sum_{n=1}^{\infty} \frac{(n!)^n}{(n^n)^2}$

Determining Convergence or Divergence **In Exercises 53–70, determine the convergence or divergence of the series using any appropriate test from this chapter. Identify the test used.**

53. $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}5}{n}$
54. $\sum_{n=1}^{\infty} \frac{100}{n}$
55. $\sum_{n=1}^{\infty} \frac{3}{n\sqrt{n}}$
56. $\sum_{n=1}^{\infty} \left(\frac{2\pi}{3}\right)^n$
57. $\sum_{n=1}^{\infty} \frac{5n}{2n-1}$
58. $\sum_{n=1}^{\infty} \frac{n}{2n^2+1}$
59. $\sum_{n=1}^{\infty} \frac{(-1)^n 3^{n-2}}{2^n}$
60. $\sum_{n=1}^{\infty} \frac{10}{3\sqrt{n^3}}$
61. $\sum_{n=1}^{\infty} \frac{10n+3}{n2^n}$
62. $\sum_{n=1}^{\infty} \frac{2^n}{4n^2-1}$
63. $\sum_{n=1}^{\infty} \frac{\cos n}{3^n}$
64. $\sum_{n=2}^{\infty} \frac{(-1)^n}{n \ln n}$
65. $\sum_{n=1}^{\infty} \frac{n!}{n7^n}$
66. $\sum_{n=1}^{\infty} \frac{\ln n}{n^2}$
67. $\sum_{n=1}^{\infty} \frac{(-1)^n 3^{n-1}}{n!}$
68. $\sum_{n=1}^{\infty} \frac{(-1)^n 3^n}{n2^n}$
69. $\sum_{n=1}^{\infty} \frac{(-3)^n}{3 \cdot 5 \cdot 7 \cdot \cdots \cdot (2n+1)}$
70. $\sum_{n=1}^{\infty} \frac{3 \cdot 5 \cdot 7 \cdot \cdots \cdot (2n+1)}{18^n(2n-1)n!}$

Identifying Series **In Exercises 71–74, identify the two series that are the same.**

71. (a) $\sum_{n=1}^{\infty} \frac{n5^n}{n!}$
(b) $\sum_{n=0}^{\infty} \frac{n5^n}{(n+1)!}$
(c) $\sum_{n=0}^{\infty} \frac{(n+1)5^{n+1}}{(n+1)!}$

72. (a) $\sum_{n=4}^{\infty} n\left(\frac{3}{4}\right)^n$
(b) $\sum_{n=0}^{\infty} (n+1)\left(\frac{3}{4}\right)^n$
(c) $\sum_{n=1}^{\infty} n\left(\frac{3}{4}\right)^{n-1}$

73. (a) $\sum_{n=0}^{\infty} \frac{(-1)^n}{(2n+1)!}$
(b) $\sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{(2n-1)!}$
(c) $\sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{(2n+1)!}$

74. (a) $\sum_{n=2}^{\infty} \frac{(-1)^n}{(n-1)2^{n-1}}$
(b) $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n2^n}$
(c) $\sum_{n=0}^{\infty} \frac{(-1)^{n+1}}{(n+1)2^n}$

Writing an Equivalent Series **In Exercises 75 and 76, write an equivalent series with the index of summation beginning at $n = 0$.**

75. $\sum_{n=1}^{\infty} \frac{n}{7^n}$
76. $\sum_{n=2}^{\infty} \frac{4^{n+1}}{(n-2)!}$

Using a Recursively Defined Series **In Exercises 77–82, the terms of a series $\sum_{n=1}^{\infty} a_n$ are defined recursively. Determine the convergence or divergence of the series. Explain your reasoning.**

77. $a_1 = \frac{1}{2}, a_{n+1} = \frac{4n-1}{3n+2}a_n$
78. $a_1 = 2, a_{n+1} = \frac{2n+1}{5n-4}a_n$
79. $a_1 = 1, a_{n+1} = \frac{\sin n + 1}{\sqrt{n}}a_n$
80. $a_1 = \frac{1}{5}, a_{n+1} = \frac{\cos n + 1}{n}a_n$
81. $a_1 = \frac{1}{3}, a_{n+1} = \left(1+\frac{1}{n}\right)a_n$
82. $a_1 = \frac{1}{4}, a_{n+1} = \sqrt[n]{a_n}$

Using the Ratio Test or Root Test **In Exercises 83–86, use the Ratio Test or the Root Test to determine the convergence or divergence of the series.**

83. $1 + \frac{1 \cdot 2}{1 \cdot 3} + \frac{1 \cdot 2 \cdot 3}{1 \cdot 3 \cdot 5} + \frac{1 \cdot 2 \cdot 3 \cdot 4}{1 \cdot 3 \cdot 5 \cdot 7} + \cdots$
84. $1 + \frac{2}{3} + \frac{3}{3^2} + \frac{4}{3^3} + \frac{5}{3^4} + \frac{6}{3^5} + \cdots$
85. $\frac{1}{(\ln 3)^3} + \frac{1}{(\ln 4)^4} + \frac{1}{(\ln 5)^5} + \frac{1}{(\ln 6)^6} + \cdots$
86. $1 + \frac{1 \cdot 3}{1 \cdot 2 \cdot 3} + \frac{1 \cdot 3 \cdot 5}{1 \cdot 2 \cdot 3 \cdot 4 \cdot 5} + \frac{1 \cdot 3 \cdot 5 \cdot 7}{1 \cdot 2 \cdot 3 \cdot 4 \cdot 5 \cdot 6 \cdot 7} + \cdots$

Finding Values **In Exercises 87–92, find the values of x for which the series converges.**

87. $\sum_{n=0}^{\infty} 2\left(\frac{x}{3}\right)^n$
88. $\sum_{n=0}^{\infty} \left(\frac{x-3}{5}\right)^n$
89. $\sum_{n=1}^{\infty} \frac{(-1)^n(x+1)^n}{n}$
90. $\sum_{n=0}^{\infty} 3(x-4)^n$
91. $\sum_{n=0}^{\infty} n!\left(\frac{x}{2}\right)^n$
92. $\sum_{n=0}^{\infty} \frac{(x+1)^n}{n!}$

Exploring Concepts

93. What can you conclude about the convergence or divergence of Σa_n using the Ratio Test when a_n is a rational function of n? Explain.

94. Describe two ways to show that the geometric series

$$\sum_{n=0}^{\infty} ar^n, \quad r \neq 0$$

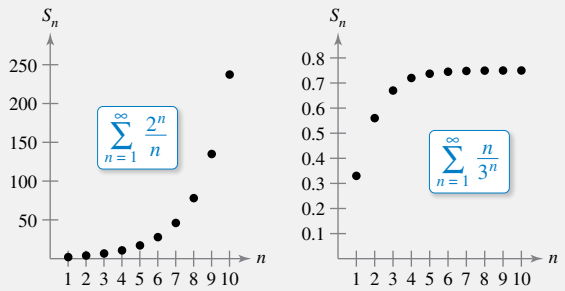
converges when $|r| < 1$. Verify that both methods give the same result.

95. You are told that the terms of a positive series appear to approach zero rapidly as n approaches infinity. In fact, $a_7 \leq 0.0001$. Given no other information, does this imply that the series converges? Support your conclusion with examples.

96. HOW DO YOU SEE IT? The graphs show the sequences of partial sums of the series

$$\sum_{n=1}^{\infty} \frac{2^n}{n} \quad \text{and} \quad \sum_{n=1}^{\infty} \frac{n}{3^n}.$$

Using the Ratio Test, the first series diverges and the second series converges. Explain how the graphs show this.



97. Proof Prove Property 2 of Theorem 9.17.

98. Proof Prove Theorem 9.18. (*Hint for Property 1:* If the limit equals $r < 1$, choose a real number R such that $r < R < 1$. By the definitions of the limit, there exists some $N > 0$ such that $\sqrt[n]{|a_n|} < R$ for $n > N$.)

Verifying an Inconclusive Test **In Exercises 99–102, verify that the Ratio Test is inconclusive for the *p*-series.**

99. $\displaystyle\sum_{n=1}^{\infty} \frac{1}{n^{3/2}}$

100. $\displaystyle\sum_{n=1}^{\infty} \frac{1}{n^{0.05}}$

101. $\displaystyle\sum_{n=1}^{\infty} \frac{1}{n^4}$

102. $\displaystyle\sum_{n=1}^{\infty} \frac{1}{n^p}$

103. Verifying an Inconclusive Test Show that the Root Test is inconclusive for the p-series

$$\sum_{n=1}^{\infty} \frac{1}{n^p}.$$

104. Verifying Inconclusive Tests Show that the Ratio Test and the Root Test are both inconclusive for the logarithmic p-series

$$\sum_{n=2}^{\infty} \frac{1}{n(\ln n)^p}.$$

105. Using Values Determine the convergence or divergence of the series

$$\sum_{n=1}^{\infty} \frac{(n!)^2}{(xn)!}$$

when (a) $x = 1$, (b) $x = 2$, (c) $x = 3$, and (d) x is a positive integer.

106. Using a Series Show that if

$$\sum_{n=1}^{\infty} a_n$$

is absolutely convergent, then

$$\left|\sum_{n=1}^{\infty} a_n\right| \leq \sum_{n=1}^{\infty} |a_n|.$$

107. Proof Let $\{a_n\}$ be a sequence of positive numbers satisfying

$$\lim_{n\to\infty} (a_n)^{1/n} = L < \frac{1}{r}, \quad r > 0.$$

Prove that the series $\displaystyle\sum_{n=1}^{\infty} a_n r^n$ converges.

108. Using a Series Consider the infinite series $\displaystyle\sum_{n=1}^{\infty} \frac{1}{2^{n+(-1)^n}}$.

(a) Find the first five terms of the sequence of partial sums.

(b) Show that the Ratio Test is inconclusive for this series.

(c) Use the Root Test to determine the convergence or divergence of this series.

PUTNAM EXAM CHALLENGE

109. Show that if the series

$$a_1 + a_2 + a_3 + \cdots + a_n + \cdots$$

converges, then the series

$$a_1 + \frac{a_2}{2} + \frac{a_3}{3} + \cdots + \frac{a_n}{n} + \cdots$$

converges also.

110. Is the following series convergent or divergent?

$$1 + \frac{1}{2} \cdot \frac{19}{7} + \frac{2!}{3^2}\left(\frac{19}{7}\right)^2 + \frac{3!}{4^3}\left(\frac{19}{7}\right)^3 + \frac{4!}{5^4}\left(\frac{19}{7}\right)^4 + \cdots$$

9.7 Taylor Polynomials and Approximations

GO DIGITAL

- **Find polynomial approximations of elementary functions and compare them with the elementary functions.**
- **Find Taylor and Maclaurin polynomial approximations of elementary functions.**
- **Use the remainder of a Taylor polynomial to determine the accuracy of an approximation.**

Polynomial Approximations of Elementary Functions

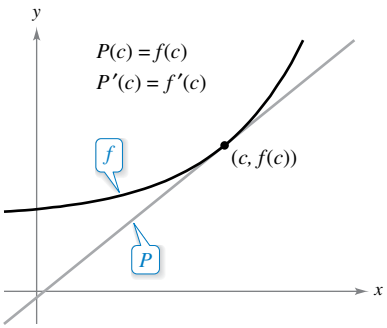
The goal of this section is to show how polynomial functions can be used as approximations for other elementary functions. To find a polynomial function P that approximates another function f, begin by choosing a number c in the domain of f at which f and P have the same value. That is,

$$P(c) = f(c). \qquad \text{Graphs of } f \text{ and } P \text{ pass through } (c, f(c)).$$

The approximating polynomial is said to be **expanded about c** or **centered at c.** Geometrically, the requirement that $P(c) = f(c)$ means that the graph of P passes through the point $(c, f(c))$. Of course, there are many polynomials whose graphs pass through the point $(c, f(c))$. Your task is to find a polynomial whose graph resembles the graph of f near this point. One way to do this is to impose the additional requirement that the slope of the polynomial function be the same as the slope of the graph of f at the point $(c, f(c))$.

$$P'(c) = f'(c) \qquad \text{Graphs of } f \text{ and } P \text{ have the same slope at } (c, f(c)).$$

With these two requirements, you can obtain a simple linear approximation of f, as shown in Figure 9.12.



Near $(c, f(c))$, the graph of P can be used to approximate the graph of f.
Figure 9.12

REMARK Example 1 is not the first time you have used a linear function to approximate another function. The same procedure was used as the basis for Newton's Method.

EXAMPLE 1 **First-Degree Polynomial Approximation of $f(x) = e^x$**

For the function $f(x) = e^x$, find a first-degree polynomial function $P_1(x) = a_0 + a_1x$ whose value and slope agree with the value and slope of f at $x = 0$.

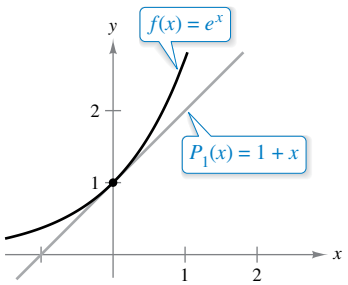
Solution Because $f(x) = e^x$ and $f'(x) = e^x$, the value and the slope of f at $x = 0$ are

$$f(0) = e^0 = 1 \qquad \text{Value of } f \text{ at } x = 0$$

and

$$f'(0) = e^0 = 1. \qquad \text{Slope of } f \text{ at } x = 0$$

Because $P_1(x) = a_0 + a_1x$, use the condition that $P_1(0) = f(0)$ to conclude that $a_0 = 1$. Moreover, because $P_1'(x) = a_1$, use the condition that $P_1'(0) = f'(0)$ to conclude that $a_1 = 1$. So, $P_1(x) = 1 + x$. The figure shows the graphs of $P_1(x) = 1 + x$ and $f(x) = e^x$.



P_1 is the first-degree polynomial approximation of $f(x) = e^x$.

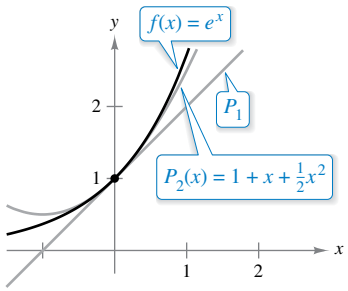
GO DIGITAL



P_2 is the second-degree polynomial approximation of $f(x) = e^x$.
Figure 9.13

Figure 9.13 shows that, at points near $(0, 1)$, the graph of the first-degree polynomial function

$$P_1(x) = 1 + x \qquad \text{1st-degree approximation}$$

is reasonably close to the graph of $f(x) = e^x$. As you move away from $(0, 1)$, however, the graphs move farther and farther from each other and the accuracy of the approximation decreases. To improve the approximation, you can impose yet another requirement—that the values of the second derivatives of P and f agree when $x = 0$. The polynomial, P_2, of least degree that satisfies all three requirements $P_2(0) = f(0)$, $P_2'(0) = f'(0)$, and $P_2''(0) = f''(0)$ is

$$P_2(x) = 1 + x + \frac{1}{2}x^2. \qquad \text{2nd-degree approximation}$$

Moreover, Figure 9.13 shows that P_2 is a better approximation of f than P_1. By requiring that the values of $P_n(x)$ and its first n derivatives match those of $f(x) = e^x$ at $x = 0$, you obtain the nth-degree approximation shown below.

$$P_n(x) = 1 + x + \frac{1}{2}x^2 + \frac{1}{3!}x^3 + \cdots + \frac{1}{n!}x^n \qquad n\text{th-degree approximation}$$
$$\approx e^x$$

EXAMPLE 2 Third-Degree Polynomial Approximation of $f(x) = e^x$

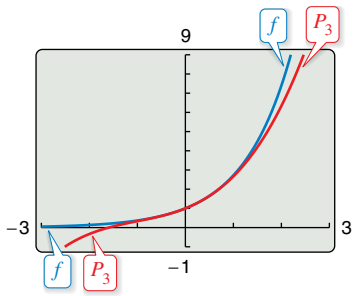
Construct a table comparing the values of the polynomial

$$P_3(x) = 1 + x + \frac{1}{2}x^2 + \frac{1}{3!}x^3 \qquad \text{3rd-degree approximation}$$

with $f(x) = e^x$ for several values of x near 0.

Solution Use a calculator to obtain the results shown in the table. Note that for $x = 0$, the two functions have the same value, but that as x moves farther away from 0, the accuracy of the approximating polynomial $P_3(x)$ decreases.

x	-1	-0.2	-0.1	0	0.1	0.2	1
e^x	0.3679	0.81873	0.904837	1	1.105171	1.22140	2.7183
$P_3(x)$	0.3333	0.81867	0.904833	1	1.105167	1.22133	2.6667



P_3 is the third-degree polynomial approximation of $f(x) = e^x$.
Figure 9.14

TECHNOLOGY A graphing utility can be used to compare the graph of the approximating polynomial with the graph of the function f. For instance, in Figure 9.14, the graph of

$$P_3(x) = 1 + x + \tfrac{1}{2}x^2 + \tfrac{1}{6}x^3 \qquad \text{3rd-degree approximation}$$

is compared with the graph of $f(x) = e^x$. Use a graphing utility to compare the graphs of

$$P_4(x) = 1 + x + \tfrac{1}{2}x^2 + \tfrac{1}{6}x^3 + \tfrac{1}{24}x^4 \qquad \text{4th-degree approximation}$$
$$P_5(x) = 1 + x + \tfrac{1}{2}x^2 + \tfrac{1}{6}x^3 + \tfrac{1}{24}x^4 + \tfrac{1}{120}x^5 \qquad \text{5th-degree approximation}$$

and

$$P_6(x) = 1 + x + \tfrac{1}{2}x^2 + \tfrac{1}{6}x^3 + \tfrac{1}{24}x^4 + \tfrac{1}{120}x^5 + \tfrac{1}{720}x^6 \qquad \text{6th-degree approximation}$$

with the graph of f. What do you notice?

BROOK TAYLOR (1685–1731)

Although Taylor was not the first to seek polynomial approximations of transcendental functions, his account published in 1715 was one of the first comprehensive works on the subject.

See LarsonCalculus.com to read more of this biography.

Taylor and Maclaurin Polynomials

The polynomial approximation of

$$f(x) = e^x$$

in Example 2 is expanded about $c = 0$. For expansions about an arbitrary value of c, it is convenient to write the polynomial in the form

$$P_n(x) = a_0 + a_1(x - c) + a_2(x - c)^2 + a_3(x - c)^3 + \cdots + a_n(x - c)^n.$$

In this form, repeated differentiation produces

$$\begin{aligned}
P_n'(x) &= a_1 + 2a_2(x - c) + 3a_3(x - c)^2 + \cdots + na_n(x - c)^{n-1} \\
P_n''(x) &= 2a_2 + 2(3a_3)(x - c) + \cdots + n(n - 1)a_n(x - c)^{n-2} \\
P_n'''(x) &= 2(3a_3) + \cdots + n(n - 1)(n - 2)a_n(x - c)^{n-3} \\
&\vdots \\
P_n^{(n)}(x) &= n(n - 1)(n - 2) \cdots (2)(1)a_n.
\end{aligned}$$

Letting $x = c$, you then obtain

$$P_n(c) = a_0, \quad P_n'(c) = a_1, \quad P_n''(c) = 2a_2, \quad \ldots, \quad P_n^{(n)}(c) = n!a_n$$

and because the values of f and its first n derivatives must agree with the values of P_n and its first n derivatives at $x = c$, it follows that

$$f(c) = a_0, \quad f'(c) = a_1, \quad \frac{f''(c)}{2!} = a_2, \quad \ldots, \quad \frac{f^{(n)}(c)}{n!} = a_n.$$

In the definition below, these coefficients are used to define **Taylor polynomials,** named after the English mathematician Brook Taylor, and **Maclaurin polynomials,** named after the Scottish mathematician Colin Maclaurin (1698–1746).

Definitions of *n*th Taylor Polynomial and *n*th Maclaurin Polynomial

If f has n derivatives at c, then the polynomial

$$P_n(x) = f(c) + f'(c)(x - c) + \frac{f''(c)}{2!}(x - c)^2 + \cdots + \frac{f^{(n)}(c)}{n!}(x - c)^n$$

is called the ***n*th Taylor polynomial for f at c.** If $c = 0$, then

$$P_n(x) = f(0) + f'(0)x + \frac{f''(0)}{2!}x^2 + \frac{f'''(0)}{3!}x^3 + \cdots + \frac{f^{(n)}(0)}{n!}x^n$$

is also called the ***n*th Maclaurin polynomial for f.**

REMARK Maclaurin polynomials are special types of Taylor polynomials for which $c = 0$.

EXAMPLE 3 A Maclaurin Polynomial for $f(x) = e^x$

From the discussion on the preceding page, the nth Maclaurin polynomial for $f(x) = e^x$ is given by

$$P_n(x) = 1 + x + \frac{1}{2!}x^2 + \frac{1}{3!}x^3 + \cdots + \frac{1}{n!}x^n.$$

GO DIGITAL

EXAMPLE 4 Finding Taylor Polynomials for ln *x*

Find the Taylor polynomials P_0, P_1, P_2, P_3, and P_4 for

$$f(x) = \ln x$$

centered at $c = 1$.

Solution Begin by expanding about $c = 1$. To do this, find the first four derivatives of f. Then evaluate f and each derivative at $c = 1$.

$f(x) = \ln x$	$f(1) = \ln 1 = 0$	Original function
$f'(x) = \frac{1}{x}$	$f'(1) = \frac{1}{1} = 1$	First derivative
$f''(x) = -\frac{1}{x^2}$	$f''(1) = -\frac{1}{1^2} = -1$	Second derivative
$f'''(x) = \frac{2!}{x^3}$	$f'''(1) = \frac{2!}{1^3} = 2$	Third derivative
$f^{(4)}(x) = -\frac{3!}{x^4}$	$f^{(4)}(1) = -\frac{3!}{1^4} = -6$	Fourth derivative

So, the Taylor polynomials are as follows.

$$P_0(x) = f(1) = 0$$

$$P_1(x) = f(1) + f'(1)(x - 1) = (x - 1)$$

$$P_2(x) = f(1) + f'(1)(x - 1) + \frac{f''(1)}{2!}(x - 1)^2$$

$$= (x - 1) - \frac{1}{2}(x - 1)^2$$

$$P_3(x) = f(1) + f'(1)(x - 1) + \frac{f''(1)}{2!}(x - 1)^2 + \frac{f'''(1)}{3!}(x - 1)^3$$

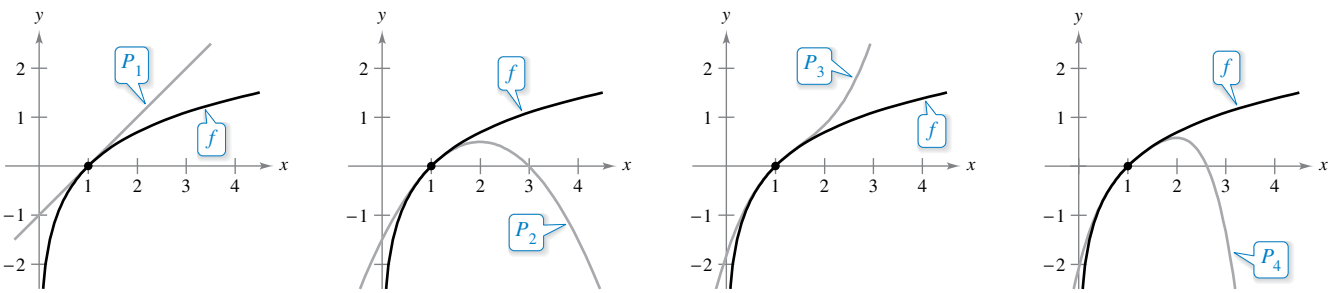
$$= (x - 1) - \frac{1}{2}(x - 1)^2 + \frac{1}{3}(x - 1)^3$$

$$P_4(x) = f(1) + f'(1)(x - 1) + \frac{f''(1)}{2!}(x - 1)^2 + \frac{f'''(1)}{3!}(x - 1)^3 + \frac{f^{(4)}(1)}{4!}(x - 1)^4$$

$$= (x - 1) - \frac{1}{2}(x - 1)^2 + \frac{1}{3}(x - 1)^3 - \frac{1}{4}(x - 1)^4$$

Figure 9.15 compares the graphs of P_1, P_2, P_3, and P_4 with the graph of $f(x) = \ln x$. Note that near $x = 1$, the graphs are nearly indistinguishable. For instance,

$$P_4(1.1) \approx 0.0953083 \quad \text{and} \quad \ln(1.1) \approx 0.0953102.$$



As n increases, the graph of P_n becomes a better and better approximation of the graph of $f(x) = \ln x$ near $x = 1$.

Figure 9.15

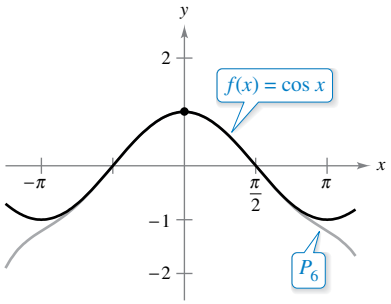
GO DIGITAL



Near (0, 1), the graph of P_6 can be used to approximate the graph of $f(x) = \cos x$.
Figure 9.16

EXAMPLE 5 Finding Maclaurin Polynomials for cos *x*

Find the Maclaurin polynomials P_0, P_2, P_4, and P_6 for $f(x) = \cos x$. Use $P_6(x)$ to approximate the value of $\cos(0.1)$.

Solution Begin by expanding about $c = 0$.

$$\begin{aligned} f(x) &= \cos x & f(0) &= \cos 0 = 1 \\ f'(x) &= -\sin x & f'(0) &= -\sin 0 = 0 \\ f''(x) &= -\cos x & f''(0) &= -\cos 0 = -1 \\ f'''(x) &= \sin x & f'''(0) &= \sin 0 = 0 \end{aligned}$$

Through repeated differentiation, the pattern $1, 0, -1, 0$ continues. So, you can write the Maclaurin polynomials

$$P_0(x) = 1, \quad P_2(x) = 1 - \frac{1}{2!}x^2, \quad P_4(x) = 1 - \frac{1}{2!}x^2 + \frac{1}{4!}x^4,$$

and

$$P_6(x) = 1 - \frac{1}{2!}x^2 + \frac{1}{4!}x^4 - \frac{1}{6!}x^6.$$

To nine decimal places, the approximation

$$P_6(0.1) \approx 0.995004165$$

is the same as $\cos(0.1)$. Figure 9.16 compares the graphs of $f(x) = \cos x$ and P_6. ■

Note in Example 5 that the Maclaurin polynomials for $\cos x$ have only even powers of x. Similarly, the Maclaurin polynomials for $\sin x$ have only odd powers of x (see Exercise 19). This is not generally true of the Taylor polynomials for $\sin x$ and $\cos x$ expanded about $c \neq 0$, as shown in the next example.

EXAMPLE 6 Finding a Taylor Polynomial for sin *x*

See LarsonCalculus.com for an interactive version of this type of example.

Find the third Taylor polynomial for $f(x) = \sin x$, expanded about $c = \pi/6$.

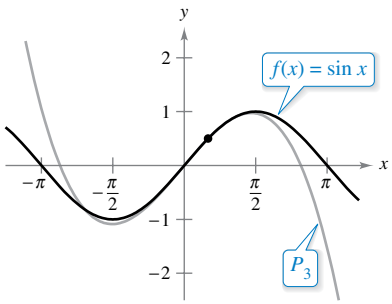
Solution Begin by expanding about $c = \pi/6$.

$$\begin{aligned} f(x) &= \sin x & f\left(\frac{\pi}{6}\right) &= \sin\frac{\pi}{6} = \frac{1}{2} \\ f'(x) &= \cos x & f'\left(\frac{\pi}{6}\right) &= \cos\frac{\pi}{6} = \frac{\sqrt{3}}{2} \\ f''(x) &= -\sin x & f''\left(\frac{\pi}{6}\right) &= -\sin\frac{\pi}{6} = -\frac{1}{2} \\ f'''(x) &= -\cos x & f'''\left(\frac{\pi}{6}\right) &= -\cos\frac{\pi}{6} = -\frac{\sqrt{3}}{2} \end{aligned}$$

So, the third Taylor polynomial for $f(x) = \sin x$, expanded about $c = \pi/6$, is

$$\begin{aligned} P_3(x) &= f\left(\frac{\pi}{6}\right) + f'\left(\frac{\pi}{6}\right)\left(x - \frac{\pi}{6}\right) + \frac{f''\left(\frac{\pi}{6}\right)}{2!}\left(x - \frac{\pi}{6}\right)^2 + \frac{f'''\left(\frac{\pi}{6}\right)}{3!}\left(x - \frac{\pi}{6}\right)^3 \\ &= \frac{1}{2} + \frac{\sqrt{3}}{2}\left(x - \frac{\pi}{6}\right) - \frac{1}{2(2!)}\left(x - \frac{\pi}{6}\right)^2 - \frac{\sqrt{3}}{2(3!)}\left(x - \frac{\pi}{6}\right)^3. \end{aligned}$$

Figure 9.17 compares the graphs of $f(x) = \sin x$ and P_3. ■



Near $(\pi/6, 1/2)$, the graph of P_3 can be used to approximate the graph of $f(x) = \sin x$.

Taylor polynomials and Maclaurin polynomials can be used to approximate the value of a function at a specific point. For instance, to approximate the value of $\ln(1.1)$, you can use Taylor polynomials for $f(x) = \ln x$ expanded about $c = 1$, as shown in Example 4, or you can use Maclaurin polynomials, as shown in Example 7.

EXAMPLE 7 Approximation Using Maclaurin Polynomials

Use a fourth Maclaurin polynomial to approximate the value of $\ln(1.1)$.

Solution Because 1.1 is closer to 1 than to 0, you should consider Maclaurin polynomials for the function $g(x) = \ln(1 + x)$.

$$\begin{aligned} g(x) &= \ln(1 + x) & g(0) &= \ln(1 + 0) = 0 \\ g'(x) &= (1 + x)^{-1} & g'(0) &= (1 + 0)^{-1} = 1 \\ g''(x) &= -(1 + x)^{-2} & g''(0) &= -(1 + 0)^{-2} = -1 \\ g'''(x) &= 2(1 + x)^{-3} & g'''(0) &= 2(1 + 0)^{-3} = 2 \\ g^{(4)}(x) &= -6(1 + x)^{-4} & g^{(4)}(0) &= -6(1 + 0)^{-4} = -6 \end{aligned}$$

Note that you obtain the same coefficients as in Example 4. So, the fourth Maclaurin polynomial for $g(x) = \ln(1 + x)$ is

$$\begin{aligned} P_4(x) &= g(0) + g'(0)x + \frac{g''(0)}{2!}x^2 + \frac{g'''(0)}{3!}x^3 + \frac{g^{(4)}(0)}{4!}x^4 \\ &= x - \frac{1}{2}x^2 + \frac{1}{3}x^3 - \frac{1}{4}x^4. \end{aligned}$$

Consequently,

$$\ln(1.1) = \ln(1 + 0.1) \approx P_4(0.1) \approx 0.0953083.$$

REMARK Check that the fourth Taylor polynomial from Example 4, evaluated at $x = 1.1$, yields the same result as the fourth Maclaurin polynomial in Example 7.

The table below illustrates the accuracy of the Maclaurin polynomial approximation of the calculator value of $\ln(1.1)$. The table shows that as n increases, $P_n(0.1)$ approaches the value of $\ln(1.1) \approx 0.0953102$.

Maclaurin Polynomial Approximations of $\ln(1 + x)$ at $x = 0.1$

n	1	2	3	4
$P_n(0.1)$	0.1000000	0.0950000	0.0953333	0.0953083

On the other hand, the table below illustrates that as you move away from the expansion point $c = 0$, the accuracy of the approximation decreases.

Fourth Maclaurin Polynomial Approximations of $\ln(1 + x)$

x	0	0.1	0.5	0.75	1.0
$\ln(1 + x)$	0	0.0953102	0.4054651	0.5596158	0.6931472
$P_4(x)$	0	0.0953083	0.4010417	0.5302734	0.5833333

These two tables illustrate two very important points about the accuracy of Taylor (or Maclaurin) polynomials for use in approximations.

1. The approximation is usually better for higher-degree Taylor (or Maclaurin) polynomials than for those of lower degree.
2. The approximation is usually better at x-values close to c than at x-values far from c.

Remainder of a Taylor Polynomial

An approximation technique is of little value without some idea of its accuracy. To measure the accuracy of approximating a function value $f(x)$ by the Taylor polynomial $P_n(x)$, you can use the concept of a **remainder** $R_n(x)$, defined as follows.

$$f(x) = P_n(x) + R_n(x)$$

Exact value — Approximate value — Remainder

So, $R_n(x) = f(x) - P_n(x)$. The absolute value of $R_n(x)$ is called the **error** associated with the approximation. That is,

$$\text{Error} = |R_n(x)| = |f(x) - P_n(x)|.$$

The next theorem gives a general procedure for estimating the remainder associated with a Taylor polynomial. This important theorem is called **Taylor's Theorem,** and the remainder given in the theorem is called the **Lagrange form of the remainder.**

THEOREM 9.19 Taylor's Theorem

If a function f is differentiable through order $n + 1$ in an interval I containing c, then, for each x in I, there exists z between x and c such that

$$f(x) = f(c) + f'(c)(x - c) + \frac{f''(c)}{2!}(x - c)^2 + \cdots + \frac{f^{(n)}(c)}{n!}(x - c)^n + R_n(x)$$

where

$$R_n(x) = \frac{f^{(n+1)}(z)}{(n + 1)!}(x - c)^{n+1}.$$

A proof of this theorem is given in Appendix A.

REMARK In Exercise 74, you are asked to show that the *integral form* of the remainder R_n is given by

$$\frac{1}{n!}\int_c^x (x - t)^n f^{(n+1)}(t)\, dt.$$

One useful consequence of Taylor's Theorem is that

$$|R_n(x)| \leq \frac{|x - c|^{n+1}}{(n + 1)!} \max |f^{(n+1)}(z)|$$

where $\max|f^{(n+1)}(z)|$ is the maximum value of $f^{(n+1)}(z)$ between x and c.

For $n = 0$, Taylor's Theorem states that if f is differentiable in an interval I containing c, then, for each x in I, there exists z between x and c such that

$$f(x) = f(c) + f'(z)(x - c) \quad \text{or} \quad f'(z) = \frac{f(x) - f(c)}{x - c}.$$

Do you recognize this special case of Taylor's Theorem? (It is the Mean Value Theorem.)

When applying Taylor's Theorem, you should not expect to be able to find the exact value of z. (If you could do this, an approximation would not be necessary.) Rather, you are trying to find bounds for $f^{(n+1)}(z)$ from which you are able to tell how large the remainder $R_n(x)$ is.

EXAMPLE 8 Determining the Accuracy of an Approximation

The third Maclaurin polynomial for $\sin x$ is

$$P_3(x) = x - \frac{x^3}{3!}.$$

Use Taylor's Theorem to approximate $\sin(0.1)$ by $P_3(0.1)$ and determine the accuracy of the approximation.

Solution Using Taylor's Theorem, you have

$$\sin x = x - \frac{x^3}{3!} + R_3(x) = x - \frac{x^3}{3!} + \frac{f^{(4)}(z)}{4!}x^4$$

where $0 < z < 0.1$. So,

$$\sin(0.1) \approx 0.1 - \frac{(0.1)^3}{3!} \approx 0.1 - 0.000167 = 0.099833.$$

Because $f^{(4)}(z) = \sin z$, it follows that the error $|R_3(0.1)|$ can be bounded as follows.

$$0 < R_3(0.1) = \frac{\sin z}{4!}(0.1)^4 < \frac{0.0001}{4!} \approx 0.000004$$

This implies that

$$0.099833 < \sin(0.1) \approx 0.099833 + R_3(0.1) < 0.099833 + 0.000004$$

or

$$0.099833 < \sin(0.1) < 0.099837.$$

REMARK Note that when you use a calculator,

$$\sin(0.1) \approx 0.0998334.$$

EXAMPLE 9 Approximating a Value to a Desired Accuracy

Determine the degree of the Taylor polynomial $P_n(x)$ expanded about $c = 1$ that should be used to approximate $\ln(1.2)$ so that the error is less than 0.001.

Solution Use the pattern of Example 4 to determine that the $(n + 1)$st derivative of $f(x) = \ln x$ is

$$f^{(n+1)}(x) = (-1)^n \frac{n!}{x^{n+1}}.$$

Using Taylor's Theorem, the error $|R_n(1.2)|$ is

$$\begin{aligned} |R_n(1.2)| &= \left| \frac{f^{(n+1)}(z)}{(n+1)!}(1.2 - 1)^{n+1} \right| \\ &= \frac{n!}{z^{n+1}} \left[\frac{1}{(n+1)!} \right] (0.2)^{n+1} \\ &= \frac{(0.2)^{n+1}}{z^{n+1}(n+1)} \end{aligned}$$

REMARK Note that when you use a calculator,

$$P_3(1.2) \approx 0.1827$$

and

$$\ln(1.2) \approx 0.1823.$$

where $1 < z < 1.2$. In this interval, $(0.2)^{n+1}/[z^{n+1}(n + 1)]$ is less than $(0.2)^{n+1}/(n + 1)$. So, you are seeking a value of n such that

$$\frac{(0.2)^{n+1}}{(n+1)} < 0.001 \quad \Rightarrow \quad 1000 < (n + 1)5^{n+1}.$$

By trial and error, you can determine that the least value of n that satisfies this inequality is $n = 3$. So, you would need the third Taylor polynomial to achieve the desired accuracy in approximating $\ln(1.2)$. ■

9.7 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

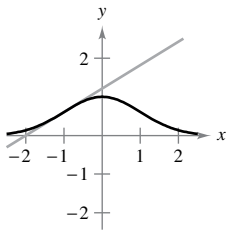
GO DIGITAL

Concept Check

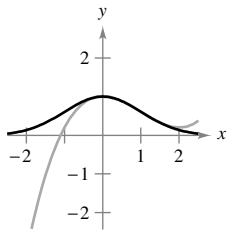
1. An elementary function is approximated by a polynomial. Describe what is meant by saying that the polynomial is *expanded about c* or *centered at c*.
2. Explain how Taylor polynomials and Maclaurin polynomials are related.
3. Describe the accuracy of the nth-degree Taylor polynomial of f centered at c as the distance between c and x increases.
4. In general, how does the accuracy of a Taylor polynomial change as the degree of the polynomial increases? Explain your reasoning.

Matching **In Exercises 5–8, match the Taylor polynomial approximation of the function $f(x) = e^{-x^2/2}$ with its graph. [The graphs are labeled (a), (b), (c), and (d).]**

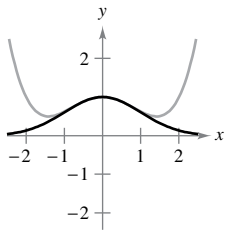
(a)



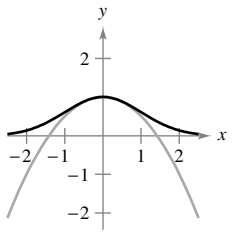
(b)



(c)



(d)



5. $g(x) = -\frac{1}{2}x^2 + 1$
6. $g(x) = \frac{1}{8}x^4 - \frac{1}{2}x^2 + 1$
7. $g(x) = e^{-1/2}[(x + 1) + 1]$
8. $g(x) = e^{-1/2}\left[\frac{1}{3}(x - 1)^3 - (x - 1) + 1\right]$

Finding a First-Degree Polynomial Approximation **In Exercises 9–12, find a first-degree polynomial function P_1 whose value and slope agree with the value and slope of f at $x = c$. Use a graphing utility to graph f and P_1.**

9. $f(x) = \frac{\sqrt{x}}{4}, \quad c = 4$
10. $f(x) = \frac{6}{\sqrt[3]{x}}, \quad c = 8$
11. $f(x) = \sec x, \quad c = \frac{\pi}{6}$
12. $f(x) = \tan x, \quad c = \frac{\pi}{4}$

Graphical and Numerical Analysis **In Exercises 13 and 14, use a graphing utility to graph f and its second-degree polynomial approximation P_2 at $x = c$. Complete the table comparing the values of f and P_2.**

13. $f(x) = \frac{4}{\sqrt{x}}, \quad c = 1$

$P_2(x) = 4 - 2(x - 1) + \frac{3}{2}(x - 1)^2$

x	0	0.8	0.9	1	1.1	1.2	2
$f(x)$							
$P_2(x)$							

14. $f(x) = \sec x, \quad c = \frac{\pi}{4}$

$P_2(x) = \sqrt{2} + \sqrt{2}\left(x - \frac{\pi}{4}\right) + \frac{3}{2}\sqrt{2}\left(x - \frac{\pi}{4}\right)^2$

x	-2.15	0.585	0.685	$\frac{\pi}{4}$	0.885	0.985	1.785
$f(x)$							
$P_2(x)$							

15. **Conjecture** Consider the function $f(x) = \cos x$ and its Maclaurin polynomials P_2, P_4, and P_6 (see Example 5).
   (a) Use a graphing utility to graph f and the indicated polynomial approximations.
   (b) Evaluate and compare the values of $f^{(n)}(0)$ and $P_n^{(n)}(0)$ for $n = 2$, 4, and 6.
   (c) Use the results in part (b) to make a conjecture about $f^{(n)}(0)$ and $P_n^{(n)}(0)$.
16. **Conjecture** Consider the function $f(x) = x^2e^x$.
   (a) Find the Maclaurin polynomials P_2, P_3, and P_4 for f.
   (b) Use a graphing utility to graph f, P_2, P_3, and P_4.
   (c) Evaluate and compare the values of $f^{(n)}(0)$ and $P_n^{(n)}(0)$ for $n = 2$, 3, and 4.
   (d) Use the results in part (c) to make a conjecture about $f^{(n)}(0)$ and $P_n^{(n)}(0)$.

Finding a Maclaurin Polynomial **In Exercises 17–26, find the nth Maclaurin polynomial for the function.**

17. $f(x) = e^{4x}, \quad n = 4$
18. $f(x) = e^{-x}, \quad n = 5$
19. $f(x) = \sin x, \quad n = 5$
20. $f(x) = \cos \pi x, \quad n = 4$
21. $f(x) = xe^x, \quad n = 4$
22. $f(x) = x^2e^{-x}, \quad n = 4$
23. $f(x) = \frac{1}{1 - x}, \quad n = 5$
24. $f(x) = \frac{x}{x + 1}, \quad n = 4$
25. $f(x) = \sec x, \quad n = 2$
26. $f(x) = \tan x, \quad n = 3$

Finding a Taylor Polynomial **In Exercises 27–32, find the nth Taylor polynomial for the function, centered at c.**

27. $f(x) = \frac{2}{x}, \quad n = 3, \quad c = 1$

28. $f(x) = \frac{1}{x^2}, \quad n = 4, \quad c = -2$

29. $f(x) = \sqrt{x}, \quad n = 2, \quad c = 4$

30. $f(x) = \sqrt[3]{x}, \quad n = 3, \quad c = 8$

31. $f(x) = \ln x, \quad n = 4, \quad c = 2$

32. $f(x) = x^2 \cos x, \quad n = 2, \quad c = \pi$

Finding Taylor Polynomials Using Technology **In Exercises 33 and 34, use a graphing utility to find the indicated Taylor polynomials for the function f. Graph the function and the Taylor polynomials.**

33. $f(x) = \tan \pi x$

(a) $n = 3, \quad c = 0$

(b) $n = 3, \quad c = 1/4$

34. $f(x) = \frac{1}{x^2 + 1}$

(a) $n = 4, \quad c = 0$

(b) $n = 4, \quad c = 1$

35. **Numerical and Graphical Approximations**

(a) Use the Maclaurin polynomials $P_1(x)$, $P_3(x)$, and $P_5(x)$ for $f(x) = \sin x$ to complete the table.

x	0	0.25	0.50	0.75	1
$\sin x$	0	0.2474	0.4794	0.6816	0.8415
$P_1(x)$					
$P_3(x)$					
$P_5(x)$					

(b) Use a graphing utility to graph $f(x) = \sin x$ and the Maclaurin polynomials in part (a).

(c) Describe the change in accuracy of a polynomial approximation as the distance from the point where the polynomial is centered increases.

36. **Numerical and Graphical Approximations**

(a) Use the Taylor polynomials $P_1(x)$, $P_2(x)$, and $P_4(x)$ for $f(x) = e^x$, centered at $c = 1$, to complete the table.

x	1	1.25	1.50	1.75	2
e^x	e	3.4903	4.4817	5.7546	7.3891
$P_1(x)$					
$P_2(x)$					
$P_4(x)$					

(b) Use a graphing utility to graph $f(x) = e^x$ and the Taylor polynomials in part (a).

(c) Describe the change in accuracy of polynomial approximations as the degree increases.

Numerical and Graphical Approximations **In Exercises 37 and 38, (a) find the Maclaurin polynomial $P_3(x)$ for $f(x)$, (b) complete the table for $f(x)$ and $P_3(x)$, and (c) sketch the graphs of $f(x)$ and $P_3(x)$, on the same set of coordinate axes.**

x	-0.75	-0.50	-0.25	0	0.25	0.50	0.75
$f(x)$							
$P_3(x)$							

37. $f(x) = \arcsin x$

38. $f(x) = \arctan x$

Approximating a Function Value **In Exercises 39–44, approximate the function at the given value of x, using the polynomial found in the indicated exercise.**

39. $f(x) = e^{4x}, \quad f\left(\frac{1}{4}\right),$ Exercise 17

40. $f(x) = x^2 e^{-x}, \quad f\left(\frac{1}{5}\right),$ Exercise 22

41. $f(x) = \frac{1}{x^2}, \quad f(-2.1),$ Exercise 28

42. $f(x) = \sqrt[3]{x}, \quad f(8.05),$ Exercise 30

43. $f(x) = \ln x, \quad f(2.1),$ Exercise 31

44. $f(x) = x^2 \cos x, \quad f\left(\frac{7\pi}{8}\right),$ Exercise 32

Using Taylor's Theorem **In Exercises 45–50, use Taylor's Theorem to obtain an upper bound for the error of the approximation. Then calculate the exact value of the error.**

45. $\cos(0.3) \approx 1 - \frac{(0.3)^2}{2!} + \frac{(0.3)^4}{4!}$

46. $\arccos(0.15) \approx \frac{\pi}{2} - 0.15$

47. $\sinh(0.2) \approx 0.2 + \frac{(0.2)^3}{3!} + \frac{(0.2)^5}{5!}$

48. $e \approx 1 + 1 + \frac{1^2}{2!} + \frac{1^3}{3!} + \frac{1^4}{4!} + \frac{1^5}{5!}$

49. $\arcsin(0.4) \approx 0.4 + \frac{(0.4)^3}{2 \cdot 3}$

50. $\arctan(0.4) \approx 0.4 - \frac{(0.4)^3}{3}$

Finding a Degree **In Exercises 51–56, determine the degree of the Maclaurin polynomial required for the error in the approximation of the function at the indicated value of x to be less than 0.001.**

51. $f(x) = \sin x, \quad$ approximate $f(0.3)$

52. $f(x) = \cos x, \quad$ approximate $f(0.4)$

53. $f(x) = e^x, \quad$ approximate $f(0.6)$

54. $f(x) = \ln(x + 1), \quad$ approximate $f(1.25)$

55. $f(x) = \frac{1}{x - 2}, \quad$ approximate $f(0.15)$

56. $f(x) = \frac{1}{x + 1}, \quad$ approximate $f(0.2)$

Finding a Degree Using Technology **In Exercises 57 and 58, determine the degree of the Maclaurin polynomial required for the error in the approximation of the function at the indicated value of x to be less than 0.0001. Use a graphing utility to obtain and evaluate the required derivative.**

57. $f(x) = \ln(x + 1)$, approximate $f(0.5)$.

58. $f(x) = e^{-\pi x}$, approximate $f(1.3)$.

Finding Values **In Exercises 59–62, determine the values of x for which the function can be replaced by the Taylor polynomial if the error cannot exceed 0.001.**

59. $f(x) = e^x \approx 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!}, \quad x < 0$

60. $f(x) = \sin x \approx x - \frac{x^3}{3!}$

61. $f(x) = \cos x \approx 1 - \frac{x^2}{2!} + \frac{x^4}{4!}$

62. $f(x) = e^{-2x} \approx 1 - 2x + 2x^2 - \frac{4}{3}x^3$

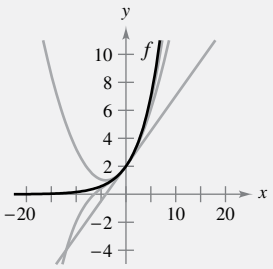
Exploring Concepts

63. Explain the relationship between the equation of a tangent line to a differentiable function at a point and the first Taylor polynomial for that function centered at the point.

64. Without performing any calculations, find the second Maclaurin polynomial for $f(x) = a + bx^2$. Explain your reasoning.

65. Find the fourth Maclaurin polynomials for $f(x) = e^x$ and $g(x) = e^{2x}$. Explain how you can use the fourth Maclaurin polynomial for f to find the fourth Maclaurin polynomial for g.

66. **HOW DO YOU SEE IT?** The figure shows the graphs of the first-, second-, and third-degree polynomial approximations P_1, P_2, and P_3 of a function f. Label the graphs of P_1, P_2, and P_3. To print an enlarged copy of the graph, go to *MathGraphs.com*.



67. **Proof** Prove that if f is an even function, then its nth Maclaurin polynomial contains only terms with even powers of x.

68. **Proof** Prove that if f is an odd function, then its nth Maclaurin polynomial contains only terms with odd powers of x.

69. **Comparing Maclaurin Polynomials**

(a) Compare the Maclaurin polynomials of degree 4 and degree 5, respectively, for the functions

$$f(x) = e^x \quad \text{and} \quad g(x) = xe^x.$$

What is the relationship between them?

(b) Use the result in part (a) and the Maclaurin polynomial of degree 5 for $f(x) = \sin x$ to find a Maclaurin polynomial of degree 6 for the function $g(x) = x \sin x$.

(c) Use the result in part (a) and the Maclaurin polynomial of degree 5 for $f(x) = \sin x$ to find a Maclaurin polynomial of degree 4 for the function $g(x) = (\sin x)/x$.

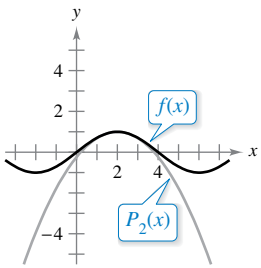
70. **Differentiating Maclaurin Polynomials**

(a) Differentiate the Maclaurin polynomial of degree 5 for $f(x) = \sin x$ and compare the result with the Maclaurin polynomial of degree 4 for $g(x) = \cos x$.

(b) Differentiate the Maclaurin polynomial of degree 6 for $f(x) = \cos x$ and compare the result with the Maclaurin polynomial of degree 5 for $g(x) = \sin x$.

(c) Differentiate the Maclaurin polynomial of degree 4 for $f(x) = e^x$. Describe the relationship between the two series.

71. **Graphical Reasoning** The figure shows the graphs of the function $f(x) = \sin(\pi x/4)$ and the second-degree Taylor polynomial $P_2(x) = 1 - (\pi^2/32)(x - 2)^2$ centered at $x = 2$.



(a) Use the symmetry of the graph of f to write the second-degree Taylor polynomial $Q_2(x)$ for f centered at $x = -2$.

(b) Use a horizontal translation of the result in part (a) to find the second-degree Taylor polynomial $R_2(x)$ for f centered at $x = 6$.

(c) Is it possible to use a horizontal translation of the result in part (a) to write a second-degree Taylor polynomial for f centered at $x = 4$? Explain.

72. **Proof** Let $P_n(x)$ be the nth Taylor polynomial for f at c. Prove that $P_n(c) = f(c)$ and $P^{(k)}(c) = f^{(k)}(c)$ for $1 \leq k \leq n$.

73. **Proof** Consider a function f with continuous first and second derivatives at $x = c$. Prove that if f has a relative maximum at $x = c$, then the second Taylor polynomial centered at $x = c$ also has a relative maximum at $x = c$.

74. **Integral Form of the Remainder** Show that the integral form of the remainder R_n is given by

$$\frac{1}{n!}\int_c^x (x - t)^n f^{(n+1)}(t)\, dt.$$

9.8 Power Series

GO DIGITAL

- Define a power series.
- Find the radius and interval of convergence of a power series.
- Determine the endpoint convergence of a power series.
- Differentiate and integrate a power series.

Power Series

In Section 9.7, you were introduced to the concept of approximating functions by Taylor polynomials. For instance, the function $f(x) = e^x$ can be *approximated* by its third-degree Maclaurin polynomial

$$e^x \approx 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!}.$$

In that section, you learned that the higher the degree of the approximating polynomial, the better the approximation becomes.

In this section and the next two sections, you will learn that several important types of functions, including $f(x) = e^x$, can be represented *exactly* by an infinite series called a **power series.** For example, the power series representation for e^x is

$$e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots + \frac{x^n}{n!} + \cdots.$$

For each real number x, it can be shown that the infinite series on the right converges to the number e^x. Before doing this, however, some preliminary results dealing with power series will be discussed—beginning with the next definition.

Exploration

Graphical Reasoning

Use a graphing utility to approximate the graph of each power series near $x = 0$. (Use the first several terms of each series.) Each series represents a well-known function. What is the function?

a. $\displaystyle\sum_{n=0}^{\infty} \frac{(-1)^n x^n}{n!}$

b. $\displaystyle\sum_{n=0}^{\infty} \frac{(-1)^n x^{2n}}{(2n)!}$

c. $\displaystyle\sum_{n=0}^{\infty} \frac{(-1)^n x^{2n+1}}{(2n+1)!}$

d. $\displaystyle\sum_{n=0}^{\infty} \frac{(-1)^n x^{2n+1}}{2n+1}$

e. $\displaystyle\sum_{n=0}^{\infty} \frac{2^n x^n}{n!}$

REMARK To simplify the notation for power series, assume that $(x - c)^0 = 1$, even when $x = c$.

Definition of Power Series

If x is a variable, then an infinite series of the form

$$\sum_{n=0}^{\infty} a_n x^n = a_0 + a_1 x + a_2 x^2 + a_3 x^3 + \cdots + a_n x^n + \cdots$$

is called a **power series.** More generally, an infinite series of the form

$$\sum_{n=0}^{\infty} a_n (x - c)^n = a_0 + a_1 (x - c) + a_2 (x - c)^2 + \cdots + a_n (x - c)^n + \cdots$$

is called a **power series centered at c,** where c is a constant.

EXAMPLE 1 Power Series

a. The power series below is centered at 0.

$$\sum_{n=0}^{\infty} \frac{x^n}{n!} = 1 + x + \frac{x^2}{2} + \frac{x^3}{3!} + \cdots$$

b. The power series below is centered at -1.

$$\sum_{n=0}^{\infty} (-1)^n (x + 1)^n = 1 - (x + 1) + (x + 1)^2 - (x + 1)^3 + \cdots$$

c. The power series below is centered at 1.

$$\sum_{n=1}^{\infty} \frac{1}{n} (x - 1)^n = (x - 1) + \frac{1}{2}(x - 1)^2 + \frac{1}{3}(x - 1)^3 + \cdots$$

GO DIGITAL

Radius and Interval of Convergence

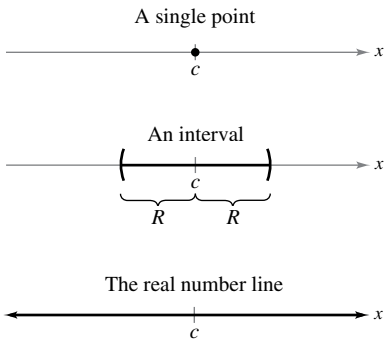
A power series in x can be viewed as a function of x

$$f(x) = \sum_{n=0}^{\infty} a_n(x - c)^n$$

where the *domain of* f is the set of all x for which the power series converges. Determination of the domain of a power series is the primary concern in this section. Of course, every power series converges at its center c because

$$\begin{aligned} f(c) &= \sum_{n=0}^{\infty} a_n(c - c)^n \\ &= a_0(1) + 0 + 0 + \cdots + 0 + \cdots \\ &= a_0. \end{aligned}$$

So, c always lies in the domain of f. Theorem 9.20 (see below) states that the domain of a power series can take three basic forms: a single point, an interval centered at c, or the entire real number line, as shown in Figure 9.18.



The domain of a power series has only three basic forms: a single point, an interval centered at c, or the entire real number line.
Figure 9.18

THEOREM 9.20 Convergence of a Power Series

For a power series centered at c, precisely one of three cases is true.

1. The series converges only at c.
2. There exists a real number $R > 0$ such that the series converges absolutely for
$$|x - c| < R$$
and diverges for
$$|x - c| > R.$$
3. The series converges absolutely for all x.

The number R is the **radius of convergence** of the power series. If the series converges only at c, then the radius of convergence is $R = 0$. If the series converges for all x, then the radius of convergence is $R = \infty$. The set of all values of x for which the power series converges is the **interval of convergence** of the power series.

A proof of this theorem is given in Appendix A.

REMARK In Case 2 of Theorem 9.20, the series converges in the interval $(c - R, c + R)$ and diverges in the intervals $(-\infty, c - R)$ and $(c + R, \infty)$. Determining the convergence or divergence at the endpoints $c - R$ and $c + R$ will be discussed later in this section.

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

To determine the radius of convergence of a power series, use the Ratio Test, as demonstrated in Examples 2, 3, and 4.

EXAMPLE 2 Finding the Radius of Convergence

Find the radius of convergence of $\sum_{n=0}^{\infty} n!x^n$.

Solution For $x = 0$, you obtain

$$f(0) = \sum_{n=0}^{\infty} n!0^n = 1 + 0 + 0 + \cdots = 1.$$

For any fixed value of x such that $|x| > 0$, let $u_n = n!x^n$. Then

$$\begin{aligned}\lim_{n\to\infty}\left|\frac{u_{n+1}}{u_n}\right| &= \lim_{n\to\infty}\left|\frac{(n+1)!x^{n+1}}{n!x^n}\right| && \text{Apply Ratio Test.}\\ &= |x|\lim_{n\to\infty}(n+1)\\ &= \infty.\end{aligned}$$

By the Ratio Test, the series diverges for $|x| > 0$ and converges only at its center, 0. So, the radius of convergence is $R = 0$.

EXAMPLE 3 Finding the Radius of Convergence

Find the radius of convergence of

$$\sum_{n=0}^{\infty} 3(x-2)^n.$$

Solution For $x \neq 2$, let $u_n = 3(x-2)^n$. Then

$$\begin{aligned}\lim_{n\to\infty}\left|\frac{u_{n+1}}{u_n}\right| &= \lim_{n\to\infty}\left|\frac{3(x-2)^{n+1}}{3(x-2)^n}\right| && \text{Apply Ratio Test.}\\ &= \lim_{n\to\infty}|x-2|\\ &= |x-2|.\end{aligned}$$

By the Ratio Test, the series converges for $|x-2| < 1$ and diverges for $|x-2| > 1$. So, the radius of convergence of the series is $R = 1$.

EXAMPLE 4 Finding the Radius of Convergence

Find the radius of convergence of

$$\sum_{n=0}^{\infty}\frac{(-1)^n x^{2n+1}}{(2n+1)!}.$$

Solution Let $u_n = (-1)^n x^{2n+1}/(2n+1)!$. Then

$$\begin{aligned}\lim_{n\to\infty}\left|\frac{u_{n+1}}{u_n}\right| &= \lim_{n\to\infty}\left|\frac{(-1)^{n+1}x^{2n+3}/(2n+3)!}{(-1)^n x^{2n+1}/(2n+1)!}\right| && \text{Apply Ratio Test.}\\ &= \lim_{n\to\infty}\left|\frac{(-1)^{n+1}x^{2n+3}}{(2n+3)!}\cdot\frac{(2n+1)!}{(-1)^n x^{2n+1}}\right| && \text{Invert and multiply.}\\ &= \lim_{n\to\infty}\frac{x^2}{(2n+3)(2n+2)}.\end{aligned}$$

For any *fixed* value of x, this limit is 0. So, by the Ratio Test, the series converges for all x. The radius of convergence is $R = \infty$. ■

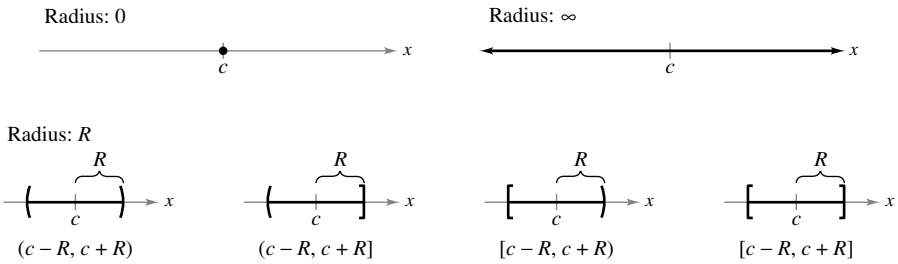
GO DIGITAL

Endpoint Convergence

Note that for a power series whose radius of convergence is a finite number R, Theorem 9.20 says nothing about the convergence at the *endpoints* of the interval of convergence. Each endpoint must be tested separately for convergence or divergence. As a result, the interval of convergence of a power series can take any one of the six forms shown in Figure 9.19.



Intervals of convergence

Figure 9.19

EXAMPLE 5 Finding the Interval of Convergence

See LarsonCalculus.com for an interactive version of this type of example.

Find the interval of convergence of

$$\sum_{n=1}^{\infty} \frac{x^n}{n}.$$

Solution Letting $u_n = x^n/n$ produces

$$\lim_{n\to\infty} \left|\frac{u_{n+1}}{u_n}\right| = \lim_{n\to\infty} \left|\frac{x^{n+1}/(n+1)}{x^n/n}\right| \qquad \text{Apply Ratio Test.}$$

$$= \lim_{n\to\infty} \left|\frac{x^{n+1}}{n+1} \cdot \frac{n}{x^n}\right| \qquad \text{Invert and multiply.}$$

$$= \lim_{n\to\infty} \left|\frac{nx}{n+1}\right|$$

$$= |x|.$$

So, by the Ratio Test, the radius of convergence is $R = 1$. Moreover, because the series is centered at 0, it converges in the interval $(-1, 1)$. This interval, however, is not necessarily the *interval of convergence*. To determine this, you must test for convergence at each endpoint. When $x = 1$, you obtain the *divergent* harmonic series

$$\sum_{n=1}^{\infty} \frac{1}{n} = \frac{1}{1} + \frac{1}{2} + \frac{1}{3} + \cdots. \qquad \text{Diverges when } x = 1.$$

When $x = -1$, you obtain the *convergent* alternating harmonic series

$$\sum_{n=1}^{\infty} \frac{(-1)^n}{n} = -1 + \frac{1}{2} - \frac{1}{3} + \frac{1}{4} - \cdots. \qquad \text{Converges when } x = -1.$$

So, the interval of convergence for the series is $[-1, 1)$, as shown in Figure 9.20.

GO DIGITAL

EXAMPLE 6 Finding the Interval of Convergence

Find the interval of convergence of $\sum_{n=0}^{\infty} \frac{(-1)^n(x+1)^n}{2^n}$.

Solution Letting $u_n = (-1)^n(x+1)^n/2^n$ produces

$$\lim_{n\to\infty}\left|\frac{u_{n+1}}{u_n}\right| = \lim_{n\to\infty}\left|\frac{(-1)^{n+1}(x+1)^{n+1}/2^{n+1}}{(-1)^n(x+1)^n/2^n}\right| \quad \text{Apply Ratio Test.}$$

$$= \lim_{n\to\infty}\left|\frac{(-1)^{n+1}(x+1)^{n+1}}{2^{n+1}} \cdot \frac{2^n}{(-1)^n(x+1)^n}\right| \quad \text{Invert and multiply.}$$

$$= \lim_{n\to\infty}\left|\frac{x+1}{2}\right|$$

$$= \left|\frac{x+1}{2}\right|.$$

By the Ratio Test, the series converges for

$$\left|\frac{x+1}{2}\right| < 1$$

or $|x+1| < 2$. So, the radius of convergence is $R = 2$. Because the series is centered at $x = -1$, it will converge in the interval $(-3, 1)$. Furthermore, at the endpoints,

$$\sum_{n=0}^{\infty} \frac{(-1)^n(-2)^n}{2^n} = \sum_{n=0}^{\infty} \frac{2^n}{2^n} = \sum_{n=0}^{\infty} 1 \quad \text{Diverges when } x = -3.$$

and

$$\sum_{n=0}^{\infty} \frac{(-1)^n(2)^n}{2^n} = \sum_{n=0}^{\infty} (-1)^n \quad \text{Diverges when } x = 1.$$

both of which diverge. So, the interval of convergence is $(-3, 1)$, as shown in Figure 9.21.

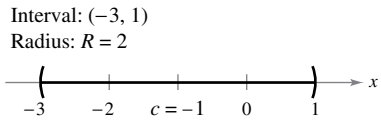

Figure 9.21

EXAMPLE 7 Finding the Interval of Convergence

Find the interval of convergence of $\sum_{n=1}^{\infty} \frac{x^n}{n^2}$.

Solution Letting $u_n = x^n/n^2$ produces

$$\lim_{n\to\infty}\left|\frac{u_{n+1}}{u_n}\right| = \lim_{n\to\infty}\left|\frac{x^{n+1}/(n+1)^2}{x^n/n^2}\right| \quad \text{Apply Ratio Test.}$$

$$= \lim_{n\to\infty}\left|\frac{n^2x}{(n+1)^2}\right|$$

$$= |x|.$$

So, the radius of convergence is $R = 1$. Because the series is centered at $x = 0$, it converges in the interval $(-1, 1)$. When $x = 1$, you obtain the convergent p-series

$$\sum_{n=1}^{\infty} \frac{1}{n^2} = \frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \frac{1}{4^2} + \cdots. \quad \text{Converges when } x = 1.$$

When $x = -1$, you obtain the convergent alternating series

$$\sum_{n=1}^{\infty} \frac{(-1)^n}{n^2} = -\frac{1}{1^2} + \frac{1}{2^2} - \frac{1}{3^2} + \frac{1}{4^2} - \cdots. \quad \text{Converges when } x = -1.$$

Therefore, the interval of convergence is $[-1, 1]$, as shown in Figure 9.22.

Differentiation and Integration of Power Series

Power series representation of functions has played an important role in the development of calculus. In fact, much of Newton's work with differentiation and integration was done in the context of power series—especially his work with complicated algebraic functions and transcendental functions. Euler, Lagrange, Leibniz, and the Bernoullis all used power series extensively in calculus.

Once you have defined a function with a power series, it is natural to wonder how you can determine the characteristics of the function. Is it continuous? Differentiable? Theorem 9.21, which is stated without proof, answers these questions.

JAMES GREGORY (1638–1675)

One of the earliest mathematicians to work with power series was a Scotsman, James Gregory. He developed a power series method for interpolating table values—a method that was later used by Brook Taylor in the development of Taylor polynomials and Taylor series.

THEOREM 9.21 Properties of Functions Defined by Power Series

If the function

$$f(x) = \sum_{n=0}^{\infty} a_n(x-c)^n = a_0 + a_1(x-c) + a_2(x-c)^2 + a_3(x-c)^3 + \cdots$$

has a radius of convergence of $R > 0$, then, on the interval

$$(c-R, c+R)$$

f is differentiable (and therefore continuous). Moreover, the derivative and antiderivative of f are as follows.

1. $$f'(x) = \sum_{n=1}^{\infty} na_n(x-c)^{n-1} = a_1 + 2a_2(x-c) + 3a_3(x-c)^2 + \cdots$$

2. $$\int f(x)\,dx = C + \sum_{n=0}^{\infty} a_n \frac{(x-c)^{n+1}}{n+1} = C + a_0(x-c) + a_1\frac{(x-c)^2}{2} + a_2\frac{(x-c)^3}{3} + \cdots$$

The *radius of convergence* of the series obtained by differentiating or integrating a power series is the same as that of the original power series. The *interval of convergence,* however, may differ as a result of the behavior at the endpoints.

Theorem 9.21 states that, in many ways, a function defined by a power series behaves like a polynomial. It is continuous in its interval of convergence, and both its derivative and its antiderivative can be determined by differentiating and integrating each term of the power series. For instance, the derivative of the power series

$$f(x) = \sum_{n=0}^{\infty} \frac{x^n}{n!} = 1 + x + \frac{x^2}{2} + \frac{x^3}{3!} + \frac{x^4}{4!} + \cdots$$

is

$$f'(x) = 1 + (2)\frac{x}{2} + (3)\frac{x^2}{3!} + (4)\frac{x^3}{4!} + \cdots = 1 + x + \frac{x^2}{2} + \frac{x^3}{3!} + \frac{x^4}{4!} + \cdots = f(x).$$

Notice that $f'(x) = f(x)$. Do you recognize this function?

EXAMPLE 8 Intervals of Convergence for $f(x)$, $f'(x)$, and $\int f(x)\,dx$

Consider the function

$$f(x) = \sum_{n=1}^{\infty} \frac{x^n}{n} = x + \frac{x^2}{2} + \frac{x^3}{3} + \cdots.$$

Find the interval of convergence for each expression.

a. $\int f(x)\,dx$ **b.** $f(x)$ **c.** $f'(x)$

Solution By Theorem 9.21, you have

$$f'(x) = \sum_{n=1}^{\infty} x^{n-1}$$
$$= 1 + x + x^2 + x^3 + \cdots$$

and

$$\int f(x)\,dx = C + \sum_{n=1}^{\infty} \frac{x^{n+1}}{n(n+1)}$$
$$= C + \frac{x^2}{1 \cdot 2} + \frac{x^3}{2 \cdot 3} + \frac{x^4}{3 \cdot 4} + \cdots.$$

REMARK Notice in Example 8 that when differentiating the power series, differentiation is done on a *term-by-term* basis. Likewise, when integrating a series, integration is done on a *term-by-term* basis.

By the Ratio Test, you can show that each series has a radius of convergence of $R = 1$. Considering the interval $(-1, 1)$, find the interval of convergence for each given expression.

a. For $\int f(x)\,dx$, the series

$$\sum_{n=1}^{\infty} \frac{x^{n+1}}{n(n+1)}$$ Interval of convergence: $[-1, 1]$

converges for $x = \pm 1$, and its interval of convergence is $[-1, 1]$. See Figure 9.23(a).

b. For $f(x)$, the series

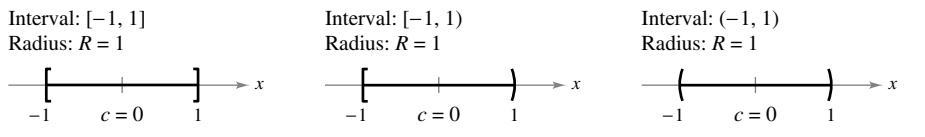
$$\sum_{n=1}^{\infty} \frac{x^n}{n}$$ Interval of convergence: $[-1, 1)$

converges for $x = -1$ and diverges for $x = 1$. So, its interval of convergence is $[-1, 1)$. See Figure 9.23(b).

c. For $f'(x)$, the series

$$\sum_{n=1}^{\infty} x^{n-1}$$ Interval of convergence: $(-1, 1)$

diverges for $x = \pm 1$, and its interval of convergence is $(-1, 1)$. See Figure 9.23(c).



(a) **(b)** **(c)**

Figure 9.23

From Example 8, it appears that of the three series, the one for the derivative, $f'(x)$, is the least likely to converge at the endpoints. In fact, it can be shown that if the series for $f'(x)$ converges at the endpoints

$$x = c \pm R$$

then the series for $f(x)$ will also converge there.

9.8 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Explain how a Maclaurin polynomial and a power series centered at 0 for a function are different.
2. Explain what the domain of
$$f(x) = \sum_{n=0}^{\infty} a_n(x - c)^n$$
represents.
3. Determine the radius of convergence for the power series $\sum_{n=0}^{\infty} a_n(x - 2)^n$ given the following result of the Ratio Test, where $u_n = a_n(x - 2)^n$.
$$\lim_{n\to\infty} \left|\frac{u_{n+1}}{u_n}\right| = \left|\frac{x - 2}{5}\right|$$
4. Describe how a function defined by a power series behaves like a polynomial.

Finding the Center of a Power Series

In Exercises 5–8, state where the power series is centered.

5. $\sum_{n=0}^{\infty} nx^n$
6. $\sum_{n=1}^{\infty} \frac{(-1)^n(2n - 1)}{2^n n!}x^n$
7. $\sum_{n=1}^{\infty} \frac{(x - 2)^n}{n^3}$
8. $\sum_{n=0}^{\infty} \frac{(-1)^n(x - \pi)^{2n}}{(2n)!}$

Finding the Radius of Convergence

In Exercises 9–14, find the radius of convergence of the power series.

9. $\sum_{n=0}^{\infty} (-1)^n \frac{x^n}{n + 1}$
10. $\sum_{n=0}^{\infty} (3x)^n$
11. $\sum_{n=1}^{\infty} \frac{(4x)^n}{n^2}$
12. $\sum_{n=0}^{\infty} \frac{(-1)^n x^n}{5^n}$
13. $\sum_{n=0}^{\infty} \frac{x^{2n}}{(2n)!}$
14. $\sum_{n=0}^{\infty} \frac{(2n)!x^{3n}}{n!}$

Finding the Interval of Convergence

In Exercises 15–38, find the interval of convergence of the power series. (Be sure to include a check for convergence at the endpoints of the interval.)

15. $\sum_{n=0}^{\infty} \left(\frac{x}{4}\right)^n$
16. $\sum_{n=0}^{\infty} (2x)^n$
17. $\sum_{n=1}^{\infty} \frac{(-1)^n x^n}{n}$
18. $\sum_{n=0}^{\infty} (-1)^{n+1}(n + 1)x^n$
19. $\sum_{n=0}^{\infty} \frac{x^{5n}}{n!}$
20. $\sum_{n=0}^{\infty} \frac{(3x)^n}{(2n)!}$
21. $\sum_{n=0}^{\infty} (2n)! \left(\frac{x}{3}\right)^n$
22. $\sum_{n=0}^{\infty} \frac{(-1)^n x^n}{(n + 1)(n + 2)}$
23. $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}x^n}{6^n}$
24. $\sum_{n=0}^{\infty} \frac{(-1)^n n!(x - 5)^n}{3^n}$
25. $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}(x - 4)^n}{n9^n}$
26. $\sum_{n=0}^{\infty} \frac{(x - 3)^{n+1}}{(n + 1)4^{n+1}}$
27. $\sum_{n=0}^{\infty} \frac{(-1)^{n+1}(x - 1)^{n+1}}{n + 1}$
28. $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}(x - 2)^n}{n2^n}$
29. $\sum_{n=1}^{\infty} \frac{(x - 3)^{n-1}}{3^{n-1}}$
30. $\sum_{n=0}^{\infty} \frac{(-1)^n x^{2n+1}}{2n + 1}$
31. $\sum_{n=1}^{\infty} \frac{n}{n + 1}(-2x)^{n-1}$
32. $\sum_{n=0}^{\infty} \frac{(-1)^n x^{2n}}{n!}$
33. $\sum_{n=0}^{\infty} \frac{x^{3n+1}}{(3n + 1)!}$
34. $\sum_{n=1}^{\infty} \frac{n!x^n}{(2n)!}$
35. $\sum_{n=1}^{\infty} \frac{2 \cdot 3 \cdot 4 \cdot \cdots (n + 1)x^n}{n!}$
36. $\sum_{n=1}^{\infty} \left[\frac{2 \cdot 4 \cdot 6 \cdot \cdots 2n}{3 \cdot 5 \cdot 7 \cdot \cdots (2n + 1)}\right] x^{2n+1}$
37. $\sum_{n=1}^{\infty} \frac{(-1)^{n+1} 3 \cdot 7 \cdot 11 \cdot \cdots (4n - 1)(x - 3)^n}{4^n}$
38. $\sum_{n=1}^{\infty} \frac{n!(x + 1)^n}{1 \cdot 3 \cdot 5 \cdot \cdots (2n - 1)}$

Finding the Radius of Convergence

In Exercises 39 and 40, find the radius of convergence of the power series, where $c > 0$ and k is a positive integer.

39. $\sum_{n=1}^{\infty} \frac{(x - c)^{n-1}}{c^{n-1}}$
40. $\sum_{n=0}^{\infty} \frac{(n!)^k x^n}{(kn)!}$

Finding the Interval of Convergence

In Exercises 41–44, find the interval of convergence of the power series, where $c > 0$ and k is a positive integer. (Be sure to include a check for convergence at the endpoints of the interval.)

41. $\sum_{n=0}^{\infty} \left(\frac{x}{k}\right)^n$
42. $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}(x - c)^n}{nc^n}$
43. $\sum_{n=1}^{\infty} \frac{k(k + 1)(k + 2) \cdot \cdots (k + n - 1)x^n}{n!}$
44. $\sum_{n=1}^{\infty} \frac{n!(x - c)^n}{1 \cdot 3 \cdot 5 \cdot \cdots (2n - 1)}$

Writing an Equivalent Series

In Exercises 45–48, write an equivalent series with the index of summation beginning at $n = 1$.

45. $\sum_{n=0}^{\infty} \frac{x^n}{n!}$
46. $\sum_{n=0}^{\infty} (-1)^{n+1}(n + 1)x^n$
47. $\sum_{n=2}^{\infty} \frac{x^{n-1}}{(7n - 1)!}$
48. $\sum_{n=2}^{\infty} \frac{x^{3n-1}}{(2n - 1)!}$

Finding Intervals of Convergence **In Exercises 49–52, find the intervals of convergence of (a) $f(x)$, (b) $f'(x)$, (c) $f''(x)$, and (d) $\int f(x)\,dx$. (Be sure to include a check for convergence at the endpoints of the intervals.)**

49. $f(x) = \sum_{n=0}^{\infty} \left(\frac{x}{3}\right)^n$

50. $f(x) = \sum_{n=1}^{\infty} \frac{(-1)^{n+1}(x-5)^n}{n5^n}$

51. $f(x) = \sum_{n=0}^{\infty} \frac{(-1)^{n+1}(x-1)^{n+1}}{n+1}$

52. $f(x) = \sum_{n=1}^{\infty} \frac{(-1)^{n+1}(x-2)^n}{n}$

Exploring Concepts

In Exercises 53 and 54, write a power series that has the indicated interval of convergence. Explain your reasoning.

53. $(-3, 3)$

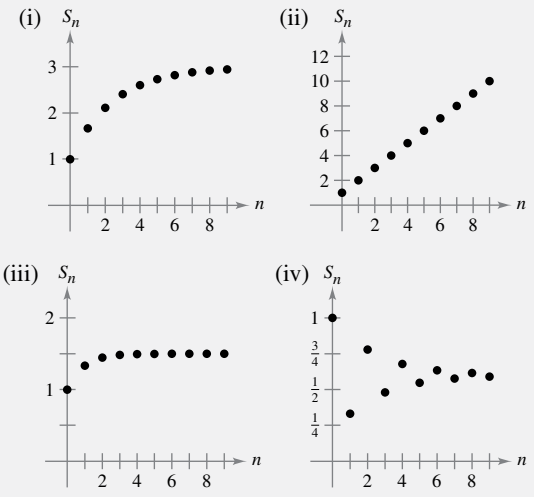
54. $[-3, 7]$

55. Give examples that show that the convergence of a power series at an endpoint of its interval of convergence may be either conditional or absolute. Explain your reasoning.

56. HOW DO YOU SEE IT? Match the graph of the first 10 terms of the sequence of partial sums of the series

$$g(x) = \sum_{n=0}^{\infty} \left(\frac{x}{3}\right)^n$$

with the indicated value of the function. [The graphs are labeled (i), (ii), (iii), and (iv).] Explain how you made your choice.



(a) $g(1)$ (b) $g(2)$

(c) $g(3)$ (d) $g(-2)$

57. Using Power Series Let $f(x) = \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n+1}}{(2n+1)!}$ and $g(x) = \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n}}{(2n)!}$.

(a) Find the intervals of convergence of f and g.

(b) Show that $f'(x) = g(x)$ and $g'(x) = -f(x)$.

(c) Identify the functions f and g.

58. Using a Power Series Let $f(x) = \sum_{n=0}^{\infty} \frac{x^{2n+1}}{(2n+1)!}$ and $g(x) = \sum_{n=0}^{\infty} \frac{x^{2n}}{(2n)!}$.

(a) Find the intervals of convergence of f and g.

(b) Show that $f'(x) = g(x)$ and $g'(x) = f(x)$.

(c) Identify the functions f and g.

Differential Equation **In Exercises 59–64, show that the function represented by the power series is a solution of the differential equation.**

59. $y = \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n+1}}{(2n+1)!}$, $y'' + y = 0$

60. $y = \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n}}{(2n)!}$, $y'' + y = 0$

61. $y = \sum_{n=0}^{\infty} \frac{x^{2n+1}}{(2n+1)!}$, $y'' - y = 0$

62. $y = \sum_{n=0}^{\infty} \frac{x^{2n}}{(2n)!}$, $y'' - y = 0$

63. $y = \sum_{n=0}^{\infty} \frac{x^{2n}}{2^n n!}$, $y'' - xy' - y = 0$

64. $y = 1 + \sum_{n=1}^{\infty} \frac{(-1)^n x^{4n}}{2^{2n} n! \cdot 3 \cdot 7 \cdot 11 \cdot \cdots \cdot (4n-1)}$, $y'' + x^2 y = 0$

65. Bessel Function The Bessel function of order 0 is

$$J_0(x) = \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k}}{2^{2k}(k!)^2}.$$

(a) Show that the series converges for all x.

(b) Show that the series is a solution of the differential equation $x^2 J_0'' + x J_0' + x^2 J_0 = 0$.

(c) Use a graphing utility to graph the polynomial composed of the first four terms of J_0.

(d) Approximate $\int_0^1 J_0\,dx$ accurate to two decimal places.

66. Bessel Function The Bessel function of order 1 is

$$J_1(x) = x \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k}}{2^{2k+1} k!(k+1)!}$$

(a) Show that the series converges for all x.

(b) Show that the series is a solution of the differential equation $x^2 J_1'' + x J_1' + (x^2 - 1) J_1 = 0$.

(c) Use a graphing utility to graph the polynomial composed of the first four terms of J_1.

(d) Use J_0 from Exercise 65 to show that $J_0'(x) = -J_1(x)$.

67. Investigation The interval of convergence of the geometric series $\sum_{n=0}^{\infty}\left(\frac{x}{4}\right)^n$ is $(-4, 4)$.

(a) Find the sum of the series when $x = \frac{5}{2}$. Use a graphing utility to graph the first six terms of the sequence of partial sums and the horizontal line representing the sum of the series.

(b) Repeat part (a) for $x = -\frac{5}{2}$.

(c) Write a short paragraph comparing the rates of convergence of the partial sums with the sums of the series in parts (a) and (b). How do the plots of the partial sums differ as they converge toward the sum of the series?

(d) Given any positive real number M, there exists a positive integer N such that the partial sum

$$\sum_{n=0}^{N}\left(\frac{5}{4}\right)^n > M.$$

Use a graphing utility to complete the table.

M	10	100	1000	10,000
N				

68. Investigation The interval of convergence of the series $\sum_{n=0}^{\infty}(3x)^n$ is $\left(-\frac{1}{3}, \frac{1}{3}\right)$.

(a) Find the sum of the series when $x = \frac{1}{6}$. Use a graphing utility to graph the first six terms of the sequence of partial sums and the horizontal line representing the sum of the series.

(b) Repeat part (a) for $x = -\frac{1}{6}$.

(c) Write a short paragraph comparing the rates of convergence of the partial sums with the sums of the series in parts (a) and (b). How do the plots of the partial sums differ as they converge toward the sum of the series?

(d) Given any positive real number M, there exists a positive integer N such that the partial sum

$$\sum_{n=0}^{N}\left(3 \cdot \frac{2}{3}\right)^n > M.$$

Use a graphing utility to complete the table.

M	10	100	1000	10,000
N				

Identifying a Function **In Exercises 69–72, the series represents a well-known function. Use a graphing utility to graph the partial sum S_{10} and identify the function from the graph.**

69. $f(x) = \sum_{n=0}^{\infty}(-1)^n \frac{\pi^{2n}x^{2n}}{(2n)!}$

70. $f(x) = \sum_{n=0}^{\infty}(-1)^{n+1} \frac{x^{2n+1}}{(2n+1)!}$

71. $f(x) = \sum_{n=0}^{\infty}(-1)^n x^n, \quad -1 < x < 1$

72. $f(x) = \sum_{n=0}^{\infty}(3x)^n$

True or False? **In Exercises 73–75, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

73. If the interval of convergence for

$$\sum_{n=0}^{\infty} a_n x^n$$

is $(-1, 1)$, then the interval of convergence for $\sum_{n=0}^{\infty} a_n(x-1)^n$ is $(0, 2)$.

74. It is possible to find a power series whose interval of convergence is $[0, \infty)$.

75. If $f(x) = \sum_{n=0}^{\infty} a_n x^n$ converges for $|x| < 2$, then

$$\int_0^1 f(x)\,dx = \sum_{n=0}^{\infty}\frac{a_n}{n+1}.$$

76. Using a Power Series Let

$$g(x) = 1 + 2x + x^2 + 2x^3 + x^4 + \cdots$$

where the coefficients are $c_{2n} = 1$ and $c_{2n+1} = 2$ for $n \geq 0$.

(a) Find the interval of convergence of the series.

(b) Find an explicit formula for $g(x)$.

77. Using a Power Series Let

$$f(x) = \sum_{n=0}^{\infty} c_n x^n$$

where $c_{n+3} = c_n$ for $n \geq 0$.

(a) Find the interval of convergence of the series.

(b) Find an explicit formula for $f(x)$.

78. Proof Prove that the power series

$$\sum_{n=0}^{\infty}\frac{(n+p)!}{n!(n+q)!}x^n$$

has a radius of convergence of $R = \infty$ when p and q are positive integers.

79. Proof For $n > 0$, let $R > 0$ and $c_n > 0$. Prove that if the interval of convergence of the series

$$\sum_{n=0}^{\infty} c_n(x - x_0)^n$$

is $[x_0 - R, x_0 + R)$, then the series converges conditionally at $x = x_0 - R$.

80. Proof Prove that if the power series $\sum_{n=0}^{\infty} c_n x^n$ has a radius of convergence of R, then $\sum_{n=0}^{\infty} c_n x^{2n}$ has a radius of convergence of $\sqrt{R}$.

9.9 Representation of Functions by Power Series

GO DIGITAL

- **Find a geometric power series that represents a function.**
- **Construct a power series using series operations.**

JOSEPH FOURIER (1768–1830)

Some of the early work in representing functions by power series was done by the French mathematician Joseph Fourier. Fourier's work is important in the history of calculus, partly because it forced eighteenth-century mathematicians to question the then-prevailing narrow concept of a function. Both Cauchy and Dirichlet were motivated by Fourier's work with series, and in 1837, Dirichlet published the general definition of a function that is used today.

See LarsonCalculus.com to read more of this biography.

Geometric Power Series

In this section and the next section, you will study several techniques for finding a power series that represents a function. Consider the function

$$f(x) = \frac{1}{1 - x}.$$

The form of f closely resembles the sum of a geometric series

$$\sum_{n=0}^{\infty} ar^n = \frac{a}{1 - r}, \quad |r| < 1.$$

In other words, when $a = 1$ and $r = x$, a power series representation for $1/(1 - x)$, centered at 0, is

$$\begin{aligned} \frac{1}{1 - x} &= \sum_{n=0}^{\infty} ar^n \\ &= \sum_{n=0}^{\infty} x^n \\ &= 1 + x + x^2 + x^3 + \cdots, \quad |x| < 1. \end{aligned}$$

Of course, this series represents $f(x) = 1/(1 - x)$ only on the interval $(-1, 1)$, whereas f is defined for all $x \neq 1$, as shown in Figure 9.24. To represent f in another interval, you must develop a different series. For instance, to obtain the power series centered at -1, you could write

$$\frac{1}{1 - x} = \frac{1}{2 - (x + 1)} = \frac{1/2}{1 - [(x + 1)/2]} = \frac{a}{1 - r}$$

which implies that $a = \frac{1}{2}$ and $r = (x + 1)/2$. So, for $|x + 1| < 2$, you have

$$\begin{aligned} \frac{1}{1 - x} &= \sum_{n=0}^{\infty} \left(\frac{1}{2}\right)\left(\frac{x + 1}{2}\right)^n \\ &= \frac{1}{2}\left[1 + \frac{(x + 1)}{2} + \frac{(x + 1)^2}{4} + \frac{(x + 1)^3}{8} + \cdots\right], \quad |x + 1| < 2 \end{aligned}$$

which converges on the interval $(-3, 1)$.

GO DIGITAL

EXAMPLE 1 Finding a Geometric Power Series Centered at 0

Find a power series for $f(x) = \dfrac{4}{x+2}$, centered at 0.

Solution Writing $f(x)$ in the form $a/(1-r)$ produces

$$\frac{4}{2+x} = \frac{2}{1-(-x/2)} = \frac{a}{1-r}$$

which implies that $a = 2$ and

$$r = -\frac{x}{2}.$$

So, the power series for $f(x)$ is

$$\begin{aligned}\frac{4}{x+2} &= \sum_{n=0}^{\infty} ar^n \\ &= \sum_{n=0}^{\infty} 2\left(-\frac{x}{2}\right)^n \\ &= 2\left(1 - \frac{x}{2} + \frac{x^2}{4} - \frac{x^3}{8} + \cdots\right).\end{aligned}$$

This power series converges when

$$\left|-\frac{x}{2}\right| < 1$$

which implies that the interval of convergence is $(-2, 2)$. ■

Long Division

$$\begin{array}{r} 2 - x + \frac{1}{2}x^2 - \frac{1}{4}x^3 + \cdots \\ 2 + x \overline{)\,4} \\ \underline{4 + 2x} \\ -2x \\ \underline{-2x - x^2} \\ x^2 \\ \underline{x^2 + \frac{1}{2}x^3} \\ -\frac{1}{2}x^3 \\ \underline{-\frac{1}{2}x^3 - \frac{1}{4}x^4} \end{array}$$

Another way to determine a power series for a rational function such as the one in Example 1 is to use long division. For instance, by dividing $2 + x$ into 4, you obtain the result shown at the left.

EXAMPLE 2 Finding a Geometric Power Series Centered at 1

Find a power series for $f(x) = \dfrac{1}{x}$, centered at 1.

Solution Writing $f(x)$ in the form $a/(1-r)$ produces

$$\frac{1}{x} = \frac{1}{1-(-x+1)} = \frac{a}{1-r}$$

which implies that $a = 1$ and $r = 1 - x = -(x-1)$. So, the power series for $f(x)$ is

$$\begin{aligned}\frac{1}{x} &= \sum_{n=0}^{\infty} ar^n \\ &= \sum_{n=0}^{\infty} [-(x-1)]^n \\ &= \sum_{n=0}^{\infty} (-1)^n (x-1)^n \\ &= 1 - (x-1) + (x-1)^2 - (x-1)^3 + \cdots.\end{aligned}$$

This power series converges when

$$|x-1| < 1$$

which implies that the interval of convergence is $(0, 2)$. ■

Operations with Power Series

The versatility of geometric power series will be shown later in this section, following a discussion of power series operations. These operations, used with differentiation and integration, provide a means of developing power series for a variety of elementary functions. (For simplicity, the operations are stated for a series centered at 0.)

Operations with Power Series

Let $f(x) = \sum_{n=0}^{\infty} a_n x^n$ and $g(x) = \sum_{n=0}^{\infty} b_n x^n$.

1. $f(kx) = \sum_{n=0}^{\infty} a_n k^n x^n$
2. $f(x^N) = \sum_{n=0}^{\infty} a_n x^{nN}$
3. $f(x) \pm g(x) = \sum_{n=0}^{\infty} (a_n \pm b_n) x^n$

The operations described above can change the interval of convergence for the resulting series. For example, in the addition shown below, the interval of convergence for the sum is the *intersection* of the intervals of convergence of the two original series.

$$\underbrace{\sum_{n=0}^{\infty} x^n}_{(-1,\,1)} + \underbrace{\sum_{n=0}^{\infty} \left(\frac{x}{2}\right)^n}_{(-2,\,2)} = \underbrace{\sum_{n=0}^{\infty} \left(1 + \frac{1}{2^n}\right) x^n}_{(-1,\,1)}$$

$(-1, 1) \cap (-2, 2) = (-1, 1)$

EXAMPLE 3 Adding Two Power Series

Find a power series for

$$f(x) = \frac{3x - 1}{x^2 - 1}$$

centered at 0.

Solution Using partial fractions, you can write $f(x)$ as

$$\frac{3x - 1}{x^2 - 1} = \frac{2}{x + 1} + \frac{1}{x - 1}.$$

By adding the two geometric power series

$$\frac{2}{x + 1} = \frac{2}{1 - (-x)} = \sum_{n=0}^{\infty} 2(-1)^n x^n, \quad |x| < 1$$

and

$$\frac{1}{x - 1} = \frac{-1}{1 - x} = -\sum_{n=0}^{\infty} x^n, \quad |x| < 1$$

you obtain the power series shown below.

$$\begin{aligned} \frac{3x - 1}{x^2 - 1} &= \sum_{n=0}^{\infty} \left[2(-1)^n - 1\right] x^n \\ &= 1 - 3x + x^2 - 3x^3 + x^4 - \cdots \end{aligned}$$

The interval of convergence for this power series is $(-1, 1)$. ■

GO DIGITAL

EXAMPLE 4 Finding a Power Series by Integration

Find a power series for

$$f(x) = \ln x$$

centered at 1.

Solution Recall from Example 2 that

$$\frac{1}{x} = \sum_{n=0}^{\infty} (-1)^n (x-1)^n.$$ Interval of convergence: (0, 2)

Integrating this series produces

$$\begin{aligned}\ln x &= \int \frac{1}{x}\,dx + C \\ &= C + \sum_{n=0}^{\infty} (-1)^n \frac{(x-1)^{n+1}}{n+1}.\end{aligned}$$

By letting $x = 1$, you can conclude that $C = 0$. So,

$$\begin{aligned}\ln x &= \sum_{n=0}^{\infty} (-1)^n \frac{(x-1)^{n+1}}{n+1} \\ &= \frac{(x-1)}{1} - \frac{(x-1)^2}{2} + \frac{(x-1)^3}{3} - \frac{(x-1)^4}{4} + \cdots.\end{aligned}$$ Interval of convergence: (0, 2]

Note that the series converges at $x = 2$. This is consistent with the observation in Section 9.8 that integration of a power series may alter the convergence at the endpoints of the interval of convergence. ■

■ **FOR FURTHER INFORMATION** To read about finding a power series using integration by parts, see the article "Integration by Parts and Infinite Series" by Shelby J. Kilmer in *Mathematics Magazine.* To view this article, go to *MathArticles.com.*

In Section 9.7, Example 4, the fourth-degree Taylor polynomial (centered at $c = 1$) for the natural logarithmic function

$$\ln x \approx (x-1) - \frac{(x-1)^2}{2} + \frac{(x-1)^3}{3} - \frac{(x-1)^4}{4}$$

was used to approximate $\ln(1.1)$.

$$\begin{aligned}\ln(1.1) &\approx (0.1) - \frac{1}{2}(0.1)^2 + \frac{1}{3}(0.1)^3 - \frac{1}{4}(0.1)^4 \\ &\approx 0.0953083\end{aligned}$$

You now know from Example 4 in this section that this polynomial represents the first four terms of the power series for $\ln x$. Moreover, using the Alternating Series Remainder, you can determine that the error in this approximation is less than

$$\begin{aligned}|R_4| &\le |a_5| \\ &= \frac{1}{5}(0.1)^5 \\ &= 0.000002.\end{aligned}$$

During the seventeenth and eighteenth centuries, mathematical tables for logarithms and values of other transcendental functions were computed in this manner. Such numerical techniques are far from outdated, because it is precisely by such means that many modern calculating devices are programmed to evaluate transcendental functions.

GO DIGITAL

EXAMPLE 5 Finding a Power Series by Integration

See LarsonCalculus.com for an interactive version of this type of example.

Find a power series for

$$g(x) = \arctan x$$

centered at 0.

Solution Because $D_x[\arctan x] = 1/(1 + x^2)$, you can use the series

$$f(x) = \frac{1}{1+x} = \sum_{n=0}^{\infty} (-1)^n x^n. \qquad \text{Interval of convergence: } (-1, 1)$$

Substituting x^2 for x produces

$$f(x^2) = \frac{1}{1+x^2} = \sum_{n=0}^{\infty} (-1)^n x^{2n}.$$

Finally, by integrating, you obtain

$$\begin{aligned} \arctan x &= \int \frac{1}{1+x^2}\,dx + C \\ &= C + \sum_{n=0}^{\infty} (-1)^n \frac{x^{2n+1}}{2n+1} \\ &= \sum_{n=0}^{\infty} (-1)^n \frac{x^{2n+1}}{2n+1} && \text{Let } x = 0, \text{ then } C = 0. \\ &= x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \cdots. && \text{Interval of convergence: } (-1, 1) \end{aligned}$$

SRINIVASA RAMANUJAN (1887–1920)

Series that can be used to approximate π have interested mathematicians for the past 300 years. An amazing series for approximating $1/\pi$ was discovered by the Indian mathematician Srinivasa Ramanujan in 1914 (see Exercise 57). Each successive term of Ramanujan's series adds roughly eight more correct digits to the value of $1/\pi$. For more information about Ramanujan's work, see the article "Ramanujan and Pi" by Jonathan M. Borwein and Peter B. Borwein in *Scientific American*.

See LarsonCalculus.com to read more of this biography.

It can be shown that the power series developed for $\arctan x$ in Example 5 also converges (to $\arctan x$) for $x = \pm 1$. For instance, when $x = 1$, you can write

$$\begin{aligned} \arctan 1 &= 1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \cdots \\ &= \frac{\pi}{4}. \end{aligned}$$

This series (developed by James Gregory in 1671) is, however, not a practical way of approximating π because it converges so slowly that hundreds of terms have to be used to obtain reasonable accuracy. Example 6 shows how to use *two* different arctangent series to obtain a very good approximation of π using only a few terms. This approximation was developed by John Machin in 1706.

EXAMPLE 6 Approximating π with a Series

Use the trigonometric identity

$$4 \arctan \frac{1}{5} - \arctan \frac{1}{239} = \frac{\pi}{4}$$

to approximate the number π. [See Exercise 44(b).]

Solution By using only five terms from each of the series for $\arctan(1/5)$ and $\arctan(1/239)$, you obtain

$$4\left(4 \arctan \frac{1}{5} - \arctan \frac{1}{239}\right) \approx 3.1415927$$

which agrees with the exact value of π with an error of less than 0.0000001.

FOR FURTHER INFORMATION

To read about other methods for approximating π, see the article "Two Methods for Approximating π" by Chien-Lih Hwang in *Mathematics Magazine*. To view this article, go to *MathArticles.com*.

9.9 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Explain how to use a geometric power series to represent a function of the form $f(x) = \dfrac{b}{c - x}$.

2. Consider $f(x) = \sum_{n=0}^{\infty} 5x^{2n}$. What are the values of a and b in terms of n?

$f\left(\dfrac{x^3}{5}\right) = \sum_{n=0}^{\infty} \dfrac{x^a}{5^b}$

Finding a Geometric Power Series **In Exercises 3–6, find a geometric power series for the function, centered at 0, (a) by the technique shown in Examples 1 and 2 and (b) by long division.**

3. $f(x) = \dfrac{1}{4 - x}$

4. $f(x) = \dfrac{1}{2 + x}$

5. $f(x) = \dfrac{4}{3 + x}$

6. $f(x) = \dfrac{2}{5 - x}$

Finding a Power Series **In Exercises 7–18, find a power series for the function, centered at c, and determine the interval of convergence.**

7. $f(x) = \dfrac{1}{6 - x}, \quad c = 1$

8. $f(x) = \dfrac{2}{6 - x}, \quad c = -2$

9. $f(x) = \dfrac{1}{1 - 3x}, \quad c = 0$

10. $h(x) = \dfrac{1}{1 - 4x}, \quad c = 0$

11. $g(x) = \dfrac{5}{2x - 3}, \quad c = -3$

12. $f(x) = \dfrac{3}{2x - 1}, \quad c = 2$

13. $f(x) = \dfrac{2}{5x + 4}, \quad c = -1$

14. $f(x) = \dfrac{4}{3x + 2}, \quad c = 3$

15. $g(x) = \dfrac{4x}{x^2 + 2x - 3}, \quad c = 0$

16. $g(x) = \dfrac{3x - 8}{3x^2 + 5x - 2}, \quad c = 0$

17. $f(x) = \dfrac{2}{1 - x^2}, \quad c = 0$

18. $f(x) = \dfrac{5}{4 - x^2}, \quad c = 0$

Using a Power Series **In Exercises 19–28, use the power series**

$$\frac{1}{1 + x} = \sum_{n=0}^{\infty} (-1)^n x^n, \quad |x| < 1$$

to find a power series for the function, centered at 0, and determine the interval of convergence.

19. $h(x) = \dfrac{-2}{x^2 - 1} = \dfrac{1}{1 + x} + \dfrac{1}{1 - x}$

20. $h(x) = \dfrac{x}{x^2 - 1} = \dfrac{1}{2(1 + x)} - \dfrac{1}{2(1 - x)}$

21. $f(x) = -\dfrac{1}{(x + 1)^2} = \dfrac{d}{dx}\left[\dfrac{1}{x + 1}\right]$

22. $f(x) = \dfrac{2}{(x + 1)^3} = \dfrac{d^2}{dx^2}\left[\dfrac{1}{x + 1}\right]$

23. $f(x) = \ln(x + 1) = \displaystyle\int \frac{1}{x + 1}\,dx$

24. $f(x) = \ln(1 - x^2) = \displaystyle\int \frac{1}{1 + x}\,dx - \int \frac{1}{1 - x}\,dx$

25. $g(x) = \dfrac{1}{x^2 + 1}$

26. $f(x) = \ln(x^2 + 1)$

27. $h(x) = \dfrac{1}{4x^2 + 1}$

28. $f(x) = \arctan 2x$

Graphical and Numerical Analysis **In Exercises 29 and 30, let**

$$S_n = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \cdots \pm \frac{x^n}{n}.$$

Use a graphing utility to confirm the inequality graphically. Then complete the table to confirm the inequality numerically.

x	0.0	0.2	0.4	0.6	0.8	1.0
S_n						
$\ln(x + 1)$						
S_{n+1}						

29. $S_2 \le \ln(x + 1) \le S_3$

30. $S_4 \le \ln(x + 1) \le S_5$

Approximating a Sum **In Exercises 31 and 32, (a) use a graphing utility to graph several partial sums of the series, (b) find the sum of the series and its radius of convergence, (c) use a graphing utility and 50 terms of the series to approximate the sum when $x = 0.5$, and (d) determine what the approximation represents and how good the approximation is.**

31. $\displaystyle\sum_{n=1}^{\infty} \frac{(-1)^{n+1}(x - 1)^n}{n}$

32. $\displaystyle\sum_{n=0}^{\infty} \frac{(-1)^n x^{2n+1}}{(2n + 1)!}$

Approximating a Value **In Exercises 33–36, use the power series for $f(x) = \arctan x$ to approximate the value, using $R_N \le 0.001$.**

33. $\arctan \dfrac{1}{4}$

34. $\displaystyle\int_0^{3/4} \arctan x^2\,dx$

35. $\displaystyle\int_0^{1/2} \frac{\arctan x^2}{x}\,dx$

36. $\displaystyle\int_0^{1/2} x^2 \arctan x\,dx$

Using a Power Series **In Exercises 37–40, use the power series**

$$\frac{1}{1-x} = \sum_{n=0}^{\infty} x^n, \quad |x| < 1$$

to find a power series for the function, centered at 0, and determine the interval of convergence.

37. $f(x) = \dfrac{1}{(1-x)^2}$

38. $f(x) = \dfrac{x}{(1-x)^2}$

39. $f(x) = \dfrac{1+x}{(1-x)^2}$

40. $f(x) = \dfrac{x(1+x)}{(1-x)^2}$

41. Probability A fair coin is tossed repeatedly. The probability that the first head occurs on the nth toss is $P(n) = \left(\frac{1}{2}\right)^n$. When this game is repeated many times, the average number of tosses required until the first head occurs is

$$E(n) = \sum_{n=1}^{\infty} nP(n).$$

(This value is called the *expected value* of n.) Use the results of Exercises 37–40 to find $E(n)$. Is the answer what you expected? Why or why not?

42. Finding the Sum of a Series Use the results of Exercises 37–40 to find the sum of each series.

(a) $\dfrac{1}{3}\displaystyle\sum_{n=1}^{\infty} n\left(\frac{2}{3}\right)^n$ (b) $\dfrac{1}{10}\displaystyle\sum_{n=1}^{\infty} n\left(\frac{9}{10}\right)^n$

43. Proof Prove that

$$\arctan x + \arctan y = \arctan\frac{x+y}{1-xy}$$

for $xy \neq 1$, provided the value of the left side of the equation is between $-\pi/2$ and $\pi/2$.

44. Verifying an Identity Use the result of Exercise 43 to verify each identity.

(a) $\arctan\dfrac{120}{119} - \arctan\dfrac{1}{239} = \dfrac{\pi}{4}$

(b) $4\arctan\dfrac{1}{5} - \arctan\dfrac{1}{239} = \dfrac{\pi}{4}$

[*Hint:* Use Exercise 43 twice to find $4\arctan\frac{1}{5}$. Then use part (a).]

Approximating Pi **In Exercises 45 and 46, (a) use the result of Exercise 43 to verify the given identity and (b) use the identity and the series for the arctangent to approximate π by using four terms of each series.**

45. $2\arctan\dfrac{1}{2} - \arctan\dfrac{1}{7} = \dfrac{\pi}{4}$

46. $\arctan\dfrac{1}{2} + \arctan\dfrac{1}{3} = \dfrac{\pi}{4}$

Finding the Sum of a Series **In Exercises 47–52, find the sum of the convergent series by using a well-known function. Identify the function and explain how you obtained the sum.**

47. $\displaystyle\sum_{n=1}^{\infty} (-1)^{n+1}\frac{1}{2^n n}$

48. $\displaystyle\sum_{n=1}^{\infty} (-1)^{n+1}\frac{1}{3^n n}$

49. $\displaystyle\sum_{n=1}^{\infty} (-1)^{n+1}\frac{2^n}{5^n n}$

50. $\displaystyle\sum_{n=0}^{\infty} (-1)^{n}\frac{1}{2n+1}$

51. $\displaystyle\sum_{n=0}^{\infty} (-1)^{n}\frac{1}{2^{2n+1}(2n+1)}$

52. $\displaystyle\sum_{n=1}^{\infty} (-1)^{n+1}\frac{1}{3^{2n-1}(2n-1)}$

Exploring Concepts

53. Determine which of the series in Exercises 47–52 converges to its sum at a much slower rate than the other five series. Explain why this series converges so slowly. Use a graphing utility to illustrate the rate of convergence.

54. The radius of convergence of the power series $\displaystyle\sum_{n=0}^{\infty} a_n x^n$ is 3. What is the radius of convergence of the series

$$\sum_{n=1}^{\infty} n a_n x^{n-1}?$$

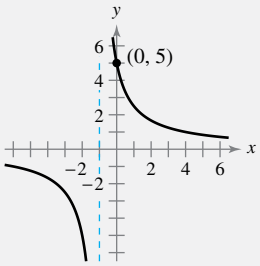
Explain.

55. The power series $\displaystyle\sum_{n=0}^{\infty} a_n x^n$ converges for $|x+1| < 4$. What can you conclude about the convergence of the series

$$\sum_{n=0}^{\infty} a_n \frac{x^{n+1}}{n+1}?$$

Explain.

56. HOW DO YOU SEE IT? The figure on the left shows the graph of a function. The figure on the right shows the graph of a power series representation of the function.



(a) Identify the function.

(b) What are the center and interval of convergence of the power series?

57. Ramanujan and Pi Use a graphing utility to show that

$$\frac{\sqrt{8}}{9801}\sum_{n=0}^{\infty}\frac{(4n)!(1103+26{,}390n)}{(n!)^4 396^{4n}} = \frac{1}{\pi}.$$

9.10 Taylor and Maclaurin Series

GO DIGITAL

- Find a Taylor or Maclaurin series for a function.
- Find a binomial series.
- Use a basic list of Taylor series to find other Taylor series.

Taylor Series and Maclaurin Series

In Section 9.9, you derived power series for several functions using geometric series with term-by-term differentiation or integration. In this section, you will study a *general* procedure for deriving the power series for a function that has derivatives of all orders. The next theorem gives the form that *every* convergent power series must take.

REMARK Be sure you understand Theorem 9.22. The theorem says that *if a power series converges to* $f(x)$, then the series must be a Taylor series. The theorem does *not* say that every series formed with the Taylor coefficients $a_n = f^{(n)}(c)/n!$ will converge to $f(x)$.

THEOREM 9.22 The Form of a Convergent Power Series

If f is represented by a power series $f(x) = \Sigma\, a_n(x - c)^n$ for all x in an open interval I containing c, then

$$a_n = \frac{f^{(n)}(c)}{n!}$$

and

$$f(x) = f(c) + f'(c)(x - c) + \frac{f''(c)}{2!}(x - c)^2 + \cdots + \frac{f^{(n)}(c)}{n!}(x - c)^n + \cdots.$$

Proof Consider a power series $\Sigma\, a_n(x - c)^n$ that has a radius of convergence R. Then, by Theorem 9.21, the nth derivative of f exists for $|x - c| < R$, and by successive differentiation you obtain the following.

$$\begin{aligned}
f^{(0)}(x) &= a_0 + a_1(x - c) + a_2(x - c)^2 + a_3(x - c)^3 + a_4(x - c)^4 + \cdots \\
f^{(1)}(x) &= a_1 + 2a_2(x - c) + 3a_3(x - c)^2 + 4a_4(x - c)^3 + \cdots \\
f^{(2)}(x) &= 2a_2 + 3!a_3(x - c) + 4 \cdot 3a_4(x - c)^2 + \cdots \\
f^{(3)}(x) &= 3!a_3 + 4!a_4(x - c) + \cdots \\
&\vdots \\
f^{(n)}(x) &= n!a_n + (n + 1)!a_{n+1}(x - c) + \cdots
\end{aligned}$$

Evaluating each of these derivatives at $x = c$ yields

$$\begin{aligned}
f^{(0)}(c) &= 0!a_0 \\
f^{(1)}(c) &= 1!a_1 \\
f^{(2)}(c) &= 2!a_2 \\
f^{(3)}(c) &= 3!a_3
\end{aligned}$$

and, in general, $f^{(n)}(c) = n!a_n$. Solving for a_n, the coefficients of the power series representation of $f(x)$ are

$$a_n = \frac{f^{(n)}(c)}{n!}.$$

Notice that the coefficients of the power series in Theorem 9.22 are precisely the coefficients of the Taylor polynomials for f at c as defined in Section 9.7. For this reason, the series is called the **Taylor series** for f at c.

MADHAVA (1350–1425)

Madhava, a mathematician and astronomer, was born in 1350 in Sangamagramma in Kerala, India. Although some of his astronomy texts have been preserved, none of his works in mathematics have survived. It was only through research into other Keralese mathematicians that Madhava's relevance in mathematics was again uncovered. Around 1400, Madhava identified infinite series equivalent to what is now known as the Maclaurin expansions of the sine, cosine, and arctangent functions. This puts his discovery of the series over 200 years before their rediscovery in Europe.

COLIN MACLAURIN (1698–1746)

The development of power series to represent functions is credited to the combined work of many seventeenth- and eighteenth-century mathematicians. Gregory, Newton, John and James Bernoulli, Leibniz, Euler, Lagrange, Wallis, and Fourier all contributed to this work. However, the two names that are most commonly associated with power series are Brook Taylor and Colin Maclaurin.

See LarsonCalculus.com to read more of this biography.

Definition of Taylor and Maclaurin Series

If a function f has derivatives of all orders at $x = c$, then the series

$$\sum_{n=0}^{\infty} \frac{f^{(n)}(c)}{n!}(x-c)^n = f(c) + f'(c)(x-c) + \cdots + \frac{f^{(n)}(c)}{n!}(x-c)^n + \cdots$$

is called the **Taylor series for f at c.** Moreover, if $c = 0$, then the series is the **Maclaurin series for f.**

When you know the pattern for the coefficients of the Taylor polynomials for a function, you can extend the pattern to form the corresponding Taylor series. For instance, in Example 4 in Section 9.7, you found the fourth Taylor polynomial for $\ln x$, centered at 1, to be

$$P_4(x) = (x-1) - \frac{1}{2}(x-1)^2 + \frac{1}{3}(x-1)^3 - \frac{1}{4}(x-1)^4.$$

From this pattern, you can obtain the Taylor series for $\ln x$ centered at $c = 1$,

$$(x-1) - \frac{1}{2}(x-1)^2 + \cdots + \frac{(-1)^{n+1}}{n}(x-1)^n + \cdots.$$

EXAMPLE 1 Forming a Power Series

Use the function

$$f(x) = \sin x$$

to form the Maclaurin series

$$\sum_{n=0}^{\infty} \frac{f^{(n)}(0)}{n!}x^n = f(0) + f'(0)x + \frac{f''(0)}{2!}x^2 + \frac{f'''(0)}{3!}x^3 + \frac{f^{(4)}(0)}{4!}x^4 + \cdots$$

and determine the interval of convergence.

Solution Taking successive derivatives of f yields

$f(x) = \sin x$	$f(0) = \sin 0 = 0$	Original function
$f'(x) = \cos x$	$f'(0) = \cos 0 = 1$	First derivative
$f''(x) = -\sin x$	$f''(0) = -\sin 0 = 0$	Second derivative
$f'''(x) = -\cos x$	$f'''(0) = -\cos 0 = -1$	Third derivative
$f^{(4)}(x) = \sin x$	$f^{(4)}(0) = \sin 0 = 0$	Fourth derivative
$f^{(5)}(x) = \cos x$	$f^{(5)}(0) = \cos 0 = 1$	Fifth derivative

and so on. The pattern repeats after the third derivative. So, the power series is as follows.

$$\begin{aligned}\sum_{n=0}^{\infty} \frac{f^{(n)}(0)}{n!}x^n &= f(0) + f'(0)x + \frac{f''(0)}{2!}x^2 + \frac{f'''(0)}{3!}x^3 + \frac{f^{(4)}(0)}{4!}x^4 + \cdots \\ &= 0 + (1)x + \frac{0}{2!}x^2 + \frac{(-1)}{3!}x^3 + \frac{0}{4!}x^4 + \frac{1}{5!}x^5 + \frac{0}{6!}x^6 + \frac{(-1)}{7!}x^7 + \cdots \\ &= x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \cdots \\ &= \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n+1}}{(2n+1)!}\end{aligned}$$

By the Ratio Test, you can conclude that this series converges for all x. ■

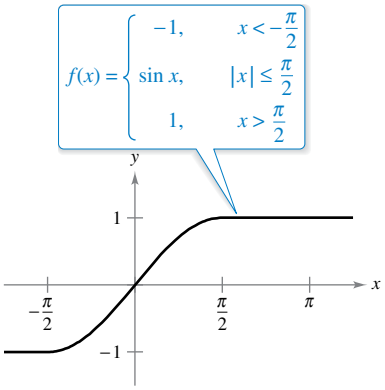

Figure 9.25

Notice that in Example 1, you cannot conclude that the power series converges to $\sin x$ for all x. You can simply conclude that the power series converges to some function, but you are not sure what function it is. This is a subtle, but important, point in dealing with Taylor or Maclaurin series. To persuade yourself that the series

$$f(c) + f'(c)(x - c) + \frac{f''(c)}{2!}(x - c)^2 + \cdots + \frac{f^{(n)}(c)}{n!}(x - c)^n + \cdots$$

might converge to a function other than f, remember that the derivatives are being evaluated at a single point. It can easily happen that another function will agree with the values of $f^{(n)}(x)$ when $x = c$ and disagree at other x-values. For instance, the power series (centered at 0) for the function f shown in Figure 9.25 is the same series as in Example 1. The series converges for all x, and yet it obviously cannot converge to both $f(x)$ and $\sin x$ for all x.

Let f have derivatives of all orders in an open interval I centered at c. The Taylor series for f may fail to converge for some x in I. Even when the series is convergent, it may fail to have $f(x)$ as its sum. Nevertheless, Theorem 9.19 tells us that for each n,

$$f(x) = f(c) + f'(c)(x - c) + \frac{f''(c)}{2!}(x - c)^2 + \cdots + \frac{f^{(n)}(c)}{n!}(x - c)^n + R_n(x)$$

where

$$R_n(x) = \frac{f^{(n+1)}(z)}{(n + 1)!}(x - c)^{n+1}.$$

Note that in this remainder formula, the particular value of z that makes the remainder formula true depends on the values of x and n. If $R_n \to 0$ as $n \to \infty$, then the next theorem tells us that the Taylor series for f actually converges to $f(x)$ for all x in I.

THEOREM 9.23 Convergence of Taylor Series

If $\lim_{n\to\infty} R_n = 0$ for all x in the interval I, then the Taylor series for f converges and equals $f(x)$,

$$f(x) = \sum_{n=0}^{\infty} \frac{f^{(n)}(c)}{n!}(x - c)^n.$$

Proof For a Taylor series, the nth partial sum coincides with the nth Taylor polynomial. That is, $S_n(x) = P_n(x)$. Moreover, because

$$P_n(x) = f(x) - R_n(x)$$

it follows that

$$\begin{aligned} \lim_{n\to\infty} S_n(x) &= \lim_{n\to\infty} P_n(x) \\ &= \lim_{n\to\infty} [f(x) - R_n(x)] \\ &= f(x) - \lim_{n\to\infty} R_n(x). \end{aligned}$$

So, for a given x, the Taylor series (the sequence of partial sums) converges to $f(x)$ if and only if $R_n(x) \to 0$ as $n \to \infty$. ■

Stated another way, Theorem 9.23 says that a power series formed with Taylor coefficients

$$a_n = \frac{f^{(n)}(c)}{n!}$$

converges to the function from which it was derived at precisely those values for which the remainder approaches 0 as $n \to \infty$.

GO DIGITAL

In Example 1, you derived the power series from the sine function and you also concluded that the series converges to some function on the entire real number line. In Example 2, you will see that the series actually converges to sin x. The key observation is that although the value of z is not known, it is possible to obtain an upper bound for

$$|f^{(n+1)}(z)|.$$

EXAMPLE 2 A Convergent Maclaurin Series

Show that the Maclaurin series for

$$f(x) = \sin x$$

converges to sin x for all x.

Solution Using the result in Example 1, you need to show that

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \cdots + \frac{(-1)^n x^{2n+1}}{(2n+1)!} + \cdots$$

is true for all x. Because

$$f^{(n+1)}(x) = \pm\sin x$$

or

$$f^{(n+1)}(x) = \pm\cos x$$

you can conclude that

$$|f^{(n+1)}(z)| \leq 1$$

for every real number z. So, for any fixed x, you can apply Taylor's Theorem (Theorem 9.19) to conclude that

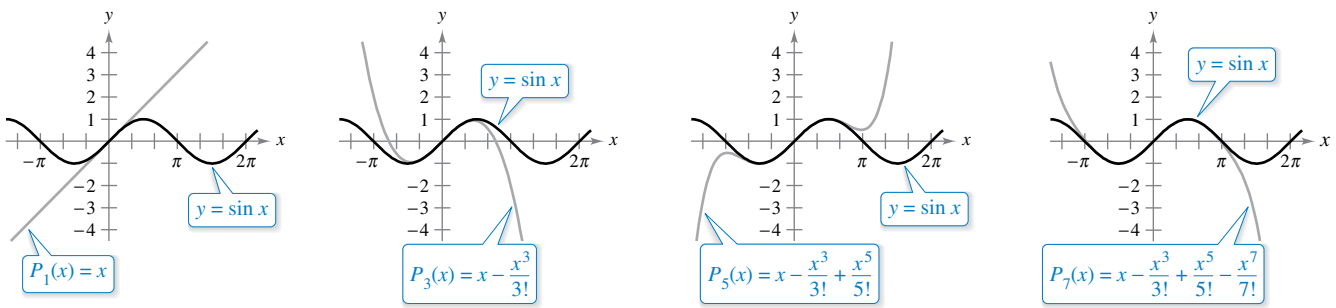
$$0 \leq |R_n(x)| = \left|\frac{f^{(n+1)}(z)}{(n+1)!}x^{n+1}\right| \leq \frac{|x|^{n+1}}{(n+1)!}.$$

From the discussion in Section 9.1 regarding the relative rates of convergence of exponential and factorial sequences, it follows that for a fixed x,

$$\lim_{n\to\infty} \frac{|x|^{n+1}}{(n+1)!} = 0.$$

Finally, by the Squeeze Theorem, it follows that for all x, $R_n(x) \to 0$ as $n \to \infty$. So, by Theorem 9.23, the Maclaurin series for sin x converges to sin x for all x. ■

Figure 9.26 shows the convergence of the Maclaurin series for sin x by comparing the graphs of the Maclaurin polynomials P_1, P_3, P_5, and P_7 with the graph of the sine function. Notice that as the degree of the polynomial increases, its graph more closely resembles that of the sine function.



As n increases, the graph of P_n more closely resembles the sine function.

The guidelines for finding a Taylor series for f at c are summarized below.

Guidelines for Finding a Taylor Series

1. Differentiate f with respect to x several times and evaluate each derivative at c.

   $$f(c), f'(c), f''(c), f'''(c), \cdots, f^{(n)}(c), \cdots$$

   Try to recognize a pattern in these numbers.
2. Use the sequence developed in the first step to form the Taylor coefficients $a_n = f^{(n)}(c)/n!$ and determine the interval of convergence for the resulting power series

   $$f(c) + f'(c)(x - c) + \frac{f''(c)}{2!}(x - c)^2 + \cdots + \frac{f^{(n)}(c)}{n!}(x - c)^n + \cdots.$$

3. Within this interval of convergence, determine whether the series converges to $f(x)$.

REMARK When you have difficulty recognizing a pattern, remember that you can use Theorem 9.22 to find the Taylor series. Also, you can try using the coefficients of a known Taylor or Maclaurin series, as shown in Example 3.

The direct determination of Taylor or Maclaurin coefficients using successive differentiation can be difficult, and the next example illustrates a shortcut for finding the coefficients indirectly—using the coefficients of a known Taylor or Maclaurin series.

EXAMPLE 3 **Maclaurin Series for a Composite Function**

Find the Maclaurin series for

$$f(x) = \sin x^2.$$

Solution To find the coefficients for this Maclaurin series directly, you must calculate successive derivatives of $f(x) = \sin x^2$. Calculating the first two derivatives

$$f'(x) = 2x \cos x^2$$

and

$$f''(x) = -4x^2 \sin x^2 + 2 \cos x^2$$

shows you that this task would be quite cumbersome. Fortunately, there is an alternative. First, consider the Maclaurin series for $\sin x$ found in Example 1.

$$g(x) = \sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \cdots$$

Now, because $\sin x^2 = g(x^2)$, you can substitute x^2 for x in the series for $\sin x$ to obtain

$$\sin x^2 = g(x^2) = x^2 - \frac{x^6}{3!} + \frac{x^{10}}{5!} - \frac{x^{14}}{7!} + \cdots.$$

Be sure to understand the point illustrated in Example 3. Because direct computation of Taylor or Maclaurin coefficients can be tedious, the most practical way to find a Taylor or Maclaurin series is to develop power series for a *basic list* of elementary functions. From this list, you can determine power series for other functions by the operations of addition, subtraction, multiplication, division, differentiation, integration, and composition with known power series.

GO DIGITAL

Binomial Series

Before presenting the basic list for elementary functions, you will develop one more series—for a function of the form $f(x) = (1 + x)^k$. This produces the **binomial series.**

EXAMPLE 4 Binomial Series

Find the Maclaurin series for

$$f(x) = (1 + x)^k$$

and determine its radius of convergence. Assume that k is not a positive integer and $k \neq 0$.

Solution By successive differentiation, you have

$$\begin{aligned} f(x) &= (1 + x)^k & f(0) &= 1 \\ f'(x) &= k(1 + x)^{k-1} & f'(0) &= k \\ f''(x) &= k(k - 1)(1 + x)^{k-2} & f''(0) &= k(k - 1) \\ f'''(x) &= k(k - 1)(k - 2)(1 + x)^{k-3} & f'''(0) &= k(k - 1)(k - 2) \\ &\vdots & &\vdots \\ f^{(n)}(x) &= k \cdot \cdot \cdot (k - n + 1)(1 + x)^{k-n} & f^{(n)}(0) &= k(k - 1) \cdot \cdot \cdot (k - n + 1) \end{aligned}$$

which produces the series

$$1 + kx + \frac{k(k - 1)x^2}{2} + \cdot \cdot \cdot + \frac{k(k - 1) \cdot \cdot \cdot (k - n + 1)x^n}{n!} + \cdot \cdot \cdot .$$

By the Ratio Test, you can conclude that the radius of convergence is $R = 1$. So, the series converges to some function in the interval $(-1, 1)$. ■

Note that Example 4 shows that the Taylor series for $(1 + x)^k$ converges to some function in the interval $(-1, 1)$. However, the example does not show that the series actually converges to $(1 + x)^k$. To do this, you could show that the remainder $R_n(x)$ converges to 0, as illustrated in Example 2. You now have enough information to find a binomial series for a function, as shown in the next example.

EXAMPLE 5 Finding a Binomial Series

Find the power series for $f(x) = \sqrt[3]{1 + x}$.

Solution Using the binomial series

$$(1 + x)^k = 1 + kx + \frac{k(k - 1)x^2}{2!} + \frac{k(k - 1)(k - 2)x^3}{3!} + \cdot \cdot \cdot$$

let $k = \frac{1}{3}$ and write

$$(1 + x)^{1/3} = 1 + \frac{x}{3} - \frac{2x^2}{3^2 2!} + \frac{2 \cdot 5x^3}{3^3 3!} - \frac{2 \cdot 5 \cdot 8x^4}{3^4 4!} + \cdot \cdot \cdot .$$ ■

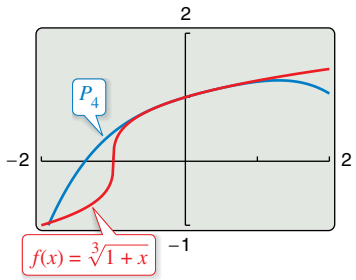

Figure 9.27

TECHNOLOGY Use a graphing utility to support the result in Example 5. When you graph the functions

$$f(x) = (1 + x)^{1/3}$$

and

$$P_4(x) = 1 + \frac{x}{3} - \frac{x^2}{9} + \frac{5x^3}{81} - \frac{10x^4}{243}$$

in the same viewing window, you should obtain the result shown in Figure 9.27.

Deriving Taylor Series from a Basic List

The list below provides the power series for several elementary functions with the corresponding intervals of convergence.

Power Series for Elementary Functions

Function	Interval of Convergence
$\frac{1}{x} = 1 - (x-1) + (x-1)^2 - (x-1)^3 + (x-1)^4 - \cdots + (-1)^n(x-1)^n + \cdots$	$0 < x < 2$
$\frac{1}{1-x} = 1 + x + x^2 + x^3 + x^4 + x^5 + \cdots + x^n + \cdots$	$-1 < x < 1$
$\frac{1}{1+x} = 1 - x + x^2 - x^3 + x^4 - x^5 + \cdots + (-1)^n x^n + \cdots$	$-1 < x < 1$
$\ln x = (x-1) - \frac{(x-1)^2}{2} + \frac{(x-1)^3}{3} - \frac{(x-1)^4}{4} + \cdots + \frac{(-1)^{n-1}(x-1)^n}{n} + \cdots$	$0 < x \le 2$
$e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \frac{x^5}{5!} + \cdots + \frac{x^n}{n!} + \cdots$	$-\infty < x < \infty$
$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \frac{x^9}{9!} - \cdots + \frac{(-1)^n x^{2n+1}}{(2n+1)!} + \cdots$	$-\infty < x < \infty$
$\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \frac{x^8}{8!} - \cdots + \frac{(-1)^n x^{2n}}{(2n)!} + \cdots$	$-\infty < x < \infty$
$\arctan x = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \frac{x^9}{9} - \cdots + \frac{(-1)^n x^{2n+1}}{2n+1} + \cdots$	$-1 \le x \le 1$
$\arcsin x = x + \frac{x^3}{2 \cdot 3} + \frac{1 \cdot 3x^5}{2 \cdot 4 \cdot 5} + \frac{1 \cdot 3 \cdot 5x^7}{2 \cdot 4 \cdot 6 \cdot 7} + \cdots + \frac{(2n)!x^{2n+1}}{(2^n n!)^2(2n+1)} + \cdots$	$-1 \le x \le 1$
$(1+x)^k = 1 + kx + \frac{k(k-1)x^2}{2!} + \frac{k(k-1)(k-2)x^3}{3!} + \cdots + \frac{k(k-1)\cdots(k-n+1)x^n}{n!} + \cdots$	$-1 < x < 1^*$

* The convergence at $x = \pm 1$ depends on the value of k.

Note that the binomial series is valid for noninteger values of k. Also, when k is a positive integer, the binomial series reduces to a simple binomial expansion.

EXAMPLE 6 Deriving a Power Series from a Basic List

Find the power series for

$$f(x) = \cos \sqrt{x}.$$

Solution Using the power series

$$\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \frac{x^8}{8!} - \cdots$$

you can replace x by $\sqrt{x}$ to obtain the series

$$\cos \sqrt{x} = 1 - \frac{x}{2!} + \frac{x^2}{4!} - \frac{x^3}{6!} + \frac{x^4}{8!} - \cdots.$$

This series converges for all x in the domain of $\cos \sqrt{x}$—that is, for $x \ge 0$. ■

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Power series can be multiplied and divided like polynomials. After finding the first few terms of the product (or quotient), you may be able to recognize a pattern.

EXAMPLE 7 Multiplication of Power Series

Find the first three nonzero terms in the Maclaurin series $e^x \arctan x$.

Solution Using the Maclaurin series for e^x and $\arctan x$ in the table, you have

$$e^x \arctan x = \left(1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \cdots\right)\left(x - \frac{x^3}{3} + \frac{x^5}{5} - \cdots\right).$$

Multiply these expressions and collect like terms as you would in multiplying polynomials.

$$\begin{array}{r}
1 + x + \frac{1}{2}x^2 + \frac{1}{6}x^3 + \frac{1}{24}x^4 + \cdots \\
x \qquad - \frac{1}{3}x^3 \qquad + \frac{1}{5}x^5 - \cdots \\
\hline
x + \quad x^2 + \frac{1}{2}x^3 + \quad \frac{1}{6}x^4 + \frac{1}{24}x^5 + \cdots \\
\quad - \frac{1}{3}x^3 - \quad \frac{1}{3}x^4 - \quad \frac{1}{6}x^5 - \cdots \\
\qquad\qquad + \quad \frac{1}{5}x^5 + \cdots \\
\hline
x + \quad x^2 + \frac{1}{6}x^3 - \quad \frac{1}{6}x^4 + \frac{3}{40}x^5 + \cdots
\end{array}$$

So, $e^x \arctan x = x + x^2 + \frac{1}{6}x^3 + \cdots$.

EXAMPLE 8 Division of Power Series

Find the first three nonzero terms in the Maclaurin series $\tan x$.

Solution Using the Maclaurin series for $\sin x$ and $\cos x$ in the table, you have

$$\tan x = \frac{\sin x}{\cos x} = \frac{x - \frac{x^3}{3!} + \frac{x^5}{5!} - \cdots}{1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \cdots}.$$

Divide using long division.

$$\begin{array}{r}
x + \frac{1}{3}x^3 + \quad \frac{2}{15}x^5 + \cdots \\
\hline
1 - \frac{1}{2}x^2 + \frac{1}{24}x^4 - \cdots \;\Big)\; x - \frac{1}{6}x^3 + \frac{1}{120}x^5 - \cdots \\
\qquad\quad x - \frac{1}{2}x^3 + \quad \frac{1}{24}x^5 - \cdots \\
\hline
\qquad\quad \frac{1}{3}x^3 - \quad \frac{1}{30}x^5 + \cdots \\
\qquad\quad \frac{1}{3}x^3 - \quad \frac{1}{6}x^5 + \cdots \\
\hline
\qquad\qquad\quad \frac{2}{15}x^5 + \cdots
\end{array}$$

So, $\tan x = x + \frac{1}{3}x^3 + \frac{2}{15}x^5 + \cdots$.

EXAMPLE 9 A Power Series for $\sin^2 x$

Find the power series for

$$f(x) = \sin^2 x.$$

Solution Consider rewriting $\sin^2 x$ as

$$\sin^2 x = \frac{1 - \cos 2x}{2} = \frac{1}{2} - \frac{1}{2}\cos 2x.$$

Now, use the series for $\cos x$.

$$\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \frac{x^8}{8!} - \cdots$$

$$\cos 2x = 1 - \frac{2^2}{2!}x^2 + \frac{2^4}{4!}x^4 - \frac{2^6}{6!}x^6 + \frac{2^8}{8!}x^8 - \cdots$$

$$-\frac{1}{2}\cos 2x = -\frac{1}{2} + \frac{2}{2!}x^2 - \frac{2^3}{4!}x^4 + \frac{2^5}{6!}x^6 - \frac{2^7}{8!}x^8 + \cdots$$

$$\frac{1}{2} - \frac{1}{2}\cos 2x = \frac{1}{2} - \frac{1}{2} + \frac{2}{2!}x^2 - \frac{2^3}{4!}x^4 + \frac{2^5}{6!}x^6 - \frac{2^7}{8!}x^8 + \cdots$$

So, the series for $f(x) = \sin^2 x$ is

$$\sin^2 x = \frac{2}{2!}x^2 - \frac{2^3}{4!}x^4 + \frac{2^5}{6!}x^6 - \frac{2^7}{8!}x^8 + \cdots.$$

This series converges for $-\infty < x < \infty$. ■

As mentioned in Section 9.9, power series can be used to obtain tables of values of transcendental functions. They are also useful for estimating the values of definite integrals for which antiderivatives cannot be found. The next example demonstrates this use.

EXAMPLE 10 Power Series Approximation of a Definite Integral

See LarsonCalculus.com for an interactive version of this type of example.

Use a power series to approximate

$$\int_0^1 e^{-x^2}\,dx$$

with an error of less than 0.01.

Solution Replacing x with $-x^2$ in the series for e^x produces the following.

$$e^{-x^2} = 1 - x^2 + \frac{x^4}{2!} - \frac{x^6}{3!} + \frac{x^8}{4!} - \cdots$$

$$\int_0^1 e^{-x^2}\,dx = \left[x - \frac{x^3}{3} + \frac{x^5}{5 \cdot 2!} - \frac{x^7}{7 \cdot 3!} + \frac{x^9}{9 \cdot 4!} - \cdots\right]_0^1$$

$$= 1 - \frac{1}{3} + \frac{1}{10} - \frac{1}{42} + \frac{1}{216} - \cdots$$

Summing the first four terms, you have

$$\int_0^1 e^{-x^2}\,dx \approx 0.74$$

which, by the Alternating Series Test, has an error of less than $\frac{1}{216} \approx 0.005$. ■

Concept Check

1. Explain how to determine whether a Taylor series for a function f converges to f.
2. The binomial series is used to represent a function of what form? What is the radius of convergence for the binomial series?
3. Explain how to multiply and divide power series.
4. Explain how to use the series

$$g(x) = e^x = \sum_{n=0}^{\infty} \frac{x^n}{n!}$$

to find the series for $f(x) = x^2e^{-3x}$. Do not find the series.

Finding a Taylor Series **In Exercises 5–16, use the definition of Taylor series to find the Taylor series, centered at c, for the function.**

5. $f(x) = e^{2x}, \quad c = 0$
6. $f(x) = e^{-4x}, \quad c = 0$
7. $f(x) = \cos x, \quad c = \frac{\pi}{4}$
8. $f(x) = \sin x, \quad c = \frac{\pi}{4}$
9. $f(x) = \frac{1}{x}, \quad c = 1$
10. $f(x) = \frac{1}{1-x}, \quad c = 2$
11. $f(x) = \ln x, \quad c = 1$
12. $f(x) = e^x, \quad c = 1$
13. $f(x) = \sin 3x, \quad c = 0$
14. $f(x) = \ln(x^2 + 1), \quad c = 0$
15. $f(x) = \sec x, \quad c = 0$ (first three nonzero terms)
16. $f(x) = \tan x, \quad c = 0$ (first three nonzero terms)

Proof **In Exercises 17–20, prove that the Maclaurin series for the function converges to the function for all x.**

17. $f(x) = \cos x$
18. $f(x) = e^{-2x}$
19. $f(x) = \sinh x$
20. $f(x) = \cosh x$

Using a Binomial Series **In Exercises 21–26, use the binomial series to find the Maclaurin series for the function.**

21. $f(x) = \frac{1}{\sqrt{1-x}}$
22. $f(x) = \frac{1}{(1+x)^4}$
23. $f(x) = \frac{1}{\sqrt{1-x^2}}$
24. $f(x) = \frac{1}{(2+x)^3}$
25. $f(x) = \sqrt[4]{1+x}$
26. $f(x) = \sqrt{1+x^3}$

Finding a Maclaurin Series **In Exercises 27–40, find the Maclaurin series for the function. Use the table of power series for elementary functions on page 674.**

27. $f(x) = e^{x^2/2}$
28. $g(x) = e^{-x/3}$
29. $f(x) = \ln(1 + x)$
30. $f(x) = \ln(1 + x^3)$
31. $f(x) = \cos 4x$
32. $f(x) = \sin \pi x$
33. $g(x) = \arctan 5x$
34. $f(x) = \arcsin \pi x$
35. $f(x) = \cos x^{3/2}$
36. $g(x) = 2 \sin x^3$
37. $f(x) = \frac{1}{2}(e^x - e^{-x}) = \sinh x$
38. $f(x) = e^x + e^{-x} = 2 \cosh x$
39. $f(x) = \cos^2 x$
40. $f(x) = \sinh^{-1} x = \ln\left(x + \sqrt{x^2 + 1}\right)$

$\left(\textit{Hint:}\ \text{Integrate the series for } \frac{1}{\sqrt{x^2+1}}.\right)$

Verifying a Formula **In Exercises 41 and 42, use a power series and the fact that $i^2 = -1$ to verify the formula.**

41. $g(x) = \frac{1}{2i}(e^{ix} - e^{-ix}) = \sin x$
42. $g(x) = \frac{1}{2}(e^{ix} + e^{-ix}) = \cos x$

Finding a Maclaurin Series **In Exercises 43–46, find the Maclaurin series for the function.**

43. $f(x) = x \sin x$
44. $h(x) = x \cos x$
45. $g(x) = \begin{cases} \frac{\sin x}{x}, & x \neq 0 \\ 1, & x = 0 \end{cases}$
46. $f(x) = \begin{cases} \frac{\arcsin x}{x}, & x \neq 0 \\ 1, & x = 0 \end{cases}$

Finding Terms of a Maclaurin Series **In Exercises 47–52, find the first four nonzero terms of the Maclaurin series for the function by multiplying or dividing the appropriate power series. Use the table of power series for elementary functions on page 674.**

47. $f(x) = e^x \sin x$
48. $g(x) = e^x \cos x$
49. $h(x) = (\cos x) \ln(1 + x)$
50. $f(x) = e^x \ln(1 + x)$
51. $g(x) = \frac{\sin x}{1 + x}$
52. $f(x) = \frac{e^x}{1 + x}$

Finding a Maclaurin Series **In Exercises 53 and 54, find a Maclaurin series for $f(x)$.**

53. $f(x) = \int_0^x (e^{-t^2} - 1)\, dt$
54. $f(x) = \int_0^x \sqrt{1 + t^3}\, dt$

Verifying a Sum **In Exercises 55–58, verify the sum. Then use a graphing utility to approximate the sum with an error of less than 0.0001.**

55. $\sum_{n=1}^{\infty} (-1)^{n+1} \frac{1}{n} = \ln 2$

56. $\sum_{n=0}^{\infty} (-1)^n \left[\frac{1}{(2n+1)!}\right] = \sin 1$

57. $\sum_{n=0}^{\infty} \frac{2^n}{n!} = e^2$

58. $\sum_{n=1}^{\infty} (-1)^{n-1} \left(\frac{1}{n!}\right) = \frac{e-1}{e}$

Finding a Limit **In Exercises 59–62, use the series representation of the function f to find $\lim_{x\to 0} f(x)$, if it exists.**

59. $f(x) = \frac{1-\cos x}{x}$

60. $f(x) = \frac{\sin x}{x}$

61. $f(x) = \frac{e^x - 1}{x}$

62. $f(x) = \frac{\ln(x+1)}{x}$

Approximating an Integral **In Exercises 63–70, use a power series to approximate the value of the definite integral with an error of less than 0.0001. (In Exercises 65 and 67, assume that the integrand is defined as 1 when $x = 0$.)**

63. $\int_0^1 e^{-x^3}\,dx$

64. $\int_0^{1/4} x \ln(x+1)\,dx$

65. $\int_0^1 \frac{\sin x}{x}\,dx$

66. $\int_0^1 \cos x^2\,dx$

67. $\int_0^{1/2} \frac{\arctan x}{x}\,dx$

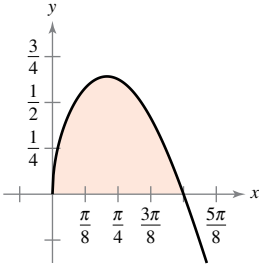
68. $\int_0^{1/2} \arctan x^2\,dx$

69. $\int_{0.1}^{0.3} \sqrt{1+x^3}\,dx$

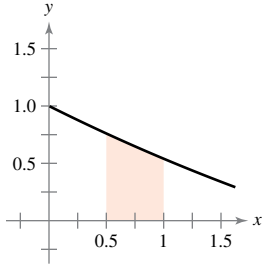
70. $\int_0^{0.2} \sqrt{1+x^2}\,dx$

Area **In Exercises 71 and 72, use a power series to approximate the area of the region with an error of less than 0.0001. Use a graphing utility to verify the result.**

71. $\int_0^{\pi/2} \sqrt{x}\cos x\,dx$

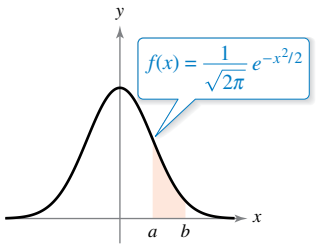


72. $\int_{0.5}^{1} \cos\sqrt{x}\,dx$



Probability **In Exercises 73 and 74, approximate the probability with an error of less than 0.0001, where the probability is given by**

$$P(a < x < b) = \frac{1}{\sqrt{2\pi}} \int_a^b e^{-x^2/2}\,dx.$$



73. $P(0 < x < 1)$

74. $P(1 < x < 2)$

Exploring Concepts

75. Describe three ways to find the Maclaurin series for $\cos^2 x$. Show that each method produces the same first three terms.

76. Explain how to use the power series for $f(x) = \arctan x$ to find the Maclaurin series for

$$g(x) = \frac{1}{1+x^2}.$$

What is another way to find the Maclaurin series for g using a power series for an elementary function?

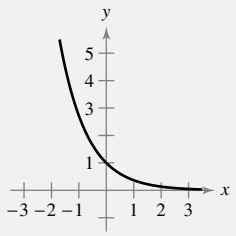
77. Which function has the Maclaurin series

$$\sum_{n=0}^{\infty} \frac{(-1)^n (x+3)^{2n+1}}{2^2\,(2n+1)!}\,?$$

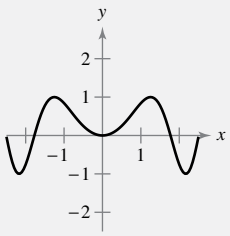
Explain your reasoning.

78. **HOW DO YOU SEE IT?** Identify the function represented by each power series and match the function with its graph. [The graphs are labeled (i) and (ii).]

(i)



(ii)



(a) $\sum_{n=0}^{\infty} \frac{(-1)^n x^{4n+2}}{(2n+1)!}$

(b) $\sum_{n=0}^{\infty} \frac{(-1)^n x^n}{n!}$

79. Projectile Motion A projectile fired from the ground follows the trajectory given by

$$y = \left(\tan\theta + \frac{g}{kv_0\cos\theta}\right)x + \frac{g}{k^2}\ln\left(1 - \frac{kx}{v_0\cos\theta}\right)$$

where v_0 is the initial speed, θ is the angle of projection, g is the acceleration due to gravity, and k is the drag factor caused by air resistance. Using the power series representation

$$\ln(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \cdots, \quad -1 < x < 1$$

verify that the trajectory can be rewritten as

$$y = (\tan\theta)x - \frac{gx^2}{2v_0^2\cos^2\theta} - \frac{kgx^3}{3v_0^3\cos^3\theta} - \frac{k^2gx^4}{4v_0^4\cos^4\theta} - \cdots.$$

80. Projectile Motion

Use the result of Exercise 79 to determine the series for the path of a projectile launched from ground level at an angle of $\theta = 60°$, with an initial speed of $v_0 = 64$ feet per second and a drag factor of $k = \frac{1}{16}$.

81. Investigation Consider the function f defined by

$$f(x) = \begin{cases} e^{-1/x^2}, & x \neq 0 \\ 0, & x = 0. \end{cases}$$

(a) Sketch a graph of the function.

(b) Use the alternative form of the definition of the derivative (Section 2.1) and L'Hôpital's Rule to show that $f'(0) = 0$. [By continuing this process, it can be shown that $f^{(n)}(0) = 0$ for $n > 1$.]

(c) Using the result in part (b), find the Maclaurin series for f. Does the series converge to f?

82. Investigation

(a) Find the power series centered at 0 for the function

$$f(x) = \frac{\ln(x^2+1)}{x^2}.$$

(b) Use a graphing utility to graph f and the eighth-degree Taylor polynomial $P_8(x)$ for f.

(c) Use a graphing utility to complete the table, where

$$F(x) = \int_0^x \frac{\ln(t^2+1)}{t^2}\,dt \quad \text{and} \quad G(x) = \int_0^x P_8(t)\,dt.$$

x	0.25	0.50	0.75	1.00	1.50	2.00
$F(x)$						
$G(x)$						

(d) Describe the relationship between the graphs of f and P_8 and the results given in the table in part (c).

83. Proof Prove that

$$\lim_{n\to\infty}\frac{x^n}{n!} = 0$$

for any real x.

84. Finding a Maclaurin Series Find the Maclaurin series for

$$f(x) = \ln\frac{1+x}{1-x}$$

and determine its radius of convergence. Use the first four terms of the series to approximate ln 3.

85. Writing a Power Series Write the power series for $(1+x)^k$ in terms of binomial coefficients.

86. Proof Prove that the Taylor series for e^x, centered at $x = a$, is given by

$$e^a\left[1 + (x-a) + \frac{(x-a)^2}{2!} + \cdots\right].$$

87. Proof Prove that e is irrational. [*Hint:* Assume that $e = p/q$ is rational (p and q are integers) and consider

$$e = 1 + 1 + \frac{1}{2!} + \cdots + \frac{1}{n!} + \cdots.\Big]$$

88. Using Fibonacci Numbers Show that the Maclaurin series for the function

$$g(x) = \frac{x}{1-x-x^2}$$

is

$$\sum_{n=1}^{\infty} F_n x^n$$

where F_n is the nth Fibonacci number with $F_1 = F_2 = 1$ and $F_n = F_{n-2} + F_{n-1}$, for $n \geq 3$. (*Hint:* Write

$$\frac{x}{1-x-x^2} = a_0 + a_1x + a_2x^2 + \cdots$$

and multiply each side of this equation by $1 - x - x^2$.)

89. Limits Consider the function

$$f(x) = \frac{\sin x - x}{x^3}.$$

(a) Calculate $\lim_{x\to 0} f(x)$ using L'Hôpital's Rule.

(b) Calculate $\lim_{x\to 0} f(x)$ using an appropriate infinite series.

PUTNAM EXAM CHALLENGE

90. Assume that $|f(x)| \leq 1$ and $|f''(x)| \leq 1$ for all x on an interval of length at least 2. Show that $|f'(x)| \leq 2$ on the interval.

This problem was composed by the Committee on the Putnam Prize Competition.

Exploring Concepts

The theory of sequences and series is one of the most beautiful and useful areas of calculus. After studying sequences and limits of sequences, you learned that an infinite series (or simply a series) is an "infinite summation."

$$\sum_{n=1}^{\infty} a_n = a_1 + a_2 + a_3 + \cdots + a_n + \cdots$$

You studied several types of series, including geometric, telescoping, p-series, and alternating series. The convergence or divergence of a series is determined by the behavior of its sequence of partial sums. To determine this behavior, you can use a convergence test, such as the Integral Test, the comparison tests, the Ratio Test, and the Root Test. While the first six sections covered sequences and series of *constant* terms, the last four sections considered series with *variable* terms. This led to the development of Taylor polynomials, Taylor series, and power series. Many elementary functions, such as $\ln x$, e^x, $\sin x$, and $\arctan x$, can be represented by power series.

1. Is it possible for a sequence to converge to two different numbers? If so, give an example. If not, explain why not.

2. In your own words, explain the difference between a sequence and a series.

3. Determine whether each statement is true or false. If it is false, explain why or give an example that shows it is false.

(a) If $\lim_{n\to\infty} a_n = 0$, then $\sum_{n=1}^{\infty} a_n$ converges.

(b) If $\sum_{n=1}^{\infty} |a_n|$ diverges, then $\sum_{n=1}^{\infty} a_n$ diverges.

(c) $\sum_{n=0}^{\infty} r^n = \dfrac{1}{1-r}$

(d) If $0 < a_n \le b_n$ and $\sum_{n=1}^{\infty} b_n$ diverges, then $\sum_{n=1}^{\infty} a_n$ diverges.

(e) If the power series

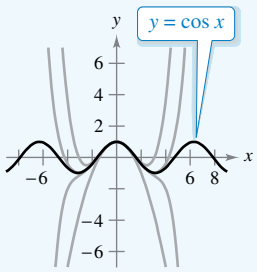
$$\sum_{n=1}^{\infty} a_n x^n$$

converges for $x = 2$, then it also converges for $x = -2$.

4. Explain why the statement is incorrect.

$$\sum_{n=0}^{\infty} x^n + \sum_{n=0}^{\infty} \left(\frac{x}{5}\right)^n = \sum_{n=0}^{\infty} \left(1 + \frac{1}{5}\right) x^n$$ ✗

5. The graph of $y = \cos x$ is shown with four of its Maclaurin polynomials. Identify the Maclaurin polynomials and use a graphing utility to confirm your results.



6. Let $f(x) = \sum_{n=0}^{\infty} \dfrac{x^n}{n!}$.

(a) Find the interval of convergence of f.

(b) Show that $f'(x) = f(x)$ and $f(0) = 1$.

(c) Identify the function f.

Writing the Terms of a Sequence **In Exercises 7–10, write the first five terms of the sequence with the given nth term.**

7. $a_n = 6^n - 2$

8. $a_n = \dfrac{5^{n-1}}{n!}$

9. $a_n = \left(-\dfrac{1}{4}\right)^n$

10. $a_n = \dfrac{2n}{n+5}$

Finding the Limit of a Sequence **In Exercises 11 and 12, use a graphing utility to graph the first 10 terms of the sequence with the given nth term. Use the graph to make an inference about the convergence or divergence of the sequence. Verify your inference analytically and, if the sequence converges, find its limit.**

11. $a_n = \dfrac{5n+2}{n}$

12. $a_n = \cos\dfrac{n\pi}{3}$

Determining Convergence or Divergence **In Exercises 13–20, determine the convergence or divergence of the sequence with the given *n*th term. If the sequence converges, find its limit.**

13. $a_n = \dfrac{1}{\sqrt{n}}$

14. $a_n = \dfrac{n}{n^2 + 1}$

15. $a_n = \left(\dfrac{2}{5}\right)^n + 5$

16. $a_n = \dfrac{2n^3 - 1}{3n + 4}$

17. $a_n = \dfrac{(4n)!}{(4n - 1)!}$

18. $a_n = \dfrac{n}{\ln n}$

19. $a_n = \dfrac{e^{2n}}{\ln n}$

20. $a_n = \dfrac{\sin\sqrt{n}}{\sqrt{n}}$

Finding the *n*th Term of a Sequence **In Exercises 21–24, find the *n*th term, a_n, of the sequence and then determine whether the sequence you have chosen converges or diverges. (There is more than one correct answer.)**

21. 3, 8, 13, 18, 23, . . .

22. $-5, -2, 3, 10, 19, \ldots$

23. $\dfrac{1}{2}, \dfrac{1}{3}, \dfrac{1}{7}, \dfrac{1}{25}, \dfrac{1}{121}, \ldots$

24. $\dfrac{1}{2}, \dfrac{2}{5}, \dfrac{3}{10}, \dfrac{4}{17}, \ldots$

Monotonic and Bounded Sequences **In Exercises 25 and 26, determine whether the sequence with the given *n*th term is monotonic and whether it is bounded. Use a graphing utility to confirm your results.**

25. $a_n = 3 - \dfrac{1}{2n}$

26. $a_n = \left(\dfrac{4}{3}\right)^n$

27. Compound Interest A deposit of \$8000 is made in an account that earns 5% interest compounded quarterly. The balance in the account after n quarters is

$$A_n = 8000(1.0125)^n, \quad n = 1, 2, 3, \ldots$$

(a) Compute the first eight terms of the sequence $\{A_n\}$.

(b) Find the balance in the account after 10 years by computing the 40th term of the sequence.

28. Depreciation A company buys a machine for \$175,000. During the next 5 years, the machine will depreciate at a rate of 30% per year. (That is, at the end of each year, the depreciated value will be 70% of what it was at the beginning of the year.)

(a) Write an expression for the value of the machine after n years.

(b) Compute the depreciated values of the machine for the first 5 years.

Finding Partial Sums **In Exercises 29 and 30, find the sequence of partial sums $S_1, S_2, S_3, S_4,$ and S_5.**

29. $3 + \dfrac{3}{2} + 1 + \dfrac{3}{4} + \dfrac{3}{5} + \cdots$

30. $-7 + 1 - \dfrac{1}{7} + \dfrac{1}{49} - \dfrac{1}{343} + \cdots$

Numerical, Graphical, and Analytic Analysis **In Exercises 31 and 32, (a) use a graphing utility to find the indicated partial sum S_n and complete the table, and (b) use a graphing utility to graph the first 10 terms of the sequence of partial sums.**

n	5	10	15	20	25
S_n					

31. $\displaystyle\sum_{n=1}^{\infty} \left(\frac{3}{2}\right)^{n-1}$

32. $\displaystyle\sum_{n=1}^{\infty} \frac{1}{n(n + 1)}$

Finding the Sum of a Convergent Series **In Exercises 33–36, find the sum of the convergent series.**

33. $\displaystyle\sum_{n=0}^{\infty} \left(\frac{2}{5}\right)^n$

34. $\displaystyle\sum_{n=0}^{\infty} \frac{3^{n+2}}{7^n}$

35. $\displaystyle\sum_{n=0}^{\infty} [(0.4)^n + (0.9)^n]$

36. $\displaystyle\sum_{n=0}^{\infty} \left[\left(\frac{3}{4}\right)^n - \frac{1}{(n + 1)(n + 2)}\right]$

Using a Geometric Series **In Exercises 37 and 38, (a) write the repeating decimal as a geometric series and (b) write the sum of the series as the ratio of two integers.**

37. $0.\overline{09}$

38. $0.\overline{64}$

Using a Geometric Series or the *n*th-Term Test **In Exercises 39–42, use a geometric series or the *n*th-Term Test to determine the convergence or divergence of the series.**

39. $\displaystyle\sum_{n=0}^{\infty} (1.67)^n$

40. $\displaystyle\sum_{n=0}^{\infty} 9^{-n}$

41. $\displaystyle\sum_{n=0}^{\infty} \frac{2n + 1}{3n + 2}$

42. $\displaystyle\sum_{n=1}^{\infty} \frac{5n! + 6}{n! + 1}$

43. Marketing A manufacturer producing a new product estimates the annual sales to be 9600 units. Each year, 8% of the units that have been sold will become inoperative. So, 9600 units will be in use after 1 year, $[9600 + 0.92(9600)]$ units will be in use after 2 years, and so on. How many units will be in use after n years?

44. Distance A ball is dropped from a height of 8 meters. Each time it drops h meters, it rebounds $0.7h$ meters. Find the total distance traveled by the ball.

Using the Integral Test or a *p*-Series **In Exercises 45–50, use the Integral Test or a *p*-series to determine the convergence or divergence of the series.**

45. $\displaystyle\sum_{n=1}^{\infty} \frac{2}{6n + 1}$

46. $\displaystyle\sum_{n=1}^{\infty} \frac{1}{\sqrt[4]{n^3}}$

47. $\displaystyle\sum_{n=1}^{\infty} \frac{1}{n^{5/2}}$

48. $\displaystyle\sum_{n=1}^{\infty} \frac{1}{5^n}$

49. $\displaystyle\sum_{n=1}^{\infty} \left(\frac{1}{n^2} - \frac{1}{n}\right)$

50. $\displaystyle\sum_{n=1}^{\infty} \frac{\ln n}{n^4}$

Using the Direct Comparison Test or the Limit Comparison Test In Exercises 51–56, use the Direct Comparison Test or the Limit Comparison Test to determine the convergence or divergence of the series.

51. $\sum_{n=2}^{\infty} \frac{1}{\sqrt[3]{n} - 1}$

52. $\sum_{n=0}^{\infty} \frac{7^n}{8^n + 5}$

53. $\sum_{n=1}^{\infty} \frac{1}{\sqrt{n^3 + 2n}}$

54. $\sum_{n=1}^{\infty} \frac{n + 1}{n(n + 2)}$

55. $\sum_{n=1}^{\infty} \frac{1 \cdot 3 \cdot 5 \cdot \cdots \cdot (2n - 1)}{2 \cdot 4 \cdot 6 \cdot \cdots \cdot (2n)}$

56. $\sum_{n=1}^{\infty} \frac{1}{3^n - 5}$

Using the Alternating Series Test In Exercises 57–62, use the Alternating Series Test, if applicable, to determine the convergence or divergence of the series.

57. $\sum_{n=1}^{\infty} \frac{(-1)^n}{n^5}$

58. $\sum_{n=1}^{\infty} \frac{(-1)^n(n + 1)}{n^2 + 1}$

59. $\sum_{n=2}^{\infty} \frac{(-1)^n n}{n^2 - 3}$

60. $\sum_{n=4}^{\infty} \frac{(-1)^n n}{n - 3}$

61. $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}\sqrt{n}}{\sqrt[4]{n} + 2}$

62. $\sum_{n=2}^{\infty} \frac{(-1)^n \ln n^3}{n}$

Finding the Number of Terms In Exercises 63 and 64, use Theorem 9.15 to determine the number of terms required to approximate the sum of the series with an error of less than 0.0001.

63. $\sum_{n=1}^{\infty} \frac{(-1)^n}{n^4}$

64. $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{3n^3 - 2}$

Using the Ratio Test or the Root Test In Exercises 65–70, use the Ratio Test or the Root Test to determine the convergence or divergence of the series.

65. $\sum_{n=1}^{\infty} \left(\frac{3n - 1}{2n + 5}\right)^n$

66. $\sum_{n=1}^{\infty} \left(\frac{4n}{7n - 1}\right)^n$

67. $\sum_{n=1}^{\infty} \frac{2^n}{n^3}$

68. $\sum_{n=0}^{\infty} \frac{7^n}{(2n + 3)^n}$

69. $\sum_{n=1}^{\infty} \frac{n}{e^{n^2}}$

70. $\sum_{n=1}^{\infty} \frac{n!}{e^{2n}}$

Finding a Maclaurin Polynomial In Exercises 71 and 72, find the nth Maclaurin polynomial for the function.

71. $f(x) = e^{-2x}, \quad n = 3$

72. $f(x) = \cos 3x, \quad n = 4$

Finding a Taylor Polynomial In Exercises 73 and 74, find the third Taylor polynomial for the function, centered at c.

73. $f(x) = \frac{1}{x^3}, \quad c = 1$

74. $f(x) = \tan x, \quad c = -\frac{\pi}{4}$

Finding a Degree In Exercises 75 and 76, determine the degree of the Maclaurin polynomial required for the error in the approximation of the function at the indicated value of x to be less than 0.001.

75. $f(x) = \cos x$, approximate $f(0.75)$

76. $f(x) = e^x$, approximate $f(-0.25)$

Numerical, Graphical, and Analytic Analysis In Exercises 77 and 78, (a) verify that the series converges, (b) use a graphing utility to find the indicated partial sum S_n and complete the table, (c) use a graphing utility to graph the first 10 terms of the sequence of partial sums, and (d) use the table to estimate the sum of the series.

S_n					

77. $\sum_{n=1}^{\infty} n\left(\frac{3}{5}\right)^n$

78. $\sum_{n=1}^{\infty} \frac{(-1)^{n-1}n}{n^3 + 5}$

Determining Convergence or Divergence In Exercises 79–84, determine the convergence or divergence of the series using any appropriate test from this chapter. Identify the test used.

79. $\sum_{n=1}^{\infty} \frac{4}{n^{2\pi}}$

80. $\sum_{n=0}^{\infty} \frac{7^{n+1}}{8^n}$

81. $\sum_{n=1}^{\infty} \frac{5n^3 + 6}{7n^3 + 2n}$

82. $\sum_{n=1}^{\infty} e^{-n/3}$

83. $\sum_{n=1}^{\infty} \frac{10^n}{4 + 9^n}$

84. $\sum_{n=1}^{\infty} \frac{(n!)^n}{3^n}$

Finding the Interval of Convergence In Exercises 85–90, find the interval of convergence of the power series. (Be sure to include a check for convergence at the endpoints of the interval.)

85. $\sum_{n=0}^{\infty} \left(\frac{x}{10}\right)^n$

86. $\sum_{n=0}^{\infty} (5x)^n$

87. $\sum_{n=0}^{\infty} \frac{(-1)^n(x - 2)^n}{(n + 1)^2}$

88. $\sum_{n=1}^{\infty} \frac{4^n(x - 1)^n}{n}$

89. $\sum_{n=0}^{\infty} n!(x - 2)^n$

90. $\sum_{n=0}^{\infty} \frac{(x - 3)^n}{3^n}$

Finding Intervals of Convergence In Exercises 91 and 92, find the intervals of convergence of (a) $f(x)$, (b) $f'(x)$, (c) $f''(x)$, and (d) $\int f(x)\,dx$. (Be sure to include a check for convergence at the endpoints of the intervals.)

91. $f(x) = \sum_{n=0}^{\infty} \left(\frac{x}{5}\right)^n$

92. $f(x) = \sum_{n=1}^{\infty} \frac{(-1)^{n+1}(x - 4)^n}{n}$

Differential Equation In Exercises 93 and 94, show that the function represented by the power series is a solution of the differential equation.

93. $y = \sum_{n=0}^{\infty} (-1)^n \frac{x^{2n}}{4^n(n!)^2}, \quad x^2y'' + xy' + x^2y = 0$

94. $y = \sum_{n=0}^{\infty} \frac{(-3)^n x^{2n}}{2^n n!}, \quad y'' + 3xy' + 3y = 0$

Finding a Geometric Power Series In Exercises 95 and 96, find a geometric power series for the function, centered at 0.

95. $g(x) = \frac{2}{3 - x}$

96. $h(x) = \frac{3}{2 + x}$

Finding a Power Series **In Exercises 97 and 98, find a power series for the function, centered at c, and determine the interval of convergence.**

97. $f(x) = \dfrac{6}{4 - x}, \quad c = 1$

98. $f(x) = \dfrac{6x}{x^2 + 4x - 5}, \quad c = 0$

Finding the Sum of a Series **In Exercises 99–104, find the sum of the convergent series by using a well-known function. Identify the function and explain how you obtained the sum.**

99. $\displaystyle\sum_{n=1}^{\infty} (-1)^{n+1} \frac{1}{4^n n}$

100. $\displaystyle\sum_{n=1}^{\infty} (-1)^{n+1} \frac{1}{5^n n}$

101. $\displaystyle\sum_{n=0}^{\infty} \frac{1}{2^n\, n!}$

102. $\displaystyle\sum_{n=0}^{\infty} \frac{2^n}{3^n\, n!}$

103. $\displaystyle\sum_{n=0}^{\infty} (-1)^n \frac{2^{2n}}{3^{2n}\,(2n)!}$

104. $\displaystyle\sum_{n=0}^{\infty} (-1)^n \frac{1}{3^{2n+1}(2n+1)!}$

Finding a Taylor Series **In Exercises 105–112, use the definition of Taylor series to find the Taylor series, centered at c, for the function.**

105. $f(x) = \sin x, \quad c = \dfrac{3\pi}{4}$

106. $f(x) = \cos x, \quad c = -\dfrac{\pi}{4}$

107. $f(x) = 3^x, \quad c = 0$

108. $f(x) = \csc x, \quad c = \dfrac{\pi}{2}$ (first three nonzero terms)

109. $f(x) = \dfrac{1}{x}, \quad c = -1$

110. $f(x) = \sqrt{x}, \quad c = 4$

111. $g(x) = \sqrt[5]{1 + x}, \quad c = 0$

112. $h(x) = \dfrac{1}{(1 + x)^3}, \quad c = 0$

113. Forming Maclaurin Series Determine the first four terms of the Maclaurin series for e^{2x}

(a) by using the definition of Maclaurin series.

(b) by replacing x by $2x$ in the series for e^x.

(c) by multiplying the series for e^x by itself, because $e^{2x} = e^x \cdot e^x$.

114. Forming Maclaurin Series Determine the first four terms of the Maclaurin series for $\sin 2x$

(a) by using the definition of Maclaurin series.

(b) by replacing x by $2x$ in the series for $\sin 2x$.

(c) by multiplying 2 by the series for $\sin x$ by the series for $\cos x$, because $\sin 2x = 2 \sin x \cos x$.

Finding a Maclaurin Series **In Exercises 115–118, find the Maclaurin series for the function. Use the table of power series for elementary functions on page 674.**

115. $f(x) = e^{6x}$

116. $f(x) = \ln(x - 1)$

117. $f(x) = \sin 5x$

118. $f(x) = \cos 3x$

Approximating an Integral **In Exercises 119 and 120, use a power series to approximate the value of the definite integral with an error of less than 0.01.**

119. $\displaystyle\int_0^{0.5} \cos x^3\, dx$

120. $\displaystyle\int_0^1 e^{-x^4}\, dx$

Building on Concepts

121. It can be shown that

$$\sum_{n=1}^{\infty} \frac{1}{n^2} = \frac{\pi^2}{6}.$$

(See Section 9.3, page 612.) Use this fact to show that

$$\sum_{n=1}^{\infty} \frac{1}{(2n - 1)^2} = \frac{\pi^2}{8}.$$

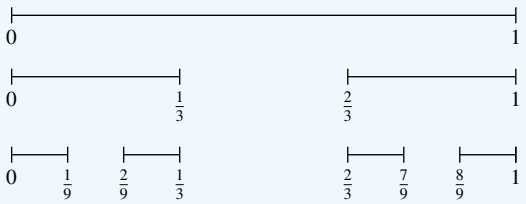
122. (a) Find a power series for the function $f(x) = xe^x$ centered at 0. Use this representation to find the sum of the infinite series

$$\sum_{n=1}^{\infty} \frac{1}{n!(n + 2)}.$$

(b) Differentiate the power series for $f(x) = xe^x$. Use the result to find the sum of the infinite series

$$\sum_{n=0}^{\infty} \frac{n + 1}{n!}.$$

123. The **Cantor set** (Georg Cantor, 1845–1918) is a subset of the unit interval $[0, 1]$. To construct the Cantor set, first remove the middle third of the interval, $\left(\frac{1}{3}, \frac{2}{3}\right)$, leaving two line segments. For the second step, remove the middle third of each of the two remaining segments, leaving four line segments. Continue this procedure indefinitely, as shown in the figure. The Cantor set consists of all numbers in the unit interval $[0, 1]$ that still remain.



(a) Find the total length of the removed line segments.

(b) Identify three numbers that are in the Cantor set.

(c) Let C_n denote the total length of the remaining line segments after n steps. Find $\lim_{n\to\infty} C_n$.

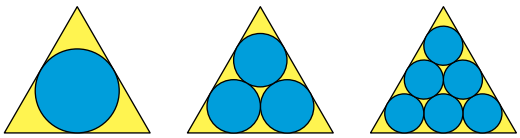
P.S. Problem Solving

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

1. Finding a Limit Let T be an equilateral triangle with sides of length 1. Let a_n be the number of circles that can be packed tightly in n rows inside the triangle. For example, $a_1 = 1$, $a_2 = 3$, and $a_3 = 6$, as shown in the figure. Let A_n be the combined area of the a_n circles. Find $\lim_{n\to\infty} A_n$.



2. Deriving Identities Derive each identity using the appropriate geometric series.

(a) $\dfrac{1}{0.99} = 1.01010101\ldots$

(b) $\dfrac{1}{0.98} = 1.0204081632\ldots$

3. Proof

(a) Consider the following sequence of numbers defined recursively.

$$a_1 = 3$$
$$a_2 = \sqrt{3}$$
$$a_3 = \sqrt{3 + \sqrt{3}}$$
$$\vdots$$
$$a_{n+1} = \sqrt{3 + a_n}$$

Write the decimal approximations for the first six terms of this sequence. Prove that the sequence converges and find its limit.

(b) Consider the following sequence defined recursively by $a_1 = \sqrt{a}$ and $a_{n+1} = \sqrt{a + a_n}$, where $a > 2$.

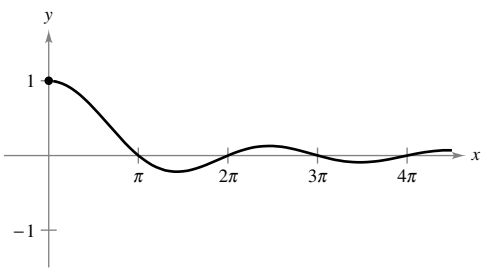
$$\sqrt{a},\quad \sqrt{a + \sqrt{a}},\quad \sqrt{a + \sqrt{a + \sqrt{a}}},\ldots$$

Prove that this sequence converges and find its limit.

4. Using the Alternating Series Test The graph of the function

$$f(x) = \begin{cases} 1, & x = 0 \\ \dfrac{\sin x}{x}, & x > 0 \end{cases}$$

is shown below. Use the Alternating Series Test to show that the improper integral $\int_1^\infty f(x)\,dx$ converges.



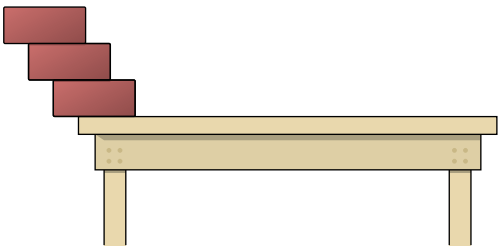
5. Using Sequences

(a) Given that $\lim_{n\to\infty} a_{2n} = L$ and $\lim_{n\to\infty} a_{2n+1} = L$, show that $\{a_n\}$ is convergent and $\lim_{n\to\infty} a_n = L$.

(b) Let $a_1 = 1$ and $a_{n+1} = 1 + \dfrac{1}{1 + a_n}$. Write out the first eight terms of $\{a_n\}$. Use part (a) to show that $\lim_{n\to\infty} a_n = \sqrt{2}$. This gives the **continued fraction expansion**

$$\sqrt{2} = 1 + \cfrac{1}{2 + \cfrac{1}{2 + \cdots}}.$$

6. Using Center of Gravity Identical blocks of unit length are stacked on top of each other at the edge of a table. The center of gravity of the top block must lie over the block below it, the center of gravity of the top two blocks must lie over the block below them, and so on (see figure).



(a) When there are three blocks, show that it is possible to stack them so that the left edge of the top block extends $\frac{11}{12}$ unit beyond the edge of the table.

(b) Is it possible to stack the blocks so that the right edge of the top block extends beyond the edge of the table?

(c) How far beyond the table can the blocks be stacked?

7. Using Power Series

(a) Consider the power series

$$\sum_{n=0}^{\infty} a_n x^n = 1 + 2x + 3x^2 + x^3 + 2x^4 + 3x^5 + x^6 + \cdots$$

in which the coefficients $a_n = 1, 2, 3, 1, 2, 3, 1, \ldots$ are periodic of period $p = 3$. Find the radius of convergence and the sum of this power series.

(b) Consider a power series

$$\sum_{n=0}^{\infty} a_n x^n$$

in which the coefficients are periodic, $(a_{n+p} = a_p)$, and $a_n > 0$. Find the radius of convergence and the sum of this power series.

8. Conditional and Absolute Convergence For what values of the positive constants a and b does the following series converge absolutely? For what values does it converge conditionally?

$$a - \frac{b}{2} + \frac{a}{3} - \frac{b}{4} + \frac{a}{5} - \frac{b}{6} + \frac{a}{7} - \frac{b}{8} + \cdots$$

10.1 Conics and Calculus

GO DIGITAL

- **Describe a conic section.**
- **Analyze and write equations of parabolas using properties of parabolas.**
- **Analyze and write equations of ellipses using properties of ellipses.**
- **Analyze and write equations of hyperbolas using properties of hyperbolas.**

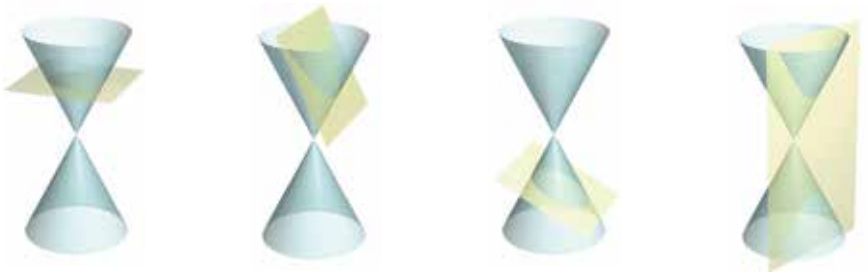
HYPATIA (370–415 A.D.)

The Greeks discovered conic sections sometime between 600 and 300 B.C. By the beginning of the Alexandrian period, enough was known about conics for Apollonius (262–190 B.C.) to produce an eight-volume work on the subject. Later, toward the end of the Alexandrian period, Hypatia wrote a textbook entitled *On the Conics of Apollonius*. Her death marked the end of major mathematical discoveries in Europe for several hundred years. The early Greeks were largely concerned with the geometric properties of conics. It was not until 1900 years later, in the early seventeenth century, that the broader applicability of conics became apparent. Conics then played a prominent role in the development of calculus.

See LarsonCalculus.com to read more of this biography.

Conic Sections

Each **conic section** (or simply **conic**) can be described as the intersection of a plane and a double-napped cone. Notice in Figure 10.1 that for the four basic conics, the intersecting plane does not pass through the vertex of the cone. When the plane passes through the vertex, the resulting figure is a **degenerate conic,** as shown in Figure 10.2.



Circle | Parabola | Ellipse | Hyperbola

Conic sections

Figure 10.1

Point | Line | Two intersecting lines

Degenerate conics

Figure 10.2

There are several ways to study conics. You could begin as the Greeks did, by defining the conics in terms of the intersections of planes and cones, or you could define them algebraically in terms of the general second-degree equation

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0.$$ General second-degree equation

However, a third approach, in which each of the conics is defined as a **locus** (collection) of points satisfying a certain geometric property, works best. For example, a circle can be defined as the collection of all points (x, y) that are equidistant from a fixed point (h, k). This locus definition easily produces the standard equation of a circle

$$(x - h)^2 + (y - k)^2 = r^2.$$ Standard equation of a circle

For information about rotating second-degree equations in two variables, see Appendix D.

Parabolas

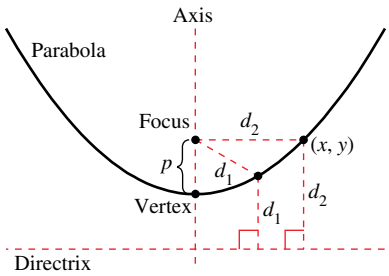

Figure 10.3

A **parabola** is the set of all points (x, y) that are equidistant from a fixed line, the **directrix,** and a fixed point, the **focus,** not on the line. The midpoint between the focus and the directrix is the **vertex,** and the line passing through the focus and the vertex is the **axis** of the parabola. Note in Figure 10.3 that a parabola is symmetric with respect to its axis.

THEOREM 10.1 Standard Equation of a Parabola

The **standard form** of the equation of a parabola with vertex (h, k) and directrix $y = k - p$ is

$$(x - h)^2 = 4p(y - k). \qquad \text{Vertical axis}$$

For directrix $x = h - p$, the equation is

$$(y - k)^2 = 4p(x - h). \qquad \text{Horizontal axis}$$

The focus lies on the axis p units (*directed distance*) from the vertex. The coordinates of the focus are as follows.

$$(h, k + p) \qquad \text{Vertical axis}$$
$$(h + p, k) \qquad \text{Horizontal axis}$$

EXAMPLE 1 Finding the Focus of a Parabola

Find the focus of the parabola

$$y = \frac{1}{2} - x - \frac{1}{2}x^2.$$

Solution To find the focus, convert to standard form by completing the square.

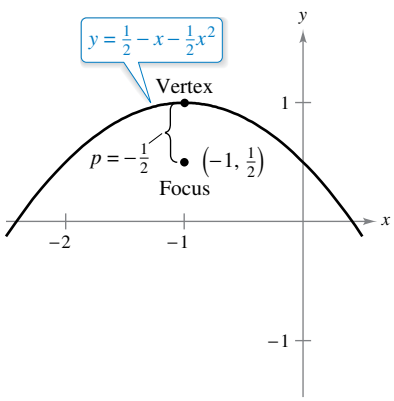
$$y = \frac{1}{2} - x - \frac{1}{2}x^2 \qquad \text{Write original equation.}$$
$$2y = 1 - 2x - x^2 \qquad \text{Multiply each side by 2.}$$
$$2y = 1 - (x^2 + 2x) \qquad \text{Group terms.}$$
$$2y = 2 - (x^2 + 2x + 1) \qquad \text{Add and subtract 1 on right side.}$$
$$x^2 + 2x + 1 = -2y + 2$$
$$(x + 1)^2 = -2(y - 1) \qquad \text{Write in standard form.}$$

Comparing this equation with

$$(x - h)^2 = 4p(y - k)$$

you can conclude that

$$h = -1, \quad k = 1, \quad \text{and} \quad p = -\frac{1}{2}.$$



Parabola with a vertical axis, $p < 0$

Figure 10.4

Because p is negative, the parabola opens downward, as shown in Figure 10.4. So, the focus of the parabola is p units from the vertex, or

$$(h, k + p) = \left(-1, \frac{1}{2}\right). \qquad \text{Focus}$$

GO DIGITAL

A line segment that passes through the focus of a parabola and has endpoints on the parabola is called a **focal chord.** The specific focal chord perpendicular to the axis of the parabola is the **latus rectum.** The next example shows how to determine the length of the latus rectum and the length of the corresponding intercepted arc.

GO DIGITAL

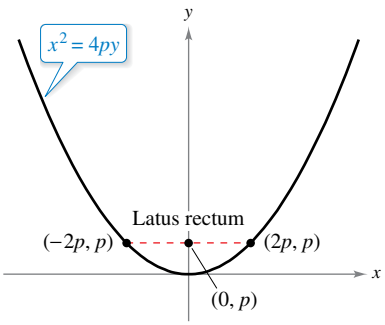
EXAMPLE 2 Focal Chord Length and Arc Length

See LarsonCalculus.com for an interactive version of this type of example.

Find the length of the latus rectum of the parabola

$$x^2 = 4py.$$

Then find the length of the parabolic arc intercepted by the latus rectum.



Length of latus rectum: $4p$
Figure 10.5

Solution Because the latus rectum passes through the focus $(0, p)$ and is perpendicular to the y-axis, the coordinates of its endpoints are

$$(-x, p) \quad \text{and} \quad (x, p).$$

Substituting p for y in the equation of the parabola produces

$$x^2 = 4p(p) \quad \Rightarrow \quad x = \pm 2p.$$

So, the endpoints of the latus rectum are $(-2p, p)$ and $(2p, p)$, and you can conclude that its length is $4p$, as shown in Figure 10.5. In contrast, the length of the intercepted arc is

$$s = \int_{-2p}^{2p} \sqrt{1 + (y')^2}\, dx \qquad \text{Use arc length formula.}$$

$$= 2\int_{0}^{2p} \sqrt{1 + \left(\frac{x}{2p}\right)^2}\, dx \qquad y = \frac{x^2}{4p} \Rightarrow y' = \frac{x}{2p}$$

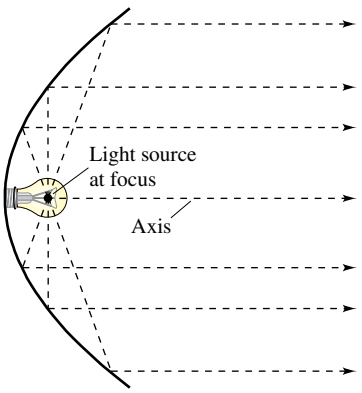
$$= \frac{1}{p}\int_{0}^{2p} \sqrt{4p^2 + x^2}\, dx \qquad \text{Simplify.}$$

$$= \frac{1}{2p}\left[x\sqrt{4p^2 + x^2} + 4p^2 \ln\left|x + \sqrt{4p^2 + x^2}\right|\right]_0^{2p} \qquad \text{Theorem 8.2}$$

$$= \frac{1}{2p}\left[2p\sqrt{8p^2} + 4p^2 \ln\left(2p + \sqrt{8p^2}\right) - 4p^2 \ln(2p)\right]$$

$$= 2p\left[\sqrt{2} + \ln\left(1 + \sqrt{2}\right)\right]$$

$$\approx 4.59p.$$



Parabolic reflector: light is reflected in parallel rays.
Figure 10.6

One widely used property of a parabola is its reflective property. In physics, a surface is called **reflective** when the tangent line at any point on the surface makes equal angles with an incoming ray and the resulting outgoing ray. The angle corresponding to the incoming ray is the **angle of incidence,** and the angle corresponding to the outgoing ray is the **angle of reflection.** One example of a reflective surface is a flat mirror.

Another type of reflective surface is that formed by revolving a parabola about its axis. The resulting surface has the property that all incoming rays parallel to the axis are directed through the focus of the parabola. This is the principle behind the design of the parabolic mirrors used in reflecting telescopes. Conversely, all light rays emanating from the focus of a parabolic reflector used in a flashlight are parallel, as shown in Figure 10.6.

THEOREM 10.2 Reflective Property of a Parabola

Let P be a point on a parabola. The tangent line to the parabola at point P makes equal angles with the following two lines.

1. The line passing through P and the focus
2. The line passing through P parallel to the axis of the parabola

NICOLAUS COPERNICUS (1473–1543)

Copernicus began to study planetary motion when he was asked to revise the calendar. At that time, the exact length of the year could not be accurately predicted using the theory that Earth was the center of the universe.

See LarsonCalculus.com to read more of this biography.

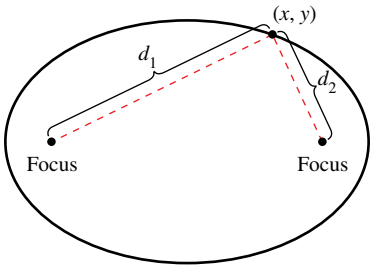
Ellipses

More than a thousand years after the close of the Alexandrian period of Greek mathematics, Western civilization finally began a Renaissance of mathematical and scientific discovery. One of the principal figures in this rebirth was the Polish astronomer Nicolaus Copernicus (1473–1543). In his work *On the Revolutions of the Heavenly Spheres,* Copernicus claimed that all of the planets, including Earth, revolved about the sun in circular orbits. Although some of Copernicus's claims were invalid, the controversy set off by his heliocentric theory motivated astronomers to search for a mathematical model to explain the observed movements of the sun and planets. The first to find an accurate model was the German astronomer Johannes Kepler (1571–1630). Kepler discovered that the planets move about the sun in elliptical orbits, with the sun not as the center but as a focal point of the orbit.

The use of ellipses to explain the movements of the planets is only one of many practical and aesthetic uses. As with parabolas, you will begin your study of this second type of conic by defining it as a locus of points. Now, however, *two* focal points are used rather than one.

An **ellipse** is the set of all points (x, y) the sum of whose distances from two distinct fixed points called **foci** is constant. (See Figure 10.7.) The line through the foci intersects the ellipse at two points called **vertices.** The chord joining the vertices is the **major axis,** and its midpoint is the **center** of the ellipse. The chord perpendicular to the major axis at the center is the **minor axis** of the ellipse. (See Figure 10.8.)

GO DIGITAL



$d_1 + d_2$ is constant.

Figure 10.7

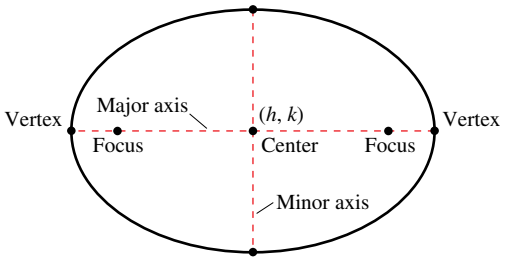


Figure 10.8

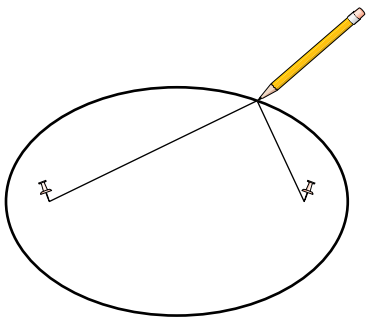

If the ends of a fixed length of string are fastened to the thumbtacks and the string is drawn taut with a pencil, then the path traced by the pencil will be an ellipse.

Figure 10.9

THEOREM 10.3 Standard Equation of an Ellipse

The **standard form** of the equation of an ellipse with center (h, k) and major and minor axes of lengths $2a$ and $2b$, respectively, where $a > b$, is

$$\frac{(x-h)^2}{a^2} + \frac{(y-k)^2}{b^2} = 1$$ Major axis is horizontal.

or

$$\frac{(x-h)^2}{b^2} + \frac{(y-k)^2}{a^2} = 1.$$ Major axis is vertical.

The foci lie on the major axis, c units from the center, with

$$c^2 = a^2 - b^2.$$

You can visualize the definition of an ellipse by imagining two thumbtacks placed at the foci, as shown in Figure 10.9.

FOR FURTHER INFORMATION To learn about how an ellipse may be "exploded" into a parabola, see the article "Exploding the Ellipse" by Arnold Good in *Mathematics Teacher.* To view this article, go to *MathArticles.com.*

GO DIGITAL

EXAMPLE 3 Analyzing an Ellipse

Find the center, vertices, and foci of the ellipse

$$4x^2 + y^2 - 8x + 4y - 8 = 0.$$ General second-degree equation

Solution Complete the square to write the original equation in standard form.

$$\begin{aligned} 4x^2 + y^2 - 8x + 4y - 8 &= 0 && \text{Write original equation.} \\ 4x^2 - 8x + y^2 + 4y &= 8 \\ 4(x^2 - 2x + 1) + (y^2 + 4y + 4) &= 8 + 4 + 4 \\ 4(x - 1)^2 + (y + 2)^2 &= 16 \\ \frac{(x - 1)^2}{4} + \frac{(y + 2)^2}{16} &= 1 && \text{Write in standard form.} \end{aligned}$$

So, the major axis is vertical, where $h = 1$, $k = -2$, $a = 4$, $b = 2$, and

$$c = \sqrt{16 - 4} = 2\sqrt{3}.$$

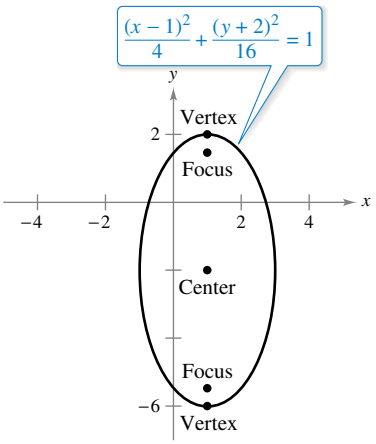
So, you obtain the following.

Center: $(1, -2)$ (h, k)

Vertices: $(1, -6)$ and $(1, 2)$ $(h, k \pm a)$

Foci: $\left(1, -2 - 2\sqrt{3}\right)$ and $\left(1, -2 + 2\sqrt{3}\right)$ $(h, k \pm c)$

The graph of the ellipse is shown in Figure 10.10.



Ellipse with a vertical major axis
Figure 10.10

In Example 3, the constant term in the general second-degree equation is $F = -8$. For a constant term greater than or equal to 8, you would obtain one of the degenerate cases listed below.

1. $F = 8$, single point, $(1, -2)$: $\dfrac{(x - 1)^2}{4} + \dfrac{(y + 2)^2}{16} = 0$

2. $F > 8$, no solution points: $\dfrac{(x - 1)^2}{4} + \dfrac{(y + 2)^2}{16} < 0$

EXAMPLE 4 The Orbit of the Moon

The moon orbits Earth in an elliptical path with the center of Earth at one focus, as shown in Figure 10.11. The major and minor axes of the orbit have lengths of 768,800 kilometers and 767,641 kilometers, respectively. Find the greatest and least distances (the apogee and perigee) from Earth's center to the moon's center.

Solution Begin by solving for a and b.

$2a = 768{,}800$ Length of major axis

$a = 384{,}400$ Solve for a.

$2b = 767{,}641$ Length of minor axis

$b = 383{,}820.5$ Solve for b.

Now, using these values, you can solve for c as follows.

$$c = \sqrt{a^2 - b^2} \approx 21{,}099$$

The greatest distance between the center of Earth and the center of the moon is

$$a + c \approx 405{,}499 \text{ kilometers}$$

and the least distance is

$$a - c \approx 363{,}301 \text{ kilometers.}$$

FOR FURTHER INFORMATION
For more information on some uses of the reflective properties of conics, see the article "Parabolic Mirrors, Elliptic and Hyperbolic Lenses" by Mohsen Maesumi in *The American Mathematical Monthly.* Also see the article "The Geometry of Microwave Antennas" by William R. Parzynski in *Mathematics Teacher.*

Theorem 10.2 presented a reflective property of parabolas. Ellipses have a similar reflective property. You are asked to prove the next theorem in Exercise 80.

THEOREM 10.4 Reflective Property of an Ellipse

Let P be a point on an ellipse. The tangent line to the ellipse at point P makes equal angles with the lines through P and the foci.

One of the reasons that astronomers had difficulty detecting that the orbits of the planets are ellipses is that the foci of the planetary orbits are relatively close to the center of the sun, making the orbits nearly circular. To measure the ovalness of an ellipse, you can use the concept of **eccentricity.**

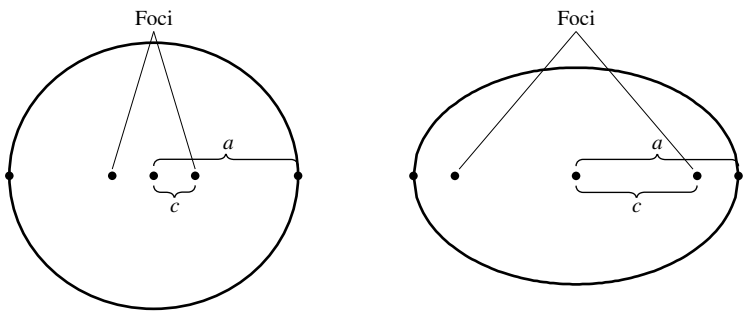
Definition of Eccentricity of an Ellipse

The **eccentricity** e of an ellipse is given by the ratio $e = \frac{c}{a}$.

To see how this ratio is used to describe the shape of an ellipse, note that because the foci of an ellipse are located along the major axis between the vertices and the center, it follows that $0 < c < a$. For an ellipse that is nearly circular, the foci are close to the center and the ratio c/a is close to 0, and for an elongated ellipse, the foci are close to the vertices and the ratio c/a is close to 1, as shown in Figure 10.12. Note that

$0 < e < 1$ The eccentricity e of an ellipse is between 0 and 1.

for every ellipse.



(a) $\frac{c}{a}$ is small. **(b)** $\frac{c}{a}$ is close to 1.

Eccentricity is the ratio $\frac{c}{a}$.

Figure 10.12

The orbit of the moon has an eccentricity of $e \approx 0.0549$, and the eccentricities of the eight planetary orbits are listed below.

Mercury:	$e \approx 0.2056$	Jupiter:	$e \approx 0.0489$
Venus:	$e \approx 0.0067$	Saturn:	$e \approx 0.0565$
Earth:	$e \approx 0.0167$	Uranus:	$e \approx 0.0457$
Mars:	$e \approx 0.0935$	Neptune:	$e \approx 0.0113$

Recall from Section 8.4, Example 5, that you used integration to show that the area of an ellipse is $A = \pi ab$. It is not so simple, however, to find the *circumference* of an ellipse. The next example shows how to use eccentricity to set up an "elliptic integral" for the circumference of an ellipse.

GO DIGITAL

EXAMPLE 5 Finding the Circumference of an Ellipse

See LarsonCalculus.com for an interactive version of this type of example.

Show that the circumference of the ellipse $(x^2/a^2) + (y^2/b^2) = 1$ is

$$4a\int_0^{\pi/2} \sqrt{1 - e^2 \sin^2\theta}\, d\theta. \qquad e = \frac{c}{a}$$

Solution Because the ellipse is symmetric with respect to both the x-axis and the y-axis, you know that its circumference C is four times the arc length of

$$y = \frac{b}{a}\sqrt{a^2 - x^2}$$

in the first quadrant. The function y is differentiable for all x in the interval $[0, a]$ except at $x = a$. So, the circumference is given by the improper integral

$$C = \lim_{d\to a^-} 4\int_0^d \sqrt{1 + (y')^2}\, dx = 4\int_0^a \sqrt{1 + (y')^2}\, dx = 4\int_0^a \sqrt{1 + \frac{b^2x^2}{a^2(a^2 - x^2)}}\, dx.$$

Using the trigonometric substitution $x = a \sin\theta$, you obtain

$$\begin{aligned} C &= 4\int_0^{\pi/2} \sqrt{1 + \frac{b^2\sin^2\theta}{a^2\cos^2\theta}}(a\cos\theta)\, d\theta \\ &= 4\int_0^{\pi/2} \sqrt{a^2\cos^2\theta + b^2\sin^2\theta}\, d\theta \\ &= 4\int_0^{\pi/2} \sqrt{a^2(1 - \sin^2\theta) + b^2\sin^2\theta}\, d\theta \\ &= 4\int_0^{\pi/2} \sqrt{a^2 - (a^2 - b^2)\sin^2\theta}\, d\theta. \end{aligned}$$

Because $e^2 = c^2/a^2 = (a^2 - b^2)/a^2$, you can rewrite this integral as

$$C = 4a\int_0^{\pi/2} \sqrt{1 - e^2\sin^2\theta}\, d\theta.$$

AREA AND CIRCUMFERENCE OF AN ELLIPSE

In his work with elliptic orbits in the early 1600s, Johannes Kepler successfully developed a formula for the area of an ellipse, $A = \pi ab$. He was less successful, however, in developing a formula for the circumference of an ellipse; the best he could do was to give the approximate formula $C = \pi(a + b)$.

A great deal of time has been devoted to the study of elliptic integrals. Such integrals generally do not have elementary antiderivatives. To find the circumference of an ellipse, you must usually resort to an approximation technique.

EXAMPLE 6 Approximating the Value of an Elliptic Integral

Use the elliptic integral in Example 5 to approximate the circumference of the ellipse

$$\frac{x^2}{25} + \frac{y^2}{16} = 1.$$

Solution Because $e^2 = c^2/a^2 = (a^2 - b^2)/a^2 = 9/25$, you have

$$C = (4)(5)\int_0^{\pi/2} \sqrt{1 - \frac{9\sin^2\theta}{25}}\, d\theta.$$

Applying Simpson's Rule with $n = 4$ produces

$$\begin{aligned} C &\approx 20\left[\frac{\pi/2}{3(4)}\right][1 + 4(0.9733) + 2(0.9055) + 4(0.8323) + 0.8] \\ &\approx 28.36. \end{aligned}$$

So, the ellipse has a circumference of about 28.36 units, as shown in Figure 10.13.

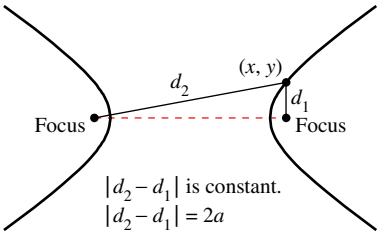

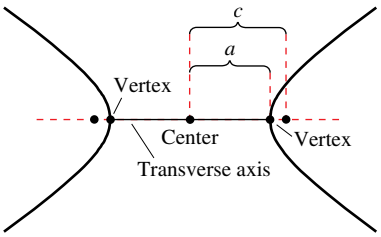

Figure 10.14

Hyperbolas

The definition of a hyperbola is similar to that of an ellipse. For an ellipse, the *sum* of the distances between the foci and a point on the ellipse is fixed, whereas for a hyperbola, the absolute value of the *difference* between these distances is fixed.

A **hyperbola** is the set of all points (x, y) for which the absolute value of the difference between the distances from two distinct fixed points called **foci** is constant. (See Figure 10.14.) The line through the two foci intersects a hyperbola at two points called **vertices.** The line segment connecting the vertices is the **transverse axis,** and the midpoint of the transverse axis is the **center** of the hyperbola. One distinguishing feature of a hyperbola is that its graph has two separate *branches.*

THEOREM 10.5 Standard Equation of a Hyperbola

The **standard form** of the equation of a hyperbola with center at (h, k) is

$$\frac{(x-h)^2}{a^2} - \frac{(y-k)^2}{b^2} = 1 \qquad \text{Transverse axis is horizontal.}$$

or

$$\frac{(y-k)^2}{a^2} - \frac{(x-h)^2}{b^2} = 1. \qquad \text{Transverse axis is vertical.}$$

The vertices are a units from the center, and the foci are c units from the center, where $c^2 = a^2 + b^2$.

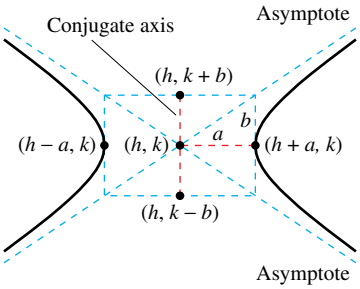

Figure 10.15

Note that the constants a, b, and c do not have the same relationship for hyperbolas as they do for ellipses. For hyperbolas, $c^2 = a^2 + b^2$, but for ellipses, $c^2 = a^2 - b^2$.

An important aid in sketching the graph of a hyperbola is the determination of its **asymptotes,** as shown in Figure 10.15. Each hyperbola has two asymptotes that intersect at the center of the hyperbola. The asymptotes pass through the vertices of a rectangle of dimensions $2a$ by $2b$, with its center at (h, k). The line segment of length $2b$ joining

$$(h, k + b)$$

and

$$(h, k - b)$$

is referred to as the **conjugate axis** of the hyperbola.

THEOREM 10.6 Asymptotes of a Hyperbola

For a *horizontal* transverse axis, the equations of the asymptotes are

$$y = k + \frac{b}{a}(x - h) \quad \text{and} \quad y = k - \frac{b}{a}(x - h).$$

For a *vertical* transverse axis, the equations of the asymptotes are

$$y = k + \frac{a}{b}(x - h) \quad \text{and} \quad y = k - \frac{a}{b}(x - h).$$

Notice in Figure 10.15 that the asymptotes coincide with the diagonals of the rectangle with dimensions $2a$ and $2b$, centered at (h, k). This provides you with a quick means of sketching the asymptotes, which in turn aids in sketching the hyperbola.

EXAMPLE 7 Using Asymptotes to Sketch a Hyperbola

See LarsonCalculus.com for an interactive version of this type of example.

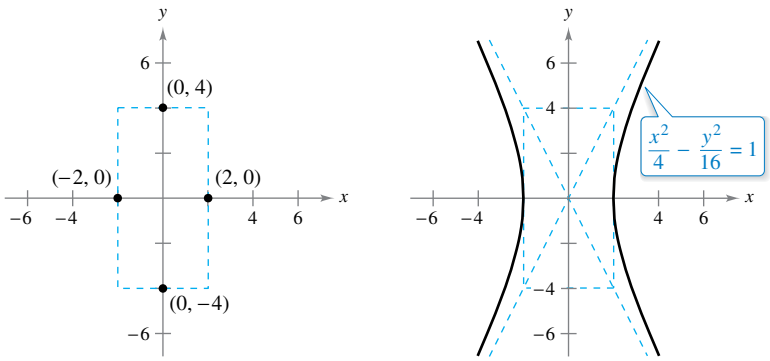
Sketch the graph of the hyperbola

$$4x^2 - y^2 = 16.$$

Solution Begin by rewriting the equation in standard form.

$$\frac{x^2}{4} - \frac{y^2}{16} = 1$$

The transverse axis is horizontal and the vertices occur at $(-2, 0)$ and $(2, 0)$. The ends of the conjugate axis occur at $(0, -4)$ and $(0, 4)$. Using these four points, you can sketch the rectangle shown in Figure 10.16(a). By drawing the asymptotes through the corners of this rectangle, you can complete the sketch as shown in Figure 10.16(b).



(a) **(b)**

Figure 10.16

Definition of Eccentricity of a Hyperbola

The **eccentricity** e of a hyperbola is given by the ratio

$$e = \frac{c}{a}.$$

FOR FURTHER INFORMATION To read about using a string that traces both elliptic and hyperbolic arcs having the same foci, see the article "Ellipse to Hyperbola: 'With This String I Thee Wed'" by Tom M. Apostol and Mamikon A. Mnatsakanian in *Mathematics Magazine*. To view this article, go to *MathArticles.com*.

As with an ellipse, the **eccentricity** of a hyperbola is $e = c/a$. Because $c > a$ for hyperbolas, it follows that $e > 1$ for hyperbolas. If the eccentricity is large, then the branches of the hyperbola are nearly flat. If the eccentricity is close to 1, then the branches of the hyperbola are more pointed, as shown in Figure 10.17.

GO DIGITAL

The application in Example 8 was developed during World War II. It shows how the properties of hyperbolas can be used in radar and other detection systems.

EXAMPLE 8 A Hyperbolic Detection System

Two microphones, 1 mile apart, record an explosion. Microphone A receives the sound 2 seconds before microphone B. Where was the explosion? (Assume sound travels at 1100 feet per second.)

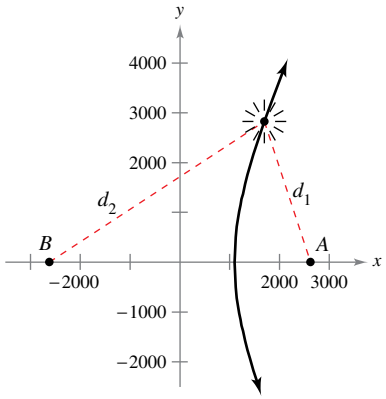

Figure 10.18

Solution Note that 1 mile = 5280 feet. So, place A at $(2640, 0)$ and B at $(-2640, 0)$, as shown in Figure 10.18. Because A received the sound 2 seconds before B, you can conclude that the explosion took place 2200 feet farther from B than from A. The locus of all points that are 2200 feet closer to A than to B is one branch of the hyperbola with the form

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1.$$

From the figure, it follows that $d_2 - d_1 = 2a = 2200$. Solving for a yields

$$a = \frac{2200}{2} = 1100.$$

The distance from the center of the hyperbola to the focus at A is 2640 feet, so $c = 2640$. Because $c^2 = a^2 + b^2$, it follows that the value of b^2 is

$$\begin{aligned} b^2 &= c^2 - a^2 && \text{Solve for } b^2. \\ &= (2640)^2 - (1100)^2 && \text{Substitute for } c \text{ and } a. \\ &= 5{,}759{,}600. && \text{Simplify.} \end{aligned}$$

So, you can conclude that the explosion occurred somewhere on the right branch of the hyperbola

$$\frac{x^2}{1{,}210{,}000} - \frac{y^2}{5{,}759{,}600} = 1.$$

CAROLINE HERSCHEL (1750–1848)

The first woman to be credited with detecting a new comet was the English astronomer Caroline Herschel. During her life, Caroline Herschel discovered a total of eight new comets.

See LarsonCalculus.com to read more of this biography.

GL Archive/Alamy Stock Photo

In Example 8, you were able to determine only the hyperbola on which the explosion occurred, but not the exact location of the explosion. If, however, you had received the sound at a third position C, then two other hyperbolas would be determined. The exact location of the explosion would be the point at which these three hyperbolas intersect.

Another interesting application of conics involves the orbits of comets in our solar system. Comets can have elliptical, parabolic, or hyperbolic orbits. The center of the sun is a focus of each orbit, and each orbit has a vertex at the point at which the comet is closest to the sun. Undoubtedly, many comets with parabolic or hyperbolic orbits have not been identified—such comets pass through our solar system only once. Only comets with elliptical orbits, such as Halley's comet, remain in our solar system.

The type of orbit for a comet can be determined as follows.

1. Ellipse: $v < \sqrt{2GM/p}$
2. Parabola: $v = \sqrt{2GM/p}$
3. Hyperbola: $v > \sqrt{2GM/p}$

In each of the above, p is the distance between one vertex and one focus of the comet's orbit (in meters), v is the velocity of the comet at the vertex (in meters per second), $M \approx 1.989 \times 10^{30}$ kilograms is the mass of the sun, and $G \approx 6.67 \times 10^{-11}$ cubic meter per kilogram-second squared is the gravitational constant.

10.1 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

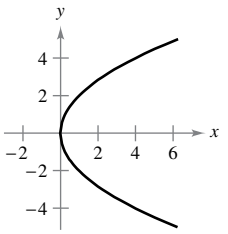
GO DIGITAL

Concept Check

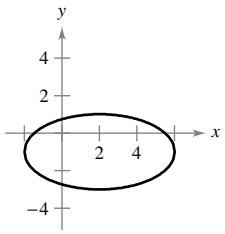
1. State the definitions of parabola, ellipse, and hyperbola.
2. State the definitions of major axis, minor axis, and transverse axis.
3. Consider an ellipse with eccentricity e.
   (a) What are the possible values of e?
   (b) What happens to the graph of the ellipse as e increases?
4. Explain how to sketch a hyperbola with a vertical transverse axis.

Matching **In Exercises 5–10, match the equation with its graph. [The graphs are labeled (a), (b), (c), (d), (e), and (f).]**

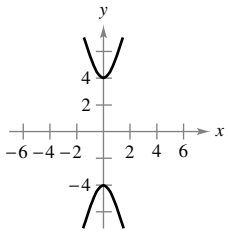
(a)



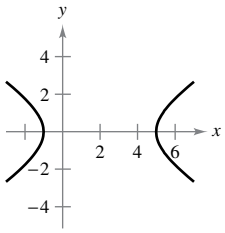
(b)



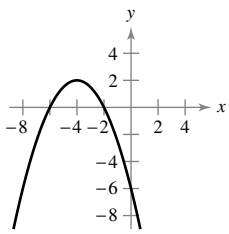
(c)



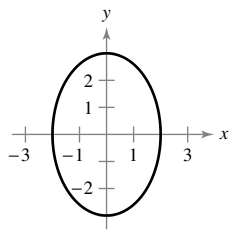
(d)



(e)



(f)



5. $y^2 = 4x$
6. $(x + 4)^2 = -2(y - 2)$
7. $\frac{y^2}{16} - \frac{x^2}{1} = 1$
8. $\frac{(x - 2)^2}{16} + \frac{(y + 1)^2}{4} = 1$
9. $\frac{x^2}{4} + \frac{y^2}{9} = 1$
10. $\frac{(x - 2)^2}{9} - \frac{y^2}{4} = 1$

Sketching a Parabola **In Exercises 11–16, find the vertex, focus, and directrix of the parabola, and sketch its graph.**

11. $(x + 5) + (y - 3)^2 = 0$
12. $(x - 6)^2 - 2(y + 7) = 0$
13. $y^2 - 4y - 4x = 0$
14. $y^2 + 6y + 8x + 25 = 0$
15. $x^2 + 4x + 4y - 4 = 0$
16. $x^2 - 2x - 4y - 7 = 0$

Finding the Standard Equation of a Parabola **In Exercises 17–24, find the standard form of the equation of the parabola with the given characteristics.**

17. Vertex: $(5, 4)$
    Focus: $(3, 4)$
18. Vertex: $(-3, -1)$
    Focus: $(-3, 1)$
19. Vertex: $(0, 5)$
    Directrix: $y = -3$
20. Focus: $(2, 2)$
    Directrix: $x = -2$
21. Vertex: $(1, -1)$
    Points on the parabola: $(-1, -4), (3, -4)$
22. Vertex: $(2, 4)$
    Points on the parabola: $(0, 0), (4, 0)$
23. Axis is parallel to y-axis; graph passes through $(0, 3)$, $(3, 4)$, and $(4, 11)$.
24. Directrix: $y = -2$; endpoints of latus rectum are $(0, 2)$ and $(8, 2)$.

Sketching an Ellipse **In Exercises 25–30, find the center, foci, vertices, and eccentricity of the ellipse, and sketch its graph.**

25. $16x^2 + y^2 = 16$
26. $3x^2 + 7y^2 = 63$
27. $\frac{(x - 3)^2}{16} + \frac{(y - 1)^2}{25} = 1$
28. $(x + 4)^2 + \frac{(y + 6)^2}{1/4} = 1$
29. $9x^2 + 4y^2 + 36x - 24y - 36 = 0$
30. $x^2 + 10y^2 - 6x + 20y + 18 = 0$

Finding the Standard Equation of an Ellipse **In Exercises 31–36, find the standard form of the equation of the ellipse with the given characteristics.**

31. Center: $(0, 0)$
    Focus: $(5, 0)$
    Vertex: $(6, 0)$
32. Vertices: $(0, 3), (8, 3)$
    Eccentricity: $\frac{3}{4}$
33. Vertices: $(3, 1), (3, 9)$
    Minor axis length: 6
34. Foci: $(0, \pm 9)$
    Major axis length: 22
35. Center: $(0, 0)$
    Major axis: horizontal
    Points on the ellipse: $(3, 1), (4, 0)$
36. Center: $(1, 2)$
    Major axis: vertical
    Points on the ellipse: $(1, 6), (3, 2)$

Sketching a Hyperbola **In Exercises 37–40, find the center, foci, vertices, and eccentricity of the hyperbola, and sketch its graph using asymptotes as an aid.**

37. $\frac{x^2}{25} - \frac{y^2}{16} = 1$
38. $\frac{(y + 3)^2}{225} - \frac{(x - 5)^2}{64} = 1$
39. $9x^2 - y^2 - 36x - 6y + 18 = 0$
40. $y^2 - 16x^2 + 64x - 208 = 0$

Finding the Standard Equation of a Hyperbola **In Exercises 41–48, find the standard form of the equation of the hyperbola with the given characteristics.**

41. Vertices: $(\pm 1, 0)$
Asymptotes: $y = \pm 5x$

42. Vertices: $(0, \pm 4)$
Asymptotes: $y = \pm 2x$

43. Vertices: $(2, \pm 3)$
Point on graph: $(0, 5)$

44. Vertices: $(2, \pm 3)$
Foci: $(2, \pm 5)$

45. Center: $(0, 0)$
Vertex: $(0, 2)$
Focus: $(0, 4)$

46. Center: $(0, 0)$
Vertex: $(6, 0)$
Focus: $(10, 0)$

47. Vertices: $(0, 2), (6, 2)$
Asymptotes: $y = \frac{2}{3}x$
$y = 4 - \frac{2}{3}x$

48. Focus: $(20, 0)$
Asymptotes: $y = \pm\frac{3}{4}x$

Finding Equations of Tangent Lines and Normal Lines **In Exercises 49 and 50, find equations for (a) the tangent lines and (b) the normal lines to the hyperbola for the given value of x. (The *normal line* at a point is perpendicular to the tangent line at the point.)**

49. $\frac{x^2}{9} - y^2 = 1, \quad x = 6$

50. $\frac{y^2}{4} - \frac{x^2}{2} = 1, \quad x = 4$

Classifying the Graph of an Equation **In Exercises 51–56, classify the graph of the equation as a circle, a parabola, an ellipse, or a hyperbola.**

51. $25x^2 - 10x - 200y - 119 = 0$

52. $4x^2 - y^2 - 4x - 3 = 0$

53. $3(x - 1)^2 = 6 + 2(y + 1)^2$

54. $9(x + 3)^2 = 36 - 4(y - 2)^2$

55. $9x^2 + 9y^2 - 36x + 6y + 34 = 0$

56. $y^2 - 4y = x + 5$

Exploring Concepts

57. Consider the equation $9x^2 + 4y^2 - 36x - 24y - 36 = 0$.

(a) Classify the graph of the equation as a circle, a parabola, an ellipse, or a hyperbola.

(b) Change the $4y^2$-term in the equation to $-4y^2$. Classify the graph of the new equation.

(c) Change the $9x^2$-term in the original equation to $4x^2$. Classify the graph of the new equation.

(d) Describe one way you could change the original equation so that its graph is a parabola.

58. Sketch the graphs of $x^2 = 4py$ for $p = \frac{1}{4}, \frac{1}{2}, 1, \frac{3}{2}$, and 2 on the same coordinate axes. Discuss the change in the graphs as p increases.

59. Let C be the circumference of the ellipse

$(x^2/a^2) + (y^2/b^2) = 1, \quad b < a.$

Explain why $2\pi b < C < 2\pi a$. Use a graph to support your explanation.

60. HOW DO YOU SEE IT? Describe in words how a plane could intersect with the double-napped cone to form each conic section (see figure).

(a) Circle (b) Ellipse
(c) Parabola (d) Hyperbola

61. Solar Collector A solar collector for heating water is constructed with a sheet of stainless steel that is formed into the shape of a parabola (see figure). The water will flow through a pipe that is located at the focus of the parabola. At what distance from the vertex is the pipe?

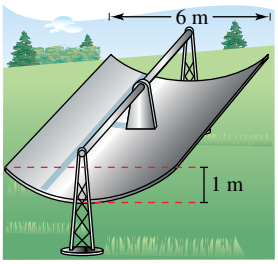

Figure for 61

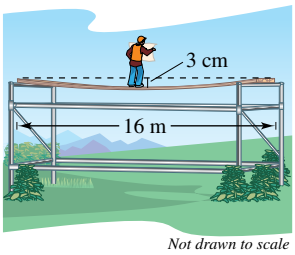

Figure for 62

62. Beam Deflection A simply supported beam that is 16 meters long has a load concentrated at the center (see figure). The deflection of the beam at its center is 3 centimeters. Assume that the shape of the deflected beam is parabolic.

(a) Find an equation of the parabola. (Assume that the origin is at the center of the beam.)

(b) How far from the center of the beam is the deflection 1 centimeter?

63. Proof

(a) Prove that any two distinct tangent lines to a parabola intersect.

(b) Demonstrate the result of part (a) by finding the point of intersection of the tangent lines to the parabola $x^2 - 4x - 4y = 0$ at the points $(0, 0)$ and $(6, 3)$.

64. Proof

(a) Prove that if any two tangent lines to a parabola intersect at right angles, then their point of intersection must lie on the directrix.

(b) Demonstrate the result of part (a) by showing that the tangent lines to the parabola $x^2 - 4x - 4y + 8 = 0$ at the points $(-2, 5)$ and $\left(3, \frac{5}{4}\right)$ intersect at right angles and that their point of intersection lies on the directrix.

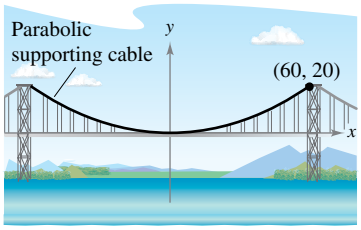
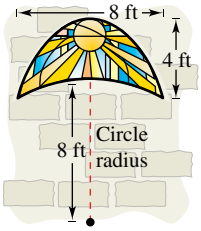
65. Bridge Design A cable of a suspension bridge is suspended (in the shape of a parabola) between two towers that are 120 meters apart and 20 meters above the roadway (see figure). The cable touches the roadway midway between the towers. Find an equation for the parabolic shape of the cable.



66. Arc Length Find the length of the parabolic cable in Exercise 65.

67. Architecture

A church window is bounded above by a parabola and below by the arc of a circle (see figure). Find the area of the window.



68. Surface Area A satellite signal receiving dish is formed by revolving the parabola given by

$$x^2 = 20y$$

about the y-axis. The radius of the dish is r feet. Verify that the surface area of the dish is given by

$$2\pi\int_0^r x\sqrt{1+\left(\frac{x}{10}\right)^2}\,dx = \frac{\pi}{15}[(100+r^2)^{3/2} - 1000].$$

69. Orbit of Earth Earth moves in an elliptical orbit with the sun at one of the foci. The length of half of the major axis is 149,598,000 kilometers, and the eccentricity is 0.0167. Find the minimum distance (*perihelion*) and the maximum distance (*aphelion*) of Earth from the sun.

70. Satellite Orbit The *apogee* (the point in orbit farthest from Earth) and the *perigee* (the point in orbit closest to Earth) of an elliptical orbit of an Earth satellite are given by A and P, respectively. Show that the eccentricity of the orbit is

$$e = \frac{A-P}{A+P}.$$

71. Explorer 1 On January 31, 1958, the United States launched the research satellite Explorer 1. Its low and high points above the surface of Earth were 220 miles and 1563 miles. Find the eccentricity of its elliptical orbit. (Use 4000 miles as the radius of Earth.)

72. Explorer 55 On November 20, 1975, the United States launched the research satellite Explorer 55. Its low and high points above the surface of Earth were 96 miles and 1865 miles. Find the eccentricity of its elliptical orbit. (Use 4000 miles as the radius of Earth.)

73. Halley's Comet

Probably the most famous of all comets, Halley's comet, has an elliptical orbit with the sun at one focus. Its maximum distance from the sun is approximately 35.29 AU (1 astronomical unit is approximately 92.956×10^6 miles), and its minimum distance is approximately 0.59 AU. Find the eccentricity of the orbit.

74. Particle Motion Consider a particle traveling clockwise on the elliptical path

$$\frac{x^2}{100} + \frac{y^2}{25} = 1.$$

The particle leaves the orbit at the point $(-8, 3)$ and travels in a straight line tangent to the ellipse. At what point will the particle cross the y-axis?

Area, Volume, and Surface Area **In Exercises 75 and 76, find (a) the area of the region bounded by the ellipse, (b) the volume and surface area of the solid generated by revolving the region about its major axis (prolate spheroid), and (c) the volume and surface area of the solid generated by revolving the region about its minor axis (oblate spheroid).**

75. $\frac{x^2}{4} + \frac{y^2}{1} = 1$

76. $\frac{x^2}{16} + \frac{y^2}{9} = 1$

77. Arc Length Use the integration capabilities of a graphing utility to approximate to two-decimal-place accuracy the elliptical integral representing the circumference of the ellipse

$$\frac{x^2}{25} + \frac{y^2}{49} = 1.$$

78. Conjecture

(a) Show that the equation of an ellipse can be written as

$$\frac{(x-h)^2}{a^2} + \frac{(y-k)^2}{a^2(1-e^2)} = 1.$$

(b) Use a graphing utility to graph the ellipse

$$\frac{(x-2)^2}{4} + \frac{(y-3)^2}{4(1-e^2)} = 1$$

for $e = 0.95$, $e = 0.75$, $e = 0.5$, $e = 0.25$, and $e = 0$.

(c) Use the results of part (b) to make a conjecture about the change in the shape of the ellipse as e approaches 0.

79. Geometry The area of the ellipse in the figure is twice the area of the circle. What is the length of the major axis?

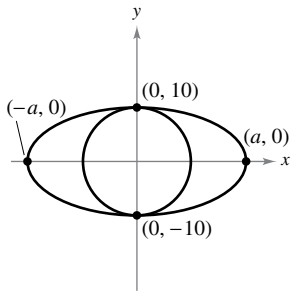

Figure for 79

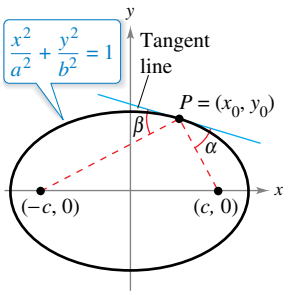

Figure for 80

80. Proof Prove Theorem 10.4 by showing that the tangent line to an ellipse at a point P makes equal angles with lines through P and the foci (see figure). [*Hint:* (1) Find the slope of the tangent line at P, (2) find the slopes of the lines through P and each focus, and (3) use the formula for the tangent of the angle θ between two lines with slopes m_1 and m_2,

$$\tan\theta = \left|\frac{m_1 - m_2}{1 + m_1 m_2}\right|.]$$

81. Finding an Equation of a Hyperbola Find an equation of the hyperbola such that for any point on the hyperbola, the difference between its distances from the points $(2, 2)$ and $(10, 2)$ is 6.

82. Hyperbola Consider a hyperbola centered at the origin with a horizontal transverse axis. Use the definition of a hyperbola to derive its standard form

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1.$$

83. Navigation LORAN (long distance radio navigation) for aircraft and ships uses synchronized pulses transmitted by widely separated transmitting stations. These pulses travel at the speed of light (186,000 miles per second). The difference in the times of arrival of these pulses at an aircraft or ship is constant on a hyperbola having the transmitting stations as foci. Assume that two stations, 300 miles apart, are positioned on a rectangular coordinate system at $(-150, 0)$ and $(150, 0)$ and that a ship is traveling on a path with coordinates $(x, 75)$ (see figure). Find the x-coordinate of the position of the ship when the time difference between the pulses from the transmitting stations is 1000 microseconds (0.001 second).

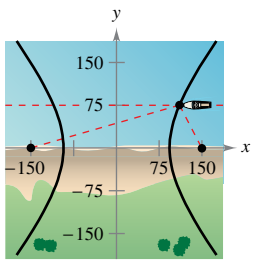

Figure for 83

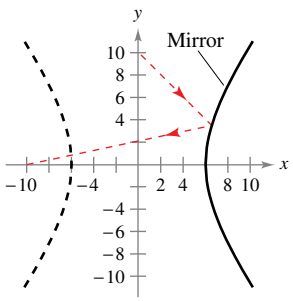

Figure for 84

84. Hyperbolic Mirror A hyperbolic mirror (used in some telescopes) has the property that a light ray directed at the focus will be reflected to the other focus. The mirror in the figure has the equation

$$\frac{x^2}{36} - \frac{y^2}{64} = 1.$$

At which point on the mirror will light from the point $(0, 10)$ be reflected to the other focus?

85. Tangent Line Show that the equation of the tangent line to $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ at the point (x_0, y_0) is $\left(\frac{x_0}{a^2}\right)x - \left(\frac{y_0}{b^2}\right)y = 1$.

86. Proof Prove that the graph of the equation

$$Ax^2 + Cy^2 + Dx + Ey + F = 0$$

is one of the following (except in degenerate cases).

Conic	Condition
(a) Circle	$A = C$
(b) Parabola	$A = 0$ or $C = 0$ (but not both)
(c) Ellipse	$AC > 0$
(d) Hyperbola	$AC < 0$

True or False? **In Exercises 87–92, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

87. It is possible for a parabola to intersect its directrix.

88. The point on a parabola closest to its focus is its vertex.

89. The eccentricity of a hyperbola with a horizontal transverse axis is $e = \sqrt{1 + m^2}$, where m and $-m$ the slopes of the asymptotes.

90. If $D \neq 0$ or $E \neq 0$, then the graph of

$$y^2 - x^2 + Dx + Ey = 0$$

is a hyperbola.

91. If the asymptotes of the hyperbola $(x^2/a^2) - (y^2/b^2) = 1$ intersect at right angles, then $a = b$.

92. Every tangent line to a hyperbola intersects the hyperbola only at the point of tangency.

PUTNAM EXAM CHALLENGE

93. For a point P on an ellipse, let d be the distance from the center of the ellipse to the line tangent to the ellipse at P. Prove that $(PF_1)(PF_2)d^2$ is constant as P varies on the ellipse, where PF_1 and PF_2 are the distances from P to the foci F_1 and F_2 of the ellipse.

94. Find the minimum value of

$$(u - v)^2 + \left(\sqrt{2 - u^2} - \frac{9}{v}\right)^2$$

for $0 < u < \sqrt{2}$ and $v > 0$.

10.2 Plane Curves and Parametric Equations

GO DIGITAL

- **Sketch the graph of a curve given by a set of parametric equations.**
- **Eliminate the parameter in a set of parametric equations.**
- **Find a set of parametric equations to represent a curve.**
- **Describe two classic calculus problems, the tautochrone and brachistochrone problems.**

Big Ideas of Calculus

So far, your study of calculus has centered around plane curves given by $y = f(x)$. Now, you will extend the concepts of calculus to curves given by a set of parametric equations and to those represented by polar coordinates. These representations are very useful in studying the motions of objects. In some applications, such as in finding the area of a region, these alternative forms may be more convenient to use than the corresponding rectangular form.

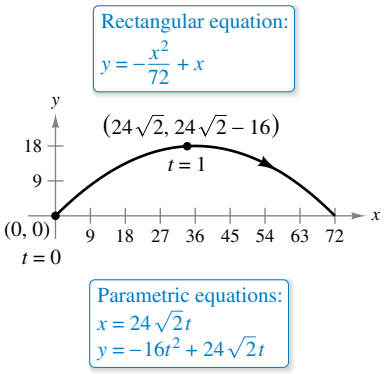
Plane Curves and Parametric Equations

Until now, you have been representing a graph by a single equation involving *two* variables. In this section, you will study situations in which *three* variables are used to represent a curve in the plane.

Consider the path followed by an object that is propelled into the air at an angle of 45°. For an initial velocity of 48 feet per second, the object travels the parabolic path given by the rectangular equation

$$y = -\frac{x^2}{72} + x$$

as shown in Figure 10.19. This equation, however, does not tell the whole story. Although it does tell you *where* the object has been, it does not tell you *when* the object was at a given point (x, y). To determine this time, you can introduce a third variable t, called a **parameter.** By writing both x and y as functions of t, you obtain the **parametric equations**



Curvilinear motion: two variables for position, one variable for time
Figure 10.19

$$x = 24\sqrt{2}t \qquad \text{Parametric equation for } x$$

and

$$y = -16t^2 + 24\sqrt{2}t. \qquad \text{Parametric equation for } y$$

From this set of equations, you can determine that at time $t = 0$, the object is at the point $(0, 0)$. Similarly, at time $t = 1$, the object is at the point

$$\left(24\sqrt{2}, 24\sqrt{2} - 16\right)$$

and so on. (You will learn a method for determining this particular set of parametric equations—the equations of motion—later, in Section 12.3.)

For this particular motion problem, x and y are continuous functions of t, and the resulting path is called a **plane curve.**

REMARK At times, it is important to distinguish between a graph (the set of points) and a curve (the points together with their defining parametric equations). When it is important, the distinction will be explicit. When it is not important, C will be used to represent either the graph or the curve.

Definition of a Plane Curve

If f and g are continuous functions of t on an interval I, then the equations

$$x = f(t) \quad \text{and} \quad y = g(t)$$

are **parametric equations** and t is the **parameter.** The set of points (x, y) obtained as t varies over the interval I is the **graph** of the parametric equations. Taken together, the parametric equations and the graph are a **plane curve,** denoted by C.

GO DIGITAL

When sketching a curve represented by a set of parametric equations, you can plot points in the xy-plane. Each set of coordinates (x, y) is determined from a value chosen for the parameter t. By plotting the resulting points in order of increasing values of t, the curve is traced out in a specific direction. This is called the **orientation** of the curve.

EXAMPLE 1 Sketching a Curve

Sketch the curve described by the parametric equations

$$x = f(t) = t^2 - 4$$

and

$$y = g(t) = \frac{t}{2}$$

where $-2 \le t \le 3$.

Solution For values of t on the given interval, the parametric equations yield the points (x, y) shown in the table.

t	-2	-1	0	1	2	3
x	0	-3	-4	-3	0	5
y	-1	$-\frac{1}{2}$	0	$\frac{1}{2}$	1	$\frac{3}{2}$

By plotting these points in order of increasing values of t and using the continuity of f and g, you obtain the curve C shown in Figure 10.20. Note that the arrows on the curve indicate its orientation as t increases from -2 to 3.

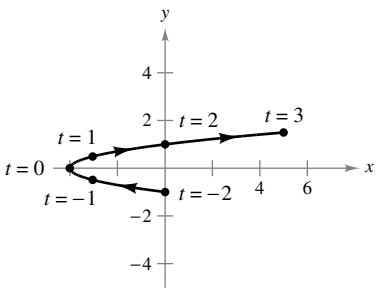

Figure 10.20

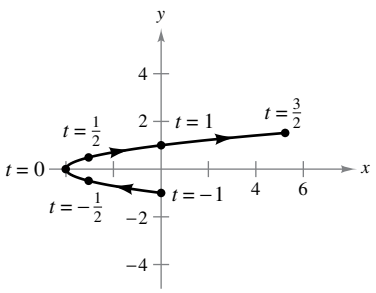

Figure 10.21

According to the Vertical Line Test, the graph shown in Figure 10.20 does not define y as a function of x. This points out one benefit of parametric equations—they can be used to represent graphs that are more general than graphs of functions.

It often happens that two different sets of parametric equations have the same graph. For instance, the set of parametric equations

$$x = 4t^2 - 4 \quad \text{and} \quad y = t, \quad -1 \le t \le \frac{3}{2}$$

has the same graph as the set given in Example 1. (See Figure 10.21.) By comparing the values of t in Figures 10.20 and 10.21, however, notice that the second graph is traced out more *rapidly* (considering t as time) than the first graph. So, in applications, different parametric representations can be used to represent various *speeds* at which objects travel along a given path.

TECHNOLOGY Most graphing utilities have a *parametric* graphing mode. If you have access to such a utility, use it to confirm the graphs shown in Figures 10.20 and 10.21. Does the curve given by the parametric equations

$$x = 4t^2 - 8t \quad \text{and} \quad y = 1 - t, \quad -\frac{1}{2} \le t \le 2$$

represent the same graph as that shown in Figures 10.20 and 10.21? What do you notice about the *orientation* of this curve?

GO DIGITAL

Eliminating the Parameter

Finding a rectangular equation that represents the graph of a set of parametric equations is called **eliminating the parameter.** For instance, one way to eliminate the parameter from the set of parametric equations in Example 1 is shown below.

Parametric equations	⇨	Solve for t in one equation.	⇨	Substitute into other equation.	⇨	Rectangular equation
$x = t^2 - 4$				$x = (2y)^2 - 4$		$x = 4y^2 - 4$
$y = \frac{t}{2}$		$t = 2y$				

After eliminating the parameter, you can recognize that the equation $x = 4y^2 - 4$ represents a parabola with a horizontal axis and vertex at $(-4, 0)$, as shown in Figure 10.20.

The range of x and y implied by the parametric equations may be altered by the change to rectangular form. In such instances, the domain of the rectangular equation must be adjusted so that its graph matches the graph of the parametric equations. Such a situation is demonstrated in the next example.

EXAMPLE 2 Eliminating the Parameter

Sketch the curve represented by the equations

$$x = \frac{1}{\sqrt{t+1}} \quad \text{and} \quad y = \frac{t}{t+1}, \quad t > -1$$

by eliminating the parameter and adjusting the domain of the resulting rectangular equation.

Solution Begin by solving one of the parametric equations for t. For instance, you can solve the first equation for t as shown below.

$$x = \frac{1}{\sqrt{t+1}} \qquad \text{Parametric equation for } x$$

$$x^2 = \frac{1}{t+1} \qquad \text{Square each side.}$$

$$t + 1 = \frac{1}{x^2}$$

$$t = \frac{1}{x^2} - 1$$

$$t = \frac{1 - x^2}{x^2} \qquad \text{Solve for } t.$$

Now, substituting into the parametric equation for y produces

$$y = \frac{t}{t+1} \qquad \text{Parametric equation for } y$$

$$y = \frac{(1 - x^2)/x^2}{[(1 - x^2)/x^2] + 1} \qquad \text{Substitute } (1 - x^2)/x^2 \text{ for } t.$$

$$y = 1 - x^2. \qquad \text{Simplify.}$$

The rectangular equation $y = 1 - x^2$ is defined for all values of x, but the parametric equation for x is defined only when $t > -1$. This implies that you should restrict the domain of x to positive values, as shown in Figure 10.22. ■

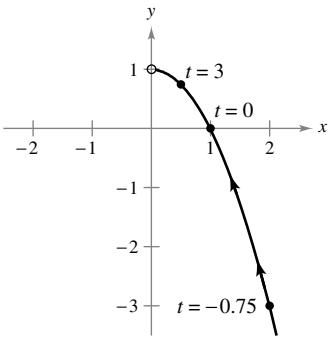

Figure 10.22

It is not necessary for the parameter in a set of parametric equations to represent time. The next example uses an *angle* as the parameter.

EXAMPLE 3 Using Trigonometry to Eliminate a Parameter

See LarsonCalculus.com for an interactive version of this type of example.

Sketch the curve represented by

$$x = 3\cos\theta \quad \text{and} \quad y = 4\sin\theta, \quad 0 \le \theta \le 2\pi$$

by eliminating the parameter and finding the corresponding rectangular equation.

Solution Begin by solving for $\cos\theta$ and $\sin\theta$ in the given equations.

$$\cos\theta = \frac{x}{3} \qquad \text{Solve for } \cos\theta.$$

and

$$\sin\theta = \frac{y}{4} \qquad \text{Solve for } \sin\theta.$$

Next, make use of the identity

$$\sin^2\theta + \cos^2\theta = 1$$

to form an equation involving only x and y.

$$\cos^2\theta + \sin^2\theta = 1 \qquad \text{Trigonometric identity}$$

$$\left(\frac{x}{3}\right)^2 + \left(\frac{y}{4}\right)^2 = 1 \qquad \text{Substitute.}$$

$$\frac{x^2}{9} + \frac{y^2}{16} = 1 \qquad \text{Rectangular equation}$$

From this rectangular equation, you can determine that the graph is an ellipse centered at $(0, 0)$, with vertices at $(0, 4)$ and $(0, -4)$ and minor axis of length $2b = 6$, as shown in Figure 10.23. Note that the ellipse is traced out *counterclockwise* as θ varies from 0 to 2π. ■

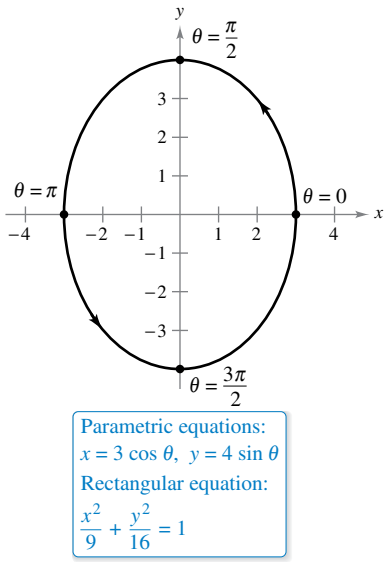

Figure 10.23

Using the technique shown in Example 3, you can conclude that the graph of the parametric equations

$$x = h + a\cos\theta \quad \text{and} \quad y = k + b\sin\theta, \quad 0 \le \theta \le 2\pi$$

is the ellipse (traced counterclockwise) given by

$$\frac{(x-h)^2}{a^2} + \frac{(y-k)^2}{b^2} = 1.$$

The graph of the parametric equations

$$x = h + a\sin\theta \quad \text{and} \quad y = k + b\cos\theta, \quad 0 \le \theta \le 2\pi$$

is also the ellipse (traced clockwise) given by

$$\frac{(x-h)^2}{a^2} + \frac{(y-k)^2}{b^2} = 1.$$

In Examples 2 and 3, it is important to realize that eliminating the parameter is primarily an *aid to curve sketching*. When the parametric equations represent the path of a moving object, the graph alone is not sufficient to describe the motion of the object. You still need the parametric equations to tell you the *position, direction,* and *speed* at a given time.

Finding Parametric Equations

The first three examples in this section illustrate techniques for sketching the graph represented by a set of parametric equations. You will now investigate the reverse problem. How can you determine a set of parametric equations for a given graph or a given physical description? As indicated by the discussion following Example 1, such a representation is not unique. This is demonstrated further in the next example, which finds two different parametric representations for a given graph.

EXAMPLE 4 Finding Parametric Equations for a Given Graph

For each parameter, find a set of parametric equations that represents the graph of $y = 1 - x^2$.

a. $t = x$ **b.** The slope $m = dy/dx$ at the point (x, y)

Solution

a. Letting $x = t$ produces the parametric equations

$$x = t \quad \text{and} \quad y = 1 - x^2 = 1 - t^2.$$

b. To write x and y in terms of the parameter m, you can proceed as follows.

$$m = \frac{dy}{dx}$$

$$m = -2x \qquad \text{Differentiate } y = 1 - x^2.$$

$$x = -\frac{m}{2} \qquad \text{Solve for } x.$$

This produces a parametric equation for x. To obtain a parametric equation for y, substitute $-m/2$ for x in the original equation.

$$y = 1 - x^2 \qquad \text{Write original rectangular equation.}$$

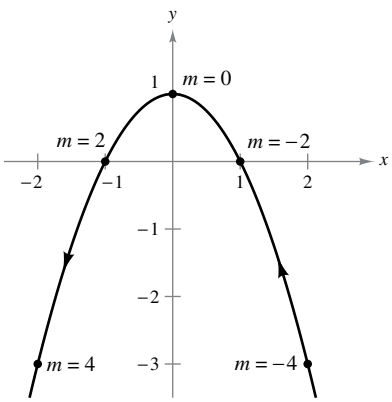
$$y = 1 - \left(-\frac{m}{2}\right)^2 \qquad \text{Substitute } -m/2 \text{ for } x.$$

$$y = 1 - \frac{m^2}{4} \qquad \text{Simplify.}$$

So, the parametric equations are

$$x = -\frac{m}{2} \quad \text{and} \quad y = 1 - \frac{m^2}{4}.$$

In Figure 10.24, note that the resulting curve has a right-to-left orientation as determined by the increasing values of slope m. For part (a), the curve would have the opposite orientation. ■



Rectangular equation: $y = 1 - x^2$
Parametric equations:
$x = -\frac{m}{2}, y = 1 - \frac{m^2}{4}$

Figure 10.24

FOR FURTHER INFORMATION
To read about other methods for finding parametric equations, see the article "Finding Rational Parametric Curves of Relative Degree One or Two" by Dave Boyles in *The College Mathematics Journal.* To view this article, go to *MathArticles.com.*

TECHNOLOGY To be efficient at using a graphing utility, it is important that you develop skill in representing a graph by a set of parametric equations. The reason for this is that some graphing utilities have only three graphing modes—(1) functions, (2) parametric equations, and (3) polar equations. Some graphing utilities are not programmed to graph a general equation. For instance, to graph the hyperbola $x^2 - y^2 = 1$ in *function* mode, you need two equations

$$y = \sqrt{x^2 - 1} \quad \text{and} \quad y = -\sqrt{x^2 - 1}.$$

In *parametric* mode, you need *one* set of parametric equations, $x = \sec t$ and $y = \tan t$.

CYCLOIDS

Galileo first called attention to the cycloid, once recommending that it be used for the arches of bridges. Pascal once spent 8 days attempting to solve many of the problems of cycloids, such as finding the area under one arch and finding the volume of the solid of revolution formed by revolving the curve about a line. The cycloid has so many interesting properties and has caused so many quarrels among mathematicians that it has been called "the Helen of geometry" and "the apple of discord."

FOR FURTHER INFORMATION

For more information on cycloids, see the article "The Geometry of Rolling Curves" by John Bloom and Lee Whitt in *The American Mathematical Monthly*. To view this article, go to *MathArticles.com*.

EXAMPLE 5 Parametric Equations for a Cycloid

Determine the curve traced by a point P on the circumference of a circle of radius a rolling along a straight line in a plane. Such a curve is called a **cycloid.**

Solution Let the parameter θ be the measure of the circle's rotation, and let the point $P = (x, y)$ begin at the origin. When $\theta = 0$, P is at the origin. When $\theta = \pi$, P is at a maximum point $(\pi a, 2a)$. When $\theta = 2\pi$, P is back on the x-axis at $(2\pi a, 0)$. From Figure 10.25, you can determine that $\angle APC = 180° - \theta$. So,

$$\sin\theta = \sin(180° - \theta) = \sin(\angle APC) = \frac{AC}{a} = \frac{BD}{a}$$

and

$$\cos\theta = -\cos(180° - \theta) = -\cos(\angle APC) = \frac{AP}{-a}$$

which implies that $AP = -a\cos\theta$ and $BD = a\sin\theta$. Because the circle rolls along the x-axis, you can determine that $OD = \overset{\frown}{PD} = a\theta$. Furthermore, because $BA = DC = a$, you have

$$x = OD - BD = a\theta - a\sin\theta \quad \text{and} \quad y = BA + AP = a - a\cos\theta.$$

So, the parametric equations are

$$x = a(\theta - \sin\theta) \quad \text{and} \quad y = a(1 - \cos\theta).$$

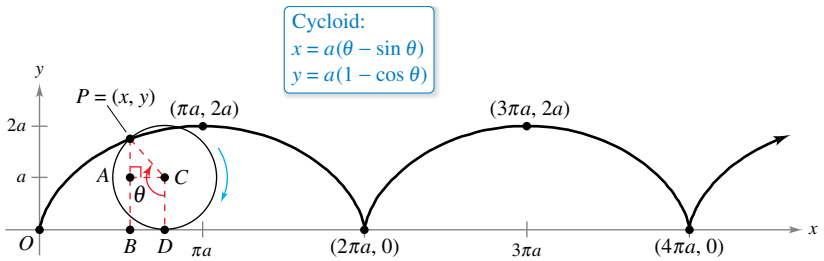

Figure 10.25

TECHNOLOGY Some graphing utilities can simulate the motion of an object that is moving in the plane. If you have access to such a utility, use it to trace out the path of the cycloid shown in Figure 10.25.

The cycloid in Figure 10.25 has sharp corners called **cusps** at the values $x = 2n\pi a$. Notice that the derivatives $x'(\theta)$ and $y'(\theta)$ are both zero at the points for which $\theta = 2n\pi$.

$$x(\theta) = a(\theta - \sin\theta) \qquad y(\theta) = a(1 - \cos\theta)$$
$$x'(\theta) = a - a\cos\theta \qquad y'(\theta) = a\sin\theta$$
$$x'(2n\pi) = 0 \qquad y'(2n\pi) = 0$$

Between these points, the cycloid is called **smooth.**

Definition of a Smooth Curve

A curve C represented by $x = f(t)$ and $y = g(t)$ on an interval I is called **smooth** when f' and g' are continuous on I and not simultaneously 0, except possibly at the endpoints of I. The curve C is called **piecewise smooth** when it is smooth on each subinterval of some partition of I.

The time required to complete a full swing of the pendulum when starting from point C is approximately the same as the time required when starting from point A.
Figure 10.26

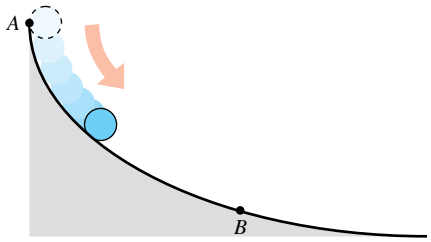
JAMES BERNOULLI (1654–1705)

James Bernoulli, also called Jacques, was the older brother of John. He was one of several accomplished mathematicians of the Swiss Bernoulli family. James's mathematical accomplishments have given him a prominent place in the early development of calculus. *See LarsonCalculus.com to read more of this biography.*

The Tautochrone and Brachistochrone Problems

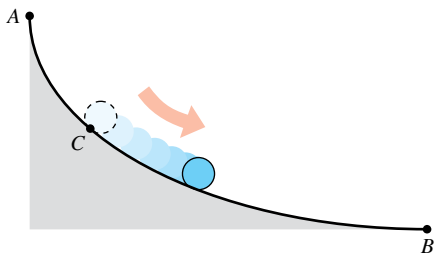
The curve described in Example 5 is related to one of the most famous pairs of problems in the history of calculus. The first problem (called the **tautochrone problem**) began with Galileo's discovery that the time required to complete a full swing of a pendulum is *approximately* the same whether it makes a large movement at high speed or a small movement at lower speed (see Figure 10.26). Late in his life, Galileo realized that he could use this principle to construct a clock. However, he was not able to conquer the mechanics of actual construction. Christian Huygens (1629–1695) was the first to design and construct a working model. In his work with pendulums, Huygens realized that a pendulum does not take exactly the same time to complete swings of varying lengths. (This does not affect a pendulum clock, because the length of the circular arc is kept constant by giving the pendulum a slight boost each time it passes its lowest point.) But, in studying the problem, Huygens discovered that a ball rolling back and forth on an inverted cycloid does complete each cycle in exactly the same time.

The second problem, which was posed by John Bernoulli in 1696, is called the **brachistochrone problem**—in Greek, *brachys* means short and *chronos* means time. The problem was to determine the path down which a particle (such as a ball) will slide from point A to point B in the *shortest time*. Several mathematicians took up the challenge, and the following year the problem was solved by Newton, Leibniz, L'Hôpital, John Bernoulli, and James Bernoulli. As it turns out, the solution is not a straight line from A to B, but an inverted cycloid passing through the points A and B, as shown in Figure 10.27.



An inverted cycloid is the path down which a ball will roll in the shortest time.
Figure 10.27

The amazing part of the solution to the brachistochrone problem is that a particle starting at rest at *any* point C of the cycloid between A and B will take exactly the same time to reach B, as shown in Figure 10.28.



A ball starting at point C takes the same time to reach point B as one that starts at point A.
Figure 10.28

FOR FURTHER INFORMATION To see a proof of the famous brachistochrone problem, see the article "A New Minimization Proof for the Brachistochrone" by Gary Lawlor in *The American Mathematical Monthly*. To view this article, go to *MathArticles.com*.

Concept Check

1. When describing the motion of an object, what information is given in a set of parametric equations that is not given in a rectangular equation?
2. Explain the process of sketching a plane curve given by parametric equations. What is meant by the orientation of the curve?
3. Explain how two sets of parametric equations can represent the same graph but different curves.
4. Consider the parametric equations

   $x = \sqrt{t-2}$ and $y = \frac{1}{2}t + 1, \quad t \geq 2.$

   What is implied about the domain of the resulting rectangular equation?

Using Parametric Equations **In Exercises 5–22, sketch the curve represented by the parametric equations (indicate the orientation of the curve), and write the corresponding rectangular equation by eliminating the parameter.**

5. $x = 2t - 3, \quad y = 3t + 1$
6. $x = 5 - 4t, \quad y = 2 + 5t$
7. $x = t + 1, \quad y = t^2$
8. $x = 2t^2, \quad y = t^4 + 1$
9. $x = t^3, \quad y = \dfrac{t^2}{2}$
10. $x = t^2 + t, \quad y = t^2 - t$
11. $x = \sqrt{t}, \quad y = t - 5$
12. $x = \sqrt[4]{t}, \quad y = 8 - t$
13. $x = t - 3, \quad y = \dfrac{t}{t-3}$
14. $x = 1 + \dfrac{1}{t}, \quad y = t - 1$
15. $x = 2t, \quad y = |t - 2|$
16. $x = |t - 1|, \quad y = t + 2$
17. $x = e^t, \quad y = e^{3t} + 1$
18. $x = e^{-t}, \quad y = e^{2t} - 1$
19. $x = 8\cos\theta, \quad y = 8\sin\theta$
20. $x = 3\cos\theta, \quad y = 7\sin\theta$
21. $x = \sec\theta, \quad y = \cos\theta, \quad 0 \leq \theta < \pi/2, \quad \pi/2 < \theta \leq \pi$
22. $x = \tan^2\theta, \quad y = \sec^2\theta$

Using Parametric Equations **In Exercises 23–34, use a graphing utility to graph the curve represented by the parametric equations (indicate the orientation of the curve). Eliminate the parameter and write the corresponding rectangular equation.**

23. $x = 6\sin 2\theta$, $y = 4\cos 2\theta$
24. $x = \cos\theta$, $y = 2\sin 2\theta$
25. $x = 4 + 2\cos\theta$, $y = -1 + \sin\theta$
26. $x = -2 + 3\cos\theta$, $y = -5 + 3\sin\theta$
27. $x = -3 + 4\cos\theta$, $y = 2 + 5\sin\theta$
28. $x = \sec\theta$, $y = \tan\theta$
29. $x = 4\sec\theta$, $y = 3\tan\theta$
30. $x = \cos^3\theta$, $y = \sin^3\theta$
31. $x = t^3, \quad y = 3\ln t$
32. $x = \ln 2t, \quad y = t^2$
33. $x = e^{-t}, \quad y = e^{3t}$
34. $x = e^{2t}, \quad y = e^t$

Comparing Plane Curves **In Exercises 35–38, determine any differences between the curves of the parametric equations. Are the graphs the same? Are the orientations the same? Are the curves smooth? Explain.**

35. (a) $x = t, y = t^2$ (b) $x = -t, y = t^2$
36. (a) $x = t + 1, y = t^3$ (b) $x = -t + 1, y = (-t)^3$
37. (a) $x = t$, $y = 2t + 1$ (b) $x = \cos\theta$, $y = 2\cos\theta + 1$
    (c) $x = e^{-t}$, $y = 2e^{-t} + 1$ (d) $x = e^t$, $y = 2e^t + 1$
38. (a) $x = 2\cos\theta$, $y = 2\sin\theta$ (b) $x = \sqrt{4t^2 - 1}/|t|$, $y = 1/t$
    (c) $x = \sqrt{t}$, $y = \sqrt{4 - t}$ (d) $x = -\sqrt{4 - e^{2t}}$, $y = e^t$

Eliminating a Parameter **In Exercises 39–42, eliminate the parameter and obtain the standard form of the rectangular equation.**

39. Line through (x_1, y_1) and (x_2, y_2):
    $x = x_1 + t(x_2 - x_1), \quad y = y_1 + t(y_2 - y_1)$
40. Circle: $x = h + r\cos\theta, \quad y = k + r\sin\theta$
41. Ellipse: $x = h + a\cos\theta, \quad y = k + b\sin\theta$
42. Hyperbola: $x = h + a\sec\theta, \quad y = k + b\tan\theta$

Writing a Set of Parametric Equations **In Exercises 43–50, use the results of Exercises 39–42 to find a set of parametric equations for the line or conic.**

43. Line: passes through $(0, 0)$ and $(4, -7)$
44. Line: passes through $(-3, 1)$ and $(1, 9)$
45. Circle: center: $(1, 1)$; radius: 2
46. Circle: center: $\left(-\frac{1}{2}, -4\right)$; radius: $\frac{1}{2}$
47. Ellipse: vertices: $(-3, 0), (7, 0)$; foci: $(-1, 0), (5, 0)$
48. Ellipse: vertices: $(-1, 8), (-1, -12)$; foci: $(-1, 4), (-1, -8)$
49. Hyperbola: vertices: $(0, \pm 1)$; foci: $\left(0, \pm\sqrt{5}\right)$
50. Hyperbola: vertices: $(-2, 1), (0, 1)$; foci: $(-3, 1), (1, 1)$

Finding Parametric Equations **In Exercises 51–54, find two different sets of parametric equations for the rectangular equation.**

51. $y = 6x - 5$
52. $y = 4/(x - 1)$
53. $y = x^3$
54. $y = x^2$

Finding Parametric Equations **In Exercises 55–58, find a set of parametric equations for the rectangular equation that satisfies the given condition.**

55. $y = 2x - 5$, $t = 0$ at the point $(3, 1)$

56. $y = 4x + 1$, $t = -1$ at the point $(-2, -7)$

57. $y = x^2$, $t = 4$ at the point $(4, 16)$

58. $y = 4 - x^2$, $t = 1$ at the point $(1, 3)$

Graphing a Plane Curve **In Exercises 59–66, use a graphing utility to graph the curve represented by the parametric equations. Indicate the orientation of the curve. Identify any points at which the curve is not smooth.**

59. Cycloid: $x = 2(\theta - \sin\theta)$, $y = 2(1 - \cos\theta)$

60. Cycloid: $x = \theta + \sin\theta$, $y = 1 - \cos\theta$

61. Prolate cycloid: $x = \theta - \frac{3}{2}\sin\theta$, $y = 1 - \frac{3}{2}\cos\theta$

62. Prolate cycloid: $x = 2\theta - 4\sin\theta$, $y = 2 - 4\cos\theta$

63. Hypocycloid: $x = 3\cos^3\theta$, $y = 3\sin^3\theta$

64. Curtate cycloid: $x = 2\theta - \sin\theta$, $y = 2 - \cos\theta$

65. Witch of Agnesi: $x = 2\cot\theta$, $y = 2\sin^2\theta$

66. Folium of Descartes: $x = 3t/(1 + t^3)$, $y = 3t^2/(1 + t^3)$

Exploring Concepts

67. Describe the orientation of the parametric equations $x = t^2$ and $y = t^4$ for $-1 \le t \le 1$.

68. Make a conjecture about the change in the graph of parametric equations when the sign of the parameter is changed. Explain your reasoning using examples to support your conjecture.

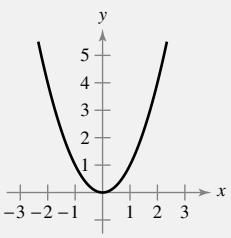
69. The following sets of parametric equations have the same graph. Does this contradict your conjecture from Exercise 68? Explain.

$x = \cos\theta$, $y = \sin^2\theta$, $0 < \theta < \pi$

$x = \cos(-\theta)$, $y = \sin^2(-\theta)$, $0 < \theta < \pi$

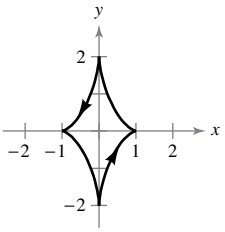
70. **HOW DO YOU SEE IT?** Which set of parametric equations is shown in the graph below? Explain your reasoning.

(a) $x = t$, $y = t^2$ (b) $x = t^2$, $y = t$

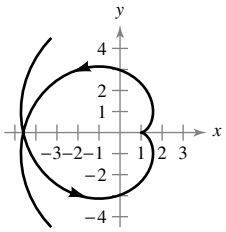


Matching **In Exercises 71–74, match the set of parametric equations with its graph. [The graphs are labeled (a), (b), (c), and (d).] Explain your reasoning.**

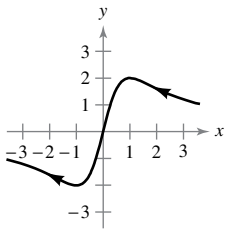
(a)



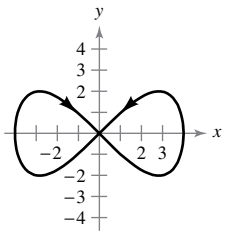
(b)



(c)



(d)



71. Lissajous curve: $x = 4\cos\theta$, $y = 2\sin 2\theta$

72. Evolute of ellipse: $x = \cos^3\theta$, $y = 2\sin^3\theta$

73. Involute of circle: $x = \cos\theta + \theta\sin\theta$, $y = \sin\theta - \theta\cos\theta$

74. Serpentine curve: $x = \cot\theta$, $y = 4\sin\theta\cos\theta$

75. **Curtate Cycloid** A wheel of radius a rolls along a line without slipping. The curve traced by a point P that is b units from the center ($b < a$) is called a **curtate cycloid** (see figure). Use the angle θ to find a set of parametric equations for this curve.

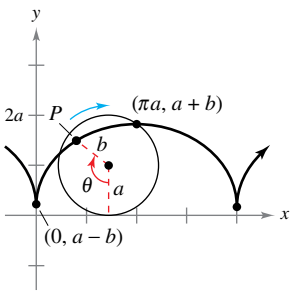


Figure for 75

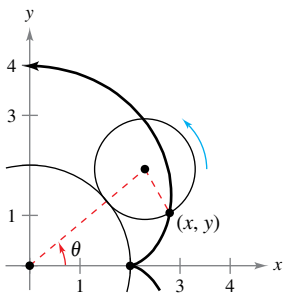

Figure for 76

76. **Epicycloid** A circle of radius 1 rolls around the outside of a circle of radius 2 without slipping. The curve traced by a point on the circumference of the smaller circle is called an **epicycloid** (see figure). Use the angle θ to find a set of parametric equations for this curve.

True or False? **In Exercises 77–79, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

77. The graph of the parametric equations $x = t^2$ and $y = t^2$ is the line $y = x$.

78. If y is a function of t and x is a function of t, then y is a function of x.

79. The curve represented by the parametric equations $x = t$ and $y = \cos t$ can be written as an equation of the form $y = f(x)$.

80. Translation of a Plane Curve Consider the parametric equations $x = 8\cos t$ and $y = 8\sin t$.

(a) Describe the curve represented by the parametric equations.

(b) How does the curve represented by the parametric equations

$x = 8\cos t + 3$ and $y = 8\sin t + 6$

compare to the curve described in part (a)?

(c) How does the original curve change when cosine and sine are interchanged?

Projectile Motion **In Exercises 81 and 82, consider a projectile launched at a height h feet above the ground and at an angle θ with the horizontal. When the initial velocity is v_0 feet per second, the path of the projectile is modeled by the parametric equations**

$$x = (v_0 \cos\theta)t$$

and

$$y = h + (v_0 \sin\theta)t - 16t^2.$$

81. Baseball

The center field fence in a ballpark is 10 feet high and 400 feet from home plate. The ball is hit 3 feet above the ground. It leaves the bat at an angle of θ degrees with the horizontal at a speed of 100 miles per hour.

Randy Faris/Getty Images

(a) Write a set of parametric equations for the path of the ball.

(b) Use a graphing utility to graph the path of the ball when $\theta = 15°$. Is the hit a home run?

(c) Use a graphing utility to graph the path of the ball when $\theta = 23°$. Is the hit a home run?

(d) Find the minimum angle at which the ball must leave the bat for the hit to be a home run.

82. A rectangular equation for the path of a projectile is $y = 5 + x - 0.005x^2$.

(a) Eliminate the parameter t from the position function for the motion of a projectile to show that the rectangular equation is

$$y = -\frac{16\sec^2\theta}{v_0^2}x^2 + (\tan\theta)x + h.$$

(b) Use the result of part (a) to find h, v_0, and θ. Find the parametric equations of the path.

(c) Use a graphing utility to graph the rectangular equation for the path of the projectile. Confirm your answer in part (b) by sketching the curve represented by the parametric equations.

(d) Use a graphing utility to approximate the maximum height of the projectile and its range.

SECTION PROJECT

Cycloids

In Greek, the word *cycloid* means *wheel*, the word *hypocycloid* means *under the wheel,* and the word *epicycloid* means *upon the wheel.* Match the hypocycloid or epicycloid with its graph. [The graphs are labeled (a), (b), (c), (d), (e), and (f).]

Hypocycloid, H(A, B)

The path traced by a fixed point on a circle of radius B as it rolls around the *inside* of a circle of radius A

$$x = (A - B)\cos t + B\cos\left(\frac{A - B}{B}\right)t$$

$$y = (A - B)\sin t - B\sin\left(\frac{A - B}{B}\right)t$$

Epicycloid, E(A, B)

The path traced by a fixed point on a circle of radius B as it rolls around the *outside* of a circle of radius A

$$x = (A + B)\cos t - B\cos\left(\frac{A + B}{B}\right)t$$

$$y = (A + B)\sin t - B\sin\left(\frac{A + B}{B}\right)t$$

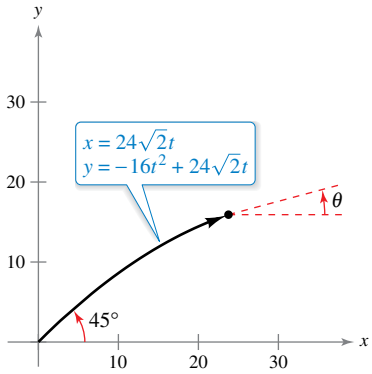
10.3 Parametric Equations and Calculus

GO DIGITAL

- **Find the slope of a tangent line to a curve given by a set of parametric equations.**
- **Find the arc length of a curve given by a set of parametric equations.**
- **Find the area of a surface of revolution (parametric form).**



At time t, the angle of elevation of the projectile is θ.
Figure 10.29

Slope and Tangent Lines

Now that you can represent a graph in the plane by a set of parametric equations, it is natural to ask how to use calculus to study plane curves. Consider the projectile represented by the parametric equations

$$x = 24\sqrt{2}t \quad \text{and} \quad y = -16t^2 + 24\sqrt{2}t$$

as shown in Figure 10.29. From the discussion at the beginning of Section 10.2, you know that these equations enable you to locate the position of the projectile at a given time. You also know that the object is initially projected at an angle of 45°, or a slope of $m = \tan 45° = 1$. But how can you find the slope at some other time t? The next theorem answers this question by giving a formula for the slope of the tangent line as a function of t.

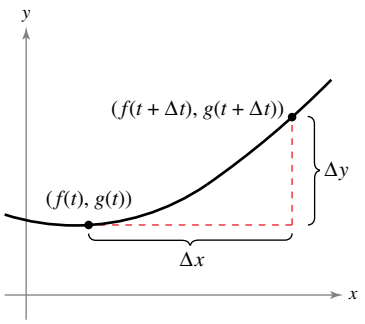
THEOREM 10.7 Parametric Form of the Derivative

If a smooth curve C is given by the equations

$$x = f(t) \quad \text{and} \quad y = g(t)$$

then the slope of C at (x, y) is

$$\frac{dy}{dx} = \frac{dy/dt}{dx/dt}, \quad \frac{dx}{dt} \neq 0.$$



The slope of the secant line through the points $(f(t), g(t))$ and $(f(t + \Delta t), g(t + \Delta t))$ is $\Delta y/\Delta x$.
Figure 10.30

Proof In Figure 10.30, consider $\Delta t > 0$ and let

$$\Delta y = g(t + \Delta t) - g(t) \quad \text{and} \quad \Delta x = f(t + \Delta t) - f(t).$$

Because $\Delta x \to 0$ as $\Delta t \to 0$, you can write

$$\frac{dy}{dx} = \lim_{\Delta x \to 0} \frac{\Delta y}{\Delta x}$$ Definition of derivative

$$= \lim_{\Delta t \to 0} \frac{g(t + \Delta t) - g(t)}{f(t + \Delta t) - f(t)}.$$ Substitute for Δy and Δx.

Dividing both the numerator and denominator by Δt, you can use the differentiability of f and g to conclude that

$$\frac{dy}{dx} = \lim_{\Delta t \to 0} \frac{[g(t + \Delta t) - g(t)]/\Delta t}{[f(t + \Delta t) - f(t)]/\Delta t}$$ Divide numerator and denominator by Δt.

$$= \frac{\lim_{\Delta t \to 0} \dfrac{g(t + \Delta t) - g(t)}{\Delta t}}{\lim_{\Delta t \to 0} \dfrac{f(t + \Delta t) - f(t)}{\Delta t}}$$ The limit of a quotient is equal to the quotient of the limits.

$$= \frac{g'(t)}{f'(t)}$$ Definition of derivative

$$= \frac{dy/dt}{dx/dt}.$$

Exploration

The curve traced out in Example 1 is a circle. Use the formula

$$\frac{dy}{dx} = -\tan t$$

to find the slopes at the points $(1, 0)$ and $(0, 1)$.

GO DIGITAL

EXAMPLE 1 Differentiation and Parametric Form

Find dy/dx for the curve given by $x = \sin t$ and $y = \cos t$.

Solution Note that $dx/dt = \cos t$ and $dy/dt = -\sin t$.

$$\frac{dy}{dx} = \frac{dy/dt}{dx/dt} \qquad \text{Apply Theorem 10.7.}$$

$$= \frac{-\sin t}{\cos t}$$

$$= -\tan t$$

Because dy/dx is a function of t, you can use Theorem 10.7 repeatedly to find *higher-order* derivatives. For example, the second and third derivatives are shown below.

$$\frac{d^2y}{dx^2} = \frac{d}{dx}\left[\frac{dy}{dx}\right] = \frac{\frac{d}{dt}\left[\frac{dy}{dx}\right]}{dx/dt} \qquad \text{Second derivative}$$

$$\frac{d^3y}{dx^3} = \frac{d}{dx}\left[\frac{d^2y}{dx^2}\right] = \frac{\frac{d}{dt}\left[\frac{d^2y}{dx^2}\right]}{dx/dt} \qquad \text{Third derivative}$$

EXAMPLE 2 Finding Slope and Concavity

For the curve given by

$$x = \sqrt{t} \quad \text{and} \quad y = \frac{1}{4}(t^2 - 4), \quad t \geq 0$$

find the slope and concavity at the point $(2, 3)$.

Solution The first derivative is

$$\frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{(1/2)t}{(1/2)t^{-1/2}} = t^{3/2}. \qquad \text{Parametric form of first derivative}$$

So, the second derivative is

$$\frac{d^2y}{dx^2} = \frac{\frac{d}{dt}\left[\frac{dy}{dx}\right]}{dx/dt} = \frac{\frac{d}{dt}[t^{3/2}]}{dx/dt} = \frac{(3/2)t^{1/2}}{(1/2)t^{-1/2}} = 3t. \qquad \text{Parametric form of second derivative}$$

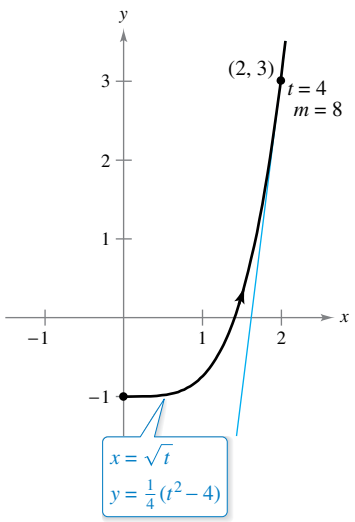
At $(x, y) = (2, 3)$, it follows that $t = 4$, and the slope is

$$\frac{dy}{dx} = (4)^{3/2} = 8.$$

Moreover, when $t = 4$, the second derivative is

$$\frac{d^2y}{dx^2} = 3(4) = 12 > 0$$

and you can conclude that the graph is concave upward at $(2, 3)$, as shown in Figure 10.31.



The graph is concave upward at $(2, 3)$ when $t = 4$.

Figure 10.31

Because the parametric equations $x = f(t)$ and $y = g(t)$ need not define y as a function of x, it is possible for a plane curve to loop around and cross itself. At such points, the curve may have more than one tangent line, as shown in the next example.

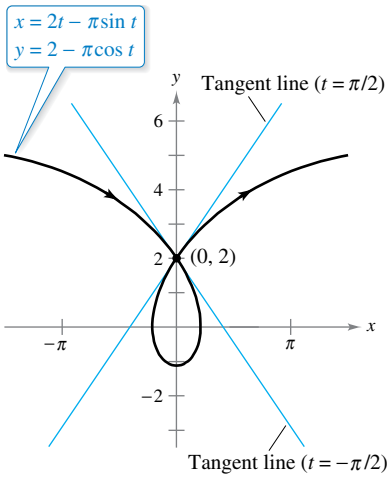
Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.



This prolate cycloid has two tangent lines at the point $(0, 2)$.
Figure 10.32

EXAMPLE 3 A Curve with Two Tangent Lines at a Point

See LarsonCalculus.com for an interactive version of this type of example.

The **prolate cycloid** given by

$$x = 2t - \pi \sin t \quad \text{and} \quad y = 2 - \pi \cos t$$

crosses itself at the point $(0, 2)$, as shown in Figure 10.32. Find the equations of both tangent lines at this point.

Solution Because $x = 0$ and $y = 2$ when $t = \pm\pi/2$, and

$$\frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{\pi \sin t}{2 - \pi \cos t}$$

you have $dy/dx = -\pi/2$ when $t = -\pi/2$ and $dy/dx = \pi/2$ when $t = \pi/2$. So, the two tangent lines at $(0, 2)$ are

$$y - 2 = -\frac{\pi}{2}x \qquad \text{Tangent line when } t = -\frac{\pi}{2}$$

and

$$y - 2 = \frac{\pi}{2}x. \qquad \text{Tangent line when } t = \frac{\pi}{2}$$

If $dy/dt = 0$ and $dx/dt \neq 0$ when $t = t_0$, then the curve represented by $x = f(t)$ and $y = g(t)$ has a horizontal tangent at $(f(t_0), g(t_0))$. For instance, in Example 3, the given curve has a horizontal tangent at the point $(0, 2 - \pi)$ (when $t = 0$). Similarly, if $dx/dt = 0$ and $dy/dt \neq 0$ when $t = t_0$, then the curve represented by $x = f(t)$ and $y = g(t)$ has a vertical tangent at $(f(t_0), g(t_0))$. If dy/dt and dx/dt are *simultaneously* 0, then no conclusion can be drawn about tangent lines.

Arc Length

You have seen how parametric equations can be used to describe the path of a particle moving in the plane. You will now develop a formula for determining the *distance* traveled by the particle along its path.

Recall from Section 7.4 that the formula for the arc length of a curve C given by $y = h(x)$ over the interval $[x_0, x_1]$ is

$$s = \int_{x_0}^{x_1} \sqrt{1 + [h'(x)]^2}\, dx \qquad \text{Formula for arc length}$$
$$= \int_{x_0}^{x_1} \sqrt{1 + \left(\frac{dy}{dx}\right)^2}\, dx.$$

If C is represented by the parametric equations $x = f(t)$ and $y = g(t)$, $a \le t \le b$, and if $dx/dt = f'(t) > 0$, then

$$s = \int_{x_0}^{x_1} \sqrt{1 + \left(\frac{dy}{dx}\right)^2}\, dx$$
$$= \int_{x_0}^{x_1} \sqrt{1 + \left(\frac{dy/dt}{dx/dt}\right)^2}\, dx$$
$$= \int_{a}^{b} \sqrt{\frac{(dx/dt)^2 + (dy/dt)^2}{(dx/dt)^2}}\, \frac{dx}{dt}\, dt$$
$$= \int_{a}^{b} \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2}\, dt$$
$$= \int_{a}^{b} \sqrt{[f'(t)]^2 + [g'(t)]^2}\, dt.$$

GO DIGITAL

THEOREM 10.8 Arc Length in Parametric Form

If a smooth curve C is given by $x = f(t)$ and $y = g(t)$ such that C does not intersect itself on the interval $a \le t \le b$ (except possibly at the endpoints), then the arc length of C over the interval is given by

$$s = \int_a^b \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2}\, dt = \int_a^b \sqrt{[f'(t)]^2 + [g'(t)]^2}\, dt.$$

REMARK When applying the arc length formula to a curve, be sure that the curve is traced out only once on the interval of integration. For instance, the circle given by $x = \cos t$ and $y = \sin t$ is traced out once on the interval $0 \le t \le 2\pi$ but is traced out twice on the interval $0 \le t \le 4\pi$.

In the preceding section, you learned that if a circle rolls along a line, then a point on its circumference will trace a path called a cycloid. If the circle rolls around the circumference of another circle, then the path of the point is an **epicycloid.** The next example shows how to find the arc length of an epicycloid.

ARCH OF A CYCLOID

The arc length of an arch of a cycloid was first calculated in 1658 by British architect and mathematician Christopher Wren, famous for rebuilding many buildings and churches in London, including St. Paul's Cathedral.

EXAMPLE 4 Finding Arc Length

A circle of radius 1 inch rolls around the circumference of a larger circle of radius 4 inches, as shown in Figure 10.33. The epicycloid traced by a point on the circumference of the smaller circle is given by

$$x = 5\cos t - \cos 5t \quad \text{and} \quad y = 5\sin t - \sin 5t.$$

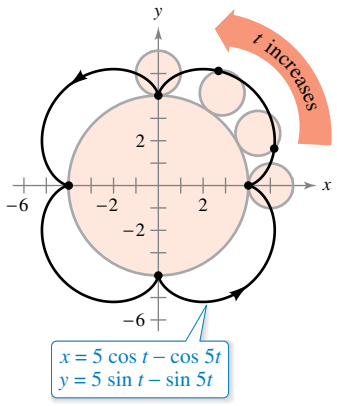
Find the distance traveled by the point in one complete trip about the larger circle.

Solution Before applying Theorem 10.8, note in Figure 10.33 that the curve has sharp points when $t = 0$ and $t = \pi/2$. Between these two points, dx/dt and dy/dt are not simultaneously 0. So, the portion of the curve generated from $t = 0$ to $t = \pi/2$ is smooth. To find the total distance traveled by the point, you can find the arc length of that portion lying in the first quadrant and multiply by 4.

$$\begin{aligned}
s &= 4\int_0^{\pi/2} \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2}\, dt && \text{Parametric form for arc length}\\
&= 4\int_0^{\pi/2} \sqrt{(-5\sin t + 5\sin 5t)^2 + (5\cos t - 5\cos 5t)^2}\, dt\\
&= 20\int_0^{\pi/2} \sqrt{2 - 2\sin t \sin 5t - 2\cos t \cos 5t}\, dt\\
&= 20\int_0^{\pi/2} \sqrt{2 - 2\cos 4t}\, dt && \text{Difference formula for cosine}\\
&= 20\int_0^{\pi/2} \sqrt{4\sin^2 2t}\, dt && \text{Double-angle formula}\\
&= 40\int_0^{\pi/2} \sin 2t\, dt\\
&= -20\Big[\cos 2t\Big]_0^{\pi/2}\\
&= 40 \text{ inches}
\end{aligned}$$

For the epicycloid shown in Figure 10.33, an arc length of 40 inches seems about right because the circumference of a circle of radius 6 inches is

$$2\pi r = 12\pi \approx 37.7 \text{ inches.}$$



An epicycloid is traced by a point on the smaller circle as it rolls around the larger circle.

Area of a Surface of Revolution

You can use the formula for the area of a surface of revolution in rectangular form to develop a formula for surface area in parametric form.

THEOREM 10.9 Area of a Surface of Revolution

If a smooth curve C given by $x = f(t)$ and $y = g(t)$ does not cross itself on an interval $a \le t \le b$, then the area S of the surface of revolution formed by revolving C about the coordinate axes is given by the following.

1. $S = 2\pi \int_a^b g(t) \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2}\, dt$ Revolution about the x-axis: $g(t) \ge 0$

2. $S = 2\pi \int_a^b f(t) \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2}\, dt$ Revolution about the y-axis: $f(t) \ge 0$

These formulas may be easier to remember if you think of the differential of arc length as

$$ds = \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2}\, dt.$$ Differential of arc length

Then the formulas in Theorem 10.9 can be written as follows.

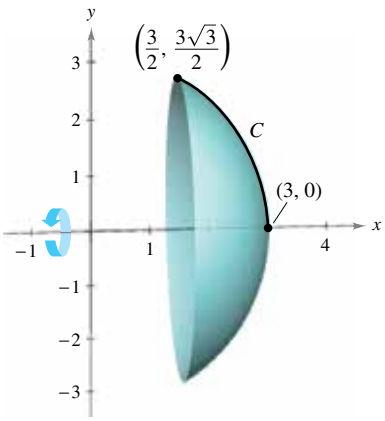
1. $S = 2\pi \int_a^b g(t)\, ds$ **2.** $S = 2\pi \int_a^b f(t)\, ds$

EXAMPLE 5 Finding the Area of a Surface of Revolution

Let C be the arc of the circle $x^2 + y^2 = 9$ from $(3, 0)$ to

$$\left(\frac{3}{2}, \frac{3\sqrt{3}}{2}\right)$$

as shown in Figure 10.34. Find the area of the surface formed by revolving C about the x-axis.



The surface of revolution has a surface area of 9π.
Figure 10.34

Solution You can represent C parametrically by the equations

$$x = 3\cos t \quad \text{and} \quad y = 3\sin t, \quad 0 \le t \le \pi/3.$$

(Note that you can determine the interval for t by observing that $t = 0$ when $x = 3$ and $t = \pi/3$ when $x = 3/2$.) On this interval, C is smooth and y is nonnegative, and you can apply Theorem 10.9 to obtain a surface area of

$$\begin{aligned}
S &= 2\pi \int_0^{\pi/3} (3\sin t)\sqrt{(-3\sin t)^2 + (3\cos t)^2}\, dt && \text{Apply formula for area of a surface of revolution.}\\
&= 6\pi \int_0^{\pi/3} \sin t \sqrt{9(\sin^2 t + \cos^2 t)}\, dt \\
&= 6\pi \int_0^{\pi/3} 3\sin t\, dt && \text{Trigonometric identity}\\
&= -18\pi \Big[\cos t\Big]_0^{\pi/3} \\
&= -18\pi\left(\frac{1}{2} - 1\right) \\
&= 9\pi.
\end{aligned}$$

10.3 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Explain what the parametric form of the derivative represents.
2. Under what circumstances can a graph that represents a set of parametric equations have more than one tangent line at a given point?
3. Consider a curve represented by the parametric equations $x = f(t)$ and $y = g(t)$. When does the graph have horizontal tangent lines? Vertical tangent lines?
4. Why does the arc length formula require that the curve not intersect itself on an interval, except possibly at the endpoints?

Finding a Derivative

In Exercises 5–8, find dy/dx.

5. $x = t^2, \quad y = 7 - 6t$
6. $x = \sqrt[3]{t}, \quad y = 4 - t$
7. $x = \sin^2\theta, \quad y = \cos^2\theta$
8. $x = 2e^{\theta}, \quad y = e^{-\theta/2}$

Finding Slope and Concavity

In Exercises 9–18, find dy/dx and d^2y/dx^2, and find the slope and concavity (if possible) at the given value of the parameter.

Parametric Equations	Parameter
9. $x = 4t, \quad y = 3t - 2$	$t = 3$
10. $x = \sqrt{t}, \quad y = 3t - 1$	$t = 1$
11. $x = t + 1, \quad y = t^2 + 3t$	$t = -2$
12. $x = t^2 + 5t + 4, \quad y = 4t$	$t = 0$
13. $x = 4\cos\theta, \quad y = 4\sin\theta$	$\theta = \frac{\pi}{4}$
14. $x = \cos\theta, \quad y = 3\sin\theta$	$\theta = 0$
15. $x = 2 + \sec\theta, \quad y = 1 + 2\tan\theta$	$\theta = -\frac{\pi}{3}$
16. $x = \sqrt{t}, \quad y = \sqrt{t-1}$	$t = 5$
17. $x = \cos^3\theta, \quad y = \sin^3\theta$	$\theta = \frac{\pi}{4}$
18. $x = \theta - \sin\theta, \quad y = 1 - \cos\theta$	$\theta = \pi$

Finding Equations of Tangent Lines

In Exercises 19–22, find an equation of the tangent line to the curve at each given point.

19. $x = 2\cot\theta, \quad y = 2\sin^2\theta, \quad \left(-\frac{2}{\sqrt{3}}, \frac{3}{2}\right), (0, 2), \left(2\sqrt{3}, \frac{1}{2}\right)$
20. $x = 2 - 3\cos\theta, \quad y = 3 + 2\sin\theta,$
$(-1, 3), (2, 5), \left(\frac{4 + 3\sqrt{3}}{2}, 2\right)$
21. $x = t^2 - 4, \quad y = t^2 - 2t, \quad (0, 0), (-3, -1), (-3, 3)$
22. $x = t^4 + 2, \quad y = t^3 + t, \quad (2, 0), (3, -2), (18, 10)$

Finding an Equation of a Tangent Line

In Exercises 23–26, (a) use a graphing utility to graph the curve represented by the parametric equations, (b) use a graphing utility to find dx/dt, dy/dt, and dy/dx at the given value of the parameter, (c) find an equation of the tangent line to the curve at the given value of the parameter, and (d) use a graphing utility to graph the curve and the tangent line from part (c).

Parametric Equations	Parameter
23. $x = 6t, \quad y = 1 - 4t^2$	$t = -\frac{1}{2}$
24. $x = t - 2, \quad y = \frac{1}{t} + 3$	$t = 1$
25. $x = t^2 - t + 2, \quad y = t^3 - 3t$	$t = -1$
26. $x = 3t - t^2, \quad y = 2t^{3/2}$	$t = \frac{1}{4}$

Finding Equations of Tangent Lines

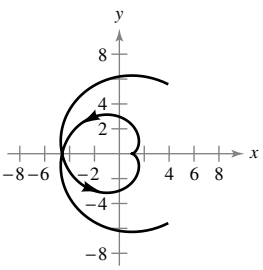
In Exercises 27–30, find the equations of the tangent lines at the point where the curve crosses itself.

27. $x = 2\sin 2t, \quad y = 3\sin t$
28. $x = 2 - \pi\cos t, \quad y = 2t - \pi\sin t$
29. $x = t^2 - t, \quad y = t^3 - 3t - 1$
30. $x = t^3 - 6t, \quad y = t^2$

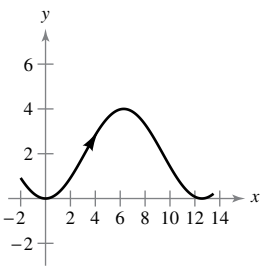
Horizontal and Vertical Tangency

In Exercises 31 and 32, find all points (if any) of horizontal and vertical tangency to the curve on the given interval.

31. $x = \cos\theta + \theta\sin\theta$
$y = \sin\theta - \theta\cos\theta$
$-2\pi \le \theta \le 2\pi$



32. $x = 2\theta$
$y = 2(1 - \cos\theta)$
$0 \le \theta \le 2\pi$



Horizontal and Vertical Tangency

In Exercises 33–42, find all points (if any) of horizontal and vertical tangency to the curve. Use a graphing utility to confirm your results.

33. $x = 9 - t, \quad y = -t^2$
34. $x = t + 1, \quad y = t^2 + 3t$
35. $x = t + 4, \quad y = t^3 - 12t + 6$
36. $x = t^2 - t + 2, \quad y = t^3 - 3t$
37. $x = 7\cos\theta, \quad y = 7\sin\theta$
38. $x = \cos\theta, \quad y = 2\sin 2\theta$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

39. $x = 5 + 3\cos\theta, \quad y = -2 + \sin\theta$

40. $x = \sec\theta, \quad y = \tan\theta$

41. $x = 4\cos^2\theta, \quad y = 2\sin\theta$ **42.** $x = \cos^2\theta, \quad y = \cos\theta$

Determining Concavity **In Exercises 43–48, determine the open t-intervals on which the curve is concave downward or concave upward.**

43. $x = 3t^2, \quad y = t^3 - t$ **44.** $x = 2 + t^2, \quad y = t^2 + t^3$

45. $x = 2t + \ln t, \quad y = 2t - \ln t$

46. $x = t^2, \quad y = \ln t$

47. $x = \sin t, \quad y = \cos t, \quad 0 < t < \pi$

48. $x = 4\cos t, \quad y = 2\sin t, \quad 0 < t < 2\pi$

Arc Length **In Exercises 49–54, find the arc length of the curve on the given interval.**

Parametric Equations	Interval
49. $x = 3t + 5, \quad y = 7 - 2t$	$-1 \le t \le 3$
50. $x = 6t^2, \quad y = 2t^3$	$1 \le t \le 4$
51. $x = e^{-t}\cos t, \quad y = e^{-t}\sin t$	$0 \le t \le \frac{\pi}{2}$
52. $x = \arcsin t, \quad y = \ln\sqrt{1 - t^2}$	$0 \le t \le \frac{1}{2}$
53. $x = \sqrt{t}, \quad y = 3t - 1$	$0 \le t \le 1$
54. $x = t, \quad y = \frac{t^5}{10} + \frac{1}{6t^3}$	$1 \le t \le 2$

Arc Length **In Exercises 55–58, find the arc length of the curve on the interval $[0, 2\pi]$.**

55. Hypocycloid perimeter: $x = a\cos^3\theta, y = a\sin^3\theta$

56. Involute of a circle: $x = \cos\theta + \theta\sin\theta$
$y = \sin\theta - \theta\cos\theta$

57. Cycloid arch: $x = a(\theta - \sin\theta), y = a(1 - \cos\theta)$

58. Nephroid perimeter: $x = a(3\cos t - \cos 3t)$
$y = a(3\sin t - \sin 3t)$

59. Path of a Projectile The path of a projectile is modeled by the parametric equations

$$x = (90\cos 30°)t \quad \text{and} \quad y = (90\sin 30°)t - 16t^2$$

where x and y are measured in feet.

(a) Use a graphing utility to graph the path of the projectile.

(b) Use a graphing utility to approximate the range of the projectile.

(c) Use the integration capabilities of a graphing utility to approximate the arc length of the path. Compare this result with the range of the projectile.

60. Path of a Projectile When the projectile in Exercise 59 is launched at an angle θ with the horizontal, its parametric equations are $x = (90\cos\theta)t$ and $y = (90\sin\theta)t - 16t^2$. Find the angle that maximizes the range of the projectile. Use a graphing utility to find the angle that maximizes the arc length of the trajectory.

61. Folium of Descartes Consider the parametric equations

$$x = \frac{4t}{1 + t^3} \quad \text{and} \quad y = \frac{4t^2}{1 + t^3}.$$

(a) Use a graphing utility to graph the curve represented by the parametric equations.

(b) Use a graphing utility to find the points of horizontal tangency to the curve.

(c) Use the integration capabilities of a graphing utility to approximate the arc length of the closed loop. (*Hint:* Use symmetry and integrate over the interval $0 \le t \le 1$.)

62. Witch of Agnesi Consider the parametric equations

$$x = 4\cot\theta \quad \text{and} \quad y = 4\sin^2\theta, \quad -\frac{\pi}{2} \le \theta \le \frac{\pi}{2}.$$

(a) Use a graphing utility to graph the curve represented by the parametric equations.

(b) Use a graphing utility to find the points of horizontal tangency to the curve.

(c) Use the integration capabilities of a graphing utility to approximate the arc length over the interval $\pi/4 \le \theta \le \pi/2$.

Surface Area **In Exercises 63–68, find the area of the surface generated by revolving the curve about each given axis.**

63. $x = 2t, \quad y = 3t, \quad 0 \le t \le 3$

(a) x-axis

(b) y-axis

64. $x = t, \quad y = 4 - 2t, \quad 0 \le t \le 2$

(a) x-axis

(b) y-axis

65. $x = 5\cos\theta, \quad y = 5\sin\theta, \quad 0 \le \theta \le \frac{\pi}{2}$, y-axis

66. $x = \frac{1}{3}t^3, \quad y = t + 1, \quad 1 \le t \le 2$, y-axis

67. $x = a\cos^3\theta, \quad y = a\sin^3\theta, \quad 0 \le \theta \le \pi$, x-axis

68. $x = a\cos\theta, \quad y = b\sin\theta, \quad 0 \le \theta \le 2\pi$

(a) x-axis

(b) y-axis

Surface Area **In Exercises 69–72, write an integral that represents the area of the surface generated by revolving the curve about the x-axis. Use a graphing utility to approximate the integral.**

Parametric Equations	Interval
69. $x = t^3, \quad y = t + 2$	$0 \le t \le 2$
70. $x = t^2, \quad y = \sqrt{t}$	$1 \le t \le 3$
71. $x = \cos^2\theta, \quad y = \cos\theta$	$0 \le \theta \le \frac{\pi}{2}$
72. $x = \theta + \sin\theta, \quad y = \theta + \cos\theta$	$0 \le \theta \le \frac{\pi}{2}$

Exploring Concepts

73. (a) Use a graphing utility to graph each set of parametric equations.

$x = t - \sin t, \quad y = 1 - \cos t, \quad 0 \le t \le 2\pi$

$x = 2t - \sin(2t), \quad y = 1 - \cos(2t), \quad 0 \le t \le \pi$

(b) Compare the graphs of the two sets of parametric equations in part (a). When the curve represents the motion of a particle and t is time, what can you infer about the average speeds of the particle on the paths represented by the two sets of parametric equations?

(c) Without graphing the curve, determine the time required for a particle to traverse the same path as in parts (a) and (b) when the path is modeled by

$x = \frac{1}{2}t - \sin\left(\frac{1}{2}t\right)$ and $y = 1 - \cos\left(\frac{1}{2}t\right)$.

74. (a) Each set of parametric equations represents the motion of a particle. Use a graphing utility to graph each set.

First Particle: $x = 3\cos t, \ y = 4\sin t, \ 0 \le t \le 2\pi$

Second Particle: $x = 4\sin t, \ y = 3\cos t, \ 0 \le t \le 2\pi$

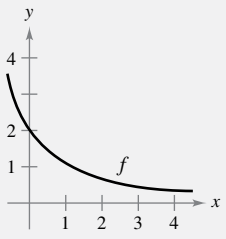
(b) Determine the number of points of intersection.

(c) Will the particles ever be at the same place at the same time? If so, identify the point(s).

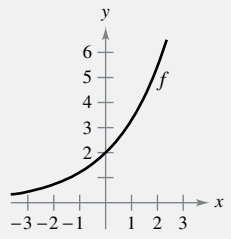
75. Find a set of parametric equations $x = f(t)$ and $y = g(t)$ such that $dx/dt < 0$ and $dy/dt < 0$ for all real numbers t. Then sketch a graph of the curve.

76. HOW DO YOU SEE IT? Using the graph of f, (a) determine whether dy/dt is positive or negative given that dx/dt is negative and (b) determine whether dx/dt is positive or negative given that dy/dt is positive. Explain your reasoning.

(i)



(ii)



77. Integration by Substitution Use integration by substitution to show that if y is a continuous function of x on the interval $a \le x \le b$, where $x = f(t)$ and $y = g(t)$, then

$$\int_a^b y\,dx = \int_{t_1}^{t_2} g(t)f'(t)\,dt$$

where $f(t_1) = a$, $f(t_2) = b$, and both g and f' are continuous on $[t_1, t_2]$.

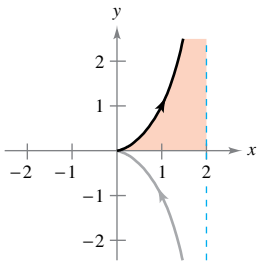
78. Surface Area A portion of a sphere of radius r is removed by cutting out a circular cone with its vertex at the center of the sphere. The vertex of the cone forms an angle of 2θ. Find the surface area removed from the sphere.

Area **In Exercises 79 and 80, find the area of the region. (Use the result of Exercise 77.)**

79. $x = 2\sin^2\theta$

$y = 2\sin^2\theta\tan\theta$

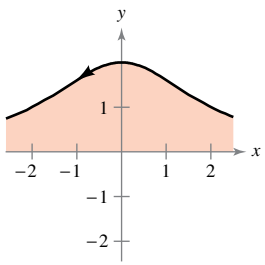
$0 \le \theta < \frac{\pi}{2}$



80. $x = 2\cot\theta$

$y = 2\sin^2\theta$

$0 < \theta < \pi$



Areas of Simple Closed Curves **In Exercises 81–86, use a computer algebra system and the result of Exercise 77 to match the closed curve with its area. (These exercises were based on "The Surveyor's Area Formula" by Bart Braden, *College Mathematics Journal*, September 1986, pp. 335–337, by permission of the author.)**

(a) $\frac{8}{3}ab$ **(b)** $\frac{3}{8}\pi a^2$

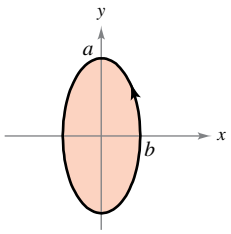
(c) $2\pi a^2$ **(d)** πab

(e) $2\pi ab$ **(f)** $6\pi a^2$

81. Ellipse: $(0 \le t \le 2\pi)$

$x = b\cos t$

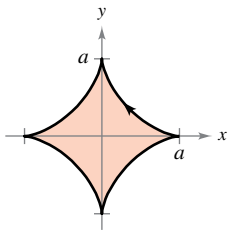
$y = a\sin t$



82. Astroid: $(0 \le t \le 2\pi)$

$x = a\cos^3 t$

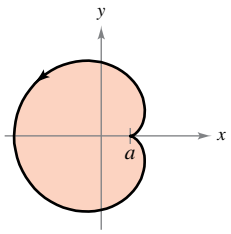
$y = a\sin^3 t$



83. Cardioid: $(0 \le t \le 2\pi)$

$x = 2a\cos t - a\cos 2t$

$y = 2a\sin t - a\sin 2t$



84. Deltoid: $(0 \le t \le 2\pi)$

$x = 2a\cos t + a\cos 2t$

$y = 2a\sin t - a\sin 2t$

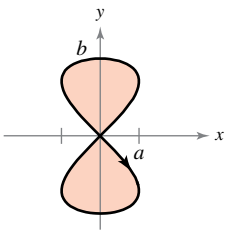
85. Hourglass: $(0 \le t \le 2\pi)$

$x = a \sin 2t$

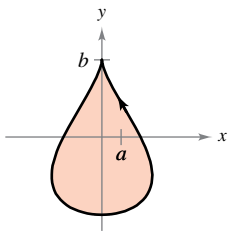
$y = b \sin t$



86. Teardrop: $(0 \le t \le 2\pi)$

$x = 2a \cos t - a \sin 2t$

$y = b \sin t$



Centroid **In Exercises 87 and 88, find the centroid of the region bounded by the graph of the parametric equations and the coordinate axes. (Use the result of Exercise 77.)**

87. $x = \sqrt{t}, \quad y = 4 - t$

88. $x = \sqrt{4 - t}, \quad y = \sqrt{t}$

Volume **In Exercises 89 and 90, find the volume of the solid formed by revolving the region bounded by the graph of the parametric equations about the x-axis. (Use the result of Exercise 77.)**

89. $x = 6 \cos \theta, \quad y = 6 \sin \theta$

90. $x = \cos \theta, \quad y = 3 \sin \theta, \quad a > 0$

91. Cycloid Use the parametric equations

$x = a(\theta - \sin \theta)$ and $y = a(1 - \cos \theta), a > 0$

to answer the following.

(a) Find dy/dx and d^2y/dx^2.

(b) Find the equation of the tangent line at the point where $\theta = \pi/6$.

(c) Find all points of horizontal tangency.

(d) Determine where the curve is concave upward or concave downward.

(e) Find the length of one arc of the curve.

92. Using Parametric Equations Use the parametric equations

$$x = t^2\sqrt{3} \quad \text{and} \quad y = 3t - \frac{1}{3}t^3$$

to answer the following.

(a) Use a graphing utility to graph the curve on the interval $-3 \le t \le 3$.

(b) Find dy/dx and d^2y/dx^2.

(c) Find the equation of the tangent line at the point $\left(\sqrt{3}, \frac{8}{3}\right)$.

(d) Find the length of the curve on the interval $-3 \le t \le 3$.

(e) Find the area of the surface generated by revolving the curve about the x-axis.

93. Involute of a Circle The involute of a circle is described by the endpoint P of a string that is held taut as it is unwound from a spool that does not turn (see figure). Show that a parametric representation of the involute is

$x = r(\cos \theta + \theta \sin \theta)$ and $y = r(\sin \theta - \theta \cos \theta)$.

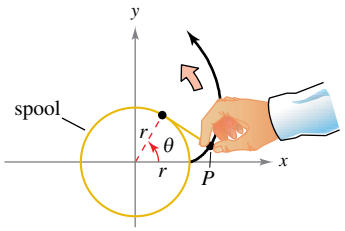


Figure for 93

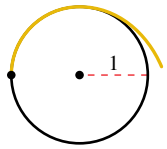

Figure for 94

94. Involute of a Circle The figure shows a piece of string tied to a circle with a radius of one unit. The string is just long enough to reach the opposite side of the circle. Find the area that is covered when the string is unwound counterclockwise.

95. Using Parametric Equations

(a) Use a graphing utility to graph the curve given by

$$x = \frac{1 - t^2}{1 + t^2} \quad \text{and} \quad y = \frac{2t}{1 + t^2}, \quad -20 \le t \le 20.$$

(b) Describe the graph and confirm your result analytically.

(c) Discuss the speed at which the curve is traced as t increases from -20 to 20.

96. Tractrix A person moves from the origin along the positive y-axis pulling a weight at the end of a 12-meter rope. Initially, the weight is located at the point $(12, 0)$.

(a) In Exercise 61 of Section 8.4, it was shown that the path of the weight is modeled by the rectangular equation

$$y = -12 \ln \frac{12 - \sqrt{144 - x^2}}{x} - \sqrt{144 - x^2}$$

where $0 < x \le 12$. Use a graphing utility to graph the rectangular equation.

(b) Use a graphing utility to graph the parametric equations

$$y = 12 \operatorname{sech} \frac{t}{12} \quad \text{and} \quad y = t - 12 \tanh \frac{t}{12}$$

where $t \ge 0$. How does this graph compare with the graph in part (a)? Which graph (if either) do you think is a better representation of the path?

(c) Use the parametric equations for the tractrix to verify that the distance from the y-intercept of the tangent line to the point of tangency is independent of the location of the point of tangency.

True or False? **In Exercises 97–100, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

97. If $x = f(t)$ and $y = g(t)$, then $\dfrac{d^2y}{dx^2} = \dfrac{g''(t)}{f''(t)}$.

98. The curve given by $x = t^3$ and $y = t^2$ has a horizontal tangent at the origin because $dy/dt = 0$ when $t = 0$.

99. The curve given by $x = x_1 + t(x_2 - x_1)$ and $y = y_1 + t(y_2 - y_1)$, $y_1 \ne y_2$, has at least one horizontal asymptote.

100. The curve given by $x = h + a \cos \theta$ and $y = k + b \sin \theta$ has two horizontal asymptotes and two vertical asymptotes.

10.4 Polar Coordinates and Polar Graphs

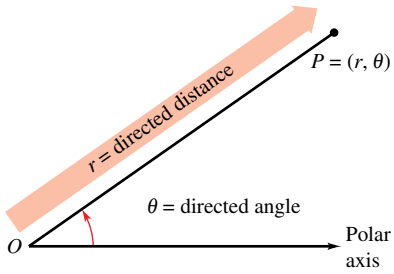
GO DIGITAL

- **Describe the polar coordinate system.**
- **Rewrite rectangular coordinates and equations in polar form and vice versa.**
- **Sketch the graph of an equation given in polar form.**
- **Find the slope of a tangent line to a polar graph.**
- **Identify several types of special polar graphs.**

Polar Coordinates

So far, you have been representing graphs as collections of points (x, y) on the rectangular coordinate system. The corresponding equations for these graphs have been in either rectangular or parametric form. In this section, you will study a coordinate system called the **polar coordinate system.**

To form the polar coordinate system in the plane, fix a point O, called the **pole** (or **origin**), and construct from O an initial ray called the **polar axis,** as shown in Figure 10.35. Then each point P in the plane can be assigned **polar coordinates** (r, θ), as follows.

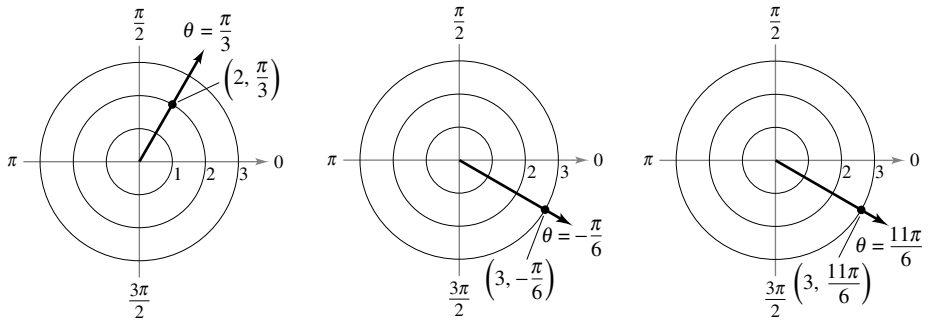


Polar coordinates
Figure 10.35

r = *directed distance* from O to P

θ = *directed angle*, counterclockwise from polar axis to segment $\overline{OP}$

Figure 10.36 shows three points on the polar coordinate system. Notice that in this system, it is convenient to locate points with respect to a grid of concentric circles intersected by **radial lines** through the pole.



(a) **(b)** **(c)**

Figure 10.36

With rectangular coordinates, each point (x, y) has a unique representation. This is not true with polar coordinates. For instance, the coordinates

$$(r, \theta) \quad \text{and} \quad (r, 2\pi + \theta)$$

represent the same point [see parts (b) and (c) in Figure 10.36]. Also, because r is a *directed distance,* the coordinates

$$(r, \theta) \quad \text{and} \quad (-r, \theta + \pi)$$

represent the same point. In general, the point (r, θ) can be written as

$$(r, \theta) = (r, \theta + 2n\pi)$$

or

$$(r, \theta) = (-r, \theta + (2n + 1)\pi)$$

where n is any integer. Moreover, the pole is represented by $(0, \theta)$, where θ is any angle.

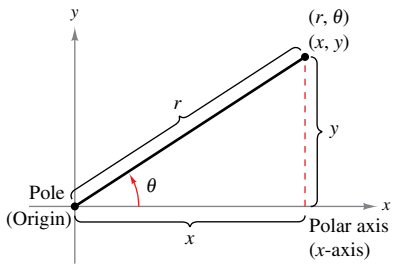
Coordinate Conversion



Relating polar and rectangular coordinates

Figure 10.37

To establish the relationship between polar and rectangular coordinates, let the polar axis coincide with the positive x-axis and the pole with the origin, as shown in Figure 10.37. Because (x, y) lies on a circle of radius r, it follows that

$$r^2 = x^2 + y^2.$$

Moreover, for $r > 0$, the definitions of the trigonometric functions imply that

$$\tan\theta = \frac{y}{x}, \quad \cos\theta = \frac{x}{r}, \quad \text{and} \quad \sin\theta = \frac{y}{r}.$$

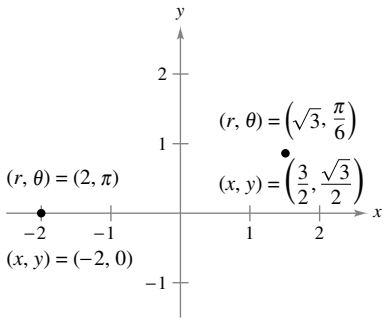
You can show that the same relationships hold for $r < 0$.

THEOREM 10.10 Coordinate Conversion

The polar coordinates (r, θ) of a point are related to the rectangular coordinates (x, y) of the point as follows.

Polar-to-Rectangular	Rectangular-to-Polar
$x = r\cos\theta$	$\tan\theta = \frac{y}{x}$
$y = r\sin\theta$	$r^2 = x^2 + y^2$

GO DIGITAL



To convert from polar to rectangular coordinates, let $x = r\cos\theta$ and $y = r\sin\theta$.

Figure 10.38

EXAMPLE 1 Polar-to-Rectangular Conversion

a. For the point $(r, \theta) = (2, \pi)$,

$$x = r\cos\theta = 2\cos\pi = -2 \quad \text{and} \quad y = r\sin\theta = 2\sin\pi = 0.$$

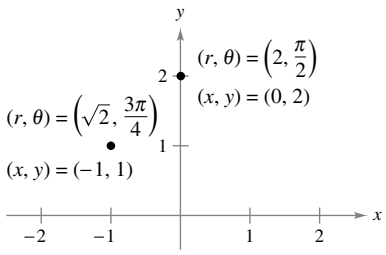
So, the rectangular coordinates are $(x, y) = (-2, 0)$.

b. For the point $(r, \theta) = \left(\sqrt{3}, \pi/6\right)$,

$$x = \sqrt{3}\cos\frac{\pi}{6} = \frac{3}{2} \quad \text{and} \quad y = \sqrt{3}\sin\frac{\pi}{6} = \frac{\sqrt{3}}{2}.$$

So, the rectangular coordinates are $(x, y) = \left(3/2, \sqrt{3}/2\right)$.

See Figure 10.38.



To convert from rectangular to polar coordinates, let $\tan\theta = y/x$ and $r = \sqrt{x^2 + y^2}$.

Figure 10.39

EXAMPLE 2 Rectangular-to-Polar Conversion

a. For the second-quadrant point $(x, y) = (-1, 1)$,

$$\tan\theta = \frac{y}{x} = -1 \quad \Rightarrow \quad \theta = \frac{3\pi}{4}.$$

Because θ was chosen to be in the same quadrant as (x, y), use a positive value of r.

$$r = \sqrt{x^2 + y^2} = \sqrt{(-1)^2 + (1)^2} = \sqrt{2}$$

This implies that *one* set of polar coordinates is $(r, \theta) = \left(\sqrt{2}, 3\pi/4\right)$.

b. Because the point $(x, y) = (0, 2)$ lies on the positive y-axis, choose $\theta = \pi/2$ and $r = 2$, and one set of polar coordinates is $(r, \theta) = (2, \pi/2)$.

See Figure 10.39. ■

Note that you can also use Theorem 10.10 to convert a polar equation to a rectangular equation (and vice versa), as shown in Example 3.

Polar Graphs

One way to sketch the graph of a polar equation is to convert to rectangular coordinates and then sketch the graph of the rectangular equation.

EXAMPLE 3 Graphing Polar Equations

Describe the graph of each polar equation. Confirm each description by converting to a rectangular equation.

a. $r = 2$ **b.** $\theta = \frac{\pi}{3}$ **c.** $r = \sec\theta$

Solution

a. The graph of the polar equation $r = 2$ consists of all points that are two units from the pole. So, this graph is a circle centered at the origin with a radius of 2. [See Figure 10.40(a).] You can confirm this by using the relationship $r^2 = x^2 + y^2$ to obtain the rectangular equation

$$x^2 + y^2 = 2^2. \qquad \text{Rectangular equation}$$

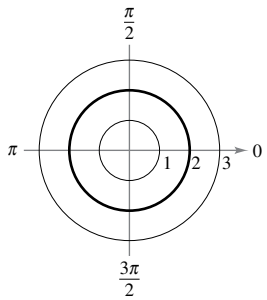
b. The graph of the polar equation $\theta = \pi/3$ consists of all points on the line that makes an angle of $\pi/3$ with the positive x-axis. [See Figure 10.40(b).] You can confirm this by using the relationship $\tan\theta = y/x$ to obtain the rectangular equation

$$y = \sqrt{3}x. \qquad \text{Rectangular equation}$$

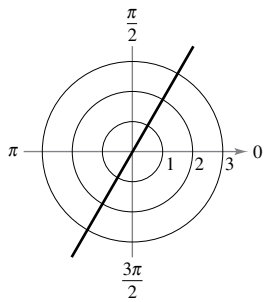
c. The graph of the polar equation $r = \sec\theta$ is not evident by simple inspection, so you can begin by converting to rectangular form using the relationship $r\cos\theta = x$.

$$r = \sec\theta \qquad \text{Polar equation}$$
$$r\cos\theta = 1$$
$$x = 1 \qquad \text{Rectangular equation}$$

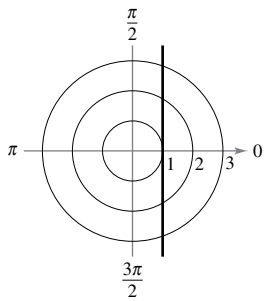
From the rectangular equation, you can determine that the graph is a vertical line. [See Figure 10.40(c).]



(a) Circle: $r = 2$



(b) Radial line: $\theta = \frac{\pi}{3}$



(c) Vertical line: $r = \sec\theta$

Figure 10.40

TECHNOLOGY Sketching the graphs of complicated polar equations without technology can be tedious. With technology, however, the task is not difficult. Use a graphing utility in *polar* mode to graph the equations in the exercise set. If your graphing utility does not have a *polar* mode but does have a *parametric* mode, you can graph $r = f(\theta)$ by writing the equation as

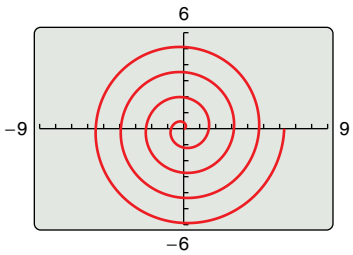
$$x = f(\theta)\cos\theta$$
$$y = f(\theta)\sin\theta.$$

For instance, the graph of $r = \frac{1}{4}\theta$ shown in Figure 10.41 was produced with a graphing utility in parametric mode. This equation was graphed using the parametric equations

$$x = \frac{1}{4}\theta\cos\theta$$

$$y = \frac{1}{4}\theta\sin\theta$$

with the values of θ varying from 0 to 8π. This curve is of the form $r = a\theta$ and is called a **spiral of Archimedes.**



Spiral of Archimedes

GO DIGITAL

EXAMPLE 4 Sketching a Polar Graph

See LarsonCalculus.com for an interactive version of this type of example.

Sketch the graph of $r = 2\cos 3\theta$.

Solution Begin by writing the polar equation in parametric form.

$$x = 2\cos 3\theta \cos\theta \quad \text{and} \quad y = 2\cos 3\theta \sin\theta$$

After some experimentation, you will find that the entire curve, which is called a **rose curve,** can be sketched by letting θ vary from 0 to π, as shown in Figure 10.42. If you try duplicating this graph with a graphing utility, you will find that by letting θ vary from 0 to 2π, you will actually trace the entire curve *twice.*

REMARK One way to sketch the graph of $r = 2\cos 3\theta$ is to make a table of values.

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$
r	2	0	-2	0	2

By extending the table and plotting the points, you will obtain the curve shown in Example 4.

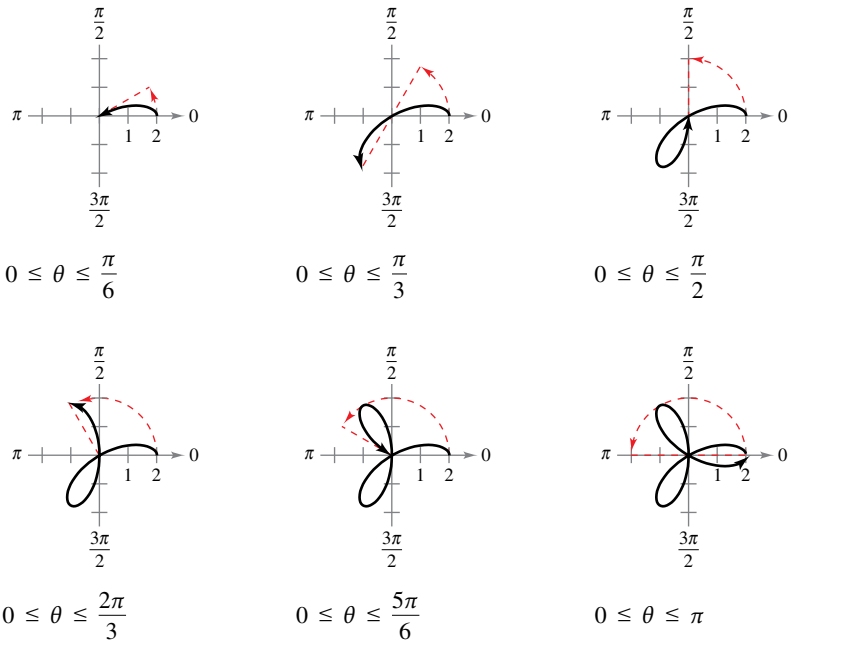

Figure 10.42

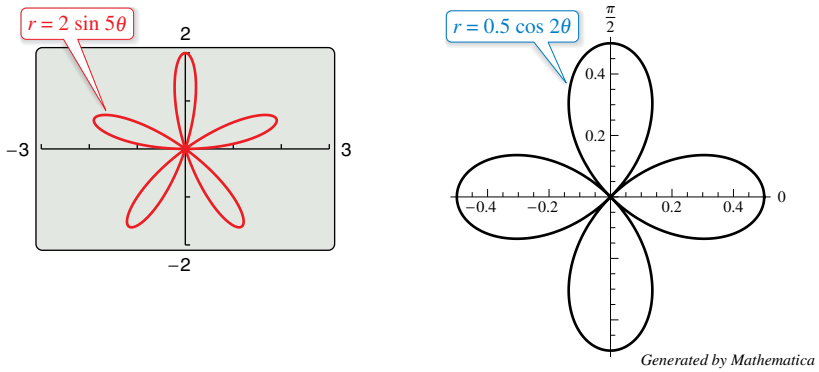
Use a graphing utility to experiment with other rose curves. Note that rose curves are of the form

$$r = a\cos n\theta \quad \text{or} \quad r = a\sin n\theta.$$

For instance, Figure 10.43 shows the graphs of two other rose curves.



Rose curves

Slope and Tangent Lines

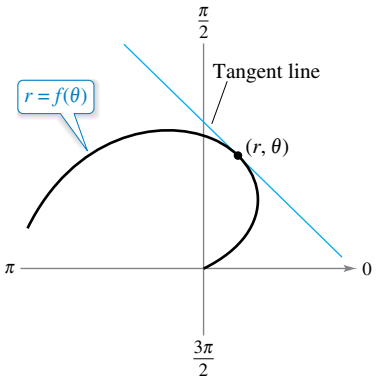
To find the slope of a tangent line to a polar graph, consider a differentiable function given by $r = f(\theta)$. To find the slope in polar form, use the parametric equations

$$x = r\cos\theta = f(\theta)\cos\theta \quad \text{and} \quad y = r\sin\theta = f(\theta)\sin\theta.$$

Using the parametric form of dy/dx given in Theorem 10.7, you have

$$\frac{dy}{dx} = \frac{dy/d\theta}{dx/d\theta} = \frac{f(\theta)\cos\theta + f'(\theta)\sin\theta}{-f(\theta)\sin\theta + f'(\theta)\cos\theta}$$

which establishes the next theorem.



Tangent line to polar curve
Figure 10.44

THEOREM 10.11 Slope in Polar Form

If f is a differentiable function of θ, then the *slope* of the tangent line to the graph of $r = f(\theta)$ at the point (r, θ) is

$$\frac{dy}{dx} = \frac{dy/d\theta}{dx/d\theta} = \frac{f(\theta)\cos\theta + f'(\theta)\sin\theta}{-f(\theta)\sin\theta + f'(\theta)\cos\theta}$$

provided that $dx/d\theta \neq 0$ at (r, θ). (See Figure 10.44.)

From Theorem 10.11, you can make the following observations.

1. Solutions of $\frac{dy}{d\theta} = 0$ yield horizontal tangents, provided that $\frac{dx}{d\theta} \neq 0$.
2. Solutions of $\frac{dx}{d\theta} = 0$ yield vertical tangents, provided that $\frac{dy}{d\theta} \neq 0$.

If $dy/d\theta$ and $dx/d\theta$ are *simultaneously* 0, then no conclusion can be drawn about tangent lines.

EXAMPLE 5 Finding Horizontal and Vertical Tangent Lines

Find the horizontal and vertical tangent lines of $r = \sin\theta$, where $0 \leq \theta < \pi$.

Solution Begin by writing the equation in parametric form.

$$x = r\cos\theta = \sin\theta\cos\theta$$

and

$$y = r\sin\theta = \sin\theta\sin\theta = \sin^2\theta$$

Next, differentiate x and y with respect to θ and set each derivative equal to 0.

$$\frac{dx}{d\theta} = \cos^2\theta - \sin^2\theta = \cos 2\theta = 0 \quad \Rightarrow \quad \theta = \frac{\pi}{4}, \frac{3\pi}{4}$$

$$\frac{dy}{d\theta} = 2\sin\theta\cos\theta = \sin 2\theta = 0 \quad \Rightarrow \quad \theta = 0, \frac{\pi}{2}$$

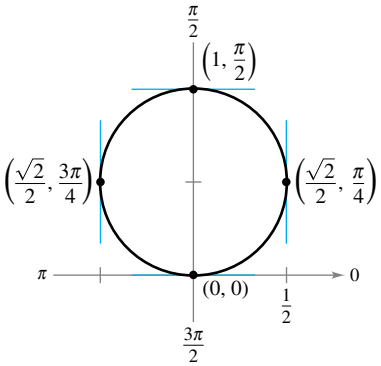
So, the graph has vertical tangent lines at

$$\left(\frac{\sqrt{2}}{2}, \frac{\pi}{4}\right) \quad \text{and} \quad \left(\frac{\sqrt{2}}{2}, \frac{3\pi}{4}\right)$$

and it has horizontal tangent lines at

$$(0, 0) \quad \text{and} \quad \left(1, \frac{\pi}{2}\right)$$

as shown in Figure 10.45.



Horizontal and vertical tangent lines of $r = \sin\theta$

EXAMPLE 6 Finding Horizontal and Vertical Tangent Lines

Find the horizontal and vertical tangent lines to the graph of $r = 2(1 - \cos\theta)$, where $0 \le \theta < 2\pi$.

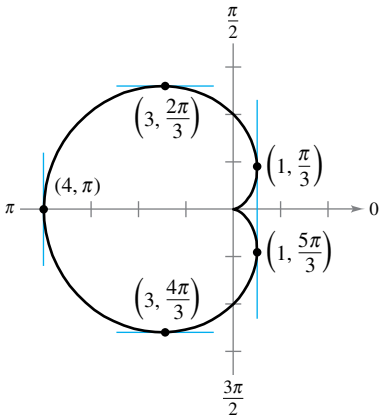
Solution Let $y = r\sin\theta$ and then differentiate with respect to θ.

$$\begin{aligned} y &= r\sin\theta && \text{Parametric equation for } y \\ &= 2(1 - \cos\theta)\sin\theta && \text{Substitute for } r. \\ \frac{dy}{d\theta} &= 2[(1 - \cos\theta)(\cos\theta) + (\sin\theta)(\sin\theta)] && \text{Derivative of } y \text{ with respect to } \theta \\ &= 2(\cos\theta - \cos^2\theta + \sin^2\theta) && \text{Multiply.} \\ &= 2(\cos\theta - \cos^2\theta + 1 - \cos^2\theta) && \text{Pythagorean identity} \\ &= -2(2\cos^2\theta - \cos\theta - 1) && \text{Combine like terms; factor out } -1. \\ &= -2(2\cos\theta + 1)(\cos\theta - 1) && \text{Factor.} \end{aligned}$$

Setting $dy/d\theta$ equal to 0, you can see that $\cos\theta = -\frac{1}{2}$ and $\cos\theta = 1$. So, $dy/d\theta = 0$ when $\theta = 2\pi/3$, $4\pi/3$, and 0. Similarly, using $x = r\cos\theta$, you have

$$\begin{aligned} x &= r\cos\theta && \text{Parametric equation for } x \\ &= 2(1 - \cos\theta)\cos\theta && \text{Substitute for } r. \\ &= 2\cos\theta - 2\cos^2\theta && \text{Multiply.} \\ \frac{dx}{d\theta} &= -2\sin\theta + 4\cos\theta\sin\theta && \text{Derivative of } x \text{ with respect to } \theta \\ &= (2\sin\theta)(2\cos\theta - 1). && \text{Factor.} \end{aligned}$$

Setting $dx/d\theta$ equal to 0, you can see that $\sin\theta = 0$ and $\cos\theta = \frac{1}{2}$. So, you can conclude that $dx/d\theta = 0$ when $\theta = 0$, π, $\pi/3$, and $5\pi/3$. From these results and from the graph shown in Figure 10.46, you can conclude that the graph has horizontal tangents at $(3, 2\pi/3)$ and $(3, 4\pi/3)$ and has vertical tangents at $(1, \pi/3)$, $(1, 5\pi/3)$, and $(4, \pi)$. This graph is called a **cardioid.** Note that both derivatives ($dy/d\theta$ and $dx/d\theta$) are 0 when $\theta = 0$. Using this information alone, you do not know whether the graph has a horizontal or vertical tangent line at the pole. From Figure 10.46, however, you can see that the graph has a cusp at the pole. ■



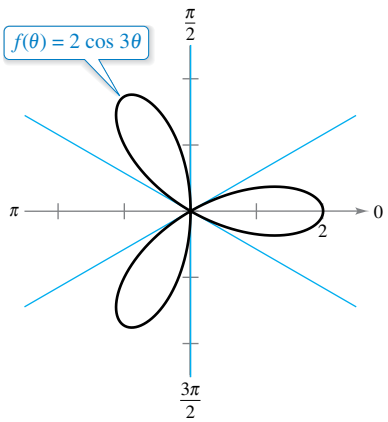
Horizontal and vertical tangent lines of $r = 2(1 - \cos\theta)$

Figure 10.46

Theorem 10.11 has an important consequence. If the graph of $r = f(\theta)$ passes through the pole when $\theta = \alpha$ and $f'(\alpha) \ne 0$, then the formula for dy/dx simplifies as follows.

$$\frac{dy}{dx} = \frac{f'(\alpha)\sin\alpha + f(\alpha)\cos\alpha}{f'(\alpha)\cos\alpha - f(\alpha)\sin\alpha} = \frac{f'(\alpha)\sin\alpha + 0}{f'(\alpha)\cos\alpha - 0} = \frac{\sin\alpha}{\cos\alpha} = \tan\alpha$$

So, the line $\theta = \alpha$ is tangent to the graph at the pole, $(0, \alpha)$.



This rose curve has three tangent lines ($\theta = \pi/6$, $\theta = \pi/2$, and $\theta = 5\pi/6$) at the pole.

Figure 10.47

THEOREM 10.12 Tangent Lines at the Pole

If $f(\alpha) = 0$ and $f'(\alpha) \ne 0$, then the line $\theta = \alpha$ is tangent at the pole to the graph of $r = f(\theta)$.

Theorem 10.12 is useful because it states that the zeros of $r = f(\theta)$ can be used to find the tangent lines at the pole. Note that because a polar curve can cross the pole more than once, it can have more than one tangent line at the pole. For example, the rose curve $f(\theta) = 2\cos 3\theta$ has three tangent lines at the pole, as shown in Figure 10.47. For this curve, $f(\theta) = 2\cos 3\theta$ is 0 when θ is $\pi/6$, $\pi/2$, and $5\pi/6$. Moreover, the derivative $f'(\theta) = -6\sin 3\theta$ is not 0 for these values of θ.

Special Polar Graphs

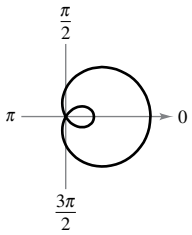
Several important types of graphs have equations that are simpler in polar form than in rectangular form. For example, the polar equation of a circle having a radius of a and centered at the origin is simply $r = a$. Later in the text, you will come to appreciate this benefit. For now, several other types of graphs that have simpler equations in polar form are shown below. (Conics are considered in Section 10.6.)

Limaçons

$r = a \pm b \cos\theta$

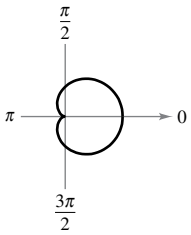
$r = a \pm b \sin\theta$

$(a > 0, b > 0)$



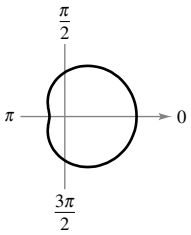
$\frac{a}{b} < 1$

Limaçon with inner loop



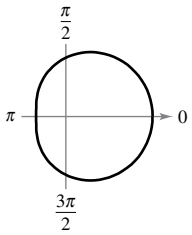
$\frac{a}{b} = 1$

Cardioid (heart-shaped)



$1 < \frac{a}{b} < 2$

Dimpled limaçon



$\frac{a}{b} \geq 2$

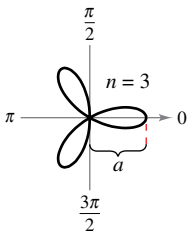
Convex limaçon

Rose Curves

n petals when n is odd

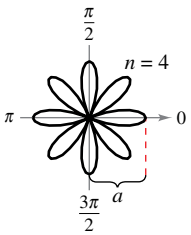
$2n$ petals when n is even

$(n \geq 2)$



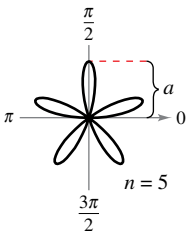
$r = a \cos n\theta$

Rose curve



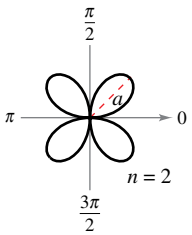
$r = a \cos n\theta$

Rose curve



$r = a \sin n\theta$

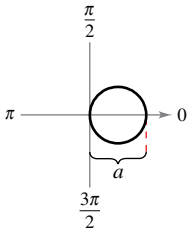
Rose curve



$r = a \sin n\theta$

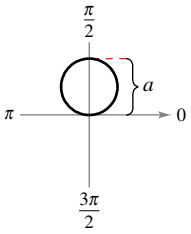
Rose curve

Circles and Lemniscates



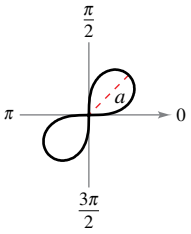
$r = a \cos\theta$

Circle



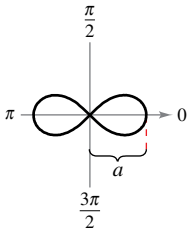
$r = a \sin\theta$

Circle



$r^2 = a^2 \sin 2\theta$

Lemniscate



$r^2 = a^2 \cos 2\theta$

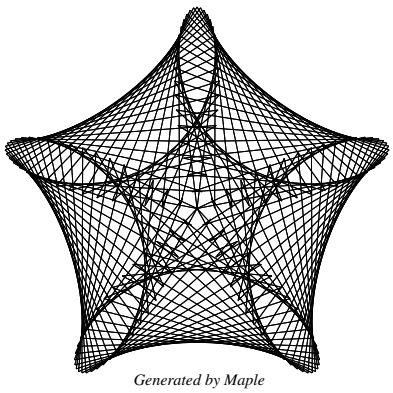
Lemniscate

TECHNOLOGY The rose curves described above are of the form $r = a \cos n\theta$ or $r = a \sin n\theta$, where n is a positive integer that is greater than or equal to 2. Use a graphing utility to graph

$$r = a \cos n\theta \quad \text{or} \quad r = a \sin n\theta$$

for some noninteger values of n. Are these graphs also rose curves? For example, try sketching the graph of

$$r = \cos\frac{2}{3}\theta, \quad 0 \leq \theta \leq 6\pi.$$



Generated by Maple

FOR FURTHER INFORMATION For more information on rose curves and related curves, see the article "A Rose is a Rose . . ." by Peter M. Maurer in *The American Mathematical Monthly*. The computer-generated graph at the left is the result of an algorithm that Maurer calls "The Rose." To view this article, go to *MathArticles.com*.

Concept Check

1. Consider the polar coordinates (r, θ). What does r represent? What does θ represent?
2. Plot the points below on the same set of coordinate axes.

$$(r, \theta) = \left(2, \frac{\pi}{2}\right) \quad \text{and} \quad (x, y) = \left(2, \frac{\pi}{2}\right)$$

3. Describe the differences between the rectangular coordinate system and the polar coordinate system.
4. Explain how to write a polar equation in parametric form.

Polar-to-Rectangular Conversion **In Exercises 5–14, the polar coordinates of a point are given. Plot the point and find the corresponding rectangular coordinates for the point.**

5. $\left(8, \frac{\pi}{2}\right)$
6. $\left(-2, \frac{5\pi}{3}\right)$
7. $\left(-4, -\frac{3\pi}{4}\right)$
8. $\left(0, -\frac{7\pi}{6}\right)$
9. $\left(7, \frac{5\pi}{4}\right)$
10. $\left(-2, \frac{11\pi}{6}\right)$
11. $\left(\sqrt{2}, 2.36\right)$
12. $(-3, -1.57)$
13. $(-8, 0.75)$
14. $(1.25, -5)$

Rectangular-to-Polar Conversion **In Exercises 15–24, the rectangular coordinates of a point are given. Plot the point and find *two* sets of polar coordinates for the point for $0 \le \theta < 2\pi$.**

15. $(1, 0)$
16. $(0, -9)$
17. $(-3, 4)$
18. $(6, -2)$
19. $\left(-5, -5\sqrt{3}\right)$
20. $\left(3, -\sqrt{3}\right)$
21. $\left(\sqrt{7}, -\sqrt{7}\right)$
22. $\left(-2\sqrt{2}, -2\sqrt{2}\right)$
23. $(4, 5)$
24. $(1, 8)$

Rectangular-to-Polar Conversion **In Exercises 25–34, convert the rectangular equation to polar form and sketch its graph.**

25. $x^2 + y^2 = 9$
26. $x^2 - y^2 = 9$
27. $x^2 + y^2 = a^2$
28. $x^2 + y^2 - 2ax = 0$
29. $y = 8$
30. $x = 12$
31. $3x - y + 2 = 0$
32. $xy = 4$
33. $y^2 = 9x$
34. $(x^2 + y^2)^2 - 9(x^2 - y^2) = 0$

Polar-to-Rectangular Conversion **In Exercises 35–44, convert the polar equation to rectangular form and sketch its graph.**

35. $r = 4$
36. $r = -1$
37. $r = 3 \sin \theta$
38. $r = 5 \cos \theta$
39. $r = \theta$
40. $\theta = \frac{5\pi}{6}$
41. $r = 3 \sec \theta$
42. $r = -6 \csc \theta$
43. $r = \sec \theta \tan \theta$
44. $r = \cot \theta \csc \theta$

Graphing a Polar Equation **In Exercises 45–54, use a graphing utility to graph the polar equation. Find an interval for θ over which the graph is traced *only once*.**

45. $r = 2 - 5 \cos \theta$
46. $r = 3(1 - 4 \cos \theta)$
47. $r = -1 + \sin \theta$
48. $r = 4 + 3 \cos \theta$
49. $r = \frac{2}{1 + \cos \theta}$
50. $r = \frac{1}{4 - 3 \sin \theta}$
51. $r = 5 \cos \frac{3\theta}{2}$
52. $r = 3 \sin \frac{5\theta}{2}$
53. $r^2 = 4 \sin 2\theta$
54. $r^2 = \frac{1}{\theta}$

55. **Verifying a Polar Equation** Convert the equation

$$r = 2(h \cos \theta + k \sin \theta)$$

to rectangular form and verify that it is the equation of a circle. Find the radius and the rectangular coordinates of the center of the circle.

56. **HOW DO YOU SEE IT?** Identify each special polar graph and write its equation.

57. Sketching a Graph Sketch the graph of $r = 4 \sin \theta$ over each interval.

(a) $0 \le \theta \le \frac{\pi}{2}$ (b) $\frac{\pi}{2} \le \theta \le \pi$ (c) $-\frac{\pi}{2} \le \theta \le \frac{\pi}{2}$

58. Distance Formula

(a) Verify that the Distance Formula for the distance between the two points (r_1, θ_1) and (r_2, θ_2) in polar coordinates is

$$d = \sqrt{r_1^2 + r_2^2 - 2r_1 r_2 \cos(\theta_1 - \theta_2)}.$$

(b) Describe the positions of the points relative to each other for $\theta_1 = \theta_2$. Simplify the Distance Formula for this case. Is the simplification what you expected? Explain.

(c) Simplify the Distance Formula for $\theta_1 - \theta_2 = 90°$. Is the simplification what you expected? Explain.

(d) Choose two points on the polar coordinate system and find the distance between them. Then choose different polar representations of the same two points and apply the Distance Formula again. Discuss the result.

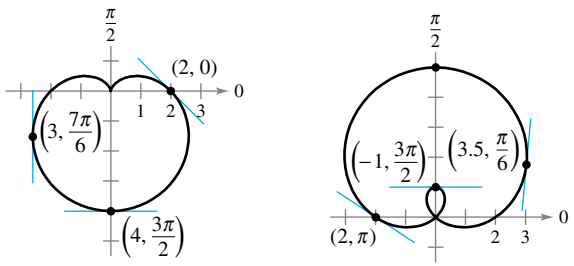
Distance Formula **In Exercises 59–62, use the result of Exercise 58 to find the distance between the two points in polar coordinates.**

59. $\left(1, \frac{5\pi}{6}\right)$, $\left(4, \frac{\pi}{3}\right)$ **60.** $\left(8, \frac{7\pi}{4}\right)$, $(5, \pi)$

61. $(2, 0.5)$, $(7, 1.2)$ **62.** $(4, 2.5)$, $(12, 1)$

Finding Slopes of Tangent Lines **In Exercises 63 and 64, find dy/dx and the slopes of the tangent lines shown on the graph of the polar equation.**

63. $r = 2(1 - \sin \theta)$ **64.** $r = 2 + 3 \sin \theta$



Finding Slopes of Tangent Lines Using Technology **In Exercises 65–68, use a graphing utility to (a) graph the polar equation, (b) draw the tangent line at the given value of θ, and (c) find dy/dx at the given value of θ. (*Hint:* Let the increment between the values of θ equal $\pi/24$.)**

65. $r = 3(1 - \cos \theta)$, $\theta = \frac{\pi}{2}$ **66.** $r = 3 - 2 \cos \theta$, $\theta = 0$

67. $r = 3 \sin \theta$, $\theta = \frac{\pi}{3}$ **68.** $r = 4$, $\theta = \frac{\pi}{4}$

Horizontal and Vertical Tangency **In Exercises 69 and 70, find the points of horizontal and vertical tangency to the polar curve.**

69. $r = 1 - \sin \theta$

70. $r = a \sin \theta$

Horizontal Tangency **In Exercises 71 and 72, find the points of horizontal tangency to the polar curve.**

71. $r = 2 \csc \theta + 3$ **72.** $r = a \sin \theta \cos^2 \theta$

Tangent Lines at the Pole **In Exercises 73–80, sketch a graph of the polar equation and find the tangent lines at the pole (if any).**

73. $r = 5 \sin \theta$ **74.** $r = 5 \cos \theta$

75. $r = 4(1 - \sin \theta)$ **76.** $r = 2(1 - \cos \theta)$

77. $r = 4 \cos 3\theta$ **78.** $r = -\sin 5\theta$

79. $r = 3 \sin 2\theta$ **80.** $r = 3 \cos 2\theta$

Sketching a Polar Graph **In Exercises 81–92, sketch a graph of the polar equation.**

81. $r = 8$ **82.** $r = 1$

83. $r = 4(1 + \cos \theta)$ **84.** $r = 1 + \sin \theta$

85. $r = 3 - 2 \cos \theta$ **86.** $r = 5 - 4 \sin \theta$

87. $r = -7 \csc \theta$ **88.** $r = \frac{6}{2 \sin \theta - 3 \cos \theta}$

89. $r = 3\theta$

90. $r = \frac{1}{\theta}$

91. $r^2 = 4 \cos 2\theta$

92. $r^2 = 4 \sin \theta$

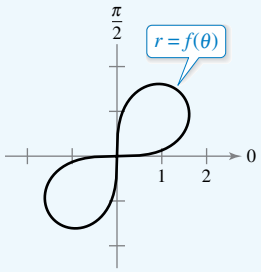
Asymptote **In Exercises 93–96, use a graphing utility to graph the equation and show that the given line is an asymptote of the graph.**

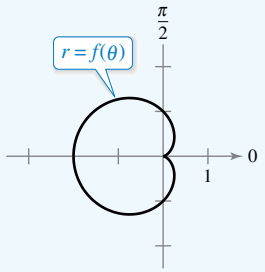
Name of Graph	Polar Equation	Asymptote
93. Conchoid	$r = 2 - \sec \theta$	$x = -1$
94. Conchoid	$r = 2 + \csc \theta$	$y = 1$
95. Hyperbolic spiral	$r = 2/\theta$	$y = 2$
96. Strophoid	$r = 2 \cos 2\theta \sec \theta$	$x = -2$

Exploring Concepts

In Exercises 97 and 98, use the graph of $r = f(\theta)$ to sketch a graph of the transformation.

97. $r = f(-\theta)$ **98.** $r = -f(\theta)$





99. Describe how to test whether a polar graph is symmetric about (a) the x-axis and (b) the y-axis.

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

100. Think About It Use a graphing utility to graph the polar equation $r = 6[1 + \cos(\theta - \phi)]$ for (a) $\phi = 0$, (b) $\phi = \pi/4$, and (c) $\phi = \pi/2$. Use the graphs to describe the effect of the angle ϕ. Write the equation as a function of $\sin\theta$ for part (c).

101. Rotated Curve Verify that if the curve whose polar equation is $r = f(\theta)$ is rotated about the pole through an angle ϕ, then an equation for the rotated curve is $r = f(\theta - \phi)$.

102. Rotated Curve The polar form of an equation of a curve is $r = f(\sin\theta)$. Show that the form becomes

(a) $r = f(-\cos\theta)$ if the curve is rotated counterclockwise $\pi/2$ radians about the pole.

(b) $r = f(-\sin\theta)$ if the curve is rotated counterclockwise π radians about the pole.

(c) $r = f(\cos\theta)$ if the curve is rotated counterclockwise $3\pi/2$ radians about the pole.

Rotated Curve **In Exercises 103–105, use the results of Exercises 101 and 102.**

103. Write an equation for the limaçon $r = 2 - \sin\theta$ after it has been rotated counterclockwise by an angle of (a) $\theta = \pi/4$, (b) $\theta = \pi/2$, (c) $\theta = \pi$, and (d) $\theta = 3\pi/2$. Use a graphing utility to graph each rotated limaçon.

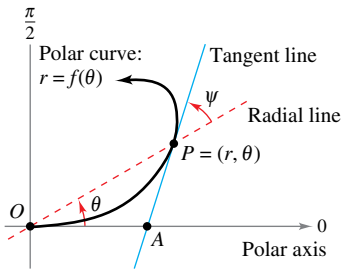
104. Write an equation for the rose curve $r = 2\sin 2\theta$ after it has been rotated counterclockwise by an angle of (a) $\theta = \pi/6$, (b) $\theta = \pi/2$, (c) $\theta = 2\pi/3$, and (d) $\theta = \pi$. Use a graphing utility to graph each rotated rose curve.

105. Sketch the graph of each equation.

(a) $r = 1 - \sin\theta$ (b) $r = 1 - \sin\left(\theta - \frac{\pi}{4}\right)$

106. Proof Prove that the tangent of the angle $\psi\,(0 \le \psi \le \pi/2)$ between the radial line and the tangent line at the point (r, θ) on the graph of $r = f(\theta)$ (see figure) is given by

$$\tan\psi = \left|\frac{r}{dr/d\theta}\right|.$$



Finding an Angle **In Exercises 107–112, use the result of Exercise 106 to find the angle ψ between the radial and tangent lines to the graph for the indicated value of θ. Use a graphing utility to graph the polar equation, the radial line, and the tangent line for the indicated value of θ. Identify the angle ψ.**

	Polar Equation	Value of θ
107.	$r = 2(1 - \cos\theta)$	$\theta = \pi$
108.	$r = 3(1 - \cos\theta)$	$\theta = \frac{3\pi}{4}$
109.	$r = 2\cos 3\theta$	$\theta = \frac{\pi}{4}$
110.	$r = 4\sin 2\theta$	$\theta = \frac{\pi}{6}$
111.	$r = \frac{6}{1 - \cos\theta}$	$\theta = \frac{2\pi}{3}$
112.	$r = 5$	$\theta = \frac{\pi}{6}$

True or False? **In Exercises 113–116, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

113. If (r_1, θ_1) and (r_2, θ_2) represent the same point on the polar coordinate system, then $|r_1| = |r_2|$.

114. If (r, θ_1) and (r, θ_2) represent the same point on the polar coordinate system, then $\theta_1 = \theta_2 + 2n\pi$ for some integer n.

115. If $x > 0$, then the point (x, y) on the rectangular coordinate system can be represented by (r, θ) on the polar coordinate system, where $r = \sqrt{x^2 + y^2}$ and $\theta = \arctan(y/x)$.

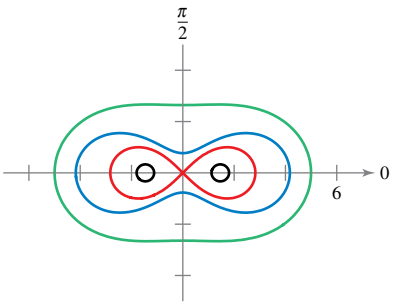
116. The polar equations $r = \sin 2\theta$, $r = -\sin 2\theta$, and $r = \sin(-2\theta)$ all have the same graph.

SECTION PROJECT

Cassini Oval

A Cassini oval is defined as the set of all points the product of whose distances from two fixed points is constant. These curves are named after the astronomer Giovanni Domenico Cassini (1625–1712). He suspected that these curves could model planetary motion. However, as you saw in Section 10.1, Kepler used ellipses to describe planetary motion. You will learn more about Kepler's Laws of planetary motion in Section 10.6.

Let $(-c, 0)$ and $(c, 0)$ be two fixed points in the plane. A point (x, y) lies on a Cassini oval when the distance between (x, y) and $(-c, 0)$ times the distance between (x, y) and $(c, 0)$ is b^2, where b is a constant.



Four different types of Cassini ovals

(a) Show that $(x^2 + y^2)^2 - 2c^2(x^2 - y^2) + c^4 = b^4$

(b) Convert the equation in part (a) to polar coordinates.

(c) Show that if $b = c$, then the Cassini oval is a lemniscate.

(d) Use a graphing utility to graph the Cassini oval for $c = 1$ and $b = 2$.

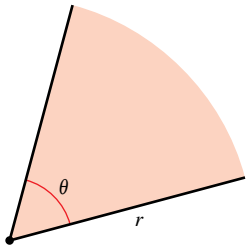
10.5 Area and Arc Length in Polar Coordinates

GO DIGITAL

- Find the area of a region bounded by a polar graph.
- Find the points of intersection of two polar graphs.
- Find the arc length of a polar graph.
- Find the area of a surface of revolution (polar form).

Area of a Polar Region

The development of a formula for the area of a polar region parallels that for the area of a region on the rectangular coordinate system but uses sectors of a circle instead of rectangles as the basic elements of area. In Figure 10.48, note that the area of a circular sector of radius r is $\frac{1}{2}\theta r^2$, provided θ is measured in radians.

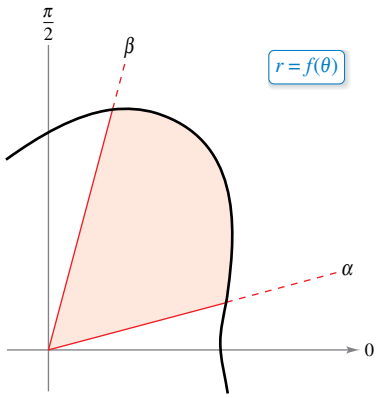


The area of a sector of a circle is $A = \frac{1}{2}\theta r^2$.
Figure 10.48

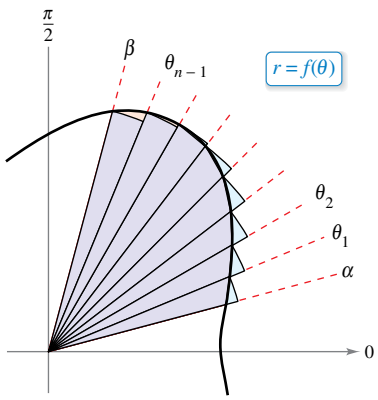
Consider the function $r = f(\theta)$, where f is continuous and nonnegative on the interval $\alpha \le \theta \le \beta$. The region bounded by the graph of f and the radial lines $\theta = \alpha$ and $\theta = \beta$ is shown in Figure 10.49(a). To find the area of this region, partition the interval $[\alpha, \beta]$ into n equal subintervals

$$\alpha = \theta_0 < \theta_1 < \theta_2 < \cdots < \theta_{n-1} < \theta_n = \beta.$$

Then approximate the area of the region by the sum of the areas of the n sectors, as shown in Figure 10.49(b).



(a)



(b)
Figure 10.49

$$\text{Radius of } i\text{th sector} = f(\theta_i)$$

$$\text{Central angle of } i\text{th sector} = \frac{\beta - \alpha}{n} = \Delta\theta$$

$$A \approx \sum_{i=1}^{n} \left(\frac{1}{2}\right)\Delta\theta[f(\theta_i)]^2$$

Taking the limit as $n \to \infty$ produces

$$A = \lim_{n\to\infty} \frac{1}{2} \sum_{i=1}^{n} [f(\theta_i)]^2 \Delta\theta$$
$$= \frac{1}{2}\int_{\alpha}^{\beta} [f(\theta)]^2 \, d\theta$$

which leads to the next theorem.

THEOREM 10.13 Area in Polar Coordinates

If a function f is continuous and nonnegative on the interval $[\alpha, \beta]$, where $0 < \beta - \alpha \le 2\pi$, then the area of the region bounded by the graph of $r = f(\theta)$ between the radial lines $\theta = \alpha$ and $\theta = \beta$ is

$$A = \frac{1}{2}\int_{\alpha}^{\beta} [f(\theta)]^2 \, d\theta$$
$$= \frac{1}{2}\int_{\alpha}^{\beta} r^2 \, d\theta. \qquad 0 < \beta - \alpha \le 2\pi$$

You can use the formula in Theorem 10.13 to find the area of a region bounded by the graph of a continuous *nonpositive* function. The formula is not necessarily valid, however, when f takes on both positive *and* negative values in the interval $[\alpha, \beta]$.

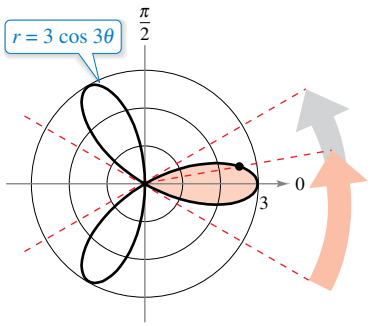
GO DIGITAL



The area of one petal of the rose curve that lies between the radial lines $\theta = -\pi/6$ and $\theta = \pi/6$ is $3\pi/4$.
Figure 10.50

EXAMPLE 1 Finding the Area of a Polar Region

See LarsonCalculus.com for an interactive version of this type of example.

Find the area of one petal of the rose curve $r = 3\cos 3\theta$.

Solution Figure 10.50 shows that the petal on the right is traced as θ increases from $-\pi/6$ to $\pi/6$. So, the area is

$$A = \frac{1}{2}\int_{\alpha}^{\beta} r^2\,d\theta = \frac{1}{2}\int_{-\pi/6}^{\pi/6} (3\cos 3\theta)^2\,d\theta$$ Use formula for area in polar coordinates.

$$= \frac{9}{2}\int_{-\pi/6}^{\pi/6} \frac{1+\cos 6\theta}{2}\,d\theta$$ Power-reducing formula

$$= \frac{9}{4}\left[\theta + \frac{\sin 6\theta}{6}\right]_{-\pi/6}^{\pi/6}$$

$$= \frac{9}{4}\left(\frac{\pi}{6} + \frac{\pi}{6}\right)$$

$$= \frac{3\pi}{4}.$$

To find the area of the region lying inside all three petals of the rose curve in Example 1, you could *not* simply integrate between 0 and 2π. By doing this, you would obtain $9\pi/2$, which is twice the area of the three petals. The duplication occurs because the rose curve is traced twice as θ increases from 0 to 2π.

EXAMPLE 2 Finding the Area Bounded by a Single Curve

Find the area of the region lying between the inner and outer loops of the limaçon $r = 1 - 2\sin\theta$.

Solution In Figure 10.51, note that the inner loop is traced as θ increases from $\pi/6$ to $5\pi/6$. So, the area inside the *inner loop* is

$$A_1 = \frac{1}{2}\int_{\pi/6}^{5\pi/6} (1 - 2\sin\theta)^2\,d\theta$$ Use formula for area in polar coordinates.

$$= \frac{1}{2}\int_{\pi/6}^{5\pi/6} (1 - 4\sin\theta + 4\sin^2\theta)\,d\theta$$

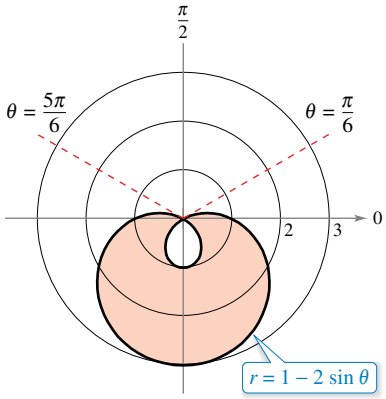
$$= \frac{1}{2}\int_{\pi/6}^{5\pi/6} \left[1 - 4\sin\theta + 4\left(\frac{1-\cos 2\theta}{2}\right)\right]d\theta$$ Power-reducing formula

$$= \frac{1}{2}\int_{\pi/6}^{5\pi/6} (3 - 4\sin\theta - 2\cos 2\theta)\,d\theta$$ Simplify.

$$= \frac{1}{2}\left[3\theta + 4\cos\theta - \sin 2\theta\right]_{\pi/6}^{5\pi/6}$$

$$= \frac{1}{2}\left(2\pi - 3\sqrt{3}\right)$$

$$= \pi - \frac{3\sqrt{3}}{2}.$$



The area between the inner and outer loops is approximately 8.34.
Figure 10.51

In a similar way, you can integrate from $5\pi/6$ to $13\pi/6$ to find that the area of the region lying inside the *outer loop* is $A_2 = 2\pi + \left(3\sqrt{3}/2\right)$. The area of the region lying between the two loops is the difference of A_2 and A_1.

$$A = A_2 - A_1 = \left(2\pi + \frac{3\sqrt{3}}{2}\right) - \left(\pi - \frac{3\sqrt{3}}{2}\right) = \pi + 3\sqrt{3} \approx 8.34$$

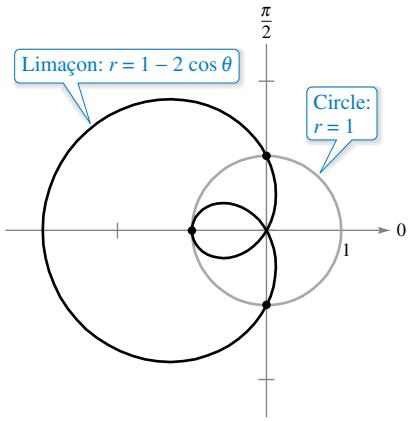
Points of Intersection of Polar Graphs

Because a point may be represented in different ways in polar coordinates, care must be taken in determining the points of intersection of two polar graphs. For example, consider the points of intersection of the graphs of

$$r = 1 - 2\cos\theta \quad \text{and} \quad r = 1$$

as shown in Figure 10.52. As with rectangular equations, you can attempt to find the points of intersection by solving the two equations simultaneously, as shown.

$$r = 1 - 2\cos\theta \qquad \text{First equation}$$
$$1 = 1 - 2\cos\theta \qquad \text{Substitute } r = 1 \text{ from second equation into first equation.}$$
$$\cos\theta = 0 \qquad \text{Simplify.}$$
$$\theta = \frac{\pi}{2}, \frac{3\pi}{2} \qquad \text{Solve for } \theta.$$



Three points of intersection: $(1, \pi/2)$, $(-1, 0)$, and $(1, 3\pi/2)$

Figure 10.52

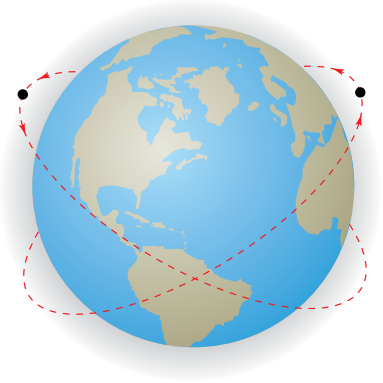
The corresponding points of intersection are $(1, \pi/2)$ and $(1, 3\pi/2)$. Figure 10.52 shows, however, that there is a *third* point of intersection that did not show up when the two polar equations were solved simultaneously. (This is one reason why you should sketch a graph when finding the area of a polar region.) The third point was not found because it does not occur with the same coordinates in the two graphs. On the graph of $r = 1$, the point occurs with coordinates $(1, \pi)$, but on the graph of

$$r = 1 - 2\cos\theta$$

the point occurs with coordinates $(-1, 0)$.

In addition to solving equations simultaneously and sketching a graph, note that because the pole can be represented by $(0, \theta)$, where θ is *any* angle, you should check separately for the pole when finding points of intersection.

You can compare the problem of finding points of intersection of two polar graphs with that of finding collision points of two satellites in intersecting orbits about Earth, as shown in Figure 10.53. The satellites will not collide as long as they reach the points of intersection at different times (θ-values). Collisions will occur only at the points of intersection that are "simultaneous points"—those that are reached at the same time (θ-value).



The paths of satellites can cross without causing a collision.

Figure 10.53

FOR FURTHER INFORMATION For more information on using technology to find points of intersection, see the article "Finding Points of Intersection of Polar-Coordinate Graphs" by Warren W. Esty in *Mathematics Teacher*. To view this article, go to *MathArticles.com*.

EXAMPLE 3 Finding the Area of a Region Between Two Curves

Find the area of the region common to the two regions bounded by the curves

$$r = -6\cos\theta \qquad \text{Circle}$$

and

$$r = 2 - 2\cos\theta. \qquad \text{Cardioid}$$

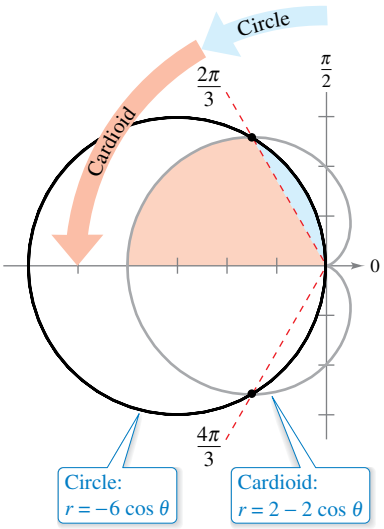

Figure 10.54

Solution Because both curves are symmetric with respect to the x-axis, you can work with the upper half-plane, as shown in Figure 10.54. The blue shaded region lies between the circle and the radial line

$$\theta = \frac{2\pi}{3}.$$

Because the circle has coordinates $(0, \pi/2)$ at the pole, you can integrate between $\pi/2$ and $2\pi/3$ to obtain the area of this region. The region that is shaded orange is bounded by the cardioid and the radial lines $\theta = 2\pi/3$ and $\theta = \pi$. So, you can find the area of this second region by integrating between $2\pi/3$ and π. The sum of these two integrals gives the area of the common region lying *above* the radial line $\theta = \pi$.

$$\frac{A}{2} = \underbrace{\frac{1}{2}\int_{\pi/2}^{2\pi/3} (-6\cos\theta)^2\,d\theta}_{\text{Region between circle and radial line } \theta = 2\pi/3} + \underbrace{\frac{1}{2}\int_{2\pi/3}^{\pi} (2 - 2\cos\theta)^2\,d\theta}_{\text{Region between cardioid and radial lines } \theta = 2\pi/3 \text{ and } \theta = \pi}$$

$$= 18\int_{\pi/2}^{2\pi/3} \cos^2\theta\,d\theta + \frac{1}{2}\int_{2\pi/3}^{\pi} (4 - 8\cos\theta + 4\cos^2\theta)\,d\theta$$

$$= 9\int_{\pi/2}^{2\pi/3} (1 + \cos 2\theta)\,d\theta + \int_{2\pi/3}^{\pi} (3 - 4\cos\theta + \cos 2\theta)\,d\theta$$

$$= 9\left[\theta + \frac{\sin 2\theta}{2}\right]_{\pi/2}^{2\pi/3} + \left[3\theta - 4\sin\theta + \frac{\sin 2\theta}{2}\right]_{2\pi/3}^{\pi}$$

$$= 9\left(\frac{2\pi}{3} - \frac{\sqrt{3}}{4} - \frac{\pi}{2}\right) + \left(3\pi - 2\pi + 2\sqrt{3} + \frac{\sqrt{3}}{4}\right)$$

$$= \frac{5\pi}{2}$$

Finally, multiplying by 2, you can conclude that the total area is

$$5\pi \approx 15.7. \qquad \text{Area of region inside circle and cardioid}$$

To check the reasonableness of this result, note that the area of the circular region is

$$\pi r^2 = 9\pi. \qquad \text{Area of circle}$$

So, it seems reasonable that the area of the region lying inside the circle and the cardioid is 5π. ■

To see the benefit of polar coordinates for finding the area in Example 3, consider the integral below, which gives the comparable area in rectangular coordinates.

$$\frac{A}{2} = \int_{-4}^{-3/2} \sqrt{2\sqrt{1 - 2x} - x^2 - 2x + 2}\,dx + \int_{-3/2}^{0} \sqrt{-x^2 - 6x}\,dx$$

Use the integration capabilities of a graphing utility to show that you obtain the same area as that found in Example 3.

Arc Length in Polar Form

The formula for the length of a polar arc can be obtained from the arc length formula for a curve described by parametric equations. (See Exercise 84.)

REMARK When applying the arc length formula to a polar curve, be sure that the curve is traced out only once on the interval of integration. For instance, the rose curve $r = \cos 3\theta$ is traced out once on the interval $0 \le \theta \le \pi$ but is traced out twice on the interval $0 \le \theta \le 2\pi$.

THEOREM 10.14 Arc Length of a Polar Curve

Let f be a function whose derivative is continuous on an interval $\alpha \le \theta \le \beta$. The length of the graph of $r = f(\theta)$ from $\theta = \alpha$ to $\theta = \beta$ is

$$s = \int_{\alpha}^{\beta} \sqrt{[f(\theta)]^2 + [f'(\theta)]^2}\, d\theta = \int_{\alpha}^{\beta} \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2}\, d\theta.$$

EXAMPLE 4 Finding the Length of a Polar Curve

Find the length of the arc from $\theta = 0$ to $\theta = 2\pi$ for the cardioid

$$r = f(\theta) = 2 - 2\cos\theta$$

as shown in Figure 10.55.

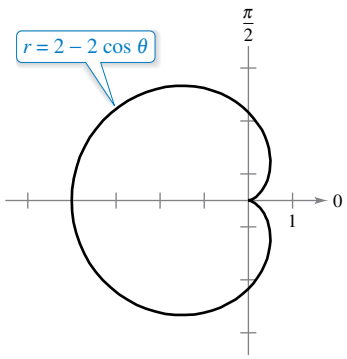

Figure 10.55

Solution Because $f'(\theta) = 2\sin\theta$, you can find the arc length as follows.

$$\begin{aligned}
s &= \int_{\alpha}^{\beta} \sqrt{[f(\theta)]^2 + [f'(\theta)]^2}\, d\theta && \text{Formula for arc length of a polar curve} \\
&= \int_{0}^{2\pi} \sqrt{(2 - 2\cos\theta)^2 + (2\sin\theta)^2}\, d\theta \\
&= 2\sqrt{2}\int_{0}^{2\pi} \sqrt{1 - \cos\theta}\, d\theta && \text{Simplify.} \\
&= 2\sqrt{2}\int_{0}^{2\pi} \sqrt{2\sin^2\frac{\theta}{2}}\, d\theta && \text{Trigonometric identity} \\
&= 4\int_{0}^{2\pi} \sin\frac{\theta}{2}\, d\theta && \sin\tfrac{\theta}{2} \ge 0 \text{ for } 0 \le \theta \le 2\pi \\
&= 8\left[-\cos\frac{\theta}{2}\right]_{0}^{2\pi} \\
&= 8(1 + 1) \\
&= 16
\end{aligned}$$

Using Figure 10.55, you can determine the reasonableness of this answer by comparing it with the circumference of a circle. For example, a circle of radius $\frac{5}{2}$ has a circumference of

$$5\pi \approx 15.7.$$

Note that in the fifth step of the solution, it is legitimate to write

$$\sqrt{2\sin^2\frac{\theta}{2}} = \sqrt{2}\sin\frac{\theta}{2}$$

rather than

$$\sqrt{2\sin^2\frac{\theta}{2}} = \sqrt{2}\left|\sin\frac{\theta}{2}\right|$$

because $\sin(\theta/2) \ge 0$ for $0 \le \theta \le 2\pi$.

Area of a Surface of Revolution

The polar coordinate versions of the formulas for the area of a surface of revolution can be obtained from the parametric versions given in Theorem 10.9, using the equations $x = r\cos\theta$ and $y = r\sin\theta$.

REMARK When using Theorem 10.15, check to see that the graph of $r = f(\theta)$ is traced only once on the interval $\alpha \le \theta \le \beta$. For example, the circle $r = \cos\theta$ is traced only once on the interval $0 \le \theta \le \pi$.

THEOREM 10.15 Area of a Surface of Revolution

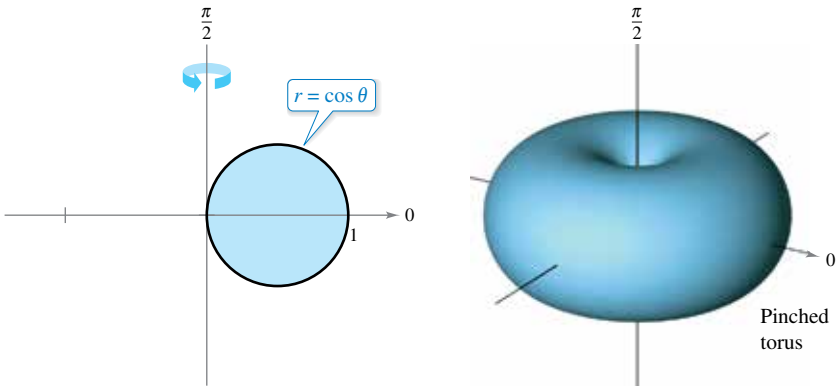
Let f be a function whose derivative is continuous on an interval $\alpha \le \theta \le \beta$. The area of the surface formed by revolving the graph of $r = f(\theta)$ from $\theta = \alpha$ to $\theta = \beta$ about the indicated line is as follows.

1. $S = 2\pi\int_{\alpha}^{\beta} f(\theta)\sin\theta\sqrt{[f(\theta)]^2 + [f'(\theta)]^2}\,d\theta$ About the polar axis

2. $S = 2\pi\int_{\alpha}^{\beta} f(\theta)\cos\theta\sqrt{[f(\theta)]^2 + [f'(\theta)]^2}\,d\theta$ About the line $\theta = \frac{\pi}{2}$

EXAMPLE 5 Finding the Area of a Surface of Revolution

Find the area of the surface formed by revolving the circle $r = f(\theta) = \cos\theta$ about the line $\theta = \pi/2$, as shown in Figure 10.56.



(a) (b)

Figure 10.56

Solution Use the second formula in Theorem 10.15 with $f'(\theta) = -\sin\theta$. Because the circle is traced once as θ increases from 0 to π, you have

$$S = 2\pi\int_{\alpha}^{\beta} f(\theta)\cos\theta\sqrt{[f(\theta)]^2 + [f'(\theta)]^2}\,d\theta$$ Formula for area of a surface of revolution

$$= 2\pi\int_{0}^{\pi} (\cos\theta)(\cos\theta)\sqrt{\cos^2\theta + \sin^2\theta}\,d\theta$$

$$= 2\pi\int_{0}^{\pi} \cos^2\theta\,d\theta$$ Trigonometric identity

$$= \pi\int_{0}^{\pi} (1 + \cos 2\theta)\,d\theta$$ Trigonometric identity

$$= \pi\left[\theta + \frac{\sin 2\theta}{2}\right]_0^{\pi}$$

$$= \pi^2.$$

10.5 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

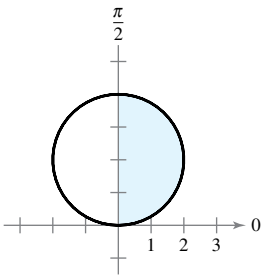
GO DIGITAL

Concept Check

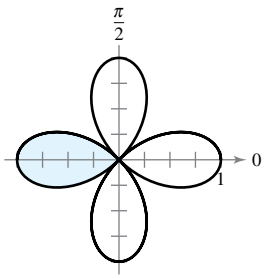
1. Give the conditions that must be true to apply Theorem 10.13 to find the area of the region bounded by the graph of $r = f(\theta)$.
2. Explain why finding points of intersection of polar graphs may require further analysis beyond solving two equations simultaneously.

Area of a Polar Region **In Exercises 3–6, write an integral that represents the area of the shaded region of the figure. Do not evaluate the integral.**

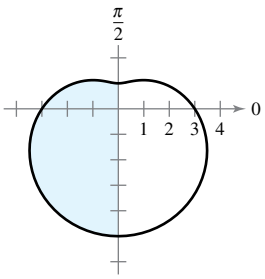
3. $r = 4 \sin \theta$



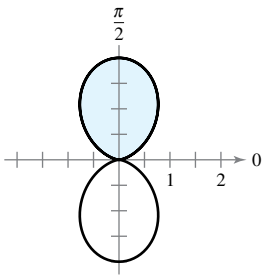
4. $r = \cos 2\theta$



5. $r = 3 - 2 \sin \theta$



6. $r = 1 - \cos 2\theta$



Finding the Area of a Polar Region **In Exercises 7–18, find the area of the region.**

7. Interior of $r = 6 \sin \theta$

8. Interior of $r = 3 \cos \theta$

9. One petal of $r = 2 \cos 3\theta$

10. Two petals of $r = 4 \sin 3\theta$

11. Two petals of $r = \sin 8\theta$

12. Three petals of $r = \cos 5\theta$

13. Interior of $r = 6 + 5 \sin \theta$ (below the polar axis)

14. Interior of $r = 9 - \sin \theta$ (above the polar axis)

15. Interior of $r = 4 + \sin \theta$

16. Interior of $r = 1 - \cos \theta$

17. Interior of $r^2 = 4 \cos 2\theta$

18. Interior of $r^2 = 6 \sin 2\theta$

Finding the Area of a Polar Region **In Exercises 19–26, use a graphing utility to graph the polar equation. Find the area of the given region analytically.**

19. Inner loop of $r = 1 + 2 \cos \theta$

20. Inner loop of $r = 2 - 4 \cos \theta$

21. Inner loop of $r = 1 + 2 \sin \theta$

22. Inner loop of $r = 4 - 6 \sin \theta$

23. Between the loops of $r = 1 + 2 \cos \theta$

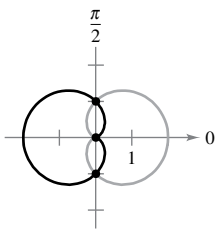
24. Between the loops of $r = 2(1 + 2 \sin \theta)$

25. Between the loops of $r = 3 - 6 \sin \theta$

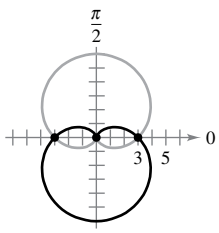
26. Between the loops of $r = \frac{1}{2} + \cos \theta$

Finding Points of Intersection **In Exercises 27–34, find the points of intersection of the graphs of the equations.**

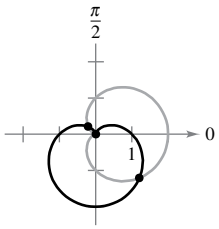
27. $r = 1 + \cos \theta$
$r = 1 - \cos \theta$



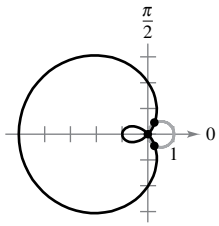
28. $r = 3(1 + \sin \theta)$
$r = 3(1 - \sin \theta)$



29. $r = 1 + \cos \theta$
$r = 1 - \sin \theta$



30. $r = 2 - 3 \cos \theta$
$r = \cos \theta$



31. $r = 4 - 5 \sin \theta$
$r = 3 \sin \theta$

32. $r = 3 + \sin \theta$
$r = 2 \csc \theta$

33. $r = \dfrac{\theta}{2}$
$r = 2$

34. $\theta = \dfrac{\pi}{4}$
$r = 2$

Writing **In Exercises 35 and 36, use a graphing utility to graph the polar equations and approximate the points of intersection of the graphs. Explain why the pole is not a point of intersection obtained by solving the equations simultaneously.**

35. $r = \cos \theta$
$r = 2 - 3 \sin \theta$

36. $r = 4 \sin \theta$
$r = 2(1 + \sin \theta)$

Finding the Area of a Polar Region Between Two Curves **In Exercises 37–44, use a graphing utility to graph the polar equations. Find the area of the given region analytically.**

37. Common interior of $r = 4 \sin 2\theta$ and $r = 2$

38. Common interior of $r = 2(1 + \cos\theta)$ and $r = 2(1 - \cos\theta)$

39. Common interior of $r = 3 - 2\sin\theta$ and $r = -3 + 2\sin\theta$

40. Common interior of $r = 5 - 3\sin\theta$ and $r = 5 - 3\cos\theta$

41. Common interior of $r = 4\sin\theta$ and $r = 2$

42. Common interior of $r = 2\cos\theta$ and $r = 2\sin\theta$

43. Inside $r = 2\cos\theta$ and outside $r = 1$

44. Inside $r = 3\sin\theta$ and outside $r = 1 + \sin\theta$

Finding the Area of a Polar Region Between Two Curves **In Exercises 45–48, find the area of the region.**

45. Inside $r = a(1 + \cos\theta)$ and outside $r = a\cos\theta$

46. Inside $r = 2a\cos\theta$ and outside $r = a$

47. Common interior of $r = a(1 + \cos\theta)$ and $r = a\sin\theta$

48. Common interior of $r = a\cos\theta$ and $r = a\sin\theta$, where $a > 0$

49. Antenna Radiation

The radiation from a transmitting antenna is not uniform in all directions. The intensity from a particular antenna is modeled by $r = a\cos^2\theta$.

(a) Convert the polar equation to rectangular form.

(b) Use a graphing utility to graph the model for $a = 4$ and $a = 6$.

(c) Find the area of the geographical region between the two curves in part (b).

50. Area The area inside one or more of the three interlocking circles $r = 2a\cos\theta$, $r = 2a\sin\theta$, and $r = a$ is divided into seven regions. Find the area of each region.

51. Conjecture Find the area of the region enclosed by

$$r = a\cos(n\theta)$$

for $n = 1, 2, 3, \ldots$. Use the results to make a conjecture about the area enclosed by the function when n is even and when n is odd.

52. Area Sketch the strophoid

$$r = \sec\theta - 2\cos\theta, \quad -\frac{\pi}{2} < \theta < \frac{\pi}{2}.$$

Convert this equation to rectangular coordinates. Find the area enclosed by the loop.

Finding the Arc Length of a Polar Curve **In Exercises 53–58, find the length of the curve over the given interval.**

53. $r = 8, \quad \left[0, \frac{\pi}{6}\right]$

54. $r = a, \quad [0, 2\pi]$

55. $r = 4\sin\theta, \quad [0, \pi]$

56. $r = 2a\cos\theta, \quad \left[-\frac{\pi}{4}, \frac{\pi}{4}\right]$

57. $r = 1 + \sin\theta, \quad [0, 2\pi]$

58. $r = 8(1 + \cos\theta), \quad \left[0, \frac{\pi}{3}\right]$

Finding the Arc Length of a Polar Curve **In Exercises 59–64, use a graphing utility to graph the polar equation over the given interval. Use the integration capabilities of the graphing utility to approximate the length of the curve.**

59. $r = 2\theta, \quad \left[0, \frac{\pi}{2}\right]$

60. $r = \sec\theta, \quad \left[0, \frac{\pi}{3}\right]$

61. $r = \frac{1}{\theta}, \quad [\pi, 2\pi]$

62. $r = e^{\theta}, \quad [0, \pi]$

63. $r = \sin(3\cos\theta), \quad [0, \pi]$

64. $r = 2\sin(2\cos\theta), \quad [0, \pi]$

Finding the Area of a Surface of Revolution **In Exercises 65–68, find the area of the surface formed by revolving the polar equation over the given interval about the given line.**

	Polar Equation	Interval	Axis of Revolution
65.	$r = 6\cos\theta$	$0 \le \theta \le \frac{\pi}{2}$	Polar axis
66.	$r = a\cos\theta$	$0 \le \theta \le \frac{\pi}{2}$	$\theta = \frac{\pi}{2}$
67.	$r = e^{a\theta}$	$0 \le \theta \le \frac{\pi}{2}$	$\theta = \frac{\pi}{2}$
68.	$r = a(1 + \cos\theta)$	$0 \le \theta \le \pi$	Polar axis

Finding the Area of a Surface of Revolution **In Exercises 69 and 70, use the integration capabilities of a graphing utility to approximate the area of the surface formed by revolving the polar equation over the given interval about the polar axis.**

69. $r = 4\cos 2\theta, \quad \left[0, \frac{\pi}{4}\right]$

70. $r = \theta, \quad [0, \pi]$

Exploring Concepts

In Exercises 71 and 72, (a) sketch the graph of the polar equation, (b) determine the interval that traces the graph only once, (c) find the area of the region bounded by the graph using a geometric formula, and (d) find the area of the region bounded by the graph using integration.

71. $r = 10\cos\theta$

72. $r = 5\sin\theta$

73. Let $f(\theta) > 0$ for all θ and let $g(\theta) < 0$ for all θ. Find polar equations $r = f(\theta)$ and $r = g(\theta)$ such that their graphs intersect.

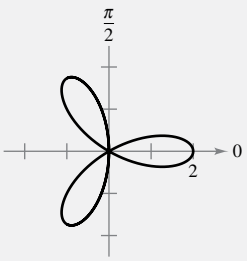
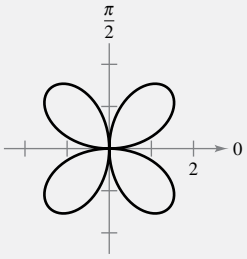
74. HOW DO YOU SEE IT? Which graph, traced out only once, has a larger arc length? Explain your reasoning.

(a)



(b)



75. Surface Area of a Torus Find the surface area of the torus generated by revolving the circle given by $r = 2$ about the line $r = 5 \sec \theta$.

76. Surface Area of a Torus Find the surface area of the torus generated by revolving the circle given by $r = a$ about the line $r = b \sec \theta$, where $0 < a < b$.

77. Approximating Area Consider the circle

$r = 8 \cos \theta$.

(a) Find the area of the circle.

(b) Complete the table for the areas A of the sectors of the circle between $\theta = 0$ and the values of θ in the table.

θ	0.2	0.4	0.6	0.8	1.0	1.2	1.4
A							

(c) Use the table in part (b) to approximate the values of θ for which the sector of the circle composes $\frac{1}{4}$, $\frac{1}{2}$, and $\frac{3}{4}$ of the total area of the circle.

(d) Use a graphing utility to approximate, to two decimal places, the angles θ for which the sector of the circle composes $\frac{1}{4}$, $\frac{1}{2}$, and $\frac{3}{4}$ of the total area of the circle.

(e) Do the results of part (d) depend on the radius of the circle? Explain.

78. Approximating Area Consider the circle

$r = 3 \sin \theta$.

(a) Find the area of the circle.

(b) Complete the table for the areas A of the sectors of the circle between $\theta = 0$ and the values of θ in the table.

θ	0.2	0.4	0.6	0.8	1.0	1.2	1.4
A							

(c) Use the table in part (b) to approximate the values of θ for which the sector of the circle composes $\frac{1}{8}$, $\frac{1}{4}$, and $\frac{1}{2}$ of the total area of the circle.

(d) Use a graphing utility to approximate, to two decimal places, the angles θ for which the sector of the circle composes $\frac{1}{8}$, $\frac{1}{4}$, and $\frac{1}{2}$ of the total area of the circle.

79. Spiral of Archimedes The curve represented by the equation $r = a\theta$, where a is a constant, is called the **spiral of Archimedes.**

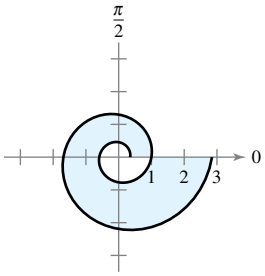
(a) Use a graphing utility to graph $r = \theta$, where $\theta \geq 0$. What happens to the graph of $r = a\theta$ as a increases? What happens if $\theta \leq 0$?

(b) Determine the points on the spiral $r = a\theta$ $(a > 0, \theta \geq 0)$, where the curve crosses the polar axis.

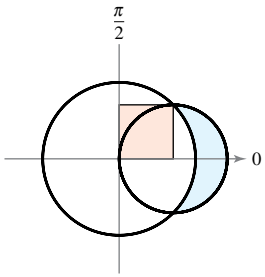
(c) Find the length of $r = \theta$ over the interval $0 \leq \theta \leq 2\pi$.

(d) Find the area under the curve $r = \theta$ for $0 \leq \theta \leq 2\pi$.

80. Logarithmic Spiral The curve represented by the equation $r = ae^{b\theta}$, where a and b are constants, is called a **logarithmic spiral.** The figure shows the graph of $r = e^{\theta/6}$, $-2\pi \leq \theta \leq 2\pi$. Find the area of the shaded region.



81. Area The larger circle in the figure is the graph of $r = 1$. Find the polar equation of the smaller circle such that the shaded regions are equal.



82. Area Find the area of the circle given by

$r = \sin \theta + \cos \theta$.

Check your result by converting the polar equation to rectangular form, then using the formula for the area of a circle.

83. Folium of Descartes A curve called the **folium of Descartes** can be represented by the parametric equations

$$x = \frac{3t}{1 + t^3} \quad \text{and} \quad y = \frac{3t^2}{1 + t^3}.$$

(a) Convert the parametric equations to polar form.

(b) Sketch the graph of the polar equation from part (a).

(c) Use a graphing utility to approximate the area enclosed by the loop of the curve.

84. Arc Length in Polar Form Use the formula for the arc length of a curve in parametric form to derive the formula for the arc length of a polar curve.

10.6 Polar Equations of Conics and Kepler's Laws

GO DIGITAL

- **Analyze and write polar equations of conics.**
- **Describe Kepler's Laws of planetary motion.**

Exploration

Graphing Conics Set a graphing utility to *polar* mode and enter polar equations of the form

$$r = \frac{a}{1 \pm b \cos \theta}$$

or

$$r = \frac{a}{1 \pm b \sin \theta}.$$

As long as $a \neq 0$, the graph should be a conic. What values of a and b produce parabolas? What values produce ellipses? What values produce hyperbolas?

Polar Equations of Conics

In this chapter, you have learned that the rectangular equations of ellipses and hyperbolas take simple forms when the origin lies at their *centers*. As it happens, there are many important applications of conics in which it is more convenient to use one of the foci as the reference point (the origin) for the coordinate system. Here are two examples.

1. The sun lies at a focus of Earth's orbit.
2. The light source of a parabolic reflector lies at its focus.

In this section, you will learn that the polar equations of conics take simpler forms when one of the foci lies at the pole.

The next theorem uses the concept of *eccentricity*, as defined in Section 10.1, to classify the three basic types of conics.

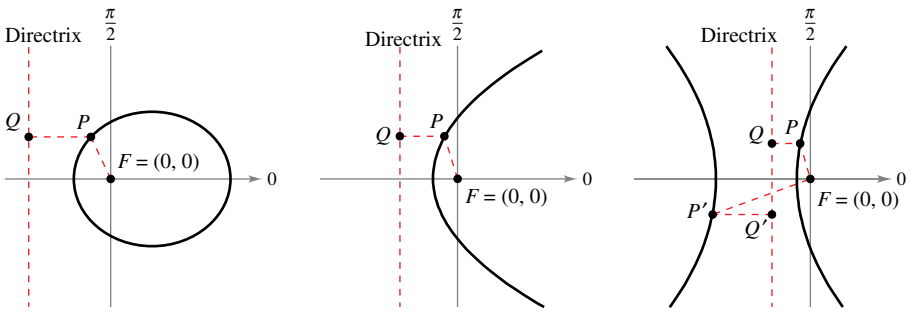
THEOREM 10.16 Classification of Conics by Eccentricity

Let F be a fixed point (*focus*) and let D be a fixed line (*directrix*) in the plane. Let P be another point in the plane and let e (*eccentricity*) be the ratio of the distance between P and F to the distance between P and D. The collection of all points P with a given eccentricity is a conic.

1. The conic is an ellipse for $0 < e < 1$.
2. The conic is a parabola for $e = 1$.
3. The conic is a hyperbola for $e > 1$.

A proof of this theorem is given in Appendix A.

In Figure 10.57, note that for each type of conic, the pole corresponds to the fixed point (focus) given in the definition.



Ellipse: $0 < e < 1$

$\frac{PF}{PQ} < 1$

Parabola: $e = 1$

$PF = PQ$

Hyperbola: $e > 1$

$\frac{PF}{PQ} = \frac{P'F}{P'Q'} > 1$

Figure 10.57

The benefit of locating a focus of a conic at the pole is that the equation of the conic becomes simpler, as shown in the proof of the next theorem.

GO DIGITAL

THEOREM 10.17 Polar Equations of Conics

The graph of a polar equation of the form

$$r = \frac{ed}{1 \pm e\cos\theta} \quad \text{or} \quad r = \frac{ed}{1 \pm e\sin\theta}$$

is a conic, where $e > 0$ is the eccentricity and $|d|$ is the distance between the focus at the pole and its corresponding directrix.

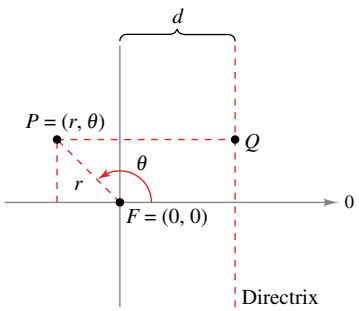

Figure 10.58

Proof This is a proof for $r = ed/(1 + e\cos\theta)$ with $d > 0$. In Figure 10.58, consider a vertical directrix d units to the right of the focus $F = (0, 0)$. If $P = (r, \theta)$ is a point on the graph of $r = ed/(1 + e\cos\theta)$, then the distance between P and the directrix can be shown to be

$$PQ = |d - x| = |d - r\cos\theta| = \left|\frac{r(1 + e\cos\theta)}{e} - r\cos\theta\right| = \left|\frac{r}{e}\right|.$$

Because the distance between P and the pole is simply $PF = |r|$, the ratio of PF to PQ is

$$\frac{PF}{PQ} = \frac{|r|}{|r/e|} = |e| = e$$

and, by Theorem 10.16, the graph of the equation must be a conic. The proofs of the other cases are similar. ∎

The four types of equations indicated in Theorem 10.17 can be classified as shown below, where $d > 0$.

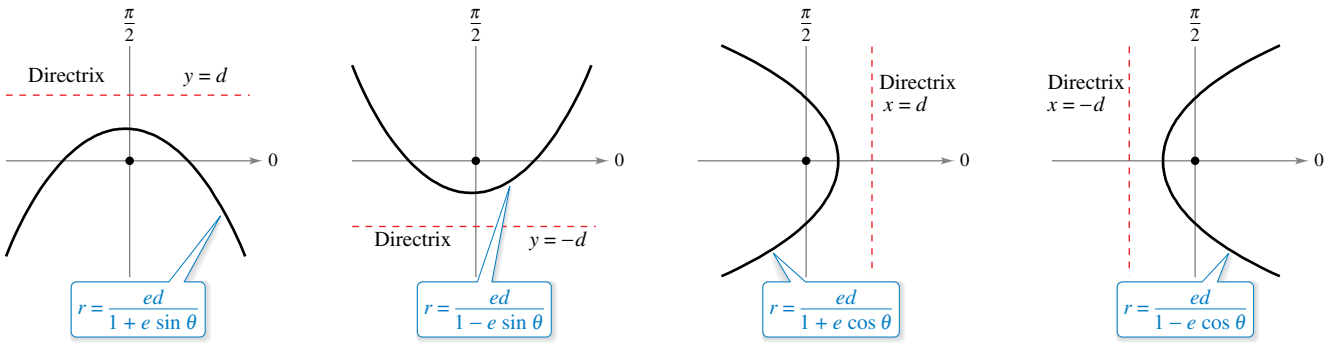
a. Horizontal directrix above the pole: $r = \dfrac{ed}{1 + e\sin\theta}$

b. Horizontal directrix below the pole: $r = \dfrac{ed}{1 - e\sin\theta}$

c. Vertical directrix to the right of the pole: $r = \dfrac{ed}{1 + e\cos\theta}$

d. Vertical directrix to the left of the pole: $r = \dfrac{ed}{1 - e\cos\theta}$

Figure 10.59 illustrates these four possibilities for a parabola. Note that for convenience, the equation for the directrix is shown in rectangular form.



(a) **(b)** **(c)** **(d)**

The four types of polar equations for a parabola

Figure 10.59

EXAMPLE 1 Determining a Conic from Its Equation

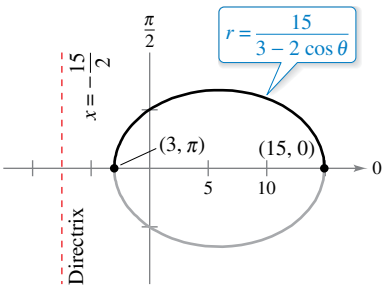
Sketch the graph of the conic $r = \dfrac{15}{3 - 2\cos\theta}$.

Solution To determine the type of conic, rewrite the equation as

$$r = \frac{15}{3 - 2\cos\theta} \qquad \text{Write original equation.}$$

$$= \frac{5}{1 - (2/3)\cos\theta}. \qquad \text{Divide numerator and denominator by 3.}$$

So, the graph is an ellipse with $e = \frac{2}{3}$. You can sketch the upper half of the ellipse by plotting points from $\theta = 0$ to $\theta = \pi$, as shown in Figure 10.60. Then, using symmetry with respect to the polar axis, you can sketch the lower half. ■



The graph of the conic is an ellipse with $e = \frac{2}{3}$.
Figure 10.60

For the ellipse in Figure 10.60, the major axis is horizontal and the vertices lie at $(15, 0)$ and $(3, \pi)$. So, the length of the *major* axis is $2a = 18$. To find the length of the minor axis, use the equations $e = c/a$ and $b^2 = a^2 - c^2$ to conclude that

$$b^2 = a^2 - c^2 = a^2 - (ea)^2 = a^2(1 - e^2). \qquad \text{Ellipse}$$

Because $e = \frac{2}{3}$, you have

$$b^2 = 9^2\left[1 - \left(\frac{2}{3}\right)^2\right] = 45$$

which implies that $b = \sqrt{45} = 3\sqrt{5}$. So, the length of the minor axis is $2b = 6\sqrt{5}$. A similar analysis for hyperbolas yields

$$b^2 = c^2 - a^2 = (ea)^2 - a^2 = a^2(e^2 - 1). \qquad \text{Hyperbola}$$

EXAMPLE 2 Sketching a Conic from Its Polar Equation

See LarsonCalculus.com for an interactive version of this type of example.

Sketch the graph of the polar equation $r = \dfrac{32}{3 + 5\sin\theta}$.

Solution Dividing the numerator and denominator by 3 produces

$$r = \frac{32/3}{1 + (5/3)\sin\theta}.$$

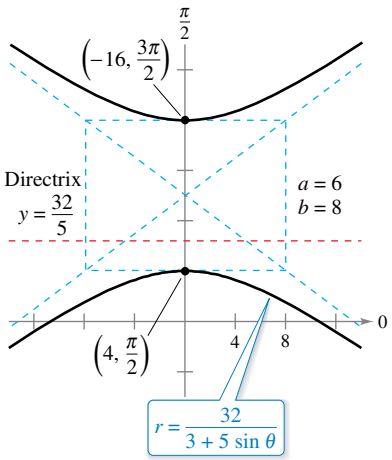
Because $e = \frac{5}{3} > 1$, the graph is a hyperbola. Because $d = \frac{32}{5}$, the directrix is the line $y = \frac{32}{5}$. The transverse axis of the hyperbola lies on the line $\theta = \pi/2$, and the vertices occur at

$$(r, \theta) = \left(4, \frac{\pi}{2}\right) \quad \text{and} \quad (r, \theta) = \left(-16, \frac{3\pi}{2}\right).$$

The length of the transverse axis is 12, so $a = 6$. To find b, write

$$b^2 = a^2(e^2 - 1) = 6^2\left[\left(\frac{5}{3}\right)^2 - 1\right] = 64.$$

So, $b = 8$. Finally, you can use a and b to determine the asymptotes of the hyperbola and obtain the sketch shown in Figure 10.61. ■



The graph of the conic is a hyperbola with $e = \frac{5}{3}$.

JOHANNES KEPLER (1571–1630)

Kepler formulated his three laws from the extensive data recorded by Danish astronomer Tycho Brahe and from direct observation of the orbit of Mars.

See LarsonCalculus.com to read more of this biography.

Kepler's Laws

Kepler's Laws, named after the German astronomer Johannes Kepler, can be used to describe the orbits of the planets about the sun.

1. Each planet moves in an elliptical orbit with the sun as a focus.
2. A ray from the sun to the planet sweeps out equal areas of the ellipse in equal times.
3. The square of the period is proportional to the cube of the mean distance between the planet and the sun.*

Although Kepler derived these laws empirically, they were later validated by Newton. In fact, Newton was able to show that each law can be deduced from a set of universal laws of motion and gravitation that govern the movement of all heavenly bodies, including comets and satellites. This is shown in the next example, involving the comet named after the English mathematician and physicist Edmund Halley (1656–1742).

EXAMPLE 3 Halley's Comet

Halley's comet has an elliptical orbit with the sun at one focus and has an eccentricity of $e \approx 0.967$. The length of the major axis of the orbit is approximately 35.88 astronomical units (AU). (An astronomical unit is defined as the mean distance between Earth and the sun, which is 93 million miles.) Find a polar equation for the orbit. How close does Halley's comet come to the sun?

Solution Using a vertical axis, you can choose an equation of the form

$$r = \frac{ed}{1 + e \sin\theta}.$$

Because the vertices of the ellipse occur when $\theta = \pi/2$ and $\theta = 3\pi/2$, you can determine the length of the major axis to be the sum of the r-values of the vertices, as shown in Figure 10.62. That is,

$$2a = \frac{0.967d}{1 + 0.967} + \frac{0.967d}{1 - 0.967}$$

$$35.88 \approx 29.79d. \qquad 2a \approx 35.88$$

So, $d \approx 1.204$ and

$$ed \approx (0.967)(1.204) \approx 1.164.$$

Using this value in the equation produces

$$r = \frac{1.164}{1 + 0.967 \sin\theta}$$

where r is measured in astronomical units. To find the closest point to the sun (the focus), you can write

$$c = ea \approx (0.967)(17.94) \approx 17.35.$$

Because c is the distance between the focus and the center, the closest point is

$$\begin{aligned} a - c &\approx 17.94 - 17.35 \\ &= 0.59 \text{ AU} \\ &\approx 55{,}000{,}000 \text{ miles}. \end{aligned}$$

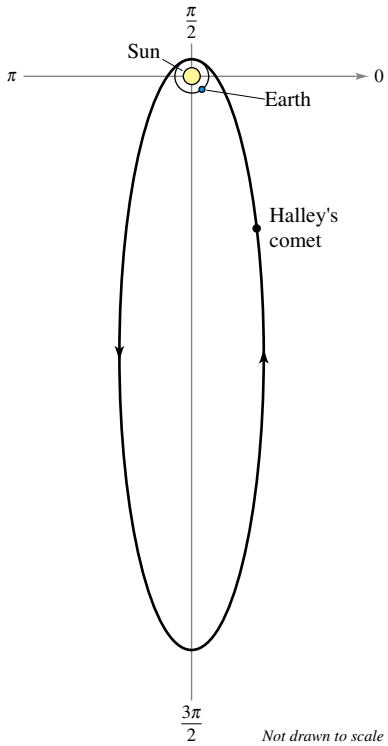

Figure 10.62

* If Earth is used as a reference with a period of 1 year and a distance of 1 astronomical unit, then the proportionality constant is 1. For example, because Mars has a mean distance to the sun of $D \approx 1.524$ AU, its period P is $D^3 = P^2$. So, the period for Mars is $P \approx 1.88$ years.

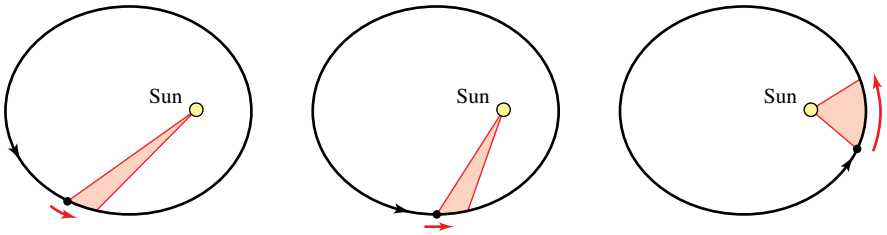
Kepler's Second Law states that as a planet moves about the sun, a ray from the sun to the planet sweeps out equal areas in equal times. This law can also be applied to comets or asteroids with elliptical orbits. For example, Figure 10.63 shows the orbit of the asteroid Apollo about the sun. Applying Kepler's Second Law to this asteroid, you know that the closer it is to the sun, the greater its velocity, because a short ray must be moving quickly to sweep out as much area as a long ray.



A ray from the sun to the asteroid Apollo sweeps out equal areas in equal times.
Figure 10.63

EXAMPLE 4 The Asteroid Apollo

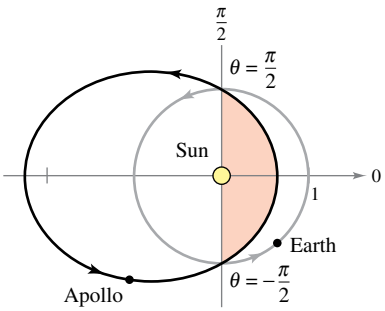


Figure 10.64

The asteroid Apollo has a period of about 661 Earth days, and its orbit is approximated by the ellipse

$$r = \frac{1}{1 + (5/9)\cos\theta} = \frac{9}{9 + 5\cos\theta}$$

where r is measured in astronomical units. How long does it take Apollo to move from the position $\theta = -\pi/2$ to $\theta = \pi/2$, as shown in Figure 10.64?

Solution Begin by finding the area swept out as θ increases from $-\pi/2$ to $\pi/2$.

$$A = \frac{1}{2}\int_{\alpha}^{\beta} r^2\, d\theta \qquad \text{Formula for area of a polar graph}$$

$$= \frac{1}{2}\int_{-\pi/2}^{\pi/2} \left(\frac{9}{9 + 5\cos\theta}\right)^2 d\theta$$

Using the substitution $u = \tan(\theta/2)$, as discussed in Section 8.7, you obtain

$$A = \frac{81}{112}\left[\frac{-5\sin\theta}{9 + 5\cos\theta} + \frac{18}{\sqrt{56}}\arctan\frac{\sqrt{56}\tan(\theta/2)}{14}\right]_{-\pi/2}^{\pi/2} \approx 0.90429.$$

Because the major axis of the ellipse has length $2a = 81/28$ and the eccentricity is $e = 5/9$, you can determine that

$$b = a\sqrt{1 - e^2} = \frac{9}{\sqrt{56}}.$$

So, the area of the ellipse is

$$\text{Area of ellipse} = \pi ab = \pi\left(\frac{81}{56}\right)\left(\frac{9}{\sqrt{56}}\right) \approx 5.46507.$$

Because the time required to complete the orbit is 661 days, you can apply Kepler's Second Law to conclude that the time t required to move from the position $\theta = -\pi/2$ to $\theta = \pi/2$ is

$$\frac{t}{661} = \frac{\text{area of elliptical segment}}{\text{area of ellipse}} \approx \frac{0.90429}{5.46507}$$

which implies that $t \approx 109$ days.

10.6 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Identify each conic using eccentricity.

(a) $r = \dfrac{4}{1 + 3\sin\theta}$ (b) $r = \dfrac{7}{1 - \cos\theta}$

(c) $r = \dfrac{8}{6 + 5\cos\theta}$ (d) $r = \dfrac{3}{2 - 3\sin\theta}$

2. Without graphing, how are the graphs of the following conics different? Explain.

$r = \dfrac{1}{1 + \sin\theta}$ and $r = \dfrac{1}{1 - \sin\theta}$

Graphing a Conic **In Exercises 3 and 4, use a graphing utility to graph the polar equation when (a) $e = 1$, (b) $e = 0.5$, and (c) $e = 1.5$. Identify the conic.**

3. $r = \dfrac{2e}{1 + e\cos\theta}$

4. $r = \dfrac{2e}{1 - e\sin\theta}$

Writing **In Exercises 5 and 6, consider the polar equation**

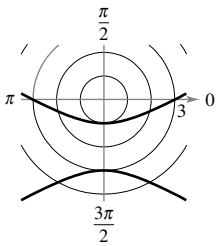
$$r = \frac{4}{1 + e\sin\theta}.$$

5. Use a graphing utility to graph the equation for $e = 0.1$, $e = 0.25$, $e = 0.5$, $e = 0.75$, and $e = 0.9$. Identify the conic and discuss the change in its shape as $e \to 1^-$ and $e \to 0^+$.

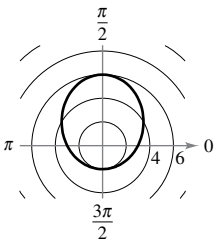
6. Use a graphing utility to graph the equation for $e = 1.1$, $e = 1.5$, and $e = 2$. Identify the conic and discuss the change in its shape as $e \to 1^+$ and $e \to \infty$.

Matching **In Exercises 7–12, match the polar equation with its correct graph. [The graphs are labeled (a), (b), (c), (d), (e), and (f).]**

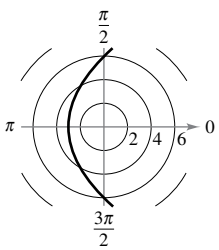
(a)



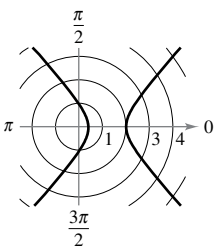
(b)



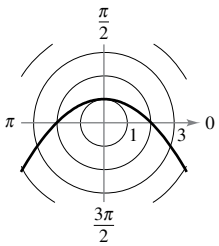
(c)



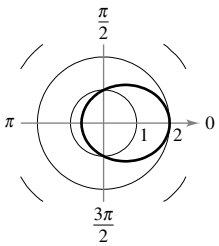
(d)



(e)



(f)



7. $r = \dfrac{6}{1 - \cos\theta}$

8. $r = \dfrac{2}{2 - \cos\theta}$

9. $r = \dfrac{3}{1 - 2\sin\theta}$

10. $r = \dfrac{2}{1 + \sin\theta}$

11. $r = \dfrac{6}{2 - \sin\theta}$

12. $r = \dfrac{2}{2 + 3\cos\theta}$

Identifying and Sketching a Conic **In Exercises 13–22, find the eccentricity and the distance from the pole to the directrix of the conic. Then identify the conic and sketch its graph. Use a graphing utility to confirm your results.**

13. $r = \dfrac{1}{1 - \cos\theta}$

14. $r = \dfrac{5}{5 - 3\cos\theta}$

15. $r = \dfrac{7}{4 + 8\sin\theta}$

16. $r = \dfrac{4}{1 + \cos\theta}$

17. $r = \dfrac{6}{-2 + 3\cos\theta}$

18. $r = \dfrac{10}{5 + 4\sin\theta}$

19. $r = \dfrac{6}{2 + \cos\theta}$

20. $r = \dfrac{-6}{3 + 7\sin\theta}$

21. $r = \dfrac{300}{-12 + 6\sin\theta}$

22. $r = \dfrac{24}{25 + 25\cos\theta}$

Identifying a Conic **In Exercises 23–26, use a graphing utility to graph the polar equation. Identify the graph and find its eccentricity.**

23. $r = \dfrac{3}{-4 + 2\sin\theta}$

24. $r = \dfrac{-15}{2 + 8\sin\theta}$

25. $r = \dfrac{-10}{1 - \cos\theta}$

26. $r = \dfrac{6}{6 + 7\cos\theta}$

Comparing Graphs **In Exercises 27–30, use a graphing utility to graph the conic. Describe how the graph differs from the graph in the indicated exercise.**

27. $r = \dfrac{4}{1 + \cos(\theta - \pi/3)}$ (See Exercise 16.)

28. $r = \dfrac{10}{5 + 4\sin(\theta - \pi/4)}$ (See Exercise 18.)

29. $r = \dfrac{6}{2 + \cos(\theta + \pi/6)}$ (See Exercise 19.)

30. $r = \dfrac{-6}{3 + 7\sin(\theta + 2\pi/3)}$ (See Exercise 20.)

31. Rotated Ellipse Write the equation for the ellipse rotated $\pi/6$ radian clockwise from the ellipse

$$r = \frac{8}{8 + 5\cos\theta}.$$

32. Rotated Parabola Write the equation for the parabola rotated $\pi/4$ radian counterclockwise from the parabola

$$r = \frac{9}{1 + \sin\theta}.$$

Finding a Polar Equation **In Exercises 33–38, find a polar equation for the conic with its focus at the pole and the given eccentricity and directrix. (For convenience, the equation for the directrix is given in rectangular form.)**

Conic	Eccentricity	Directrix
33. Parabola	$e = 1$	$x = -3$
34. Parabola	$e = 1$	$y = 4$
35. Ellipse	$e = \frac{1}{4}$	$y = 1$
36. Ellipse	$e = \frac{5}{6}$	$y = -2$
37. Hyperbola	$e = \frac{4}{3}$	$x = 2$
38. Hyperbola	$e = \frac{3}{2}$	$x = -1$

Finding a Polar Equation **In Exercises 39–44, find a polar equation for the conic with its focus at the pole and the given vertex or vertices.**

Conic	Vertex or Vertices
39. Parabola	$\left(1, -\frac{\pi}{2}\right)$
40. Parabola	$(5, \pi)$
41. Ellipse	$(2, 0), \quad (8, \pi)$
42. Ellipse	$\left(2, \frac{\pi}{2}\right), \quad \left(4, \frac{3\pi}{2}\right)$
43. Hyperbola	$\left(1, \frac{3\pi}{2}\right), \quad \left(9, \frac{3\pi}{2}\right)$
44. Hyperbola	$(2, 0), \quad (10, 0)$

Exploring Concepts

45. Consider two ellipses, where the foci of the first ellipse are farther apart than the foci of the second ellipse. Is the eccentricity of the first ellipse always greater than the eccentricity of the second ellipse? Explain.

46. Describe what happens to the distance between the directrix and the center of an ellipse when the foci remain fixed and e approaches 0.

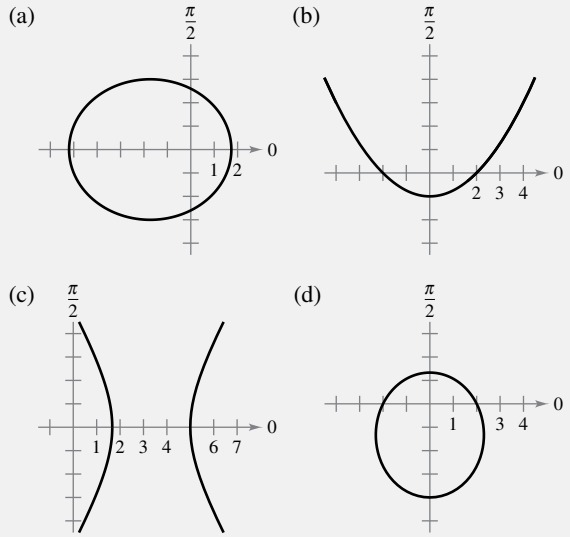
47. Finding a Polar Equation Find a polar equation for the ellipse with the following characteristics.

Focus: $(0, 0)$

Eccentricity: $e = \frac{1}{2}$

Directrix: $r = 4 \sec\theta$

48. HOW DO YOU SEE IT? Identify the conic in the graph and give the possible values for the eccentricity.



49. Ellipse Show that the polar equation for $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ is

$$r^2 = \frac{b^2}{1 - e^2\cos^2\theta}.$$ Ellipse

50. Hyperbola Show that the polar equation for $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ is

$$r^2 = \frac{-b^2}{1 - e^2\cos^2\theta}.$$ Hyperbola

Finding a Polar Equation **In Exercises 51–54, use the results of Exercises 49 and 50 to write the polar form of the equation of the conic.**

51. Ellipse: focus at $(4, 0)$; vertices at $(5, 0)$, $(5, \pi)$

52. Hyperbola: focus at $(5, 0)$; vertices at $(4, 0)$, $(4, \pi)$

53. $\frac{x^2}{9} - \frac{y^2}{16} = 1$

54. $\frac{x^2}{4} + y^2 = 1$

Area of a Region **In Exercises 55–58, use the integration capabilities of a graphing utility to approximate the area of the region bounded by the graph of the polar equation.**

55. $r = \frac{3}{2 - \cos\theta}$

56. $r = \frac{9}{4 + \cos\theta}$

57. $r = \frac{2}{7 - 6\sin\theta}$

58. $r = \frac{3}{6 + 5\sin\theta}$

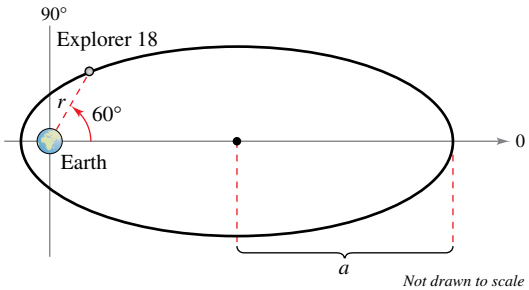
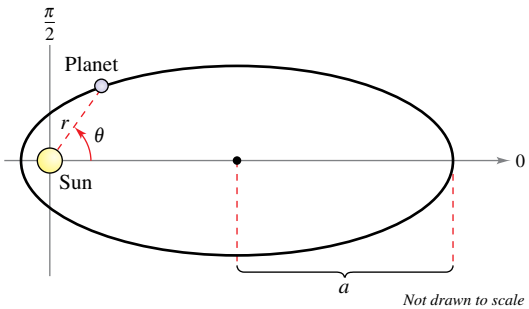
59. Explorer 18 On November 27, 1963, the United States launched Explorer 18. Its low and high points above the surface of Earth were approximately 119 miles and 123,000 miles (see figure). The center of Earth is a focus of the orbit. Find the polar equation for the orbit and find the distance between the surface of Earth and the satellite when $\theta = 60°$. (Assume that the radius of Earth is 4000 miles.)



60. Planetary Motion The planets travel in elliptical orbits with the sun as a focus, as shown in the figure.



(a) Show that the polar equation of the orbit is given by

$$r = \frac{(1 - e^2)a}{1 - e\cos\theta}$$

where e is the eccentricity.

(b) Show that the minimum distance (*perihelion*) from the sun to the planet is $r = a(1 - e)$ and the maximum distance (*aphelion*) is $r = a(1 + e)$.

Planetary Motion **In Exercises 61–64, use Exercise 60 to find the polar equation of the elliptical orbit of the planet and the perihelion and aphelion distances.**

61. Earth

$a = 1.496 \times 10^8$ kilometers

$e = 0.0167$

62. Saturn

$a = 1.434 \times 10^9$ kilometers

$e = 0.0565$

63. Neptune

$a = 4.495 \times 10^9$ kilometers

$e = 0.0113$

64. Mercury

$a = 5.791 \times 10^7$ kilometers

$e = 0.2056$

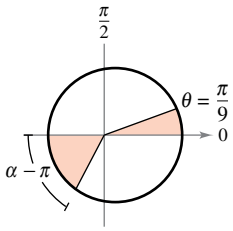
NASA images/Shutterstock.com

65. Planetary Motion

In Exercise 63, the polar equation for the elliptical orbit of Neptune was found. Use the equation and a graphing utility to perform each of the following.

(a) Approximate the area swept out by a ray from the sun to the planet as θ increases from 0 to $\pi/9$. Use this result to determine the number of years required for the planet to move through this arc when the period of one revolution around the sun is 165 years.

(b) By trial and error, approximate the angle α such that the area swept out by a ray from the sun to the planet as θ increases from π to α equals the area found in part (a) (see figure). Does the ray sweep through a larger or smaller angle than in part (a) to generate the same area? Why is this the case?



(c) Approximate the distances the planet traveled in parts (a) and (b). Use these distances to approximate the average number of kilometers per year the planet traveled in the two cases.

66. Comet Hale-Bopp The comet Hale-Bopp has an elliptical orbit with the sun at one focus and has an eccentricity of $e \approx 0.995$. The length of the major axis of the orbit is approximately 500 astronomical units. (a) Find the length of its minor axis. (b) Find a polar equation for the orbit. (c) Find the perihelion and aphelion distances.

Eccentricity **In Exercises 67 and 68, let r_0 represent the distance from a focus to the nearest vertex, and let r_1 represent the distance from the focus to the farthest vertex.**

67. Show that the eccentricity of an ellipse can be written as

$$e = \frac{r_1 - r_0}{r_1 + r_0}.$$

Then show that $\dfrac{r_1}{r_0} = \dfrac{1 + e}{1 - e}$.

68. Show that the eccentricity of a hyperbola can be written as

$$e = \frac{r_1 + r_0}{r_1 - r_0}.$$

Then show that $\dfrac{r_1}{r_0} = \dfrac{e + 1}{e - 1}$.

Exploring Concepts

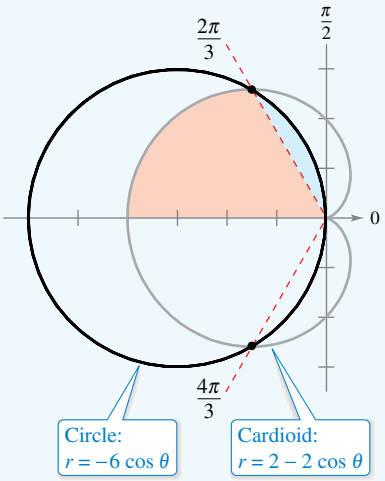
Some of the topics in this chapter, conics, parametric equations, and polar coordinates, are ones you may have studied in precalculus. Using calculus concepts with these topics gives you flexibility in solving many problems. For instance, here are two ways to find the area of the region common to the two regions bounded by the curves

$$r = -6\cos\theta \quad \text{and} \quad r = 2 - 2\cos\theta$$

shown in the figure. The first integral gives the area in polar coordinates and the second integral gives the area in rectangular coordinates. Clearly, the first integral is easier to evaluate than the second one.

$$\frac{1}{2}\int_{\pi/2}^{2\pi/3} (-6\cos\theta)^2\,d\theta + \frac{1}{2}\int_{2\pi/3}^{\pi} (2 - 2\cos\theta)^2\,d\theta \qquad \text{Polar}$$

$$\int_{-4}^{-3/2} \sqrt{2\sqrt{1-2x} - x^2 - 2x + 2}\,dx + \int_{-3/2}^{0} \sqrt{-x^2 - 6x}\,dx \qquad \text{Rectangular}$$



In addition to area, there are many other applications where conics, parametric equations, and polar coordinates are useful, such as projectile motion, arc length, and planetary motion.

1. Use a sketch to illustrate the reflective property of an ellipse.

2. (a) Describe the curve given by the parametric equations $x = 4\sin t$ and $y = 4\cos t$.

(b) How does the curve given by the parametric equations

$$x = 7 + 4\sin t \quad \text{and} \quad y = -2 + 4\cos t$$

differ from the curve in part (a)?

(c) How does the curve given by the parametric equations

$$x = 4\cos t \quad \text{and} \quad y = 4\sin t$$

differ from the curve in part (a)?

3. Find a set of parametric equations $x = f(t)$ and $y = g(t)$ such that

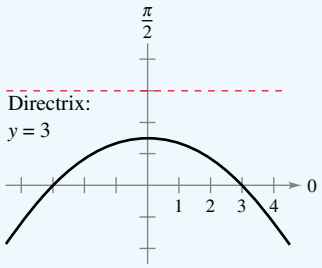
$$\frac{dx}{dt} > 0 \quad \text{and} \quad \frac{dy}{dt} < 0$$

for all real numbers t. Then sketch a graph of the curve.

4. (a) Explain how to find the polar coordinates of a point (x, y) given in rectangular coordinates. Are the polar coordinates unique?

(b) Explain how to find the rectangular coordinates of a point (r, θ) given in polar coordinates. Are the rectangular coordinates unique?

5. The figure shows the graph of $r = 3/(1 + \sin\theta)$.



Explain how the graph of each conic in parts (a)–(d) differs from the one shown above.

(a) $r = \dfrac{3}{1 - \cos\theta}$ (b) $r = \dfrac{3}{1 - \sin\theta}$

(c) $r = \dfrac{3}{1 + \cos\theta}$ (d) $r = \dfrac{3}{1 - \sin(\theta - \pi/4)}$

6. Describe the graph of each polar equation.

(a) $r = 7$ (b) $r^2 = 7$

(c) $r = \dfrac{7}{\cos\theta}$ (d) $r = \dfrac{7}{\sin\theta}$

(e) $r = 7\cos\theta$ (f) $r = 7\sin\theta$

Identifying a Conic **In Exercises 7–14, identify the conic, analyze the equation (center, radius, vertices, foci, eccentricity, directrix, and asymptotes, if possible), and sketch its graph. Use a graphing utility to confirm your results.**

7. $x^2 + y^2 - 2x - 8y - 8 = 0$

8. $y^2 - 12y - 8x + 20 = 0$

9. $3x^2 - 2y^2 + 24x + 12y + 24 = 0$

10. $5x^2 + y^2 - 20x + 19 = 0$

11. $16x^2 + 16y^2 - 16x + 24y - 3 = 0$

12. $-4x^2 + 3y^2 - 16x - 18y + 10 = 0$

13. $x^2 + 10x - 12y + 13 = 0$

14. $9x^2 + 25y^2 + 18x - 100y - 116 = 0$

Finding the Standard Equation of a Parabola **In Exercises 15 and 16, find the standard form of the equation of the parabola with the given characteristics.**

15. Vertex: $(7, 0)$
Directrix: $x = 5$

16. Vertex: $(2, 6)$
Focus: $(2, 4)$

Finding the Standard Equation of an Ellipse **In Exercises 17–20, find the standard form of the equation of the ellipse with the given characteristics.**

17. Center: $(0, 1)$
Focus: $(4, 1)$
Vertex: $(6, 1)$

18. Center: $(0, 0)$
Major axis: vertical
Points on the ellipse: $(1, 2)$, $(2, 0)$

19. Vertices: $(3, 1)$, $(3, 7)$
Eccentricity: $\frac{2}{3}$

20. Foci: $(0, \pm 7)$
Major axis length: 20

Finding the Standard Equation of a Hyperbola **In Exercises 21–24, find the standard form of the equation of the hyperbola with the given characteristics.**

21. Vertices: $(0, \pm 8)$
Asymptotes: $y = \pm 2x$

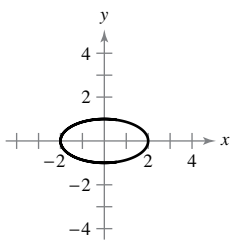
22. Vertices: $(\pm 2, 0)$
Asymptotes: $y = \pm 32x$

23. Vertices: $(\pm 7, -1)$
Foci: $(\pm 9, -1)$

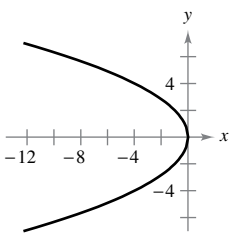
24. Center: $(0, 0)$
Vertex: $(0, 3)$
Focus: $(0, 6)$

Finding a Standard Equation **In Exercises 25–28, find the standard form of the equation of the parabola, ellipse, or hyperbola shown in the graph.**

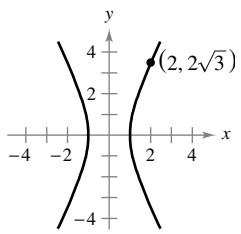
25.



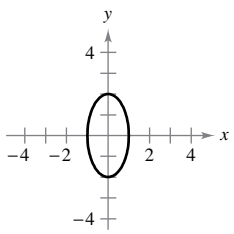
26.



27.



28.



29. Satellite Antenna A cross section of a large parabolic antenna is modeled by the graph of $y = x^2/200$, $-100 \le x \le 100$. The receiving and transmitting equipment is positioned at the focus.

(a) Find the coordinates of the focus.

(b) Find the surface area of the antenna.

30. Using an Ellipse Consider the ellipse $\frac{x^2}{25} + \frac{y^2}{9} = 1$.

(a) Find the area of the region bounded by the ellipse.

(b) Find the volume of the solid generated by revolving the region about its major axis.

Using Parametric Equations **In Exercises 31–38, sketch the curve represented by the parametric equations (indicate the orientation of the curve), and write the corresponding rectangular equation by eliminating the parameter.**

31. $x = 1 + 8t, \quad y = 3 - 4t$

32. $x = t - 2, \quad y = t^2 - 1$

33. $x = \sqrt{t} + 1, \quad y = t - 3$

34. $x = e^t - 1, \quad y = e^{3t}$

35. $x = 6 \cos \theta, \quad y = 6 \sin \theta$

36. $x = 2 + 5 \cos t, \quad y = 3 + 2 \sin t$

37. $x = 2 + \sec \theta, \quad y = 3 + \tan \theta$

38. $x = 5 \sin^3 \theta, \quad y = 5 \cos^3 \theta$

Finding Parametric Equations **In Exercises 39 and 40, find two different sets of parametric equations for the rectangular equation.**

39. $y = 4x + 3$

40. $y = x^2 - 2$

41. Rotary Engine The rotary engine was developed by Felix Wankel in the 1950s. It features a rotor that is a modified equilateral triangle. The rotor moves in a chamber that, in two dimensions, is an epitrochoid. Use a graphing utility to graph the chamber modeled by the parametric equations

$$x = \cos 3\theta + 5 \cos \theta \quad \text{and} \quad y = \sin 3\theta + 5 \sin \theta.$$

42. Serpentine Curve Consider the parametric equations $x = 2 \cot \theta$ and $y = 4 \sin \theta \cos \theta$, $0 < \theta < \pi$.

(a) Use a graphing utility to graph the curve.

(b) Eliminate the parameter to show that the rectangular equation of the serpentine curve is $(4 + x^2)y = 8x$.

Finding Slope and Concavity **In Exercises 43–50, find dy/dx and d^2y/dx^2, and find the slope and concavity (if possible) at the given value of the parameter.**

Parametric Equations	Parameter
43. $x = 1 + 6t, \quad y = 4 - 5t$	$t = 3$
44. $x = t - 6, \quad y = t^2$	$t = 5$
45. $x = \frac{1}{t}, \quad y = t^2$	$t = -2$
46. $x = \frac{1}{\sqrt{t}} + 1, \quad y = 3 - 2t$	$t = 4$
47. $x = e^t, \quad y = e^{-t}$	$t = 1$
48. $x = 5 + \cos \theta, \quad y = 3 + 4 \sin \theta$	$\theta = \frac{\pi}{6}$
49. $x = 10 \cos \theta, \quad y = 10 \sin \theta$	$\theta = \frac{\pi}{4}$
50. $x = \cos^4 \theta, \quad y = \sin^4 \theta$	$\theta = -\frac{\pi}{3}$

Finding an Equation of a Tangent Line **In Exercises 51 and 52, (a) use a graphing utility to graph the curve represented by the parametric equations, (b) use a graphing utility to find $dx/d\theta$, $dy/d\theta$, and dy/dx at the given value of the parameter, (c) find an equation of the tangent line to the curve at the given value of the parameter, and (d) use a graphing utility to graph the curve and the tangent line from part (c).**

Parametric Equations	Parameter
51. $x = \cot\theta, \quad y = \sin 2\theta$	$\theta = \frac{\pi}{6}$
52. $x = \frac{1}{4}\tan\theta, \quad y = 6\sin\theta$	$\theta = \frac{\pi}{3}$

Horizontal and Vertical Tangency **In Exercises 53–56, find all points (if any) of horizontal and vertical tangency to the curve. Use a graphing utility to confirm your results.**

53. $x = 5 - t, \quad y = 2t^2$

54. $x = t + 2, \quad y = t^3 - 2t$

55. $x = 2 + 2\sin\theta, \quad y = 1 + \cos\theta$

56. $x = 2 - 2\cos\theta, \quad y = 2\sin 2\theta$

Arc Length **In Exercises 57 and 58, find the arc length of the curve on the given interval.**

Parametric Equations	Interval
57. $x = t^2 + 1, \quad y = 4t^3 + 3$	$0 \le t \le 2$
58. $x = 7\cos\theta, \quad y = 7\sin\theta$	$0 \le \theta \le \pi$

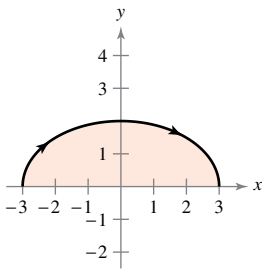
Surface Area **In Exercises 59 and 60, find the area of the surface generated by revolving the curve about (a) the x-axis and (b) the y-axis.**

59. $x = 4t, \quad y = 3t + 1, \quad 0 \le t \le 1$

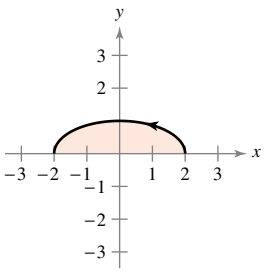
60. $x = 2\cos\theta, \quad y = 2\sin\theta, \quad 0 \le \theta \le \frac{\pi}{2}$

Area **In Exercises 61 and 62, find the area of the region.**

61. $x = 3\sin\theta, \quad y = 2\cos\theta, \quad -\frac{\pi}{2} \le \theta \le \frac{\pi}{2}$



62. $x = 2\cos\theta, \quad y = \sin\theta, \quad 0 \le \theta \le \pi$



Polar-to-Rectangular Conversion **In Exercises 63–66, the polar coordinates of a point are given. Plot the point and find the corresponding rectangular coordinates for the point.**

63. $\left(5, \frac{3\pi}{2}\right)$

64. $\left(-6, \frac{5\pi}{6}\right)$

65. $\left(\sqrt{7}, 3.25\right)$

66. $(-2, -2.45)$

Rectangular-to-Polar Conversion **In Exercises 67–70, the rectangular coordinates of a point are given. Plot the point and find *two* sets of polar coordinates for the point for $0 \le \theta < 2\pi$.**

67. $(4, -4)$

68. $(0, -7)$

69. $(-1, 3)$

70. $\left(-\sqrt{3}, -\sqrt{3}\right)$

Rectangular-to-Polar Conversion **In Exercises 71–76, convert the rectangular equation to polar form and sketch its graph.**

71. $x^2 + y^2 = 25$

72. $x^2 - y^2 = 4$

73. $y = 9$

74. $x = 6$

75. $-x + 4y - 3 = 0$

76. $x^2 = 4y$

Polar-to-Rectangular Conversion **In Exercises 77–82, convert the polar equation to rectangular form and sketch its graph.**

77. $r = 6\cos\theta$

78. $r = 10$

79. $r = -4\sec\theta$

80. $r = 3\csc\theta$

81. $\theta = \frac{3\pi}{4}$

82. $r = -2\sec\theta\tan\theta$

Graphing a Polar Equation **In Exercises 83–86, use a graphing utility to graph the polar equation. Find an interval for θ over which the graph is traced *only once*.**

83. $r = \frac{3\pi}{2}\sin 3\theta$

84. $r = 2\sin\theta\cos^2\theta$

85. $r = 4\cos 2\theta\sec\theta$

86. $r = 4(\sec\theta - \cos\theta)$

Horizontal and Vertical Tangency **In Exercises 87 and 88, find the points of horizontal and vertical tangency (if any) to the polar curve.**

87. $r = 1 - \cos\theta$

88. $r = 3\tan\theta$

Tangent Lines at the Pole **In Exercises 89 and 90, sketch a graph of the polar equation and find the tangent lines at the pole.**

89. $r = 4\sin 3\theta$

90. $r = 3\cos 4\theta$

Sketching a Polar Graph **In Exercises 91–100, sketch a graph of the polar equation.**

91. $r = 6$

92. $\theta = \frac{\pi}{10}$

93. $r = -\sec\theta$

94. $r = 5\csc\theta$

95. $r = 4 - 3\cos\theta$

96. $r = 3 + 2\sin\theta$

97. $r = 4\theta$

98. $r = -3\cos 2\theta$

99. $r^2 = 4\sin 2\theta$

100. $r^2 = 9\cos 2\theta$

Finding the Area of a Polar Region **In Exercises 101–104, find the area of the region.**

101. One petal of $r = 3\cos 5\theta$

102. One petal of $r = 2\sin 6\theta$

103. Interior of $r = 2 + \cos\theta$

104. Interior of $r = 5(1 - \sin\theta)$

Finding Points of Intersection **In Exercises 105 and 106, find the points of intersection of the graphs of the equations.**

105. $r = 1 - \cos\theta$, $r = 1 + \sin\theta$

106. $r = 1 + \sin\theta$, $r = 3\sin\theta$

Finding the Area of a Polar Region **In Exercises 107–112, use a graphing utility to graph the polar equation. Find the area of the given region analytically.**

107. Inner loop of $r = 3 - 6\cos\theta$

108. Inner loop of $r = 4 + 8\sin\theta$

109. Between the loops of $r = 3 - 6\cos\theta$

110. Between the loops of $r = 4 + 8\sin\theta$

111. Common interior of $r = 5 - 2\sin\theta$ and $r = -5 + 2\sin\theta$

112. Common interior of $r = 4\cos\theta$ and $r = 2$

Finding the Arc Length of a Polar Curve **In Exercises 113 and 114, find the length of the curve over the given interval.**

	Polar Equation	Interval
113.	$r = 5\cos\theta$	$\left[\frac{\pi}{2}, \pi\right]$
114.	$r = 3(1 - \cos\theta)$	$[0, \pi]$

Finding the Area of a Surface of Revolution **In Exercises 115 and 116, find the area of the surface formed by revolving the polar equation over the given interval about the given line.**

	Polar Equation	Interval	Axis of Revolution
115.	$r = 2\sin\theta$	$0 \le \theta \le \pi$	Polar axis
116.	$r = 2\sin\theta$	$0 \le \theta \le \frac{\pi}{2}$	$\theta = \frac{\pi}{2}$

Identifying and Sketching a Conic **In Exercises 117–122, find the eccentricity and the distance from the pole to the directrix of the conic. Then identify the conic and sketch its graph. Use a graphing utility to confirm your results.**

117. $r = \dfrac{6}{1 - \sin\theta}$

118. $r = \dfrac{2}{1 + \cos\theta}$

119. $r = \dfrac{6}{3 + 2\cos\theta}$

120. $r = \dfrac{4}{5 - 3\sin\theta}$

121. $r = \dfrac{4}{2 - 3\sin\theta}$

122. $r = \dfrac{8}{2 - 5\cos\theta}$

Finding a Polar Equation **In Exercises 123–126, find a polar equation for the conic with its focus at the pole and the given eccentricity and directrix. (For convenience, the equation for the directrix is given in rectangular form.)**

	Conic	Eccentricity	Directrix
123.	Parabola	$e = 1$	$x = 5$
124.	Ellipse	$e = \frac{3}{4}$	$y = -2$
125.	Hyperbola	$e = 3$	$y = 3$
126.	Hyperbola	$e = \frac{5}{2}$	$x = -1$

Finding a Polar Equation **In Exercises 127–130, find a polar equation for the conic with its focus at the pole and the given vertex or vertices.**

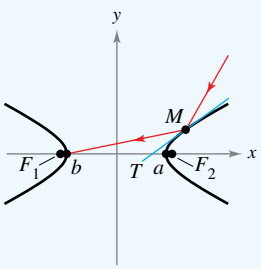
	Conic	Vertex or Vertices
127.	Parabola	$\left(2, \frac{\pi}{2}\right)$
128.	Parabola	$(3, \pi)$
129.	Ellipse	$(5, 0), (1, \pi)$
130.	Hyperbola	$(1, 0), (7, 0)$

Building on Concepts

131. Consider the hyperbola

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$

with foci F_1 and F_2, as shown in the figure. Let T be the tangent line at a point M on the hyperbola. Show that incoming rays of light aimed at one focus are reflected by a hyperbolic mirror toward the other focus.



132. Four dogs are located at the corners of a square with side length d. The dogs all move counterclockwise at the same speed directly toward the next dog, as shown in the figure. Find the polar equation of a dog's path as it spirals toward the center of the square. (Assume the pole is at the center of the square.)

P.S. Problem Solving

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

1. Using a Parabola Consider the parabola

$x^2 = 4y$

and the focal chord

$y = \frac{3}{4}x + 1$.

(a) Sketch the graph of the parabola and the focal chord.

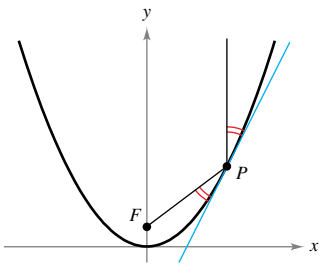
(b) Show that the tangent lines to the parabola at the endpoints of the focal chord intersect at right angles.

(c) Show that the tangent lines to the parabola at the endpoints of the focal chord intersect on the directrix of the parabola.

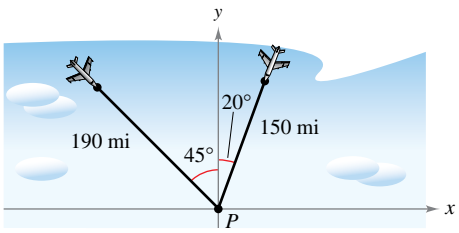
2. Area Let a and b be positive constants. Find the area of the region in the first quadrant bounded by the graph of the polar equation

$$r = \frac{ab}{(a \sin\theta + b \cos\theta)}, \quad 0 \le \theta \le \frac{\pi}{2}.$$

3. Proof Prove Theorem 10.2, Reflective Property of a Parabola, as shown in the figure.



4. Flight Paths An air traffic controller spots two planes at the same altitude flying toward each other (see figure). Their flight paths are 20° and 315°. One plane is 150 miles from point P with a speed of 375 miles per hour. The other is 190 miles from point P with a speed of 450 miles per hour.



(a) Find parametric equations for the path of each plane where t is the time in hours, with $t = 0$ corresponding to the time at which the air traffic controller spots the planes.

(b) Use the result of part (a) to write the distance between the planes as a function of t.

(c) Use a graphing utility to graph the function in part (b). When will the distance between the planes be minimum? If the planes must keep a separation of at least 3 miles, is the requirement met?

5. Strophoid The curve given by the parametric equations

$$x(t) = \frac{1 - t^2}{1 + t^2} \quad \text{and} \quad y(t) = \frac{t(1 - t^2)}{1 + t^2}$$

is called a **strophoid.**

(a) Find a rectangular equation of the strophoid.

(b) Find a polar equation of the strophoid.

(c) Sketch a graph of the strophoid.

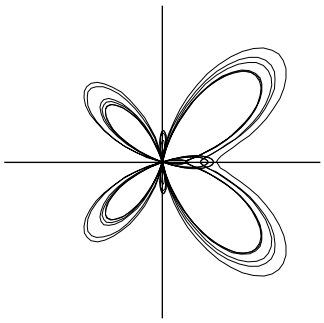
(d) Find the equations of the two tangent lines at the origin.

(e) Find the points on the graph at which the tangent lines are horizontal.

6. Butterfly Curve Use a graphing utility to graph the curve shown in the figure below. The curve is given by

$$r = e^{\cos\theta} - 2\cos 4\theta + \sin^5\frac{\theta}{12}.$$

Over what interval must θ vary to produce the curve?



FOR FURTHER INFORMATION For more information on this curve, see the article "A Study in Step Size" by Temple H. Fay in *Mathematics Magazine*. To view this article, go to *MathArticles.com.*

7. Area Consider a circular pasture of radius 1 kilometer and a goat tied to a rope on the inside of the fence surrounding the pasture. How long should the rope be in order for the goat to have access to exactly half the pasture? (Ingo Ullisch found the first exact solution to this centuries old problem, as published in *Quanta Magazine*.)

8. Cornu Spiral Consider the **cornu spiral** given by

$$x(t) = \int_0^t \cos\frac{\pi u^2}{2}\,du \quad \text{and} \quad y(t) = \int_0^t \sin\frac{\pi u^2}{2}\,du.$$

(a) Use a graphing utility to graph the spiral over the interval $-\pi \le t \le \pi$.

(b) Show that the cornu spiral is symmetric with respect to the origin.

(c) Find the length of the cornu spiral from $t = 0$ to $t = a$. What is the length of the spiral from $t = -\pi$ to $t = \pi$?

11.1 Vectors in the Plane

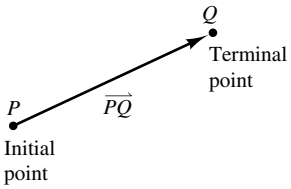
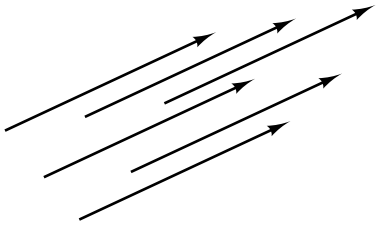
GO DIGITAL

- **Write the component form of a vector.**
- **Perform vector operations and interpret the results geometrically.**
- **Write a vector as a linear combination of standard unit vectors.**

Component Form of a Vector



A directed line segment
Figure 11.1



Equivalent directed line segments
Figure 11.2

Many quantities in geometry and physics, such as area, volume, temperature, mass, and time, can be characterized by a single real number that is scaled to appropriate units of measure. These are called **scalar quantities,** and the real number associated with each is called a **scalar.**

Other quantities, such as force, velocity, and acceleration, involve both magnitude and direction and cannot be characterized completely by a single real number. A **directed line segment** is used to represent such a quantity, as shown in Figure 11.1. The directed line segment $\overrightarrow{PQ}$ has **initial point** P and **terminal point** Q, and its **length** (or **magnitude**) is denoted by $\|\overrightarrow{PQ}\|$. Directed line segments that have the same length and direction are **equivalent,** as shown in Figure 11.2. The set of all directed line segments that are equivalent to a given directed line segment $\overrightarrow{PQ}$ is a **vector in the plane** and is denoted by

$$\mathbf{v} = \overrightarrow{PQ}.$$

A common notation for vectors is to use lowercase, boldface letters such as **u**, **v**, and **w**. Another common notation for vectors is to use letters with arrows above them, such as $\vec{u}$, $\vec{v}$, and $\vec{w}$.

Be sure you understand that a vector represents a *set* of directed line segments (each having the same length and direction). In practice, however, it is common not to distinguish between a vector and one of its representatives.

Big Ideas of Calculus

Vectors are important in many areas of mathematics and its applications. Force, torque, velocity, and work are common vector quantities. Some concepts, such as electricity and magnetism, are impossible to understand without vectors. Also, vectors are used to describe lines and planes in space (the three-dimensional coordinate system).

In addition to vectors, you will study surfaces in space and alternative coordinate systems for space. These concepts will be used in Chapter 12 to study vector calculus and the calculus of space.

EXAMPLE 1 Vector Representation: Directed Line Segments

Let **v** be represented by the directed line segment from $(0, 0)$ to $(3, 2)$, and let **u** be represented by the directed line segment from $(1, 2)$ to $(4, 4)$. Show that **v** and **u** are equivalent.

Solution Let $P(0, 0)$ and $Q(3, 2)$ be the initial and terminal points of **v**, and let $R(1, 2)$ and $S(4, 4)$ be the initial and terminal points of **u**, as shown in Figure 11.3. You can use the Distance Formula to show that $\overrightarrow{PQ}$ and $\overrightarrow{RS}$ have the *same length.*

$$\|\overrightarrow{PQ}\| = \sqrt{(3-0)^2 + (2-0)^2} = \sqrt{13}$$
$$\|\overrightarrow{RS}\| = \sqrt{(4-1)^2 + (4-2)^2} = \sqrt{13}$$

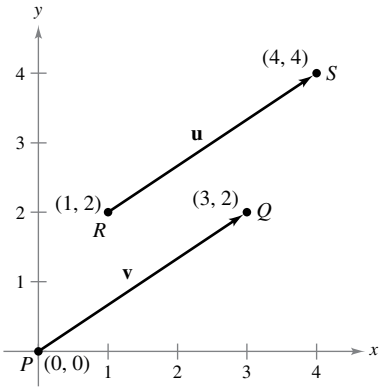
Both line segments have the *same direction,* because they both are directed toward the upper right on lines having the same slope.

$$\text{Slope of } \overrightarrow{PQ} = \frac{2-0}{3-0} = \frac{2}{3}$$

and

$$\text{Slope of } \overrightarrow{RS} = \frac{4-2}{4-1} = \frac{2}{3}$$

Because $\overrightarrow{PQ}$ and $\overrightarrow{RS}$ have the same length and direction, you can conclude that the two vectors are equivalent. That is, **v** and **u** are equivalent.



The vectors **u** and **v** are equivalent.

A vector in standard position
Figure 11.4

The directed line segment whose initial point is the origin is often the most convenient representative of a set of equivalent directed line segments such as those shown in Figure 11.3. This representation of **v** is said to be in **standard position.** A directed line segment whose initial point is the origin can be uniquely represented by the coordinates of its terminal point $Q(v_1, v_2)$, as shown in Figure 11.4. In the next definition, note the difference in the notation between the *component form* of a vector $\mathbf{v} = \langle v_1, v_2 \rangle$ and the point (v_1, v_2).

Definition of Component Form of a Vector in the Plane

If **v** is a vector in the plane whose initial point is the origin and whose terminal point is (v_1, v_2), then the **component form of v** is $\mathbf{v} = \langle v_1, v_2 \rangle$. The coordinates v_1 and v_2 are called the **components of v.** If both the initial point and the terminal point lie at the origin, then **v** is called the **zero vector** and is denoted by $\mathbf{0} = \langle 0, 0 \rangle$.

GO DIGITAL

This definition implies that two vectors $\mathbf{u} = \langle u_1, u_2 \rangle$ and $\mathbf{v} = \langle v_1, v_2 \rangle$ are **equal** if and only if $u_1 = v_1$ and $u_2 = v_2$.

The procedures listed below can be used to convert directed line segments to component form or vice versa.

1. If $P(p_1, p_2)$ and $Q(q_1, q_2)$ are the initial and terminal points of a directed line segment, then the component form of the vector **v** represented by $\overrightarrow{PQ}$ is

$$\langle v_1, v_2 \rangle = \langle q_1 - p_1, q_2 - p_2 \rangle.$$

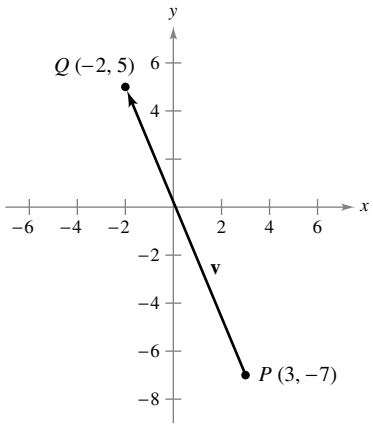
Moreover, from the Distance Formula, you can determine that the **length** (or **magnitude**) **of v** is

$$\begin{aligned} \|\mathbf{v}\| &= \sqrt{(q_1 - p_1)^2 + (q_2 - p_2)^2} \\ &= \sqrt{v_1^2 + v_2^2}. \end{aligned}$$

Length of a vector

2. If $\mathbf{v} = \langle v_1, v_2 \rangle$, then **v** can be represented by the directed line segment, in standard position, from $P(0, 0)$ to $Q(v_1, v_2)$.

The length of **v** is also called the **norm of v.** If $\|\mathbf{v}\| = 1$, then **v** is a **unit vector.** Moreover, $\|\mathbf{v}\| = 0$ if and only if **v** is the zero vector **0**.



Component form of **v**: $\mathbf{v} = \langle -5, 12 \rangle$
Figure 11.5

EXAMPLE 2 Component Form and Length of a Vector

Find the component form and length of the vector **v** that has initial point $(3, -7)$ and terminal point $(-2, 5)$.

Solution Let $P(3, -7) = (p_1, p_2)$ and $Q(-2, 5) = (q_1, q_2)$. Then the components of $\mathbf{v} = \langle v_1, v_2 \rangle$ are

$$v_1 = q_1 - p_1 = -2 - 3 = -5$$

and

$$v_2 = q_2 - p_2 = 5 - (-7) = 12.$$

So, as shown in Figure 11.5, $\mathbf{v} = \langle -5, 12 \rangle$, and the length of **v** is

$$\begin{aligned} \|\mathbf{v}\| &= \sqrt{(-5)^2 + 12^2} \\ &= \sqrt{169} \\ &= 13. \end{aligned}$$

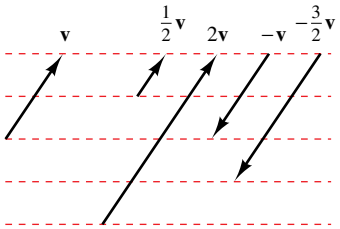
Vector Operations

Definitions of Vector Addition and Scalar Multiplication

Let $\mathbf{u} = \langle u_1, u_2 \rangle$ and $\mathbf{v} = \langle v_1, v_2 \rangle$ be vectors and let c be a scalar.

1. The **vector sum** of $\mathbf{u}$ and $\mathbf{v}$ is the vector $\mathbf{u} + \mathbf{v} = \langle u_1 + v_1, u_2 + v_2 \rangle$.
2. The **scalar multiple** of c and $\mathbf{u}$ is the vector
$$c\mathbf{u} = \langle cu_1, cu_2 \rangle.$$
3. The **negative** of $\mathbf{v}$ is the vector
$$-\mathbf{v} = (-1)\mathbf{v} = \langle -v_1, -v_2 \rangle.$$
4. The **difference** of $\mathbf{u}$ and $\mathbf{v}$ is
$$\mathbf{u} - \mathbf{v} = \mathbf{u} + (-\mathbf{v}) = \langle u_1 - v_1, u_2 - v_2 \rangle.$$

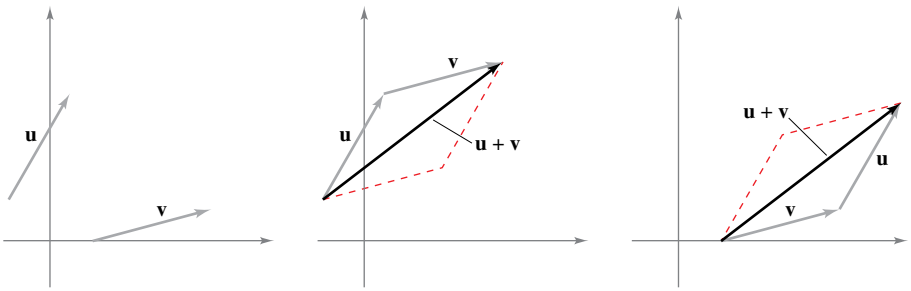


The scalar multiplication of $\mathbf{v}$

Figure 11.6

Geometrically, the scalar multiple of a vector $\mathbf{v}$ and a scalar c is the vector that is $|c|$ times as long as $\mathbf{v}$, as shown in Figure 11.6. If c is positive, then $c\mathbf{v}$ has the same direction as $\mathbf{v}$. If c is negative, then $c\mathbf{v}$ has the opposite direction.

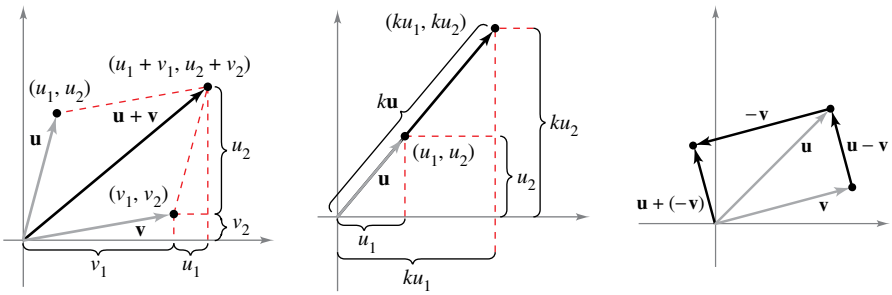
The sum of two vectors can be represented geometrically by positioning the vectors (without changing their magnitudes or directions) so that the initial point of one coincides with the terminal point of the other, as shown in Figure 11.7. The vector $\mathbf{u} + \mathbf{v}$, called the **resultant vector,** is the diagonal of a parallelogram having $\mathbf{u}$ and $\mathbf{v}$ as its adjacent sides.



To find $\mathbf{u} + \mathbf{v}$, (1) move the initial point of $\mathbf{v}$ to the terminal point of $\mathbf{u}$, or (2) move the initial point of $\mathbf{u}$ to the terminal point of $\mathbf{v}$.

Figure 11.7

Figure 11.8 shows the equivalence of the geometric and algebraic definitions of vector addition and scalar multiplication and presents (at far right) a geometric interpretation of $\mathbf{u} - \mathbf{v}$.



Vector addition — Scalar multiplication — Vector subtraction

Figure 11.8

WILLIAM ROWAN HAMILTON (1805–1865)

Some of the earliest work with vectors was done by the Irish mathematician William Rowan Hamilton. Hamilton spent many years developing a system of vector-like quantities called *quaternions*. It was not until the latter half of the nineteenth century that the Scottish physicist James Maxwell (1831–1879) restructured Hamilton's quaternions in a form useful for representing physical quantities such as force, velocity, and acceleration.

GO DIGITAL

EXAMPLE 3 Vector Operations

For $\mathbf{v} = \langle -2, 5 \rangle$ and $\mathbf{w} = \langle 3, 4 \rangle$, find each of the vectors.

a. $\frac{1}{2}\mathbf{v}$ **b.** $\mathbf{w} - \mathbf{v}$ **c.** $\mathbf{v} + 2\mathbf{w}$

Solution

a. $\frac{1}{2}\mathbf{v} = \left\langle \frac{1}{2}(-2), \frac{1}{2}(5) \right\rangle = \left\langle -1, \frac{5}{2} \right\rangle$

b. $\mathbf{w} - \mathbf{v} = \langle w_1 - v_1, w_2 - v_2 \rangle$
$= \langle 3 - (-2), 4 - 5 \rangle$
$= \langle 5, -1 \rangle$

c. Using $2\mathbf{w} = \langle 6, 8 \rangle$, you have

$$\begin{aligned} \mathbf{v} + 2\mathbf{w} &= \langle -2, 5 \rangle + \langle 6, 8 \rangle \\ &= \langle -2 + 6, 5 + 8 \rangle \\ &= \langle 4, 13 \rangle. \end{aligned}$$

Vector addition and scalar multiplication share many properties of ordinary arithmetic, as shown in the next theorem.

EMMY NOETHER (1882–1935)

One person who contributed to our knowledge of axiomatic systems was the German mathematician Emmy Noether. Noether is generally recognized as the leading woman mathematician in recent history.

FOR FURTHER INFORMATION

For more information on Emmy Noether, see the article "Emmy Noether, Greatest Woman Mathematician" by Clark Kimberling in *Mathematics Teacher.* To view this article, go to *MathArticles.com.*

THEOREM 11.1 Properties of Vector Operations

Let $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$ be vectors in the plane, and let c and d be scalars.

1. $\mathbf{u} + \mathbf{v} = \mathbf{v} + \mathbf{u}$	Commutative Property
2. $(\mathbf{u} + \mathbf{v}) + \mathbf{w} = \mathbf{u} + (\mathbf{v} + \mathbf{w})$	Associative Property
3. $\mathbf{u} + \mathbf{0} = \mathbf{u}$	Additive Identity Property
4. $\mathbf{u} + (-\mathbf{u}) = \mathbf{0}$	Additive Inverse Property
5. $c(d\mathbf{u}) = (cd)\mathbf{u}$	
6. $(c + d)\mathbf{u} = c\mathbf{u} + d\mathbf{u}$	Distributive Property
7. $c(\mathbf{u} + \mathbf{v}) = c\mathbf{u} + c\mathbf{v}$	Distributive Property
8. $1(\mathbf{u}) = \mathbf{u}$, $0(\mathbf{u}) = \mathbf{0}$	

Proof The proof of the *Associative Property* of vector addition uses the Associative Property of addition of real numbers.

$$\begin{aligned} (\mathbf{u} + \mathbf{v}) + \mathbf{w} &= [\langle u_1, u_2 \rangle + \langle v_1, v_2 \rangle] + \langle w_1, w_2 \rangle \\ &= \langle u_1 + v_1, u_2 + v_2 \rangle + \langle w_1, w_2 \rangle \\ &= \langle (u_1 + v_1) + w_1, (u_2 + v_2) + w_2 \rangle \\ &= \langle u_1 + (v_1 + w_1), u_2 + (v_2 + w_2) \rangle \\ &= \langle u_1, u_2 \rangle + \langle v_1 + w_1, v_2 + w_2 \rangle \\ &= \mathbf{u} + (\mathbf{v} + \mathbf{w}) \end{aligned}$$

The other properties can be proved in a similar manner. (See Exercise 81.)

Any set of vectors (with an accompanying set of scalars) that satisfies the eight properties listed in Theorem 11.1 is a **vector space.*** The eight properties are the *vector space axioms.* So, this theorem states that the set of vectors in the plane (with the set of real numbers) forms a vector space.

* For more information about vector spaces, see *Elementary Linear Algebra,* Eighth Edition, by Ron Larson (Boston, Massachusetts: Cengage Learning, 2017).

THEOREM 11.2 Length of a Scalar Multiple

Let $\mathbf{v}$ be a vector and let c be a scalar. Then

$$\|c\mathbf{v}\| = |c|\|\mathbf{v}\|.$$

$|c|$ is the absolute value of c.

Proof Because $c\mathbf{v} = \langle cv_1, cv_2 \rangle$, it follows that

$$\begin{aligned}
\|c\mathbf{v}\| &= \|\langle cv_1, cv_2 \rangle\| \\
&= \sqrt{(cv_1)^2 + (cv_2)^2} \\
&= \sqrt{c^2v_1^2 + c^2v_2^2} \\
&= \sqrt{c^2(v_1^2 + v_2^2)} \\
&= |c|\sqrt{v_1^2 + v_2^2} \\
&= |c|\|\mathbf{v}\|.
\end{aligned}$$

In many applications of vectors, it is useful to find a unit vector that has the same direction as a given vector. The next theorem gives a procedure for doing this.

THEOREM 11.3 Unit Vector in the Direction of v

If $\mathbf{v}$ is a nonzero vector in the plane, then the vector

$$\mathbf{u} = \frac{\mathbf{v}}{\|\mathbf{v}\|} = \frac{1}{\|\mathbf{v}\|}\mathbf{v}$$

has length 1 and the same direction as $\mathbf{v}$.

Proof Because $1/\|\mathbf{v}\|$ is positive and $\mathbf{u} = (1/\|\mathbf{v}\|)\mathbf{v}$, you can conclude that $\mathbf{u}$ has the same direction as $\mathbf{v}$. To see that $\|\mathbf{u}\| = 1$, note that

$$\|\mathbf{u}\| = \left\| \left(\frac{1}{\|\mathbf{v}\|}\right)\mathbf{v} \right\| = \left|\frac{1}{\|\mathbf{v}\|}\right| \|\mathbf{v}\| = \frac{1}{\|\mathbf{v}\|}\|\mathbf{v}\| = 1.$$

So, $\mathbf{u}$ has length 1 and the same direction as $\mathbf{v}$.

In Theorem 11.3, $\mathbf{u}$ is called a **unit vector in the direction of v.** The process of multiplying $\mathbf{v}$ by $1/\|\mathbf{v}\|$ to get a unit vector is called **normalization of v.**

EXAMPLE 4 Finding a Unit Vector

Find a unit vector in the direction of $\mathbf{v} = \langle -2, 5 \rangle$ and verify that it has length 1.

Solution From Theorem 11.3, the unit vector in the direction of $\mathbf{v}$ is

$$\begin{aligned}
\frac{\mathbf{v}}{\|\mathbf{v}\|} &= \frac{\langle -2, 5 \rangle}{\sqrt{(-2)^2 + (5)^2}} \\
&= \frac{1}{\sqrt{29}}\langle -2, 5 \rangle \\
&= \left\langle \frac{-2}{\sqrt{29}}, \frac{5}{\sqrt{29}} \right\rangle.
\end{aligned}$$

This vector has length 1, because

$$\sqrt{\left(\frac{-2}{\sqrt{29}}\right)^2 + \left(\frac{5}{\sqrt{29}}\right)^2} = \sqrt{\frac{4}{29} + \frac{25}{29}} = \sqrt{\frac{29}{29}} = 1.$$

Triangle inequality
Figure 11.9

Generally, the length of the sum of two vectors is not equal to the sum of their lengths. To see this, consider the vectors $\mathbf{u}$ and $\mathbf{v}$ as shown in Figure 11.9. With $\mathbf{u}$ and $\mathbf{v}$ as two sides of a triangle, the length of the third side is $\|\mathbf{u} + \mathbf{v}\|$, and

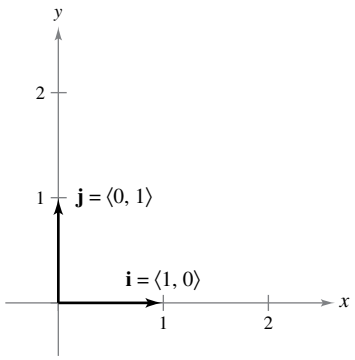
$$\|\mathbf{u} + \mathbf{v}\| \leq \|\mathbf{u}\| + \|\mathbf{v}\|.$$

Equality occurs only when the vectors $\mathbf{u}$ and $\mathbf{v}$ have the *same direction.* This result is called the **triangle inequality** for vectors. (You are asked to prove this in Exercise 73, Section 11.3.)

Standard Unit Vectors

The unit vectors $\langle 1, 0\rangle$ and $\langle 0, 1\rangle$ are called the **standard unit vectors** in the plane and are denoted by

$$\mathbf{i} = \langle 1, 0\rangle \quad \text{and} \quad \mathbf{j} = \langle 0, 1\rangle \qquad \text{Standard unit vectors}$$



Standard unit vectors **i** and **j**
Figure 11.10

as shown in Figure 11.10. These vectors can be used to represent any vector uniquely, as follows.

$$\mathbf{v} = \langle v_1, v_2\rangle = \langle v_1, 0\rangle + \langle 0, v_2\rangle = v_1\langle 1, 0\rangle + v_2\langle 0, 1\rangle = v_1\mathbf{i} + v_2\mathbf{j}$$

The vector $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j}$ is called a **linear combination** of $\mathbf{i}$ and $\mathbf{j}$. The scalars v_1 and v_2 are called the **horizontal** and **vertical components of v.**

EXAMPLE 5 Writing a Linear Combination of Unit Vectors

Let $\mathbf{u}$ be the vector with initial point $(2, -5)$ and terminal point $(-1, 3)$, and let $\mathbf{v} = 2\mathbf{i} - \mathbf{j}$. Write each vector as a linear combination of $\mathbf{i}$ and $\mathbf{j}$.

a. $\mathbf{u}$

b. $\mathbf{w} = 2\mathbf{u} - 3\mathbf{v}$

Solution

a. $\mathbf{u} = \langle q_1 - p_1, q_2 - p_2\rangle = \langle -1 - 2, 3 - (-5)\rangle = \langle -3, 8\rangle = -3\mathbf{i} + 8\mathbf{j}$

b. $\mathbf{w} = 2\mathbf{u} - 3\mathbf{v} = 2(-3\mathbf{i} + 8\mathbf{j}) - 3(2\mathbf{i} - \mathbf{j}) = -6\mathbf{i} + 16\mathbf{j} - 6\mathbf{i} + 3\mathbf{j} = -12\mathbf{i} + 19\mathbf{j}$

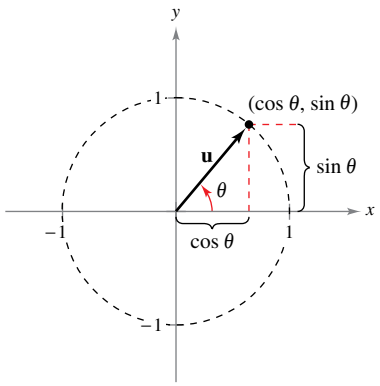
GO DIGITAL

If $\mathbf{u}$ is a unit vector and θ is the angle (measured counterclockwise) from the positive x-axis to $\mathbf{u}$, then the terminal point of $\mathbf{u}$ lies on the unit circle, and you have

$$\mathbf{u} = \langle \cos\theta, \sin\theta\rangle = \cos\theta\mathbf{i} + \sin\theta\mathbf{j} \qquad \text{Unit vector}$$

as shown in Figure 11.11. Moreover, it follows that any other nonzero vector $\mathbf{v}$ making an angle θ with the positive x-axis has the same direction as $\mathbf{u}$, and you can write

$$\mathbf{v} = \|\mathbf{v}\|\langle \cos\theta, \sin\theta\rangle = \|\mathbf{v}\|\cos\theta\mathbf{i} + \|\mathbf{v}\|\sin\theta\mathbf{j}.$$



The angle θ from the positive x-axis to the vector $\mathbf{u}$
Figure 11.11

EXAMPLE 6 Writing a Vector of Given Magnitude and Direction

The vector $\mathbf{v}$ has a magnitude of 3 and makes an angle of $30° = \pi/6$ with the positive x-axis. Write $\mathbf{v}$ as a linear combination of the unit vectors $\mathbf{i}$ and $\mathbf{j}$.

Solution Because the angle between $\mathbf{v}$ and the positive x-axis is $\theta = \pi/6$, you can write

$$\mathbf{v} = \|\mathbf{v}\|\cos\theta\mathbf{i} + \|\mathbf{v}\|\sin\theta\mathbf{j} = 3\cos\frac{\pi}{6}\mathbf{i} + 3\sin\frac{\pi}{6}\mathbf{j} = \frac{3\sqrt{3}}{2}\mathbf{i} + \frac{3}{2}\mathbf{j}.$$

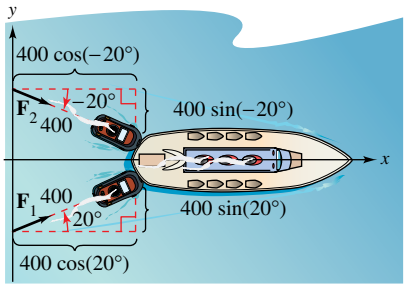
GO DIGITAL

Vectors have many applications in physics and engineering. One example is force. A vector can be used to represent force, because force has both magnitude and direction. If two or more forces are acting on an object, then the **resultant force** on the object is the vector sum of the vector forces.

EXAMPLE 7 Finding the Resultant Force

Two tugboats are pushing an ocean liner, as shown in Figure 11.12. Each boat is exerting a force of 400 pounds. What is the resultant force on the ocean liner?



The resultant force on the ocean liner that is exerted by the two tugboats
Figure 11.12

Solution Using Figure 11.12, you can represent the forces exerted by the first and second tugboats as

$$\mathbf{F}_1 = 400\langle \cos 20°, \sin 20° \rangle = 400\cos(20°)\mathbf{i} + 400\sin(20°)\mathbf{j}$$
$$\mathbf{F}_2 = 400\langle \cos(-20°), \sin(-20°) \rangle = 400\cos(20°)\mathbf{i} - 400\sin(20°)\mathbf{j}.$$

The resultant force on the ocean liner is

$$\begin{aligned}\mathbf{F} &= \mathbf{F}_1 + \mathbf{F}_2 \\ &= [400\cos(20°)\mathbf{i} + 400\sin(20°)\mathbf{j}] + [400\cos(20°)\mathbf{i} - 400\sin(20°)\mathbf{j}] \\ &= 800\cos(20°)\mathbf{i} \\ &\approx 752\mathbf{i}.\end{aligned}$$

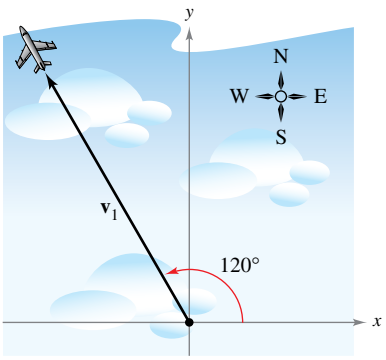
So, the resultant force on the ocean liner is approximately 752 pounds in the direction of the positive x-axis. ■

In surveying and navigation, a **bearing** is a direction that measures the acute angle that a path or line of sight makes with a fixed north-south line. In air navigation, bearings are measured in degrees clockwise from north.

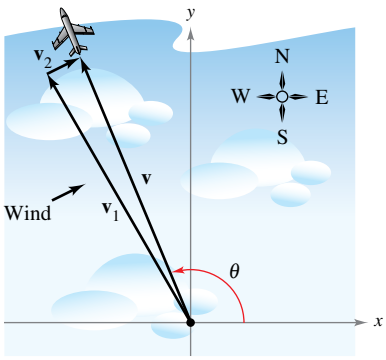
EXAMPLE 8 Finding a Velocity

See LarsonCalculus.com for an interactive version of this type of example.

An airplane is traveling at a fixed altitude with a negligible wind factor. The airplane is traveling at a speed of 500 miles per hour with a bearing of 330°, as shown in Figure 11.13(a). As the airplane reaches a certain point, it encounters wind with a velocity of 70 miles per hour in the direction N 45° E (45° east of north), as shown in Figure 11.13(b). What are the resultant speed and direction of the airplane?



(a) Direction without wind



(b) Direction with wind
Figure 11.13

Solution Using Figure 11.13(a), represent the velocity of the airplane (alone) as

$$\mathbf{v}_1 = 500\cos(120°)\mathbf{i} + 500\sin(120°)\mathbf{j}.$$

The velocity of the wind is represented by the vector

$$\mathbf{v}_2 = 70\cos(45°)\mathbf{i} + 70\sin(45°)\mathbf{j}.$$

The resultant velocity of the airplane (in the wind) is

$$\begin{aligned}\mathbf{v} &= \mathbf{v}_1 + \mathbf{v}_2 \\ &= 500\cos(120°)\mathbf{i} + 500\sin(120°)\mathbf{j} + 70\cos(45°)\mathbf{i} + 70\sin(45°)\mathbf{j} \\ &\approx -200.5\mathbf{i} + 482.5\mathbf{j}.\end{aligned}$$

To find the resultant speed and direction, write $\mathbf{v} = \|\mathbf{v}\|(\cos\theta\mathbf{i} + \sin\theta\mathbf{j})$. Because $\|\mathbf{v}\| \approx \sqrt{(-200.5)^2 + (482.5)^2} \approx 522.5$, you can write

$$\mathbf{v} \approx 522.5\left(\frac{-200.5}{522.5}\mathbf{i} + \frac{482.5}{522.5}\mathbf{j}\right) \approx 522.5[\cos(112.6°)\mathbf{i} + \sin(112.6°)\mathbf{j}].$$

The new speed of the airplane, as altered by the wind, is approximately 522.5 miles per hour in a path that makes an angle of 112.6° with the positive x-axis. ■

11.1 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

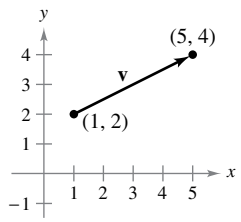
Concept Check

1. Describe the difference between a scalar and a vector. Give examples of each.
2. Two points and a vector are given. Determine which point is the initial point and which point is the terminal point. Explain.

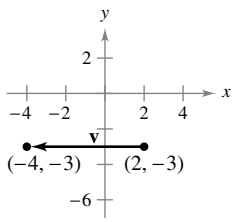
   $P(2, -1)$, $Q(-4, 6)$, and $\mathbf{v} = \langle 6, -7 \rangle$

Sketching a Vector In Exercises 3 and 4, (a) find the component form of the vector v and (b) sketch the vector with its initial point at the origin.

3.



4.



Equivalent Vectors In Exercises 5–8, find the vectors u and v whose initial and terminal points are given. Show that u and v are equivalent.

	Initial Point	Terminal Point		Initial Point	Terminal Point
5.	u: (3, 2)	(5, 6)	6.	u: (−4, 0)	(1, 8)
	v: (1, 4)	(3, 8)		v: (2, −1)	(7, 7)
7.	u: (0, 3)	(6, −2)	8.	u: (−4, −1)	(11, −4)
	v: (3, 10)	(9, 5)		v: (10, 13)	(25, 10)

Writing a Vector in Different Forms In Exercises 9–16, the initial and terminal points of a vector v are given. (a) Sketch the given directed line segment. (b) Write the vector in component form. (c) Write the vector as the linear combination of the standard unit vectors i and j. (d) Sketch the vector with its initial point at the origin.

	Initial Point	Terminal Point		Initial Point	Terminal Point
9.	(2, 0)	(5, 5)	10.	(4, −6)	(3, 6)
11.	(8, 3)	(6, −1)	12.	(0, −4)	(−5, −1)
13.	(6, 2)	(6, 6)	14.	(7, −1)	(−3, −1)
15.	$\left(\frac{3}{2}, \frac{4}{3}\right)$	$\left(\frac{1}{2}, 3\right)$	16.	(0.12, 0.60)	(0.84, 1.25)

Finding a Terminal Point In Exercises 17 and 18, the vector v and its initial point are given. Find the terminal point.

17. $\mathbf{v} = \langle -1, 3 \rangle$; Initial point: (4, 2)
18. $\mathbf{v} = \langle 4, -9 \rangle$; Initial point: (5, 3)

Finding a Magnitude of a Vector In Exercises 19–24, find the magnitude of v.

19. $\mathbf{v} = 4\mathbf{i}$
20. $\mathbf{v} = -9\mathbf{j}$
21. $\mathbf{v} = \langle 8, 15 \rangle$
22. $\mathbf{v} = \langle -24, 7 \rangle$
23. $\mathbf{v} = -\mathbf{i} - 5\mathbf{j}$
24. $\mathbf{v} = 3\mathbf{i} + 3\mathbf{j}$

Sketching Scalar Multiples In Exercises 25 and 26, sketch each scalar multiple of v.

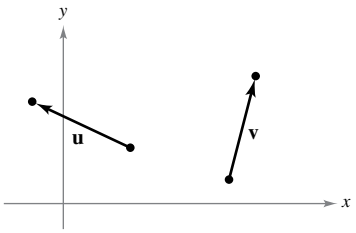
25. $\mathbf{v} = \langle 3, 5 \rangle$ (a) $2\mathbf{v}$ (b) $-3\mathbf{v}$ (c) $\frac{7}{2}\mathbf{v}$ (d) $\frac{2}{3}\mathbf{v}$
26. $\mathbf{v} = \langle -2, 3 \rangle$ (a) $4\mathbf{v}$ (b) $-\frac{1}{2}\mathbf{v}$ (c) $0\mathbf{v}$ (d) $-6\mathbf{v}$

Using Vector Operations In Exercises 27 and 28, find (a) $\frac{2}{3}\mathbf{u}$, (b) $3\mathbf{v}$, (c) $\mathbf{v} - \mathbf{u}$, and (d) $2\mathbf{u} + 5\mathbf{v}$.

27. $\mathbf{u} = \langle 4, 9 \rangle$, $\mathbf{v} = \langle 2, -5 \rangle$
28. $\mathbf{u} = \langle -3, -8 \rangle$, $\mathbf{v} = \langle 8, 7 \rangle$

Sketching a Vector In Exercises 29–34, use the figure to sketch a graph of the vector. To print an enlarged copy of the graph, go to *MathGraphs.com*.

29. $-\mathbf{u}$
30. $2\mathbf{u}$
31. $-\mathbf{v}$
32. $\frac{1}{2}\mathbf{v}$
33. $\mathbf{u} - \mathbf{v}$
34. $\mathbf{u} + 2\mathbf{v}$



Finding a Unit Vector In Exercises 35–38, find the unit vector in the direction of v and verify that it has length 1.

35. $\mathbf{v} = \langle 3, 12 \rangle$
36. $\mathbf{v} = \langle -5, 15 \rangle$
37. $\mathbf{v} = \left\langle \frac{3}{2}, \frac{5}{2} \right\rangle$
38. $\mathbf{v} = \langle -6.2, 3.4 \rangle$

Finding Magnitudes In Exercises 39–42, find the following.

(a) $\|\mathbf{u}\|$ (b) $\|\mathbf{v}\|$ (c) $\|\mathbf{u} + \mathbf{v}\|$

(d) $\left\| \frac{\mathbf{u}}{\|\mathbf{u}\|} \right\|$ (e) $\left\| \frac{\mathbf{v}}{\|\mathbf{v}\|} \right\|$ (f) $\left\| \frac{\mathbf{u} + \mathbf{v}}{\|\mathbf{u} + \mathbf{v}\|} \right\|$

39. $\mathbf{u} = \langle 1, -1 \rangle$, $\mathbf{v} = \langle -1, 2 \rangle$
40. $\mathbf{u} = \langle 0, 1 \rangle$, $\mathbf{v} = \langle 3, -3 \rangle$
41. $\mathbf{u} = \left\langle 1, \frac{1}{2} \right\rangle$, $\mathbf{v} = \langle 2, 3 \rangle$
42. $\mathbf{u} = \langle 2, -4 \rangle$, $\mathbf{v} = \langle 5, 5 \rangle$

Using the Triangle Inequality In Exercises 43 and 44, sketch a graph of u, v, and $\mathbf{u} + \mathbf{v}$. Then demonstrate the triangle inequality using the vectors u and v.

43. $\mathbf{u} = \langle 2, 1 \rangle$, $\mathbf{v} = \langle 5, 4 \rangle$
44. $\mathbf{u} = \langle -3, 2 \rangle$, $\mathbf{v} = \langle 1, -2 \rangle$

Finding a Vector In Exercises 45–48, find the vector v with the given magnitude and the same direction as u.

	Magnitude	Direction
45.	$\|\mathbf{v}\| = 6$	$\mathbf{u} = \langle 0, 3 \rangle$
46.	$\|\mathbf{v}\| = 4$	$\mathbf{u} = \langle 1, 1 \rangle$
47.	$\|\mathbf{v}\| = 5$	$\mathbf{u} = \langle -1, 2 \rangle$
48.	$\|\mathbf{v}\| = 2$	$\mathbf{u} = \langle \sqrt{3}, 3 \rangle$

Finding a Vector In Exercises 49–52, find the component form of v given its magnitude and the angle it makes with the positive x-axis.

49. $\|\mathbf{v}\| = 3, \quad \theta = 0°$
50. $\|\mathbf{v}\| = 5, \quad \theta = 120°$
51. $\|\mathbf{v}\| = 2, \quad \theta = 150°$
52. $\|\mathbf{v}\| = 4, \quad \theta = 3.5°$

Finding a Vector In Exercises 53–56, find the component form of u + v given the lengths of u and v and the angles that u and v make with the positive x-axis.

53. $\|\mathbf{u}\| = 1, \quad \theta_{\mathbf{u}} = 0°$
$\|\mathbf{v}\| = 3, \quad \theta_{\mathbf{v}} = 45°$

54. $\|\mathbf{u}\| = 4, \quad \theta_{\mathbf{u}} = 0°$
$\|\mathbf{v}\| = 2, \quad \theta_{\mathbf{v}} = 60°$

55. $\|\mathbf{u}\| = 2, \quad \theta_{\mathbf{u}} = 4$
$\|\mathbf{v}\| = 1, \quad \theta_{\mathbf{v}} = 2$

56. $\|\mathbf{u}\| = 5, \quad \theta_{\mathbf{u}} = -0.5$
$\|\mathbf{v}\| = 5, \quad \theta_{\mathbf{v}} = 0.5$

Exploring Concepts

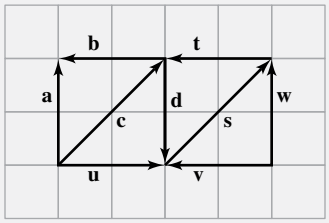
In Exercises 57 and 58, consider two forces of equal magnitude acting on a point.

57. Make a conjecture about the angle between the forces when the magnitude of the resultant is the sum of the magnitudes of the two forces.

58. Make a conjecture about the angle between the forces when the resultant of the forces is 0.

59. Consider a triangle with vertices X, Y, and Z. What is $\overrightarrow{XY} + \overrightarrow{YZ} + \overrightarrow{ZX}$? Explain.

60. **HOW DO YOU SEE IT?** Use the figure to determine whether each statement is true or false. Justify your answer.



(a) $\mathbf{a} = -\mathbf{d}$
(b) $\mathbf{c} = \mathbf{s}$
(c) $\mathbf{a} + \mathbf{u} = \mathbf{c}$
(d) $\mathbf{v} + \mathbf{w} = -\mathbf{s}$
(e) $\mathbf{a} + \mathbf{d} = \mathbf{0}$
(f) $\mathbf{u} - \mathbf{v} = -2(\mathbf{b} + \mathbf{t})$

Finding Values In Exercises 61–66, find a and b such that $\mathbf{v} = a\mathbf{u} + b\mathbf{w}$, where $\mathbf{u} = \langle 1, 2 \rangle$ and $\mathbf{w} = \langle 1, -1 \rangle$.

61. $\mathbf{v} = \langle 4, 5 \rangle$
62. $\mathbf{v} = \langle -7, -2 \rangle$
63. $\mathbf{v} = \langle -6, 0 \rangle$
64. $\mathbf{v} = \langle 0, 6 \rangle$
65. $\mathbf{v} = \langle 1, -3 \rangle$
66. $\mathbf{v} = \langle -1, 8 \rangle$

Finding Unit Vectors In Exercises 67–72, find a unit vector (a) parallel to and (b) perpendicular to the graph of f at the given point. Then sketch the graph of f and sketch the vectors at the given point.

67. $f(x) = x^2, \quad (3, 9)$
68. $f(x) = -x^2 + 5, \quad (1, 4)$
69. $f(x) = x^3, \quad (1, 1)$
70. $f(x) = x^3, \quad (-2, -8)$
71. $f(x) = \sqrt{25 - x^2}, \quad (3, 4)$
72. $f(x) = \tan x, \quad \left(\frac{\pi}{4}, 1\right)$

Finding a Vector In Exercises 73 and 74, find the component form of v given the magnitudes of u and u + v and the angles that u and u + v make with the positive x-axis.

73. $\|\mathbf{u}\| = 1, \quad \theta = 45°$
$\|\mathbf{u} + \mathbf{v}\| = \sqrt{2}, \quad \theta = 90°$

74. $\|\mathbf{u}\| = 4, \quad \theta = 30°$
$\|\mathbf{u} + \mathbf{v}\| = 6, \quad \theta = 120°$

75. **Resultant Force** Forces with magnitudes of 500 pounds and 200 pounds act on a machine part at angles of 30° and −45°, respectively, with the x-axis (see figure). Find the direction and magnitude of the resultant force.

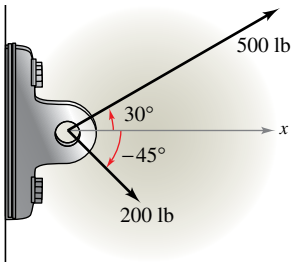


Figure for 75

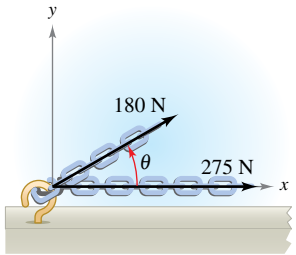

Figure for 76

76. **Numerical and Graphical Analysis** Forces with magnitudes of 180 newtons and 275 newtons act on a hook (see figure). The angle between the two forces is θ degrees.

(a) When $\theta = 30°$, find the direction and magnitude of the resultant force.

(b) Write the magnitude M and direction α of the resultant force as functions of θ, where $0° \le \theta \le 180°$.

(c) Use a graphing utility to complete the table.

θ	0°	30°	60°	90°	120°	150°	180°
M							
α							

(d) Use a graphing utility to graph the two functions M and α.

(e) Explain why one of the functions decreases for increasing values of θ, whereas the other does not.

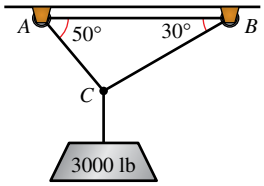
77. Resultant Force Three forces with magnitudes of 75 pounds, 100 pounds, and 125 pounds act on an object at angles of 30°, 45°, and 120°, respectively, with the positive x-axis. Find the direction and magnitude of the resultant force.

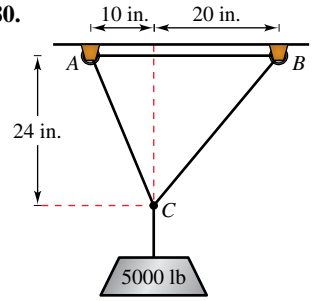
78. Resultant Force Three forces with magnitudes of 400 newtons, 280 newtons, and 350 newtons act on an object at angles of $-30°$, 45°, and 135°, respectively, with the positive x-axis. Find the direction and magnitude of the resultant force.

Cable Tension **In Exercises 79 and 80, determine the tension supporting the given load in cable *CB* and cable *CA*.**

79.



80.

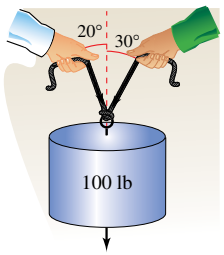


81. Proof The Associative Property of Vector Operations in Theorem 11.1 was proved on page 755. Prove the remaining properties listed in Theorem 11.1.

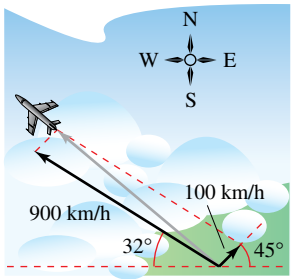
82. Shared Load To carry a 100-pound cylindrical weight, two workers lift on the ends of short ropes tied to an eyelet on the top center of the cylinder. One rope makes a 20° angle away from the vertical and the other makes a 30° angle (see figure).

(a) Find each rope's tension when the resultant force is vertical.

(b) Find the vertical component of each worker's force.



83. Navigation A plane is flying with a bearing of 302°. Its speed with respect to the air is 900 kilometers per hour. The wind at the plane's altitude is from the southwest at 100 kilometers per hour (see figure). What is the true direction of the plane, and what is its speed with respect to the ground?



84. Navigation

A plane flies at a constant ground speed of 400 miles per hour due east and encounters a 50-mile-per-hour wind from the northwest. Find the airspeed and compass direction that will allow the plane to maintain its ground speed and eastward direction.

True or False? **In Exercises 85–94, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

85. The weight of a car is a scalar.

86. The mass of a book is a scalar.

87. The temperature of your blood is a scalar.

88. The velocity of a bicycle is a vector.

89. If $\mathbf{u}$ and $\mathbf{v}$ have the same magnitude and direction, then $\mathbf{u}$ and $\mathbf{v}$ are equivalent.

90. If $\mathbf{u}$ is a unit vector in the direction of $\mathbf{v}$, then $\mathbf{v} = \|\mathbf{v}\|\mathbf{u}$.

91. If $\mathbf{u} = a\mathbf{i} + b\mathbf{j}$ is a unit vector, then $a^2 + b^2 = 1$.

92. If $\mathbf{v} = a\mathbf{i} + b\mathbf{j} = \mathbf{0}$, then $a = -b$.

93. If $a = b$, then $\|a\mathbf{i} + b\mathbf{j}\| = \sqrt{2}a$.

94. If $\mathbf{u}$ and $\mathbf{v}$ have the same magnitude but opposite directions, then $\mathbf{u} + \mathbf{v} = \mathbf{0}$.

95. Proof Prove that

$$\mathbf{u} = (\cos\theta)\mathbf{i} - (\sin\theta)\mathbf{j} \quad \text{and} \quad \mathbf{v} = (\sin\theta)\mathbf{i} + (\cos\theta)\mathbf{j}$$

are unit vectors for any angle θ.

96. Geometry Using vectors, prove that the line segment joining the midpoints of two sides of a triangle is parallel to, and one-half the length of, the third side.

97. Geometry Using vectors, prove that the diagonals of a parallelogram bisect each other.

98. Proof Prove that the vector

$$\mathbf{w} = \|\mathbf{u}\|\mathbf{v} + \|\mathbf{v}\|\mathbf{u}$$

bisects the angle between $\mathbf{u}$ and $\mathbf{v}$.

99. Using a Vector Consider the vector $\mathbf{u} = \langle x, y \rangle$. Describe the set of all points (x, y) such that $\|\mathbf{u}\| = 5$.

PUTNAM EXAM CHALLENGE

100. A coast artillery gun can fire at any angle of elevation between 0° and 90° in a fixed vertical plane. If air resistance is neglected and the muzzle velocity is constant $(= v_0)$, determine the set H of points in the plane and above the horizontal which can be hit.

This problem was composed by the Committee on the Putnam Prize Competition.

11.2 Space Coordinates and Vectors in Space

GO DIGITAL

- **Describe the three-dimensional rectangular coordinate system.**
- **Analyze vectors in space.**

Coordinates in Space

Up to this point in the text, you have been primarily concerned with the two-dimensional coordinate system. Much of the remaining part of your study of calculus will involve the three-dimensional coordinate system.

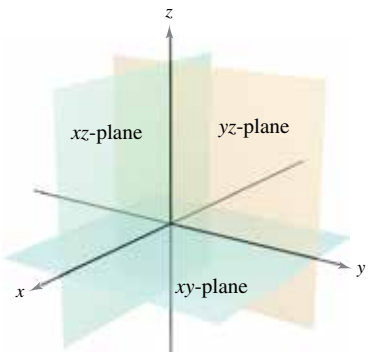
Before extending the concept of a vector to three dimensions, you must be able to identify points in the **three-dimensional coordinate system.** You can construct this system by passing a z-axis perpendicular to both the x- and y-axes at the origin, as shown in Figure 11.14. Taken as pairs, the axes determine three **coordinate planes:** the ***xy*-plane,** the ***xz*-plane,** and the ***yz*-plane.** These three coordinate planes separate three-space into eight **octants.** The first octant is the one for which all three coordinates are positive. In this three-dimensional system, a point P in space is determined by an ordered triple (x, y, z), where x, y, and z are as follows.

x = directed distance from yz-plane to P

y = directed distance from xz-plane to P

z = directed distance from xy-plane to P

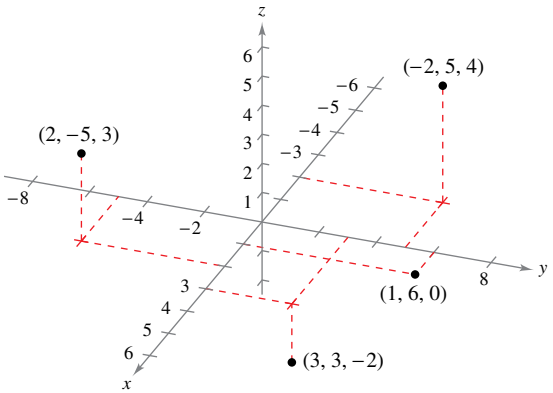
Several points are shown in Figure 11.15.



The three-dimensional coordinate system

Figure 11.14

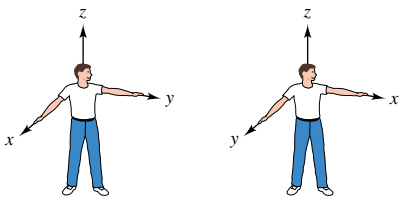
REMARK The three-dimensional rotatable graphs that are available at *LarsonCalculus.com* can help you visualize points or objects in a three-dimensional coordinate system.



Points in the three-dimensional coordinate system are represented by ordered triples.

Figure 11.15

A three-dimensional coordinate system can have either a **right-handed** or a **left-handed** orientation. To determine the orientation of a system, imagine that you are standing at the origin, with your arms pointing in the direction of the positive x- and y-axes and with the positive z-axis pointing up, as shown in Figure 11.16. The system is right-handed or left-handed depending on which hand points along the x-axis. In this text, you will work exclusively with the right-handed system.



Right-handed system

Left-handed system

The distance between two points in space

Figure 11.17

Many of the formulas established for the two-dimensional coordinate system can be extended to three dimensions. For example, to find the distance between two points in space, you can use the Pythagorean Theorem twice, as shown in Figure 11.17. By doing this, you will obtain the formula for the distance between the points (x_1, y_1, z_1) and (x_2, y_2, z_2).

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}$$ Distance Formula

EXAMPLE 1 Finding the Distance Between Two Points in Space

Find the distance between the points $(2, -1, 3)$ and $(1, 0, -2)$.

Solution

$$\begin{aligned} d &= \sqrt{(1 - 2)^2 + (0 + 1)^2 + (-2 - 3)^2} \quad \text{Distance Formula} \\ &= \sqrt{1 + 1 + 25} \\ &= \sqrt{27} \\ &= 3\sqrt{3} \end{aligned}$$

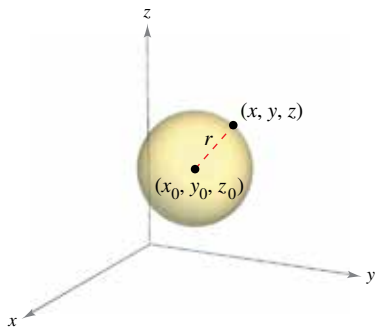

Figure 11.18

A **sphere** with center at (x_0, y_0, z_0) and radius r is defined to be the set of all points (x, y, z) such that the distance between (x, y, z) and (x_0, y_0, z_0) is r. You can use the Distance Formula to find the **standard equation of a sphere** of radius r, centered at (x_0, y_0, z_0). If (x, y, z) is an arbitrary point on the sphere, then the equation of the sphere is

$$(x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2 = r^2$$ Equation of sphere

as shown in Figure 11.18. Moreover, the midpoint of the line segment joining the points (x_1, y_1, z_1) and (x_2, y_2, z_2) has coordinates

$$\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}, \frac{z_1 + z_2}{2}\right).$$ Midpoint Formula

EXAMPLE 2 Finding the Equation of a Sphere

Find the standard equation of the sphere that has the points

$$(5, -2, 3) \quad \text{and} \quad (0, 4, -3)$$

as endpoints of a diameter.

Solution Using the Midpoint Formula, the center of the sphere is

$$\left(\frac{5 + 0}{2}, \frac{-2 + 4}{2}, \frac{3 - 3}{2}\right) = \left(\frac{5}{2}, 1, 0\right).$$ Midpoint Formula

By the Distance Formula, the radius is

$$r = \sqrt{\left(0 - \frac{5}{2}\right)^2 + (4 - 1)^2 + (-3 - 0)^2} = \sqrt{\frac{97}{4}} = \frac{\sqrt{97}}{2}.$$

So, the standard equation of the sphere is

$$\left(x - \frac{5}{2}\right)^2 + (y - 1)^2 + z^2 = \frac{97}{4}.$$ Equation of sphere

The standard unit vectors in space
Figure 11.19

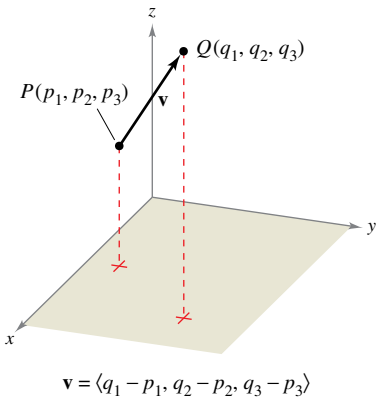

Figure 11.20

Vectors in Space

In space, vectors are denoted by ordered triples $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$. The **zero vector** is denoted by $\mathbf{0} = \langle 0, 0, 0 \rangle$. Using the unit vectors

$$\mathbf{i} = \langle 1, 0, 0 \rangle, \quad \mathbf{j} = \langle 0, 1, 0 \rangle, \quad \text{and} \quad \mathbf{k} = \langle 0, 0, 1 \rangle$$

the **standard unit vector notation** for $\mathbf{v}$ is

$$\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$$

as shown in Figure 11.19. If $\mathbf{v}$ is represented by the directed line segment from $P(p_1, p_2, p_3)$ to $Q(q_1, q_2, q_3)$, as shown in Figure 11.20, then the component form of $\mathbf{v}$ is written by subtracting the coordinates of the initial point from the coordinates of the terminal point, as follows.

$$\mathbf{v} = \langle v_1, v_2, v_3 \rangle = \langle q_1 - p_1, q_2 - p_2, q_3 - p_3 \rangle$$

Vectors in Space

Let $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$ and $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$ be vectors in space and let c be a scalar.

1. *Equality of Vectors:* $\mathbf{u} = \mathbf{v}$ if and only if $u_1 = v_1$, $u_2 = v_2$, and $u_3 = v_3$.
2. *Component Form:* If $\mathbf{v}$ is represented by the directed line segment from $P(p_1, p_2, p_3)$ to $Q(q_1, q_2, q_3)$, then
$$\mathbf{v} = \langle v_1, v_2, v_3 \rangle = \langle q_1 - p_1, q_2 - p_2, q_3 - p_3 \rangle.$$
3. *Length:* $\|\mathbf{v}\| = \sqrt{v_1^2 + v_2^2 + v_3^2}$
4. *Unit Vector in the Direction of* $\mathbf{v}$: $\dfrac{\mathbf{v}}{\|\mathbf{v}\|} = \left(\dfrac{1}{\|\mathbf{v}\|}\right)\langle v_1, v_2, v_3 \rangle, \quad \mathbf{v} \neq \mathbf{0}$
5. *Vector Addition:* $\mathbf{v} + \mathbf{u} = \langle v_1 + u_1, v_2 + u_2, v_3 + u_3 \rangle$
6. *Scalar Multiplication:* $c\mathbf{v} = \langle cv_1, cv_2, cv_3 \rangle$

Note that the properties of vector operations listed in Theorem 11.1 (see Section 11.1) are also valid for vectors in space.

EXAMPLE 3 Finding the Component Form of a Vector in Space

See LarsonCalculus.com for an interactive version of this type of example.

Find the component form and magnitude of the vector $\mathbf{v}$ having initial point $(-2, 3, 1)$ and terminal point $(0, -4, 4)$. Then find a unit vector in the direction of $\mathbf{v}$.

Solution The component form of $\mathbf{v}$ is

$$\mathbf{v} = \langle q_1 - p_1, q_2 - p_2, q_3 - p_3 \rangle = \langle 0 - (-2), -4 - 3, 4 - 1 \rangle = \langle 2, -7, 3 \rangle$$

which implies that its magnitude is

$$\|\mathbf{v}\| = \sqrt{2^2 + (-7)^2 + 3^2} = \sqrt{62}.$$

A unit vector in the direction of $\mathbf{v}$ is

$$\begin{aligned} \mathbf{u} &= \frac{\mathbf{v}}{\|\mathbf{v}\|} \\ &= \frac{1}{\sqrt{62}}\langle 2, -7, 3 \rangle \\ &= \left\langle \frac{2}{\sqrt{62}}, \frac{-7}{\sqrt{62}}, \frac{3}{\sqrt{62}} \right\rangle. \end{aligned}$$

Parallel vectors
Figure 11.21

Recall from the definition of scalar multiplication that positive scalar multiples of a nonzero vector **v** have the same direction as **v**, whereas negative multiples have the direction opposite of **v**. In general, two nonzero vectors **u** and **v** are **parallel** when there is some scalar c such that $\mathbf{u} = c\mathbf{v}$. For example, in Figure 11.21, the vectors **u**, **v**, and **w** are parallel because

$$\mathbf{u} = 2\mathbf{v} \quad \text{and} \quad \mathbf{w} = -\mathbf{v}.$$

Definition of Parallel Vectors

Two nonzero vectors **u** and **v** are **parallel** when there is some scalar c such that $\mathbf{u} = c\mathbf{v}$.

EXAMPLE 4 Parallel Vectors

Vector **w** has initial point $(2, -1, 3)$ and terminal point $(-4, 7, 5)$. Which of the following vectors is parallel to **w**?

a. $\mathbf{u} = \langle 3, -4, -1 \rangle$

b. $\mathbf{v} = \langle 12, -16, 4 \rangle$

Solution Begin by writing **w** in component form.

$$\mathbf{w} = \langle -4 - 2, 7 - (-1), 5 - 3 \rangle = \langle -6, 8, 2 \rangle$$

a. Because $\mathbf{u} = \langle 3, -4, -1 \rangle = -\frac{1}{2}\langle -6, 8, 2 \rangle = -\frac{1}{2}\mathbf{w}$, you can conclude that **u** is parallel to **w**.

b. In this case, you want to find a scalar c such that

$$\langle 12, -16, 4 \rangle = c\langle -6, 8, 2 \rangle.$$

To find c, equate the corresponding components and solve as shown.

$$\begin{aligned} 12 &= -6c \quad \Rightarrow \quad c = -2 \\ -16 &= 8c \quad \Rightarrow \quad c = -2 \\ 4 &= 2c \quad \Rightarrow \quad c = 2 \end{aligned}$$

Note that $c = -2$ for the first two components and $c = 2$ for the third component. This means that the equation $\langle 12, -16, 4 \rangle = c\langle -6, 8, 2 \rangle$ has no solution, and the vectors are not parallel.

EXAMPLE 5 Using Vectors to Determine Collinear Points

Determine whether the points

$$P(1, -2, 3), \quad Q(2, 1, 0), \quad \text{and} \quad R(4, 7, -6)$$

are collinear.

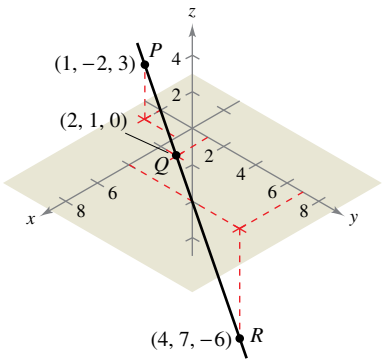
Solution The component forms of $\overrightarrow{PQ}$ and $\overrightarrow{PR}$ are

$$\overrightarrow{PQ} = \langle 2 - 1, 1 - (-2), 0 - 3 \rangle = \langle 1, 3, -3 \rangle$$

and

$$\overrightarrow{PR} = \langle 4 - 1, 7 - (-2), -6 - 3 \rangle = \langle 3, 9, -9 \rangle.$$

These two vectors have a common initial point. So, P, Q, and R lie on the same line if and only if $\overrightarrow{PQ}$ and $\overrightarrow{PR}$ are parallel—which they are because $\overrightarrow{PR} = 3\overrightarrow{PQ}$, as shown in Figure 11.22.



The points P, Q, and R lie on the same line.
Figure 11.22

GO DIGITAL

EXAMPLE 6 Standard Unit Vector Notation

a. Write the vector $\mathbf{v} = 4\mathbf{i} - 5\mathbf{k}$ in component form.

b. Find the terminal point of the vector $\mathbf{v} = 7\mathbf{i} - \mathbf{j} + 3\mathbf{k}$, given that the initial point is $P(-2, 3, 5)$.

c. Find the magnitude of the vector $\mathbf{v} = -6\mathbf{i} + 2\mathbf{j} - 3\mathbf{k}$. Then find a unit vector in the direction of $\mathbf{v}$.

Solution

a. Because $\mathbf{j}$ is missing, its component is 0 and

$$\mathbf{v} = 4\mathbf{i} - 5\mathbf{k} = \langle 4, 0, -5 \rangle.$$

b. You need to find $Q(q_1, q_2, q_3)$ such that

$$\mathbf{v} = \overrightarrow{PQ} = 7\mathbf{i} - \mathbf{j} + 3\mathbf{k}.$$

This implies that $q_1 - (-2) = 7$, $q_2 - 3 = -1$, and $q_3 - 5 = 3$. The solution of these three equations is $q_1 = 5$, $q_2 = 2$, and $q_3 = 8$. So, Q is $(5, 2, 8)$.

c. Note that $v_1 = -6$, $v_2 = 2$, and $v_3 = -3$. So, the magnitude of $\mathbf{v}$ is

$$\|\mathbf{v}\| = \sqrt{(-6)^2 + 2^2 + (-3)^2} = \sqrt{49} = 7.$$

The unit vector in the direction of $\mathbf{v}$ is

$$\frac{1}{7}(-6\mathbf{i} + 2\mathbf{j} - 3\mathbf{k}) = -\frac{6}{7}\mathbf{i} + \frac{2}{7}\mathbf{j} - \frac{3}{7}\mathbf{k}.$$

EXAMPLE 7 Measuring Force

A professional video camera weighing 9 pounds is supported by a tripod, as shown in Figure 11.23. Represent the force exerted on each leg of the tripod as a vector.

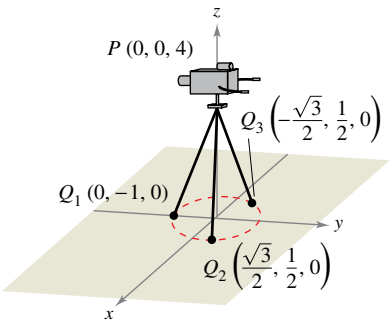

Figure 11.23

Solution

Let the vectors $\mathbf{F}_1$, $\mathbf{F}_2$, and $\mathbf{F}_3$ represent the forces exerted on the three legs. From Figure 11.23, you can determine the directions of $\mathbf{F}_1$, $\mathbf{F}_2$, and $\mathbf{F}_3$ to be as follows.

$$\mathbf{F}_1 = \overrightarrow{PQ}_1 = \langle 0 - 0, -1 - 0, 0 - 4 \rangle = \langle 0, -1, -4 \rangle$$

$$\mathbf{F}_2 = \overrightarrow{PQ}_2 = \left\langle \frac{\sqrt{3}}{2} - 0, \frac{1}{2} - 0, 0 - 4 \right\rangle = \left\langle \frac{\sqrt{3}}{2}, \frac{1}{2}, -4 \right\rangle$$

$$\mathbf{F}_3 = \overrightarrow{PQ}_3 = \left\langle -\frac{\sqrt{3}}{2} - 0, \frac{1}{2} - 0, 0 - 4 \right\rangle = \left\langle -\frac{\sqrt{3}}{2}, \frac{1}{2}, -4 \right\rangle.$$

Because all three legs have the same length and the total force is distributed equally among the three legs, you know that $\|\mathbf{F}_1\| = \|\mathbf{F}_2\| = \|\mathbf{F}_3\|$. So, there exists a constant c such that

$$\mathbf{F}_1 = c\langle 0, -1, -4 \rangle, \quad \mathbf{F}_2 = c\left\langle \frac{\sqrt{3}}{2}, \frac{1}{2}, -4 \right\rangle, \quad \text{and} \quad \mathbf{F}_3 = c\left\langle -\frac{\sqrt{3}}{2}, \frac{1}{2}, -4 \right\rangle.$$

Let the total force exerted by the object be given by $\mathbf{F} = \langle 0, 0, -9 \rangle$. Then, using the fact that

$$\mathbf{F} = \mathbf{F}_1 + \mathbf{F}_2 + \mathbf{F}_3$$

you can conclude that $\mathbf{F}_1$, $\mathbf{F}_2$, and $\mathbf{F}_3$ all have a vertical component of -3. This implies that $c(-4) = -3$ and $c = 3/4$. So, the forces exerted on the legs can be represented by

$$\mathbf{F}_1 = \left\langle 0, -\frac{3}{4}, -3 \right\rangle, \quad \mathbf{F}_2 = \left\langle \frac{3\sqrt{3}}{8}, \frac{3}{8}, -3 \right\rangle, \quad \text{and} \quad \mathbf{F}_3 = \left\langle -\frac{3\sqrt{3}}{8}, \frac{3}{8}, -3 \right\rangle.$$

11.2 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. A point in the three-dimensional coordinate system has coordinates (x_0, y_0, z_0). Describe what each coordinate measures.
2. Explain why the y-coordinate of any point in the xz-plane is 0.
3. Describe the graph of $x = 4$ on (a) the number line, (b) the two-dimensional coordinate system, and (c) the three-dimensional coordinate system.
4. Explain how to determine whether two nonzero vectors $\mathbf{u}$ and $\mathbf{v}$ are parallel.

Plotting Points **In Exercises 5–8, plot the points in the same three-dimensional coordinate system.**

5. (a) $(2, 1, 3)$ (b) $(-1, 2, 1)$
6. (a) $(3, -2, 5)$ (b) $\left(\frac{3}{2}, 4, -2\right)$
7. (a) $(5, -2, 2)$ (b) $(5, -2, -2)$
8. (a) $(0, 4, -5)$ (b) $(4, 0, 5)$

Finding Coordinates of a Point **In Exercises 9–12, find the coordinates of the point.**

9. The point is located three units behind the yz-plane, four units to the right of the xz-plane, and five units above the xy-plane.
10. The point is located seven units in front of the yz-plane, two units to the left of the xz-plane, and one unit below the xy-plane.
11. The point is located on the x-axis, 12 units in front of the yz-plane.
12. The point is located in the yz-plane, three units to the right of the xz-plane, and two units above the xy-plane.

Using the Three-Dimensional Coordinate System **In Exercises 13–24, determine the location of a point (x, y, z) that satisfies the condition(s).**

13. $z = 1$
14. $y = 6$
15. $x = -3$
16. $z = -5$
17. $y < 0$
18. $x > 0$
19. $|y| \leq 3$
20. $|x| > 4$
21. $xy > 0, \quad z = -3$
22. $xy < 0, \quad z = 4$
23. $xyz < 0$
24. $xyz > 0$

Finding the Distance Between Two Points in Space **In Exercises 25–28, find the distance between the points.**

25. $(4, 1, 5), (8, 2, 6)$
26. $(-1, 1, 1), (-3, 5, -3)$
27. $(0, 2, 4), (3, 2, 8)$
28. $(-3, 7, 1), (-5, 8, -4)$

Classifying a Triangle **In Exercises 29–32, find the lengths of the sides of the triangle with the indicated vertices, and determine whether the triangle is a right triangle, an isosceles triangle, or neither.**

29. $(0, 0, 4), (2, 6, 7), (6, 4, -8)$
30. $(3, 4, 1), (0, 6, 2), (3, 5, 6)$
31. $(-1, 0, -2), (-1, 5, 2), (-3, -1, 1)$
32. $(4, -1, -1), (2, 0, -4), (3, 5, -1)$

Finding the Midpoint **In Exercises 33–36, find the coordinates of the midpoint of the line segment joining the points.**

33. $(4, 0, -6), (8, 8, 20)$
34. $(7, 2, 2), (-5, -2, -3)$
35. $(3, 4, 6), (1, 8, 0)$
36. $(5, -9, 7), (-2, 3, 3)$

Finding the Equation of a Sphere **In Exercises 37–42, find the standard equation of the sphere with the given characteristics.**

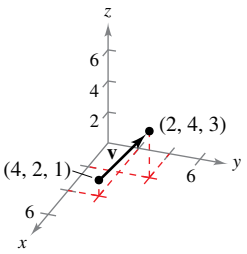
37. Center: $(7, 1, -2)$; Radius: 1
38. Center: $(-1, -5, 8)$; Radius: 5
39. Endpoints of a diameter: $(2, 1, 3), (1, 3, -1)$
40. Endpoints of a diameter: $(-2, 4, -5), (-4, 0, 3)$
41. Center: $(-7, 7, 6)$, tangent to the xy-plane
42. Center: $(-4, 0, 0)$, tangent to the yz-plane

Finding the Equation of a Sphere **In Exercises 43–46, complete the square to write the equation of the sphere in standard form. Find the center and radius.**

43. $x^2 + y^2 + z^2 - 2x + 6y + 8z + 1 = 0$
44. $x^2 + y^2 + z^2 + 9x - 2y + 10z + 19 = 0$
45. $9x^2 + 9y^2 + 9z^2 - 6x + 18y + 1 = 0$
46. $4x^2 + 4y^2 + 4z^2 - 24x - 4y + 8z - 23 = 0$

Finding the Component Form of a Vector in Space **In Exercises 47 and 48, (a) find the component form of the vector $\mathbf{v}$, (b) write the vector using standard unit vector notation, and (c) sketch the vector with its initial point at the origin.**

47.



48.

Writing a Vector in Different Forms **In Exercises 49 and 50, the initial and terminal points of a vector v are given. (a) Sketch the directed line segment. (b) Find the component form of the vector. (c) Write the vector using standard unit vector notation. (d) Sketch the vector with its initial point at the origin.**

49. Initial point: $(-1, 2, 3)$
Terminal point: $(3, 3, 4)$

50. Initial point: $(2, -1, -2)$
Terminal point: $(-4, 3, 7)$

Finding the Component Form of a Vector in Space **In Exercises 51–54, find the component form and magnitude of the vector v with the given initial and terminal points. Then find a unit vector in the direction of v.**

51. Initial point: $(3, 2, 0)$
Terminal point: $(4, 1, 6)$

52. Initial point: $(1, -2, 4)$
Terminal point: $(2, 4, -2)$

53. Initial point: $(4, 2, 0)$
Terminal point: $(0, 5, 2)$

54. Initial point: $(1, -2, 0)$
Terminal point: $(1, -2, -3)$

Finding a Terminal Point **In Exercises 55 and 56, the vector v and its initial point are given. Find the terminal point.**

55. $\mathbf{v} = \langle 3, -5, 6 \rangle$
Initial point: $(0, 6, 2)$

56. $\mathbf{v} = \left\langle 1, -\frac{2}{3}, \frac{1}{2} \right\rangle$
Initial point: $\left(0, 2, \frac{5}{2}\right)$

Finding Scalar Multiples **In Exercises 57 and 58, find each scalar multiple of v and sketch its graph.**

57. $\mathbf{v} = \langle 1, 2, 2 \rangle$
(a) $2\mathbf{v}$ (b) $-\mathbf{v}$
(c) $\frac{3}{2}\mathbf{v}$ (d) $0\mathbf{v}$

58. $\mathbf{v} = \langle 2, -2, 1 \rangle$
(a) $-\mathbf{v}$ (b) $2\mathbf{v}$
(c) $\frac{1}{2}\mathbf{v}$ (d) $\frac{5}{2}\mathbf{v}$

Finding a Vector **In Exercises 59–62, find the vector z, given that $\mathbf{u} = \langle 1, 2, 3 \rangle$, $\mathbf{v} = \langle 2, 2, -1 \rangle$, and $\mathbf{w} = \langle 4, 0, -4 \rangle$.**

59. $\mathbf{z} = \mathbf{u} - \mathbf{v} + \mathbf{w}$

60. $\mathbf{z} = 5\mathbf{u} - 3\mathbf{v} - \frac{1}{2}\mathbf{w}$

61. $\frac{1}{3}\mathbf{z} - 3\mathbf{u} = \mathbf{w}$

62. $2\mathbf{u} + \mathbf{v} - \mathbf{w} + 3\mathbf{z} = \mathbf{0}$

Parallel Vectors **In Exercises 63–66, determine which of the vectors are parallel to z. Use a graphing utility to confirm your results.**

63. $\mathbf{z} = \langle 3, 2, -5 \rangle$
(a) $\langle -6, -4, 10 \rangle$
(b) $\left\langle 2, \frac{4}{3}, -\frac{10}{3} \right\rangle$
(c) $\langle 6, 4, 10 \rangle$
(d) $\langle 1, -4, 2 \rangle$

64. $\mathbf{z} = \frac{1}{2}\mathbf{i} - \frac{2}{3}\mathbf{j} + \frac{3}{4}\mathbf{k}$
(a) $6\mathbf{i} - 4\mathbf{j} + 9\mathbf{k}$
(b) $-\mathbf{i} + \frac{4}{3}\mathbf{j} - \frac{3}{2}\mathbf{k}$
(c) $12\mathbf{i} + 9\mathbf{k}$
(d) $\frac{3}{4}\mathbf{i} - \mathbf{j} + \frac{9}{8}\mathbf{k}$

65. z has initial point $(1, -1, 3)$ and terminal point $(-2, 3, 5)$.
(a) $-6\mathbf{i} + 8\mathbf{j} + 4\mathbf{k}$ (b) $4\mathbf{j} + 2\mathbf{k}$

66. z has initial point $(5, 4, 1)$ and terminal point $(-2, -4, 4)$.
(a) $\langle 7, 6, 2 \rangle$ (b) $\langle 14, 16, -6 \rangle$

Using Vectors to Determine Collinear Points **In Exercises 67–70, use vectors to determine whether the points are collinear.**

67. $(0, -2, -5)$, $(3, 4, 4)$, $(2, 2, 1)$

68. $(4, -2, 7)$, $(-2, 0, 3)$, $(7, -3, 9)$

69. $(1, 2, 4)$, $(2, 5, 0)$, $(0, 1, 5)$

70. $(0, 0, 0)$, $(1, 3, -2)$, $(2, -6, 4)$

Verifying a Parallelogram **In Exercises 71 and 72, use vectors to show that the points form the vertices of a parallelogram.**

71. $(2, 9, 1)$, $(3, 11, 4)$, $(0, 10, 2)$, $(1, 12, 5)$

72. $(1, 1, 3)$, $(9, -1, -2)$, $(11, 2, -9)$, $(3, 4, -4)$

Finding the Magnitude **In Exercises 73–78, find the magnitude of v.**

73. $\mathbf{v} = \langle -1, 0, 1 \rangle$

74. $\mathbf{v} = \langle -5, -3, -4 \rangle$

75. $\mathbf{v} = 3\mathbf{j} - 5\mathbf{k}$

76. $\mathbf{v} = 2\mathbf{i} + 5\mathbf{j} - \mathbf{k}$

77. $\mathbf{v} = \mathbf{i} - 2\mathbf{j} - 3\mathbf{k}$

78. $\mathbf{v} = -4\mathbf{i} + 3\mathbf{j} + 7\mathbf{k}$

Finding Unit Vectors **In Exercises 79–82, find a unit vector (a) in the direction of v and (b) in the direction opposite of v.**

79. $\mathbf{v} = \langle 2, -1, 2 \rangle$

80. $\mathbf{v} = \langle 6, 0, 8 \rangle$

81. $\mathbf{v} = 4\mathbf{i} - 5\mathbf{j} + 3\mathbf{k}$

82. $\mathbf{v} = 5\mathbf{i} + 3\mathbf{j} - \mathbf{k}$

Finding a Vector **In Exercises 83–86, find the vector v with the given magnitude and the same direction as u.**

	Magnitude	Direction
83.	$\|\mathbf{v}\| = 10$	$\mathbf{u} = \langle 0, 3, 3 \rangle$
84.	$\|\mathbf{v}\| = 3$	$\mathbf{u} = \langle 1, 1, 1 \rangle$
85.	$\|\mathbf{v}\| = \frac{3}{2}$	$\mathbf{u} = \langle 2, -2, 1 \rangle$
86.	$\|\mathbf{v}\| = 7$	$\mathbf{u} = \langle -4, 6, 2 \rangle$

Sketching a Vector **In Exercises 87 and 88, sketch the vector v and write its component form.**

87. **v** lies in the yz-plane, has magnitude 2, and makes an angle of $30°$ with the positive y-axis.

88. **v** lies in the xz-plane, has magnitude 5, and makes an angle of $45°$ with the positive z-axis.

Finding a Point Using Vectors **In Exercises 89 and 90, use vectors to find the point that lies two-thirds of the way from P to Q.**

89. $P(4, 3, 0)$, $Q(1, -3, 3)$

90. $P(1, 2, 5)$, $Q(6, 8, 2)$

Exploring Concepts

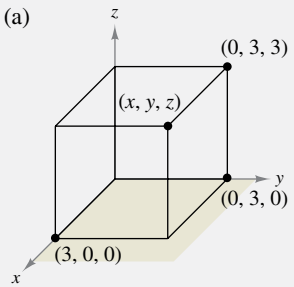
91. The initial and terminal points of the vector $\mathbf{v}$ are (x_1, y_1, z_1) and (x, y, z). Describe the set of all points (x, y, z) such that $\|\mathbf{v}\| = 4$.

92. Let $\mathbf{r} = \langle x, y, z \rangle$ and $\mathbf{r}_0 = \langle 1, 1, 1 \rangle$. Describe the set of all points (x, y, z) such that $\|\mathbf{r} - \mathbf{r}_0\| = 2$.

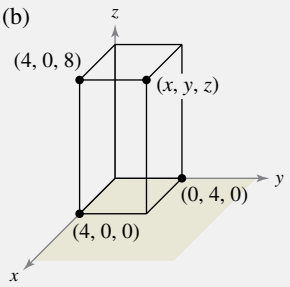
93. Let $\mathbf{r} = \langle x, y, z \rangle$. Describe the set of all points (x, y, z) such that $\|\mathbf{r}\| > 1$.

94. HOW DO YOU SEE IT? Determine (x, y, z) for each figure. Then find the component form of the vector from the point on the x-axis to the point (x, y, z).

(a)



(b)



95. Using Vectors Consider two nonzero vectors $\mathbf{u}$ and $\mathbf{v}$, and let s and t be real numbers. Describe the geometric figure generated by connecting the terminal points of the three vectors $t\mathbf{v}$, $\mathbf{u} + t\mathbf{v}$, and $s\mathbf{u} + t\mathbf{v}$.

96. Using Vectors Let $\mathbf{u} = \mathbf{i} + \mathbf{j}$, $\mathbf{v} = \mathbf{j} + \mathbf{k}$, and $\mathbf{w} = a\mathbf{u} + b\mathbf{v}$.

(a) Sketch $\mathbf{u}$ and $\mathbf{v}$.

(b) If $\mathbf{w} = \mathbf{0}$, show that a and b must both be zero.

(c) Find a and b such that $\mathbf{w} = \mathbf{i} + 2\mathbf{j} + \mathbf{k}$.

(d) Show that no choice of a and b yields $\mathbf{w} = \mathbf{i} + 2\mathbf{j} + 3\mathbf{k}$.

97. Diagonal of a Cube Find the component form of the unit vector $\mathbf{v}$ in the direction of the diagonal of the cube shown in the figure.

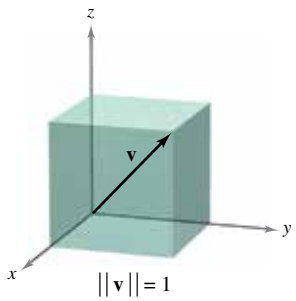


Figure for 97

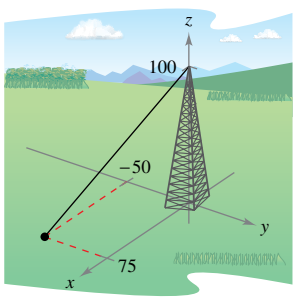

Figure for 98

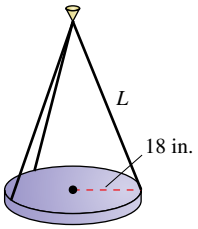
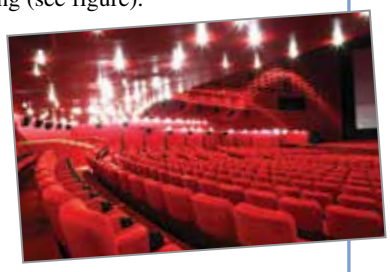
98. Tower Guy Wire The guy wire supporting a 100-foot tower has a tension of 550 pounds. Using the distance shown in the figure, write the component form of the vector $\mathbf{F}$ representing the tension in the wire.

99. Auditorium Lights

The lights in an auditorium are 24-pound discs of radius 18 inches. Each disc is supported by three equally spaced cables that are L inches long (see figure).





(a) Write the tension T in each cable as a function of L. Determine the domain of the function.

(b) Use a graphing utility and the function in part (a) to complete the table.

L	20	25	30	35	40	45	50
T							

(c) Use a graphing utility to graph the function in part (a). Determine the asymptotes of the graph.

(d) Confirm the asymptotes of the graph in part (c) analytically.

(e) Determine the minimum length of each cable when a cable is designed to carry a maximum load of 10 pounds.

100. Think About It Suppose the length of each cable in Exercise 99 has a fixed length $L = a$ and the radius of each disc is r_0 inches. Make a conjecture about the limit $\lim_{r_0 \to a^-} T$ and give a reason for your answer.

101. Load Supports Find the tension in each of the supporting cables in the figure when the weight of the crate is 500 newtons.

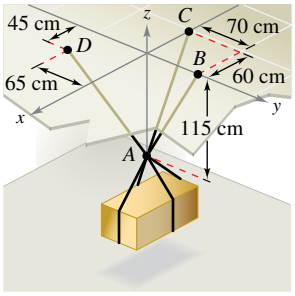


Figure for 101

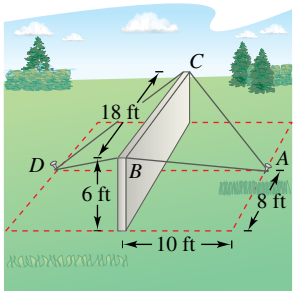

Figure for 102

102. Construction A precast concrete wall is temporarily kept in its vertical position by ropes (see figure). Find the total force exerted on the pin at position A. The tensions in AB and AC are 420 pounds and 650 pounds, respectively.

103. Geometry Write an equation whose graph consists of the set of points $P(x, y, z)$ that are twice as far from $A(0, -1, 1)$ as from $B(1, 2, 0)$. Describe the geometric figure represented by the equation.

11.3 The Dot Product of Two Vectors

GO DIGITAL

- Use properties of the dot product of two vectors.
- Find the angle between two vectors using the dot product.
- Find the direction cosines of a vector in space.
- Find the projection of a vector onto another vector.
- Use vectors to find the work done by a constant force.

The Dot Product

So far, you have studied two operations with vectors—vector addition and multiplication by a scalar—each of which yields another vector. In this section, you will study a third vector operation, the **dot product.** This product yields a scalar, rather than a vector.

REMARK Because the dot product of two vectors yields a scalar, it is also called the *scalar product* (or *inner product*) of the two vectors.

Definition of Dot Product

The **dot product** of $\mathbf{u} = \langle u_1, u_2 \rangle$ and $\mathbf{v} = \langle v_1, v_2 \rangle$ is

$$\mathbf{u} \cdot \mathbf{v} = u_1v_1 + u_2v_2.$$

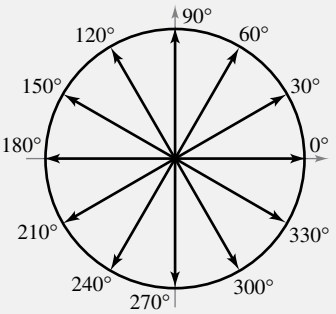
The **dot product** of $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$ and $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$ is

$$\mathbf{u} \cdot \mathbf{v} = u_1v_1 + u_2v_2 + u_3v_3.$$

Exploration

Interpreting a Dot Product

Several vectors are shown below on the unit circle. Find the dot products of several pairs of vectors. Then find the angle between each pair that you used. Make a conjecture about the relationship between the dot product of two vectors and the angle between the vectors.



THEOREM 11.4 Properties of the Dot Product

Let $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$ be vectors in the plane or in space and let c be a scalar.

1. $\mathbf{u} \cdot \mathbf{v} = \mathbf{v} \cdot \mathbf{u}$ — Commutative Property
2. $\mathbf{u} \cdot (\mathbf{v} + \mathbf{w}) = \mathbf{u} \cdot \mathbf{v} + \mathbf{u} \cdot \mathbf{w}$ — Distributive Property
3. $c(\mathbf{u} \cdot \mathbf{v}) = c\mathbf{u} \cdot \mathbf{v} = \mathbf{u} \cdot c\mathbf{v}$ — Associative Property
4. $\mathbf{0} \cdot \mathbf{v} = 0$
5. $\mathbf{v} \cdot \mathbf{v} = \|\mathbf{v}\|^2$

Proof To prove the first property, let $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$ and $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$. Then

$$\mathbf{u} \cdot \mathbf{v} = u_1v_1 + u_2v_2 + u_3v_3 = v_1u_1 + v_2u_2 + v_3u_3 = \mathbf{v} \cdot \mathbf{u}.$$

For the fifth property, let $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$. Then

$$\mathbf{v} \cdot \mathbf{v} = v_1^2 + v_2^2 + v_3^2 = \left(\sqrt{v_1^2 + v_2^2 + v_3^2}\right)^2 = \|\mathbf{v}\|^2.$$

Proofs of the other properties are left to you. ■

EXAMPLE 1 Finding Dot Products

Let $\mathbf{u} = \langle 2, -2 \rangle$, $\mathbf{v} = \langle 5, 8 \rangle$, and $\mathbf{w} = \langle -4, 3 \rangle$.

a. $\mathbf{u} \cdot \mathbf{v} = \langle 2, -2 \rangle \cdot \langle 5, 8 \rangle = 2(5) + (-2)(8) = -6$

b. $(\mathbf{u} \cdot \mathbf{v})\mathbf{w} = -6\langle -4, 3 \rangle = \langle 24, -18 \rangle$

c. $\mathbf{u} \cdot (2\mathbf{v}) = 2(\mathbf{u} \cdot \mathbf{v}) = 2(-6) = -12$

d. $\|\mathbf{w}\|^2 = \mathbf{w} \cdot \mathbf{w} = \langle -4, 3 \rangle \cdot \langle -4, 3 \rangle = (-4)(-4) + (3)(3) = 25$

Notice that the result of part (b) is a *vector* quantity, whereas the results of the other three parts are *scalar* quantities. ■

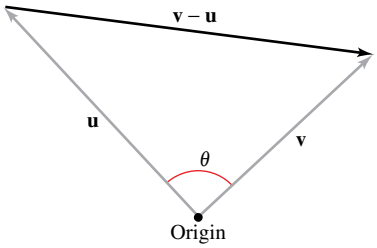
Angle Between Two Vectors

The **angle between two nonzero vectors** is the angle θ, $0 \le \theta \le \pi$, between their respective standard position vectors, as shown in Figure 11.24. The next theorem shows how to find this angle using the dot product. (Note that the angle between the zero vector and another vector is not defined here.)

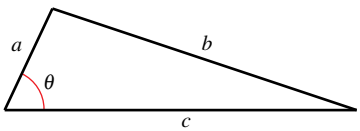


The angle between two vectors
Figure 11.24

THEOREM 11.5 Angle Between Two Vectors

If θ is the angle between two nonzero vectors $\mathbf{u}$ and $\mathbf{v}$, where $0 \le \theta \le \pi$, then

$$\cos\theta = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\|\,\|\mathbf{v}\|}.$$



Law of Cosines:
$b^2 = a^2 + c^2 - 2ac\cos\theta$
Figure 11.25

Proof Consider the triangle determined by vectors $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{v} - \mathbf{u}$, as shown in Figure 11.24. By the Law of Cosines (see Figure 11.25),

$$\|\mathbf{v} - \mathbf{u}\|^2 = \|\mathbf{u}\|^2 + \|\mathbf{v}\|^2 - 2\|\mathbf{u}\|\,\|\mathbf{v}\|\cos\theta.$$

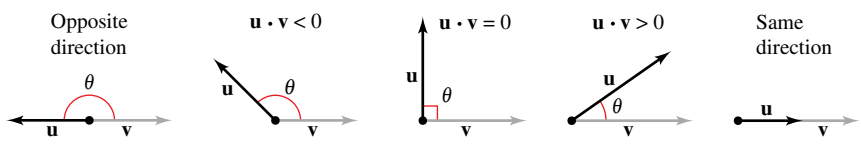
Using the properties of the dot product, the left side can be rewritten as

$$\begin{aligned}\|\mathbf{v} - \mathbf{u}\|^2 &= (\mathbf{v} - \mathbf{u}) \cdot (\mathbf{v} - \mathbf{u}) \\ &= (\mathbf{v} - \mathbf{u}) \cdot \mathbf{v} - (\mathbf{v} - \mathbf{u}) \cdot \mathbf{u} \\ &= \mathbf{v} \cdot \mathbf{v} - \mathbf{u} \cdot \mathbf{v} - \mathbf{v} \cdot \mathbf{u} + \mathbf{u} \cdot \mathbf{u} \\ &= \|\mathbf{v}\|^2 - 2\mathbf{u} \cdot \mathbf{v} + \|\mathbf{u}\|^2\end{aligned}$$

and substitution back into the Law of Cosines yields

$$\begin{aligned}\|\mathbf{v}\|^2 - 2\mathbf{u} \cdot \mathbf{v} + \|\mathbf{u}\|^2 &= \|\mathbf{u}\|^2 + \|\mathbf{v}\|^2 - 2\|\mathbf{u}\|\,\|\mathbf{v}\|\cos\theta \\ -2\mathbf{u} \cdot \mathbf{v} &= -2\|\mathbf{u}\|\,\|\mathbf{v}\|\cos\theta \\ \cos\theta &= \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\|\,\|\mathbf{v}\|}.\end{aligned}$$

Note in Theorem 11.5 that because $\|\mathbf{u}\|$ and $\|\mathbf{v}\|$ are always positive, $\mathbf{u} \cdot \mathbf{v}$ and $\cos\theta$ will always have the same sign. Figure 11.26 shows the possible orientations of two vectors.



$\theta = \pi$	$\pi/2 < \theta < \pi$	$\theta = \pi/2$	$0 < \theta < \pi/2$	$\theta = 0$
$\cos\theta = -1$	$-1 < \cos\theta < 0$	$\cos\theta = 0$	$0 < \cos\theta < 1$	$\cos\theta = 1$

GO DIGITAL

From Theorem 11.5, you can determine that two nonzero vectors meet at a right angle if and only if their dot product is zero. Two such vectors are said to be **orthogonal.**

Definition of Orthogonal Vectors

The vectors $\mathbf{u}$ and $\mathbf{v}$ are orthogonal when $\mathbf{u} \cdot \mathbf{v} = 0$.

REMARK The terms "perpendicular," "orthogonal," and "normal" all mean essentially the same thing—meeting at right angles. It is common, however, to say that two vectors are *orthogonal*, two lines or planes are *perpendicular*, and a vector is *normal* to a line or plane.

From this definition, it follows that the zero vector is orthogonal to every vector $\mathbf{u}$, because $\mathbf{0} \cdot \mathbf{u} = 0$. Moreover, for $0 \leq \theta \leq \pi$, you know that $\cos\theta = 0$ if and only if $\theta = \pi/2$. So, you can use Theorem 11.5 to conclude that two *nonzero* vectors are orthogonal if and only if the angle between them is $\pi/2$.

EXAMPLE 2 Finding the Angle Between Two Vectors

See LarsonCalculus.com for an interactive version of this type of example.

For $\mathbf{u} = \langle 3, -1, 2\rangle$, $\mathbf{v} = \langle -4, 0, 2\rangle$, $\mathbf{w} = \langle 1, -1, -2\rangle$, and $\mathbf{z} = \langle 2, 0, -1\rangle$, find the angle between each pair of vectors.

a. $\mathbf{u}$ and $\mathbf{v}$ **b.** $\mathbf{u}$ and $\mathbf{w}$ **c.** $\mathbf{v}$ and $\mathbf{z}$

Solution

a. $\cos\theta = \dfrac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\|\|\mathbf{v}\|} = \dfrac{-12 + 0 + 4}{\sqrt{14}\sqrt{20}} = \dfrac{-8}{2\sqrt{14}\sqrt{5}} = \dfrac{-4}{\sqrt{70}}$

Because $\mathbf{u} \cdot \mathbf{v} < 0$, $\theta = \arccos\dfrac{-4}{\sqrt{70}} \approx 2.069$ radians.

REMARK The angle between $\mathbf{u}$ and $\mathbf{v}$ in Example 2(a) can also be written as approximately 118.561°.

b. $\cos\theta = \dfrac{\mathbf{u} \cdot \mathbf{w}}{\|\mathbf{u}\|\|\mathbf{w}\|} = \dfrac{3 + 1 - 4}{\sqrt{14}\sqrt{6}} = \dfrac{0}{\sqrt{84}} = 0$

Because $\mathbf{u} \cdot \mathbf{w} = 0$, $\mathbf{u}$ and $\mathbf{w}$ are *orthogonal*. So, $\theta = \pi/2$.

c. $\cos\theta = \dfrac{\mathbf{v} \cdot \mathbf{z}}{\|\mathbf{v}\|\|\mathbf{z}\|} = \dfrac{-8 + 0 - 2}{\sqrt{20}\sqrt{5}} = \dfrac{-10}{\sqrt{100}} = -1$

Consequently, $\theta = \pi$. Note that $\mathbf{v}$ and $\mathbf{z}$ are parallel, with $\mathbf{v} = -2\mathbf{z}$. ■

When the angle between two vectors is known, rewriting Theorem 11.5 in the form

$$\mathbf{u} \cdot \mathbf{v} = \|\mathbf{u}\|\|\mathbf{v}\|\cos\theta \qquad \text{Alternative form of dot product}$$

produces an alternative way to calculate the dot product.

EXAMPLE 3 Alternative Form of the Dot Product

Given that $\|\mathbf{u}\| = 10$, $\|\mathbf{v}\| = 7$, and the angle between $\mathbf{u}$ and $\mathbf{v}$ is $\pi/4$, find $\mathbf{u} \cdot \mathbf{v}$.

Solution Use the alternative form of the dot product as shown.

$$\mathbf{u} \cdot \mathbf{v} = \|\mathbf{u}\|\|\mathbf{v}\|\cos\theta = (10)(7)\cos\frac{\pi}{4} = 35\sqrt{2}$$

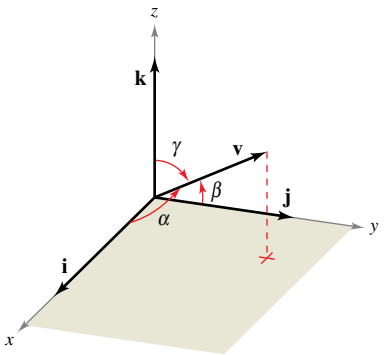
Direction Cosines



Direction angles

For a vector in the plane, you have seen that it is convenient to measure direction in terms of the angle, measured counterclockwise, *from* the positive x-axis *to* the vector. In space, it is more convenient to measure direction in terms of the angles *between* the nonzero vector $\mathbf{v}$ and the three unit vectors $\mathbf{i}$, $\mathbf{j}$, and $\mathbf{k}$, as shown in the figure at the right. The angles α, β, and γ are the **direction angles of v,** and $\cos\alpha$, $\cos\beta$, and $\cos\gamma$ are the **direction cosines of v.** Because

$$\mathbf{v} \cdot \mathbf{i} = \|\mathbf{v}\|\|\mathbf{i}\| \cos\alpha = \|\mathbf{v}\| \cos\alpha$$

and

$$\mathbf{v} \cdot \mathbf{i} = \langle v_1, v_2, v_3 \rangle \cdot \langle 1, 0, 0 \rangle = v_1$$

it follows that $\cos\alpha = v_1/\|\mathbf{v}\|$. By similar reasoning with the unit vectors $\mathbf{j}$ and $\mathbf{k}$, you have

$$\cos\alpha = \frac{v_1}{\|\mathbf{v}\|} \qquad \alpha \text{ is the angle between } \mathbf{v} \text{ and } \mathbf{i}.$$

$$\cos\beta = \frac{v_2}{\|\mathbf{v}\|} \qquad \beta \text{ is the angle between } \mathbf{v} \text{ and } \mathbf{j}.$$

$$\cos\gamma = \frac{v_3}{\|\mathbf{v}\|}. \qquad \gamma \text{ is the angle between } \mathbf{v} \text{ and } \mathbf{k}.$$

Consequently, any nonzero vector $\mathbf{v}$ in space has the normalized form

$$\frac{\mathbf{v}}{\|\mathbf{v}\|} = \frac{v_1}{\|\mathbf{v}\|}\mathbf{i} + \frac{v_2}{\|\mathbf{v}\|}\mathbf{j} + \frac{v_3}{\|\mathbf{v}\|}\mathbf{k} = \cos\alpha\mathbf{i} + \cos\beta\mathbf{j} + \cos\gamma\mathbf{k}$$

and because $\mathbf{v}/\|\mathbf{v}\|$ is a unit vector, it follows that

$$\cos^2\alpha + \cos^2\beta + \cos^2\gamma = 1.$$

REMARK Recall that α, β, and γ are the Greek letters alpha, beta, and gamma, respectively.

EXAMPLE 4 Finding Direction Angles

Find the direction cosines and angles for the vector $\mathbf{v} = 2\mathbf{i} + 3\mathbf{j} + 4\mathbf{k}$, and show that $\cos^2\alpha + \cos^2\beta + \cos^2\gamma = 1$.

Solution Because $\|\mathbf{v}\| = \sqrt{2^2 + 3^2 + 4^2} = \sqrt{29}$, you can write the following.

$$\cos\alpha = \frac{v_1}{\|\mathbf{v}\|} = \frac{2}{\sqrt{29}} \Rightarrow \alpha \approx 68.2° \qquad \text{Angle between } \mathbf{v} \text{ and } \mathbf{i}$$

$$\cos\beta = \frac{v_2}{\|\mathbf{v}\|} = \frac{3}{\sqrt{29}} \Rightarrow \beta \approx 56.1° \qquad \text{Angle between } \mathbf{v} \text{ and } \mathbf{j}$$

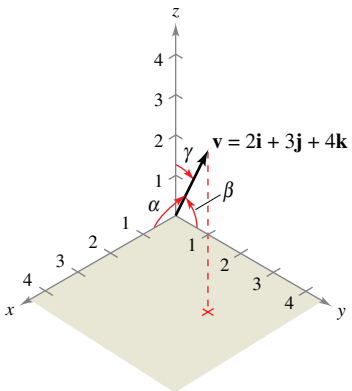
$$\cos\gamma = \frac{v_3}{\|\mathbf{v}\|} = \frac{4}{\sqrt{29}} \Rightarrow \gamma \approx 42.0° \qquad \text{Angle between } \mathbf{v} \text{ and } \mathbf{k}$$

Furthermore, the sum of the squares of the direction cosines is

$$\cos^2\alpha + \cos^2\beta + \cos^2\gamma = \frac{4}{29} + \frac{9}{29} + \frac{16}{29} = \frac{29}{29} = 1.$$

See Figure 11.27.

α = angle between $\mathbf{v}$ and $\mathbf{i}$
β = angle between $\mathbf{v}$ and $\mathbf{j}$
γ = angle between $\mathbf{v}$ and $\mathbf{k}$



The direction angles of $\mathbf{v}$

The force due to gravity pulls the boat against the ramp and down the ramp.
Figure 11.28

GO DIGITAL

Projections and Vector Components

You have already seen applications in which two vectors are added to produce a resultant vector. Many applications in physics and engineering pose the reverse problem—decomposing a vector into the sum of two **vector components.** The following physical example enables you to see the usefulness of this procedure.

Consider a boat on an inclined ramp, as shown in Figure 11.28. The force $\mathbf{F}$ due to gravity pulls the boat *down* the ramp and *against* the ramp. These two forces, $\mathbf{w}_1$ and $\mathbf{w}_2$, are orthogonal—they are called the vector components of $\mathbf{F}$.

$$\mathbf{F} = \mathbf{w}_1 + \mathbf{w}_2 \qquad \text{Vector components of } \mathbf{F}$$

The forces $\mathbf{w}_1$ and $\mathbf{w}_2$ help you analyze the effect of gravity on the boat. For example, $\mathbf{w}_1$ indicates the force necessary to keep the boat from rolling down the ramp, whereas $\mathbf{w}_2$ indicates the force that the tires must withstand.

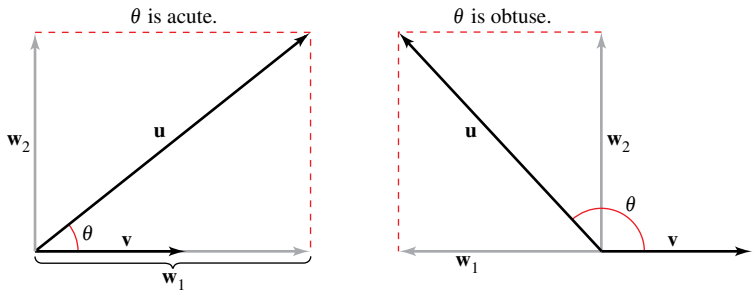
Definitions of Projection and Vector Components

Let $\mathbf{u}$ and $\mathbf{v}$ be nonzero vectors. Moreover, let

$$\mathbf{u} = \mathbf{w}_1 + \mathbf{w}_2$$

where $\mathbf{w}_1$ is parallel to $\mathbf{v}$ and $\mathbf{w}_2$ is orthogonal to $\mathbf{v}$, as shown in Figure 11.29.

1. $\mathbf{w}_1$ is called the **projection of u onto v** or the **vector component of u along v,** and is denoted by $\mathbf{w}_1 = \text{proj}_{\mathbf{v}}\mathbf{u}$.
2. $\mathbf{w}_2 = \mathbf{u} - \mathbf{w}_1$ is called the **vector component of u orthogonal to v.**



$\mathbf{w}_1 = \text{proj}_{\mathbf{v}}\mathbf{u}$ = projection of $\mathbf{u}$ onto $\mathbf{v}$ = vector component of $\mathbf{u}$ along $\mathbf{v}$
$\mathbf{w}_2$ = vector component of $\mathbf{u}$ orthogonal to $\mathbf{v}$
Figure 11.29

EXAMPLE 5 Finding a Vector Component of u Orthogonal to v

Find the vector component of $\mathbf{u} = \langle 5, 10\rangle$ that is orthogonal to $\mathbf{v} = \langle 4, 3\rangle$, given that

$$\mathbf{w}_1 = \text{proj}_{\mathbf{v}}\mathbf{u} = \langle 8, 6\rangle$$

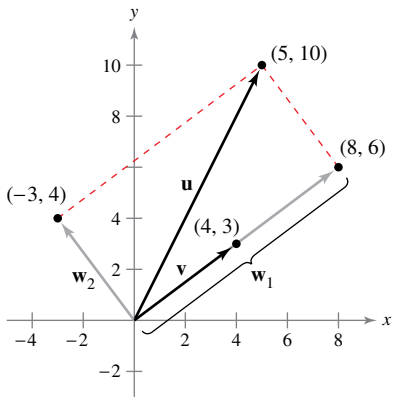
and

$$\mathbf{u} = \langle 5, 10\rangle = \mathbf{w}_1 + \mathbf{w}_2.$$

Solution Because $\mathbf{u} = \mathbf{w}_1 + \mathbf{w}_2$, where $\mathbf{w}_1$ is parallel to $\mathbf{v}$, it follows that $\mathbf{w}_2$ is the vector component of $\mathbf{u}$ orthogonal to $\mathbf{v}$. So, you have

$$\begin{aligned}\mathbf{w}_2 &= \mathbf{u} - \mathbf{w}_1\\ &= \langle 5, 10\rangle - \langle 8, 6\rangle\\ &= \langle -3, 4\rangle.\end{aligned}$$

Check to see that $\mathbf{w}_2$ is orthogonal to $\mathbf{v}$, as shown in Figure 11.30. ■



$\mathbf{u} = \mathbf{w}_1 + \mathbf{w}_2$

GO DIGITAL

In Example 5, you were given the projection of $\mathbf{u}$ onto $\mathbf{v}$. In general, to find a projection, use the next theorem. The proof of this theorem is left as an exercise (see Exercise 74).

THEOREM 11.6 Projection Using the Dot Product

If $\mathbf{u}$ and $\mathbf{v}$ are nonzero vectors, then the projection of $\mathbf{u}$ onto $\mathbf{v}$ is

$$\text{proj}_{\mathbf{v}}\mathbf{u} = \left(\frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{v}\|^2}\right)\mathbf{v}.$$

REMARK Note the distinction between the terms "component" and "vector component." For example, using the standard unit vectors with $\mathbf{u} = u_1\mathbf{i} + u_2\mathbf{j}$, u_1 is the *component* of $\mathbf{u}$ in the direction of $\mathbf{i}$, and $u_1\mathbf{i}$ is the *vector component* in the direction of $\mathbf{i}$.

The projection of $\mathbf{u}$ onto $\mathbf{v}$ can be written as a scalar multiple of a unit vector in the direction of $\mathbf{v}$. That is,

$$\left(\frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{v}\|^2}\right)\mathbf{v} = \left(\frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{v}\|}\right)\frac{\mathbf{v}}{\|\mathbf{v}\|} = (k)\frac{\mathbf{v}}{\|\mathbf{v}\|}.$$

The scalar k is called the **component of u in the direction of v.** So,

$$k = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{v}\|} = \|\mathbf{u}\| \cos\theta.$$

EXAMPLE 6 Decomposing a Vector into Vector Components

Find the projection of $\mathbf{u}$ onto $\mathbf{v}$ and the vector component of $\mathbf{u}$ orthogonal to $\mathbf{v}$ for

$$\mathbf{u} = 3\mathbf{i} - 5\mathbf{j} + 2\mathbf{k} \quad \text{and} \quad \mathbf{v} = 7\mathbf{i} + \mathbf{j} - 2\mathbf{k}.$$

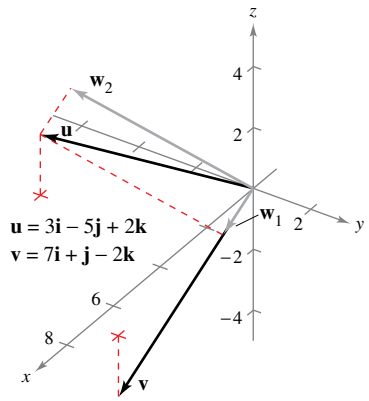
Solution The projection of $\mathbf{u}$ onto $\mathbf{v}$ is

$$\mathbf{w}_1 = \text{proj}_{\mathbf{v}}\mathbf{u} = \left(\frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{v}\|^2}\right)\mathbf{v} = \left(\frac{12}{54}\right)(7\mathbf{i} + \mathbf{j} - 2\mathbf{k}) = \frac{14}{9}\mathbf{i} + \frac{2}{9}\mathbf{j} - \frac{4}{9}\mathbf{k}.$$

The vector component of $\mathbf{u}$ orthogonal to $\mathbf{v}$ is the vector

$$\mathbf{w}_2 = \mathbf{u} - \mathbf{w}_1 = (3\mathbf{i} - 5\mathbf{j} + 2\mathbf{k}) - \left(\frac{14}{9}\mathbf{i} + \frac{2}{9}\mathbf{j} - \frac{4}{9}\mathbf{k}\right) = \frac{13}{9}\mathbf{i} - \frac{47}{9}\mathbf{j} + \frac{22}{9}\mathbf{k}.$$

See Figure 11.31.



$\mathbf{u} = \mathbf{w}_1 + \mathbf{w}_2$

Figure 11.31

EXAMPLE 7 Finding a Force

A 600-pound boat sits on a ramp inclined at 30°, as shown in Figure 11.32. What force is required to keep the boat from rolling down the ramp?

Solution Because the force due to gravity is vertical and downward, you can represent the gravitational force by the vector $\mathbf{F} = -600\mathbf{j}$. To find the force required to keep the boat from rolling down the ramp, project $\mathbf{F}$ onto a unit vector $\mathbf{v}$ in the direction of the ramp, as follows.

$$\mathbf{v} = \cos 30°\mathbf{i} + \sin 30°\mathbf{j} = \frac{\sqrt{3}}{2}\mathbf{i} + \frac{1}{2}\mathbf{j} \qquad \text{Unit vector along ramp}$$

Therefore, the projection of $\mathbf{F}$ onto $\mathbf{v}$ is

$$\mathbf{w}_1 = \text{proj}_{\mathbf{v}}\mathbf{F} = \left(\frac{\mathbf{F} \cdot \mathbf{v}}{\|\mathbf{v}\|^2}\right)\mathbf{v} = (\mathbf{F} \cdot \mathbf{v})\mathbf{v} = (-600)\left(\frac{1}{2}\right)\mathbf{v} = -300\left(\frac{\sqrt{3}}{2}\mathbf{i} + \frac{1}{2}\mathbf{j}\right).$$

The magnitude of this force is 300, so a force of 300 pounds is required to keep the boat from rolling down the ramp. ■

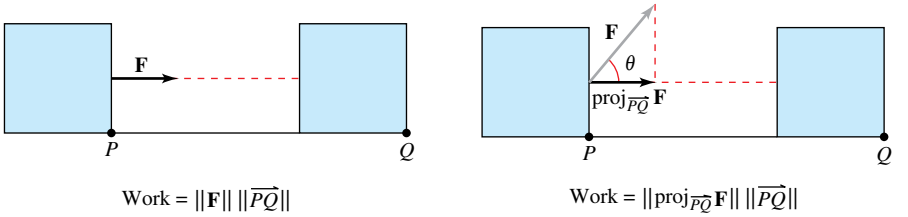
Work

The work W done by the constant force $\mathbf{F}$ acting along the line of motion of an object is given by

$$W = (\text{magnitude of force})(\text{distance}) = \|\mathbf{F}\|\|\overrightarrow{PQ}\|$$

as shown in Figure 11.33(a). When the constant force $\mathbf{F}$ is not directed along the line of motion, Figure 11.33(b) shows that the work W done by the force is

$$W = \|\text{proj}_{\overrightarrow{PQ}}\mathbf{F}\|\|\overrightarrow{PQ}\| = (\cos\theta)\|\mathbf{F}\|\|\overrightarrow{PQ}\| = \mathbf{F} \cdot \overrightarrow{PQ}.$$



(a) Force acts along the line of motion. **(b)** Force acts at angle θ with the line of motion.

Figure 11.33

This notion of work is summarized in the next definition.

Definition of Work

The work W done by a constant force $\mathbf{F}$ as its point of application moves along the vector $\overrightarrow{PQ}$ is one of the following.

1. $W = \|\text{proj}_{\overrightarrow{PQ}}\mathbf{F}\|\|\overrightarrow{PQ}\|$ Projection form
2. $W = \mathbf{F} \cdot \overrightarrow{PQ}$ Dot product form

EXAMPLE 8 Finding Work

To close a sliding door, a person pulls on a rope with a constant force of 50 pounds at a constant angle of 60°, as shown in Figure 11.34. Find the work done in moving the door 12 feet to its closed position.

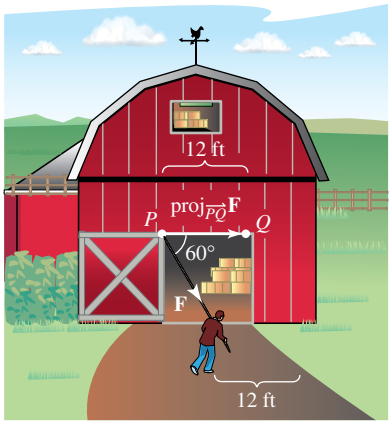


Figure 11.34

Solution Using a projection, you can calculate the work as follows.

$$W = \|\text{proj}_{\overrightarrow{PQ}}\mathbf{F}\|\|\overrightarrow{PQ}\| = \cos(60°)\|\mathbf{F}\|\|\overrightarrow{PQ}\| = \frac{1}{2}(50)(12) = 300 \text{ foot-pounds}$$

Concept Check

1. Two nonzero vectors have a dot product of zero. What is true about the relative position of the vectors?
2. Consider the vector

$\mathbf{v} = \langle v_1, v_2, v_3 \rangle$.

What is the meaning of $\arccos \dfrac{v_2}{\|\mathbf{v}\|} = 30°$?

Finding Dot Products In Exercises 3–10, find (a) $\mathbf{u} \cdot \mathbf{v}$, (b) $\mathbf{u} \cdot \mathbf{u}$, (c) $\|\mathbf{v}\|^2$, (d) $(\mathbf{u} \cdot \mathbf{v})\mathbf{v}$, and (e) $\mathbf{u} \cdot (3\mathbf{v})$.

3. $\mathbf{u} = \langle 3, 4 \rangle$, $\mathbf{v} = \langle -1, 5 \rangle$
4. $\mathbf{u} = \langle 4, 10 \rangle$, $\mathbf{v} = \langle -2, 3 \rangle$
5. $\mathbf{u} = \langle 6, -4 \rangle$, $\mathbf{v} = \langle -3, 2 \rangle$
6. $\mathbf{u} = \langle -7, -1 \rangle$, $\mathbf{v} = \langle -4, -1 \rangle$
7. $\mathbf{u} = \langle 2, -3, 4 \rangle$, $\mathbf{v} = \langle 0, 6, 5 \rangle$
8. $\mathbf{u} = \langle -5, 0, 5 \rangle$, $\mathbf{v} = \langle -1, 2, 1 \rangle$
9. $\mathbf{u} = 2\mathbf{i} - \mathbf{j} + \mathbf{k}$, $\mathbf{v} = \mathbf{i} - \mathbf{k}$
10. $\mathbf{u} = 2\mathbf{i} + \mathbf{j} - 2\mathbf{k}$, $\mathbf{v} = \mathbf{i} - 3\mathbf{j} + 2\mathbf{k}$

Finding the Angle Between Two Vectors In Exercises 11–18, find the angle θ between the vectors (a) in radians and (b) in degrees.

11. $\mathbf{u} = \langle 1, 1 \rangle$, $\mathbf{v} = \langle 2, -2 \rangle$
12. $\mathbf{u} = \langle 3, 1 \rangle$, $\mathbf{v} = \langle 2, -1 \rangle$
13. $\mathbf{u} = 3\mathbf{i} + \mathbf{j}$, $\mathbf{v} = -2\mathbf{i} + 4\mathbf{j}$
14. $\mathbf{u} = \cos\left(\dfrac{\pi}{6}\right)\mathbf{i} + \sin\left(\dfrac{\pi}{6}\right)\mathbf{j}$, $\mathbf{v} = \cos\left(\dfrac{3\pi}{4}\right)\mathbf{i} + \sin\left(\dfrac{3\pi}{4}\right)\mathbf{j}$
15. $\mathbf{u} = \langle 1, 1, 1 \rangle$, $\mathbf{v} = \langle 2, 1, -1 \rangle$
16. $\mathbf{u} = 3\mathbf{i} + 2\mathbf{j} + \mathbf{k}$, $\mathbf{v} = 2\mathbf{i} - 3\mathbf{j}$
17. $\mathbf{u} = 3\mathbf{i} + 4\mathbf{j}$, $\mathbf{v} = -2\mathbf{j} + 3\mathbf{k}$
18. $\mathbf{u} = 2\mathbf{i} - 3\mathbf{j} + \mathbf{k}$, $\mathbf{v} = \mathbf{i} - 2\mathbf{j} + \mathbf{k}$

Alternative Form of Dot Product In Exercises 19 and 20, use the alternative form of the dot product to find $\mathbf{u} \cdot \mathbf{v}$.

19. $\|\mathbf{u}\| = 8$, $\|\mathbf{v}\| = 5$, and the angle between $\mathbf{u}$ and $\mathbf{v}$ is $\pi/3$.
20. $\|\mathbf{u}\| = 40$, $\|\mathbf{v}\| = 25$, and the angle between $\mathbf{u}$ and $\mathbf{v}$ is $5\pi/6$.

Comparing Vectors In Exercises 21–26, determine whether $\mathbf{u}$ and $\mathbf{v}$ are orthogonal, parallel, or neither.

21. $\mathbf{u} = \langle 4, 3 \rangle$, $\mathbf{v} = \left\langle \frac{1}{2}, -\frac{2}{3} \right\rangle$
22. $\mathbf{u} = -\frac{1}{3}(\mathbf{i} - 2\mathbf{j})$, $\mathbf{v} = 2\mathbf{i} - 4\mathbf{j}$
23. $\mathbf{u} = \mathbf{j} + 6\mathbf{k}$, $\mathbf{v} = \mathbf{i} - 2\mathbf{j} - \mathbf{k}$
24. $\mathbf{u} = -2\mathbf{i} + 3\mathbf{j} - \mathbf{k}$, $\mathbf{v} = 2\mathbf{i} + \mathbf{j} - \mathbf{k}$
25. $\mathbf{u} = \langle 2, -3, 1 \rangle$, $\mathbf{v} = \langle -1, -1, -1 \rangle$
26. $\mathbf{u} = \langle \cos\theta, \sin\theta, -1 \rangle$, $\mathbf{v} = \langle \sin\theta, -\cos\theta, 0 \rangle$

Classifying a Triangle In Exercises 27–30, the vertices of a triangle are given. Determine whether the triangle is an acute triangle, an obtuse triangle, or a right triangle. Explain your reasoning.

27. $(1, 2, 0)$, $(0, 0, 0)$, $(-2, 1, 0)$
28. $(-3, 0, 0)$, $(0, 0, 0)$, $(1, 2, 3)$
29. $(2, 0, 1)$, $(0, 1, 2)$, $(-0.5, 1.5, 0)$
30. $(2, -7, 3)$, $(-1, 5, 8)$, $(4, 6, -1)$

Finding Direction Angles In Exercises 31–36, find the direction cosines and angles of $\mathbf{u}$ and show that $\cos^2\alpha + \cos^2\beta + \cos^2\gamma = 1$.

31. $\mathbf{u} = \mathbf{i} + 2\mathbf{j} + 2\mathbf{k}$
32. $\mathbf{u} = 5\mathbf{i} + 3\mathbf{j} - \mathbf{k}$
33. $\mathbf{u} = 7\mathbf{i} + \mathbf{j} - \mathbf{k}$
34. $\mathbf{u} = -4\mathbf{i} + 3\mathbf{j} + 5\mathbf{k}$
35. $\mathbf{u} = \langle 0, 6, -4 \rangle$
36. $\mathbf{u} = \langle -1, 5, 2 \rangle$

Finding the Projection of u onto v In Exercises 37–44, (a) find the projection of $\mathbf{u}$ onto $\mathbf{v}$ and (b) find the vector component of $\mathbf{u}$ orthogonal to $\mathbf{v}$.

37. $\mathbf{u} = \langle 6, 7 \rangle$, $\mathbf{v} = \langle 1, 4 \rangle$
38. $\mathbf{u} = \langle 9, 7 \rangle$, $\mathbf{v} = \langle 1, 3 \rangle$
39. $\mathbf{u} = 2\mathbf{i} + 3\mathbf{j}$, $\mathbf{v} = 5\mathbf{i} + \mathbf{j}$
40. $\mathbf{u} = 2\mathbf{i} - 3\mathbf{j}$, $\mathbf{v} = 3\mathbf{i} + 2\mathbf{j}$
41. $\mathbf{u} = \langle 0, 3, 3 \rangle$, $\mathbf{v} = \langle -1, 1, 1 \rangle$
42. $\mathbf{u} = \langle 8, 2, 0 \rangle$, $\mathbf{v} = \langle 2, 1, -1 \rangle$
43. $\mathbf{u} = -9\mathbf{i} - 2\mathbf{j} - 4\mathbf{k}$, $\mathbf{v} = 4\mathbf{j} + 4\mathbf{k}$
44. $\mathbf{u} = 5\mathbf{i} - \mathbf{j} - \mathbf{k}$, $\mathbf{v} = -\mathbf{i} + 5\mathbf{j} + 8\mathbf{k}$

Exploring Concepts

45. Explain why $\mathbf{u} + \mathbf{v} \cdot \mathbf{w}$ is not defined, where $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$ are nonzero vectors.
46. What can be said about the vectors $\mathbf{u}$ and $\mathbf{v}$ when the projection of $\mathbf{u}$ onto $\mathbf{v}$ equals $\mathbf{u}$?
47. When the projection of $\mathbf{u}$ onto $\mathbf{v}$ has the same magnitude as the projection of $\mathbf{v}$ onto $\mathbf{u}$, can you conclude that $\|\mathbf{u}\| = \|\mathbf{v}\|$? Explain.

48. **HOW DO YOU SEE IT?** What is known about θ, the angle between two nonzero vectors $\mathbf{u}$ and $\mathbf{v}$, when

(a) $\mathbf{u} \cdot \mathbf{v} = 0$? (b) $\mathbf{u} \cdot \mathbf{v} > 0$? (c) $\mathbf{u} \cdot \mathbf{v} < 0$?

49. Revenue The vector $\mathbf{u} = \langle 3240, 1450, 2235 \rangle$ gives the numbers of hamburgers, chicken sandwiches, and cheeseburgers, respectively, sold at a fast-food restaurant in one week. The vector $\mathbf{v} = \langle 2.25, 2.95, 2.65 \rangle$ gives the prices (in dollars) per unit for the three food items. Find the dot product $\mathbf{u} \cdot \mathbf{v}$ and explain what information it gives.

50. Revenue Repeat Exercise 49 after decreasing the prices by 2%. Identify the vector operation used to decrease the prices by 2%.

Orthogonal Vectors **In Exercises 51–54, find two vectors in opposite directions that are orthogonal to the vector u. (The answers are not unique.)**

51. $\mathbf{u} = -\frac{1}{4}\mathbf{i} + \frac{3}{2}\mathbf{j}$

52. $\mathbf{u} = 9\mathbf{i} - 4\mathbf{j}$

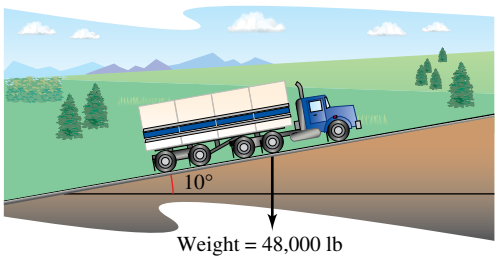
53. $\mathbf{u} = \langle 3, 1, -2 \rangle$

54. $\mathbf{u} = \langle 4, -3, 6 \rangle$

55. Finding an Angle Find the angle between a cube's diagonal and one of its edges.

56. Finding an Angle Find the angle between the diagonal of a cube and the diagonal of one of its sides.

57. Braking Load A 48,000-pound truck is parked on a 10° slope (see figure). Assume the only force to overcome is that due to gravity. Find (a) the force required to keep the truck from rolling down the hill and (b) the force perpendicular to the hill.



58. Braking Load A 5400-pound sport utility vehicle is parked on an 18° slope. Assume the only force to overcome is that due to gravity. Find (a) the force required to keep the vehicle from rolling down the hill and (b) the force perpendicular to the hill.

59. Work An object is pulled 10 feet across a floor using a force of 85 pounds. The direction of the force is 60° above the horizontal (see figure). Find the work done.

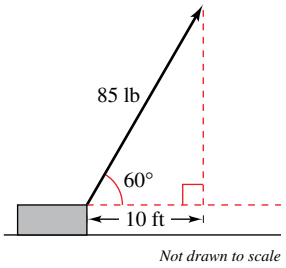


Figure for 59

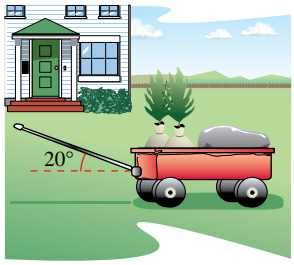

Figure for 60

60. Work A wagon is pulled by exerting a force of 65 pounds on a handle that makes a 20° angle with the horizontal (see figure). Find the work done in pulling the wagon 50 feet.

61. Work A car is towed using a force of 1600 newtons. The chain used to pull the car makes a 25° angle with the horizontal. Find the work done in towing the car 2 kilometers.

62. Work

A pallet truck is pulled by exerting a force of 400 newtons on a handle that makes a 60° angle with the horizontal. Find the work done in pulling the truck 40 meters.

True or False? **In Exercises 63 and 64, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

63. If $\mathbf{u} \cdot \mathbf{v} = \mathbf{u} \cdot \mathbf{w}$ and $\mathbf{u} \neq \mathbf{0}$, then $\mathbf{v} = \mathbf{w}$.

64. If $\mathbf{u}$ and $\mathbf{v}$ are orthogonal to $\mathbf{w}$, then $\mathbf{u} + \mathbf{v}$ is orthogonal to $\mathbf{w}$.

Using Points of Intersection **In Exercises 65–68, (a) find all points of intersection of the graphs of the two equations, (b) find the unit tangent vectors to each curve at their points of intersection, and (c) find the angles ($0° \leq \theta \leq 90°$) between the curves at their points of intersection.**

65. $y = x^2, \quad y = x^{1/3}$

66. $y = x^3, \quad y = x^{1/3}$

67. $y = 1 - x^2, \quad y = x^2 - 1$

68. $(y + 1)^2 = x, \quad y = x^3 - 1$

69. Proof Use vectors to prove that the diagonals of a rhombus are perpendicular.

70. Proof Use vectors to prove that a parallelogram is a rectangle if and only if its diagonals are equal in length.

71. Bond Angle Consider a regular tetrahedron with vertices $(0, 0, 0)$, $(k, k, 0)$, $(k, 0, k)$, and $(0, k, k)$, where k is a positive real number.

(a) Sketch the graph of the tetrahedron.

(b) Find the length of each edge.

(c) Find the angle between any two edges.

(d) Find the angle between the line segments from the centroid $(k/2, k/2, k/2)$ to two vertices. This is the bond angle for a molecule, such as CH_4 (methane) or $PbCl_4$ (lead tetrachloride), where the structure of the molecule is a tetrahedron.

72. Proof Consider the vectors $\mathbf{u} = \langle \cos\alpha, \sin\alpha, 0 \rangle$ and $\mathbf{v} = \langle \cos\beta, \sin\beta, 0 \rangle$, where $\alpha > \beta$. Find the dot product of the vectors and use the result to prove the identity

$$\cos(\alpha - \beta) = \cos\alpha \cos\beta + \sin\alpha \sin\beta.$$

73. Proof Prove the triangle inequality $\|\mathbf{u} + \mathbf{v}\| \leq \|\mathbf{u}\| + \|\mathbf{v}\|$.

74. Proof Prove Theorem 11.6.

75. Proof Prove the **Cauchy-Schwarz Inequality,**

$$|\mathbf{u} \cdot \mathbf{v}| \leq \|\mathbf{u}\| \|\mathbf{v}\|.$$

11.4 The Cross Product of Two Vectors in Space

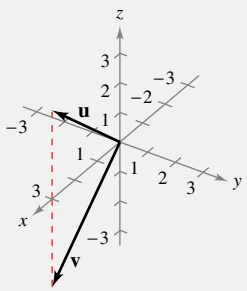
GO DIGITAL

- **Find the cross product of two vectors in space.**
- **Use the triple scalar product of three vectors in space.**

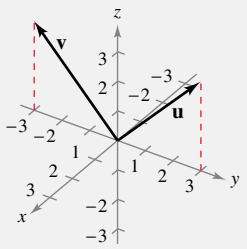
Exploration

Geometric Property of the Cross Product Three pairs of vectors are shown below. Use the definition to find the cross product of each pair. Sketch all three vectors in a three-dimensional system. Describe any relationships among the three vectors. Use your description to write a conjecture about $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{u} \times \mathbf{v}$.

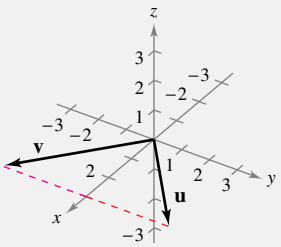
a. $\mathbf{u} = \langle 3, 0, 3 \rangle$
$\mathbf{v} = \langle 3, 0, -3 \rangle$



b. $\mathbf{u} = \langle 0, 3, 3 \rangle$
$\mathbf{v} = \langle 0, -3, 3 \rangle$



c. $\mathbf{u} = \langle 3, 3, 0 \rangle$
$\mathbf{v} = \langle 3, -3, 0 \rangle$



The Cross Product

Many applications in physics, engineering, and geometry involve finding a vector in space that is orthogonal to two given vectors. In this section, you will study a product that will yield such a vector. It is called the **cross product,** and it is most conveniently defined and calculated using the standard unit vector form. Because the cross product yields a vector, it is also called the **vector product.**

Definition of Cross Product of Two Vectors in Space

Let $\mathbf{u}$ and $\mathbf{v}$ be vectors in space, where

$$\mathbf{u} = u_1\mathbf{i} + u_2\mathbf{j} + u_3\mathbf{k} \quad \text{and} \quad \mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}.$$

The **cross product** of $\mathbf{u}$ and $\mathbf{v}$ is the vector

$$\mathbf{u} \times \mathbf{v} = (u_2v_3 - u_3v_2)\mathbf{i} - (u_1v_3 - u_3v_1)\mathbf{j} + (u_1v_2 - u_2v_1)\mathbf{k}.$$

It is important to note that this definition applies only to three-dimensional vectors. The cross product is not defined for two-dimensional vectors.

A convenient way to calculate $\mathbf{u} \times \mathbf{v}$ is to use the *determinant form* with cofactor expansion shown below. (This 3×3 determinant form is used simply to help remember the formula for the cross product. The corresponding array is technically not a matrix because its entries are not all numbers.)

$$\mathbf{u} \times \mathbf{v} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \end{vmatrix} \begin{array}{l} \\ \leftarrow \text{Put "}\mathbf{u}\text{" in Row 2.} \\ \leftarrow \text{Put "}\mathbf{v}\text{" in Row 3.} \end{array}$$

$$= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \end{vmatrix} \mathbf{i} - \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \end{vmatrix} \mathbf{j} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \end{vmatrix} \mathbf{k}$$

$$= \begin{vmatrix} u_2 & u_3 \\ v_2 & v_3 \end{vmatrix} \mathbf{i} - \begin{vmatrix} u_1 & u_3 \\ v_1 & v_3 \end{vmatrix} \mathbf{j} + \begin{vmatrix} u_1 & u_2 \\ v_1 & v_2 \end{vmatrix} \mathbf{k}$$

$$= (u_2v_3 - u_3v_2)\mathbf{i} - (u_1v_3 - u_3v_1)\mathbf{j} + (u_1v_2 - u_2v_1)\mathbf{k}$$

Note the minus sign in front of the $\mathbf{j}$-component. Each of the three 2×2 determinants can be evaluated by using the diagonal pattern

$$\begin{vmatrix} a & b \\ c & d \end{vmatrix} = ad - bc.$$

Here are a couple of examples.

$$\begin{vmatrix} 2 & 4 \\ 3 & -1 \end{vmatrix} = (2)(-1) - (4)(3) = -2 - 12 = -14$$

and

$$\begin{vmatrix} 4 & 0 \\ -6 & 3 \end{vmatrix} = (4)(3) - (0)(-6) = 12$$

GO DIGITAL

EXAMPLE 1 Finding the Cross Product

For $\mathbf{u} = \mathbf{i} - 2\mathbf{j} + \mathbf{k}$ and $\mathbf{v} = 3\mathbf{i} + \mathbf{j} - 2\mathbf{k}$, find each of the following.

a. $\mathbf{u} \times \mathbf{v}$ **b.** $\mathbf{v} \times \mathbf{u}$ **c.** $\mathbf{v} \times \mathbf{v}$

Solution

$$\mathbf{a.}\ \mathbf{u} \times \mathbf{v} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & -2 & 1 \\ 3 & 1 & -2 \end{vmatrix}$$

$$= \begin{vmatrix} -2 & 1 \\ 1 & -2 \end{vmatrix}\mathbf{i} - \begin{vmatrix} 1 & 1 \\ 3 & -2 \end{vmatrix}\mathbf{j} + \begin{vmatrix} 1 & -2 \\ 3 & 1 \end{vmatrix}\mathbf{k}$$

$$= (4 - 1)\mathbf{i} - (-2 - 3)\mathbf{j} + (1 + 6)\mathbf{k}$$

$$= 3\mathbf{i} + 5\mathbf{j} + 7\mathbf{k}$$

$$\mathbf{b.}\ \mathbf{v} \times \mathbf{u} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 3 & 1 & -2 \\ 1 & -2 & 1 \end{vmatrix}$$

$$= \begin{vmatrix} 1 & -2 \\ -2 & 1 \end{vmatrix}\mathbf{i} - \begin{vmatrix} 3 & -2 \\ 1 & 1 \end{vmatrix}\mathbf{j} + \begin{vmatrix} 3 & 1 \\ 1 & -2 \end{vmatrix}\mathbf{k}$$

$$= (1 - 4)\mathbf{i} - (3 + 2)\mathbf{j} + (-6 - 1)\mathbf{k}$$

$$= -3\mathbf{i} - 5\mathbf{j} - 7\mathbf{k}$$

REMARK Note that this result is the negative of that in part (a).

$$\mathbf{c.}\ \mathbf{v} \times \mathbf{v} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 3 & 1 & -2 \\ 3 & 1 & -2 \end{vmatrix} = \mathbf{0}$$

The results obtained in Example 1 suggest some interesting *algebraic* properties of the cross product. For instance, $\mathbf{u} \times \mathbf{v} = -(\mathbf{v} \times \mathbf{u})$, and $\mathbf{v} \times \mathbf{v} = \mathbf{0}$. These properties, and several others, are summarized in the next theorem.

NOTATION FOR DOT AND CROSS PRODUCTS

The notation for the dot product and cross product of vectors was first introduced by the American physicist Josiah Willard Gibbs (1839–1903). In the early 1880s, Gibbs built a system to represent physical quantities called "vector analysis." The system was a departure from Hamilton's theory of quaternions.

THEOREM 11.7 Algebraic Properties of the Cross Product

Let $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$ be vectors in space, and let c be a scalar.

1. $\mathbf{u} \times \mathbf{v} = -(\mathbf{v} \times \mathbf{u})$
2. $\mathbf{u} \times (\mathbf{v} + \mathbf{w}) = (\mathbf{u} \times \mathbf{v}) + (\mathbf{u} \times \mathbf{w})$
3. $c(\mathbf{u} \times \mathbf{v}) = (c\mathbf{u}) \times \mathbf{v} = \mathbf{u} \times (c\mathbf{v})$
4. $\mathbf{u} \times \mathbf{0} = \mathbf{0} \times \mathbf{u} = \mathbf{0}$
5. $\mathbf{u} \times \mathbf{u} = \mathbf{0}$
6. $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = (\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w}$

Proof To prove Property 1, let $\mathbf{u} = u_1\mathbf{i} + u_2\mathbf{j} + u_3\mathbf{k}$ and $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$. Then

$$\mathbf{u} \times \mathbf{v} = (u_2v_3 - u_3v_2)\mathbf{i} - (u_1v_3 - u_3v_1)\mathbf{j} + (u_1v_2 - u_2v_1)\mathbf{k}$$

and

$$\mathbf{v} \times \mathbf{u} = (v_2u_3 - v_3u_2)\mathbf{i} - (v_1u_3 - v_3u_1)\mathbf{j} + (v_1u_2 - v_2u_1)\mathbf{k}$$

which implies that $\mathbf{u} \times \mathbf{v} = -(\mathbf{v} \times \mathbf{u})$. Proofs of Properties 2, 3, 5, and 6 are left as exercises (see Exercises 49–52).

GO DIGITAL

Note that Property 1 of Theorem 11.7 indicates that the cross product is *not commutative*. In particular, this property indicates that the vectors $\mathbf{u} \times \mathbf{v}$ and $\mathbf{v} \times \mathbf{u}$ have equal lengths but opposite directions. The next theorem lists some other *geometric* properties of the cross product of two vectors.

THEOREM 11.8 Geometric Properties of the Cross Product

Let $\mathbf{u}$ and $\mathbf{v}$ be nonzero vectors in space, and let θ be the angle between $\mathbf{u}$ and $\mathbf{v}$.

1. $\mathbf{u} \times \mathbf{v}$ is orthogonal to both $\mathbf{u}$ and $\mathbf{v}$.
2. $\|\mathbf{u} \times \mathbf{v}\| = \|\mathbf{u}\| \|\mathbf{v}\| \sin \theta$
3. $\mathbf{u} \times \mathbf{v} = \mathbf{0}$ if and only if $\mathbf{u}$ and $\mathbf{v}$ are scalar multiples of each other.
4. $\|\mathbf{u} \times \mathbf{v}\|$ = area of parallelogram having $\mathbf{u}$ and $\mathbf{v}$ as adjacent sides.

REMARK It follows from Properties 1 and 2 in Theorem 11.8 that if $\mathbf{n}$ is a unit vector orthogonal to both $\mathbf{u}$ and $\mathbf{v}$, then

$$\mathbf{u} \times \mathbf{v} = \pm(\|\mathbf{u}\| \|\mathbf{v}\| \sin \theta)\mathbf{n}.$$

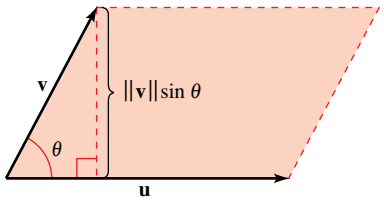
Proof To prove Property 2, note because $\cos \theta = (\mathbf{u} \cdot \mathbf{v})/(\|\mathbf{u}\| \|\mathbf{v}\|)$, it follows that

$$\begin{aligned}
\|\mathbf{u}\| \|\mathbf{v}\| \sin \theta &= \|\mathbf{u}\| \|\mathbf{v}\| \sqrt{1 - \cos^2 \theta} \\
&= \|\mathbf{u}\| \|\mathbf{v}\| \sqrt{1 - \frac{(\mathbf{u} \cdot \mathbf{v})^2}{\|\mathbf{u}\|^2 \|\mathbf{v}\|^2}} \\
&= \sqrt{\|\mathbf{u}\|^2 \|\mathbf{v}\|^2 - (\mathbf{u} \cdot \mathbf{v})^2} \\
&= \sqrt{(u_1^2 + u_2^2 + u_3^2)(v_1^2 + v_2^2 + v_3^2) - (u_1v_1 + u_2v_2 + u_3v_3)^2} \\
&= \sqrt{(u_2v_3 - u_3v_2)^2 + (u_1v_3 - u_3v_1)^2 + (u_1v_2 - u_2v_1)^2} \\
&= \|\mathbf{u} \times \mathbf{v}\|.
\end{aligned}$$

To prove Property 4, refer to Figure 11.35, which is a parallelogram having $\mathbf{v}$ and $\mathbf{u}$ as adjacent sides. Because the height of the parallelogram is $\|\mathbf{v}\| \sin \theta$, the area is

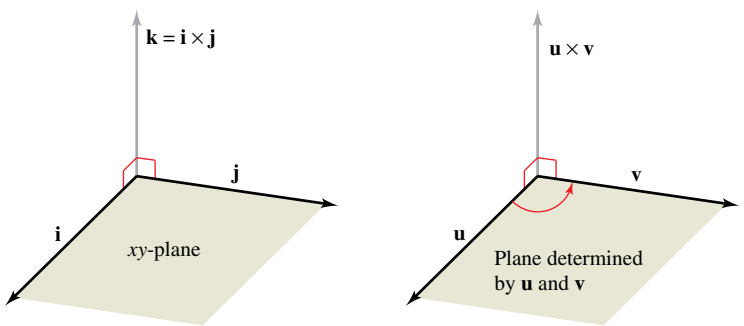
$$\begin{aligned}
\text{Area} &= (\text{base})(\text{height}) \\
&= \|\mathbf{u}\| \|\mathbf{v}\| \sin \theta \\
&= \|\mathbf{u} \times \mathbf{v}\|.
\end{aligned}$$

Proofs of Properties 1 and 3 are left as exercises (see Exercises 53 and 54).



The vectors $\mathbf{u}$ and $\mathbf{v}$ form adjacent sides of a parallelogram.
Figure 11.35

Both $\mathbf{u} \times \mathbf{v}$ and $\mathbf{v} \times \mathbf{u}$ are perpendicular to the plane determined by $\mathbf{u}$ and $\mathbf{v}$. One way to remember the orientations of the vectors $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{u} \times \mathbf{v}$ is to compare them with the unit vectors $\mathbf{i}$, $\mathbf{j}$, and $\mathbf{k} = \mathbf{i} \times \mathbf{j}$, as shown in Figure 11.36. The three vectors $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{u} \times \mathbf{v}$ form a *right-handed system,* whereas the three vectors $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{v} \times \mathbf{u}$ form a *left-handed system.*



Right-handed systems
Figure 11.36

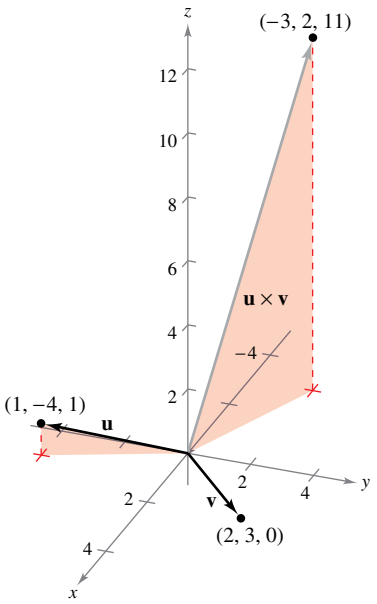
Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.



The vector $\mathbf{u} \times \mathbf{v}$ is orthogonal to both $\mathbf{u}$ and $\mathbf{v}$.
Figure 11.37

EXAMPLE 2 Using the Cross Product

See LarsonCalculus.com for an interactive version of this type of example.

Find a unit vector that is orthogonal to both

$$\mathbf{u} = \mathbf{i} - 4\mathbf{j} + \mathbf{k}$$

and

$$\mathbf{v} = 2\mathbf{i} + 3\mathbf{j}.$$

Solution The cross product $\mathbf{u} \times \mathbf{v}$, as shown in Figure 11.37, is orthogonal to both $\mathbf{u}$ and $\mathbf{v}$.

$$\mathbf{u} \times \mathbf{v} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & -4 & 1 \\ 2 & 3 & 0 \end{vmatrix} \qquad \text{Cross product}$$

$$= -3\mathbf{i} + 2\mathbf{j} + 11\mathbf{k}$$

Because

$$\|\mathbf{u} \times \mathbf{v}\| = \sqrt{(-3)^2 + 2^2 + 11^2} = \sqrt{134}$$

a unit vector orthogonal to both $\mathbf{u}$ and $\mathbf{v}$ is

$$\frac{\mathbf{u} \times \mathbf{v}}{\|\mathbf{u} \times \mathbf{v}\|} = -\frac{3}{\sqrt{134}}\mathbf{i} + \frac{2}{\sqrt{134}}\mathbf{j} + \frac{11}{\sqrt{134}}\mathbf{k}.$$

GO DIGITAL

In Example 2, note that you could have used the cross product $\mathbf{v} \times \mathbf{u}$ to form a unit vector that is orthogonal to both $\mathbf{u}$ and $\mathbf{v}$. With that choice, you would have obtained the negative of the unit vector found in the example.

EXAMPLE 3 Geometric Application of the Cross Product

The vertices of a quadrilateral are listed below. Show that the quadrilateral is a parallelogram and find its area.

$A = (5, 2, 0)$ $\quad B = (2, 6, 1)$
$C = (2, 4, 7)$ $\quad D = (5, 0, 6)$

Solution From Figure 11.38, you can determine that the sides of the quadrilateral correspond to the four vectors below.

$\overrightarrow{AB} = -3\mathbf{i} + 4\mathbf{j} + \mathbf{k}$ $\quad \overrightarrow{CD} = 3\mathbf{i} - 4\mathbf{j} - \mathbf{k} = -\overrightarrow{AB}$
$\overrightarrow{AD} = 0\mathbf{i} - 2\mathbf{j} + 6\mathbf{k}$ $\quad \overrightarrow{CB} = 0\mathbf{i} + 2\mathbf{j} - 6\mathbf{k} = -\overrightarrow{AD}$

So, $\overrightarrow{AB}$ is parallel to $\overrightarrow{CD}$ and $\overrightarrow{AD}$ is parallel to $\overrightarrow{CB}$, and you can conclude that the quadrilateral is a parallelogram with $\overrightarrow{AB}$ and $\overrightarrow{AD}$ as adjacent sides. Moreover, because

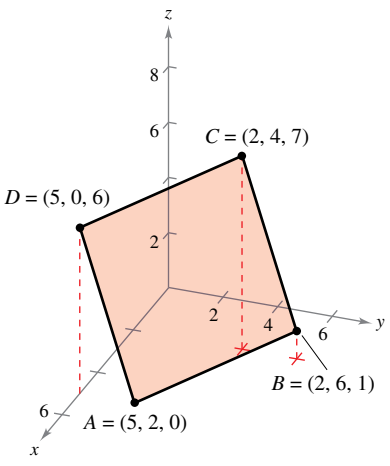
$$\overrightarrow{AB} \times \overrightarrow{AD} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -3 & 4 & 1 \\ 0 & -2 & 6 \end{vmatrix} \qquad \text{Cross product}$$

$$= 26\mathbf{i} + 18\mathbf{j} + 6\mathbf{k}$$

the area of the parallelogram is

$$\|\overrightarrow{AB} \times \overrightarrow{AD}\| = \sqrt{1036} \approx 32.19.$$

Is the parallelogram a rectangle? You can determine whether it is by finding the angle between the vectors $\overrightarrow{AB}$ and $\overrightarrow{AD}$.



The area of the parallelogram is approximately 32.19.
Figure 11.38

The moment of **F** about P
Figure 11.39

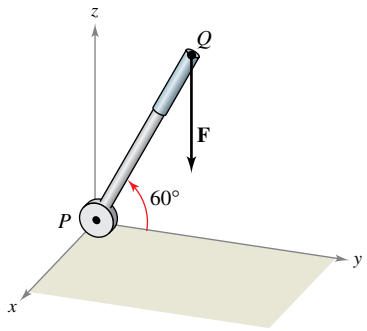
In physics, the cross product can be used to measure **torque**—the **moment M of a force F about a point *P*,** as shown in Figure 11.39. If the point of application of the force is Q, then the moment of **F** about P is

$$\mathbf{M} = \overrightarrow{PQ} \times \mathbf{F}.$$ Moment of **F** about P

The magnitude of the moment **M** measures the tendency of the vector $\overrightarrow{PQ}$ to rotate counterclockwise (using the right-hand rule) about an axis directed along the vector **M**.

EXAMPLE 4 An Application of the Cross Product

A vertical force of 50 pounds is applied to the end of a one-foot lever that is attached to an axle at point P, as shown in Figure 11.40. Find the moment of this force about the point P when $\theta = 60°$.



A vertical force of 50 pounds is applied at point Q.
Figure 11.40

Solution Represent the 50-pound force as

$$\mathbf{F} = -50\mathbf{k}$$

and the lever as

$$\overrightarrow{PQ} = \cos(60°)\mathbf{j} + \sin(60°)\mathbf{k} = \frac{1}{2}\mathbf{j} + \frac{\sqrt{3}}{2}\mathbf{k}.$$

The moment of **F** about P is

$$\mathbf{M} = \overrightarrow{PQ} \times \mathbf{F} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & \frac{1}{2} & \frac{\sqrt{3}}{2} \\ 0 & 0 & -50 \end{vmatrix} = -25\mathbf{i}.$$ Moment of **F** about P

The magnitude of this moment is 25 foot-pounds. ■

In Example 4, note that the moment (the tendency of the lever to rotate about its axle) is dependent on the angle θ. When $\theta = \pi/2$, the moment is **0**. The moment is greatest when $\theta = 0$.

The Triple Scalar Product

For vectors **u**, **v**, and **w** in space, the dot product of **u** and **v** × **w**

$$\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})$$

is called the **triple scalar product,** as defined in Theorem 11.9. The proof of this theorem is left as an exercise (see Exercise 57).

THEOREM 11.9 The Triple Scalar Product

For $\mathbf{u} = u_1\mathbf{i} + u_2\mathbf{j} + u_3\mathbf{k}$, $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$, and $\mathbf{w} = w_1\mathbf{i} + w_2\mathbf{j} + w_3\mathbf{k}$, the triple scalar product is

$$\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = \begin{vmatrix} u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \\ w_1 & w_2 & w_3 \end{vmatrix}.$$

Note that the value of a determinant is multiplied by -1 when two rows are interchanged. After two such interchanges, the value of the determinant will be unchanged. So, the following triple scalar products are equivalent.

$$\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = \mathbf{v} \cdot (\mathbf{w} \times \mathbf{u}) = \mathbf{w} \cdot (\mathbf{u} \times \mathbf{v})$$

Area of base $= \|\mathbf{v} \times \mathbf{w}\|$
Volume of parallelepiped $= |\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})|$
Figure 11.41

If the vectors $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$ do not lie in the same plane, then the triple scalar product $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})$ can be used to determine the volume of the parallelepiped (a polyhedron, all of whose faces are parallelograms) with $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$ as adjacent edges, as shown in Figure 11.41. This is established in the next theorem.

THEOREM 11.10 Geometric Property of the Triple Scalar Product

The volume V of a parallelepiped with vectors $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$ as adjacent edges is

$$V = |\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})|.$$

Proof In Figure 11.41, note that the area of the base is $\|\mathbf{v} \times \mathbf{w}\|$ and the height of the parallelepiped is $\|\text{proj}_{\mathbf{v}\times\mathbf{w}}\mathbf{u}\|$. Therefore, the volume is

$$\begin{aligned} V &= (\text{height})(\text{area of base}) \\ &= \|\text{proj}_{\mathbf{v}\times\mathbf{w}}\mathbf{u}\|\,\|\mathbf{v} \times \mathbf{w}\| \\ &= \left|\frac{\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})}{\|\mathbf{v} \times \mathbf{w}\|}\right| \|\mathbf{v} \times \mathbf{w}\| \\ &= |\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})|. \end{aligned}$$

EXAMPLE 5 Volume by the Triple Scalar Product

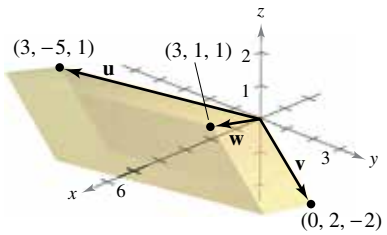
Find the volume of the parallelepiped shown in Figure 11.42 having

$$\mathbf{u} = 3\mathbf{i} - 5\mathbf{j} + \mathbf{k}$$
$$\mathbf{v} = 2\mathbf{j} - 2\mathbf{k}$$

and

$$\mathbf{w} = 3\mathbf{i} + \mathbf{j} + \mathbf{k}$$

as adjacent edges.



The parallelepiped has a volume of 36.
Figure 11.42

Solution By Theorem 11.10, you have

$$\begin{aligned} V &= |\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})| \qquad \text{Triple scalar product} \\ &= \begin{vmatrix} 3 & -5 & 1 \\ 0 & 2 & -2 \\ 3 & 1 & 1 \end{vmatrix} \\ &= 3\begin{vmatrix} 2 & -2 \\ 1 & 1 \end{vmatrix} - (-5)\begin{vmatrix} 0 & -2 \\ 3 & 1 \end{vmatrix} + (1)\begin{vmatrix} 0 & 2 \\ 3 & 1 \end{vmatrix} \\ &= 3(4) + 5(6) + 1(-6) \\ &= 36. \end{aligned}$$

A natural consequence of Theorem 11.10 is that the volume of the parallelepiped is 0 if and only if the three vectors are coplanar. That is, when the vectors $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$, $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$, and $\mathbf{w} = \langle w_1, w_2, w_3 \rangle$ have the same initial point, they lie in the same plane if and only if

$$\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = \begin{vmatrix} u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \\ w_1 & w_2 & w_3 \end{vmatrix} = 0.$$

11.4 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Explain what $\mathbf{u} \times \mathbf{v}$ represents geometrically.
2. Explain how to find the area of a parallelogram using vectors.
3. Determine what must be true about two nonzero vectors whose cross product is 0.
4. Explain how torque and moments are related.

Cross Product of Unit Vectors **In Exercises 5–8, find the cross product of the unit vectors and sketch your result.**

5. $\mathbf{j} \times \mathbf{i}$
6. $\mathbf{j} \times \mathbf{k}$
7. $\mathbf{i} \times \mathbf{k}$
8. $\mathbf{k} \times \mathbf{i}$

Finding Cross Products **In Exercises 9–12, find (a) $\mathbf{u} \times \mathbf{v}$, (b) $\mathbf{v} \times \mathbf{u}$, and (c) $\mathbf{v} \times \mathbf{v}$.**

9. $\mathbf{u} = -2\mathbf{i} + 4\mathbf{j}$, $\mathbf{v} = 3\mathbf{i} + 2\mathbf{j} + 5\mathbf{k}$
10. $\mathbf{u} = 3\mathbf{i} + 5\mathbf{k}$, $\mathbf{v} = 2\mathbf{i} + 3\mathbf{j} - 2\mathbf{k}$
11. $\mathbf{u} = \langle 7, 3, 2 \rangle$, $\mathbf{v} = \langle 1, -1, 5 \rangle$
12. $\mathbf{u} = \langle 2, 1, -9 \rangle$, $\mathbf{v} = \langle -6, -2, -1 \rangle$

Finding a Cross Product **In Exercises 13–16, find $\mathbf{u} \times \mathbf{v}$ and show that it is orthogonal to both u and v.**

13. $\mathbf{u} = \langle 4, -1, 0 \rangle$, $\mathbf{v} = \langle -6, 3, 0 \rangle$
14. $\mathbf{u} = \langle -5, 2, 2 \rangle$, $\mathbf{v} = \langle 0, 1, 8 \rangle$
15. $\mathbf{u} = \mathbf{i} + \mathbf{j} + \mathbf{k}$, $\mathbf{v} = 2\mathbf{i} + \mathbf{j} - \mathbf{k}$
16. $\mathbf{u} = \mathbf{i} + 6\mathbf{j}$, $\mathbf{v} = -2\mathbf{i} + \mathbf{j} + \mathbf{k}$

Finding a Unit Vector **In Exercises 17–20, find a unit vector that is orthogonal to both u and v.**

17. $\mathbf{u} = \langle 4, -3, 1 \rangle$, $\mathbf{v} = \langle 2, 5, 3 \rangle$
18. $\mathbf{u} = \langle -8, -6, 4 \rangle$, $\mathbf{v} = \langle 10, -12, -2 \rangle$
19. $\mathbf{u} = -3\mathbf{i} + 2\mathbf{j} - 5\mathbf{k}$, $\mathbf{v} = \mathbf{i} - \mathbf{j} + 4\mathbf{k}$
20. $\mathbf{u} = 2\mathbf{k}$, $\mathbf{v} = 4\mathbf{i} + 6\mathbf{k}$

Area **In Exercises 21–24, find the area of the parallelogram that has the given vectors as adjacent sides. Use a graphing utility to verify your result.**

21. $\mathbf{u} = \mathbf{j}$, $\mathbf{v} = \mathbf{j} + \mathbf{k}$
22. $\mathbf{u} = \mathbf{i} + \mathbf{j} + \mathbf{k}$, $\mathbf{v} = \mathbf{j} + \mathbf{k}$
23. $\mathbf{u} = \langle 3, 2, -1 \rangle$, $\mathbf{v} = \langle 1, 2, 3 \rangle$
24. $\mathbf{u} = \langle 2, -1, 0 \rangle$, $\mathbf{v} = \langle -1, 2, 0 \rangle$

Area **In Exercises 25 and 26, verify that the points are the vertices of a parallelogram, and find its area.**

25. $A(0, 3, 2)$, $B(1, 5, 5)$, $C(6, 9, 5)$, $D(5, 7, 2)$
26. $A(2, -3, 1)$, $B(6, 5, -1)$, $C(7, 2, 2)$, $D(3, -6, 4)$

Area **In Exercises 27 and 28, find the area of the triangle with the given vertices. (*Hint:* $\frac{1}{2}\|\mathbf{u} \times \mathbf{v}\|$ is the area of the triangle having u and v as adjacent sides.)**

27. $A(0, 0, 0)$, $B(1, 0, 3)$, $C(-3, 2, 0)$
28. $A(2, -3, 4)$, $B(0, 1, 2)$, $C(-1, 2, 0)$

29. **Torque** The brakes on a bicycle are applied using a downward force of 20 pounds on the pedal when the crank makes a 40° angle with the horizontal (see figure). The crank is 6 inches in length. Find the torque at P.

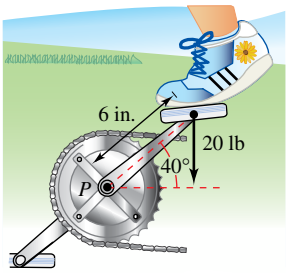

Figure for 29

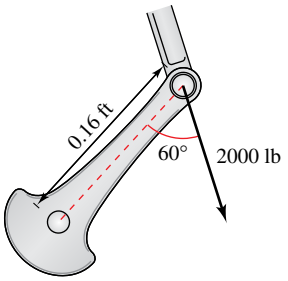

Figure for 30

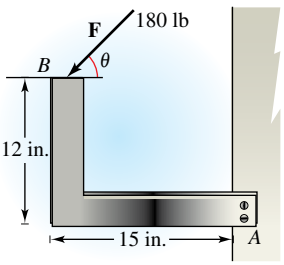
30. **Torque** Both the magnitude and the direction of the force on a crankshaft change as the crankshaft rotates. Find the torque on the crankshaft using the position and data shown in the figure.

31. **Optimization** A force of 180 pounds acts on the bracket shown in the figure.



(a) Determine the vector $\overrightarrow{AB}$ and the vector $\mathbf{F}$ representing the force. ($\mathbf{F}$ will be in terms of θ.)

(b) Find the magnitude of the moment about A by evaluating $\|\overrightarrow{AB} \times \mathbf{F}\|$.

(c) Use the result of part (b) to determine the magnitude of the moment when $\theta = 30°$.

(d) Use the result of part (b) to determine the angle θ when the magnitude of the moment is maximum. At that angle, what is the relationship between the vectors $\mathbf{F}$ and $\overrightarrow{AB}$? Is it what you expected? Why or why not?

(e) Use a graphing utility to graph the function for the magnitude of the moment about A for $0° \le \theta \le 180°$. Find the zero of the function in the given domain. Interpret the meaning of the zero in the context of the problem.

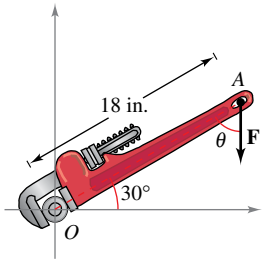
32. Optimization A force of 56 pounds acts on the pipe wrench shown in the figure.



(a) Find the magnitude of the moment about O by evaluating $\|\overrightarrow{OA} \times \mathbf{F}\|$. Use a graphing utility to graph the resulting function of θ.

(b) Use the result of part (a) to determine the magnitude of the moment when $\theta = 45°$.

(c) Use the result of part (a) to determine the angle θ when the magnitude of the moment is maximum. Is the answer what you expected? Why or why not?

Finding a Triple Scalar Product **In Exercises 33–36, find $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})$.**

33. $\mathbf{u} = \mathbf{i}$, $\mathbf{v} = \mathbf{j}$, $\mathbf{w} = \mathbf{k}$

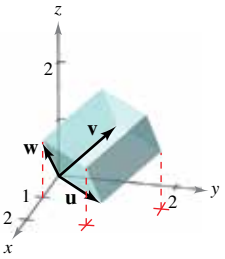
34. $\mathbf{u} = \langle 1, 1, 1 \rangle$, $\mathbf{v} = \langle 2, 1, 0 \rangle$, $\mathbf{w} = \langle 0, 0, 1 \rangle$

35. $\mathbf{u} = \langle 2, 0, 1 \rangle$, $\mathbf{v} = \langle 0, 3, 0 \rangle$, $\mathbf{w} = \langle 0, 0, 1 \rangle$

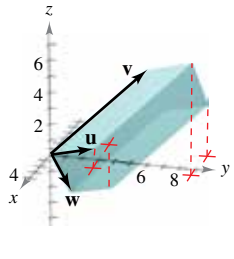
36. $\mathbf{u} = \langle 2, 0, 0 \rangle$, $\mathbf{v} = \langle 1, 1, 1 \rangle$, $\mathbf{w} = \langle 0, 2, 2 \rangle$

Volume **In Exercises 37 and 38, use the triple scalar product to find the volume of the parallelepiped having adjacent edges u, v, and w.**

37. $\mathbf{u} = \mathbf{i} + \mathbf{j}$, $\mathbf{v} = \mathbf{j} + \mathbf{k}$, $\mathbf{w} = \mathbf{i} + \mathbf{k}$



38. $\mathbf{u} = \langle 1, 3, 1 \rangle$, $\mathbf{v} = \langle 0, 6, 6 \rangle$, $\mathbf{w} = \langle -4, 0, -4 \rangle$



Volume **In Exercises 39 and 40, find the volume of the parallelepiped with the given vertices.**

39. (0, 0, 0), (3, 0, 0), (0, 5, 1), (2, 0, 5), (3, 5, 1), (5, 0, 5), (2, 5, 6), (5, 5, 6)

40. (0, 0, 0), (0, 4, 0), (−3, 0, 0), (−1, 1, 5), (−3, 4, 0), (−1, 5, 5), (−4, 1, 5), (−4, 5, 5)

Exploring Concepts

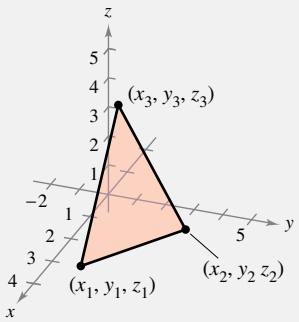
41. Identify the dot products that are equal. Explain your reasoning. (Assume $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$ are nonzero vectors.)

(a) $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})$ (b) $(\mathbf{v} \times \mathbf{w}) \cdot \mathbf{u}$
(c) $(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w}$ (d) $(\mathbf{u} \times -\mathbf{w}) \cdot \mathbf{v}$
(e) $\mathbf{u} \cdot (\mathbf{w} \times \mathbf{v})$ (f) $\mathbf{w} \cdot (\mathbf{v} \times \mathbf{u})$
(g) $(-\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w}$ (h) $(\mathbf{w} \times \mathbf{u}) \cdot \mathbf{v}$

42. When $\mathbf{u} \times \mathbf{v} = \mathbf{0}$ and $\mathbf{u} \cdot \mathbf{v} = \mathbf{0}$, what can you conclude about $\mathbf{u}$ and $\mathbf{v}$?

43. Two nonzero vectors lie in the yz-plane. Where does the cross product of the vectors lie? Explain.

44. HOW DO YOU SEE IT? The vertices of a triangle in space are (x_1, y_1, z_1), (x_2, y_2, z_2), and (x_3, y_3, z_3). Explain how to find a vector perpendicular to the triangle.



True or False? **In Exercises 45–48, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

45. It is possible to find the cross product of two vectors in a two-dimensional coordinate system.

46. The cross product of two nonzero vectors is a nonzero vector.

47. If $\mathbf{u} \neq \mathbf{0}$ and $\mathbf{u} \times \mathbf{v} = \mathbf{u} \times \mathbf{w}$, then $\mathbf{v} = \mathbf{w}$.

48. If $\mathbf{u} \neq \mathbf{0}$, $\mathbf{u} \cdot \mathbf{v} = \mathbf{u} \cdot \mathbf{w}$, and $\mathbf{u} \times \mathbf{v} = \mathbf{u} \times \mathbf{w}$, then $\mathbf{v} = \mathbf{w}$.

Proof **In Exercises 49–54, prove the property of the cross product.**

49. $\mathbf{u} \times (\mathbf{v} + \mathbf{w}) = (\mathbf{u} \times \mathbf{v}) + (\mathbf{u} \times \mathbf{w})$

50. $c(\mathbf{u} \times \mathbf{v}) = (c\mathbf{u}) \times \mathbf{v} = \mathbf{u} \times (c\mathbf{v})$

51. $\mathbf{u} \times \mathbf{u} = \mathbf{0}$

52. $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = (\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w}$

53. $\mathbf{u} \times \mathbf{v}$ is orthogonal to both $\mathbf{u}$ and $\mathbf{v}$.

54. $\mathbf{u} \times \mathbf{v} = \mathbf{0}$ if and only if $\mathbf{u}$ and $\mathbf{v}$ are scalar multiples of each other.

55. Proof Prove that $\|\mathbf{u} \times \mathbf{v}\| = \|\mathbf{u}\| \|\mathbf{v}\|$ if $\mathbf{u}$ and $\mathbf{v}$ are orthogonal.

56. Proof Prove that $\mathbf{u} \times (\mathbf{v} \times \mathbf{w}) = (\mathbf{u} \cdot \mathbf{w})\mathbf{v} - (\mathbf{u} \cdot \mathbf{v})\mathbf{w}$.

57. Proof Prove Theorem 11.9.

11.5 Lines and Planes in Space

GO DIGITAL

- **Write a set of parametric equations for a line in space.**
- **Write a linear equation to represent a plane in space.**
- **Sketch the plane given by a linear equation.**
- **Find the distances between points, planes, and lines in space.**

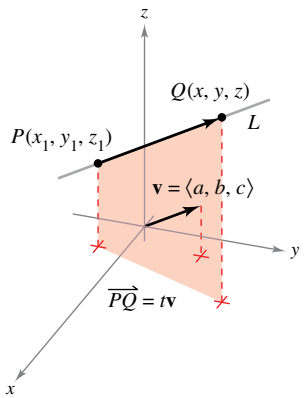
Lines in Space

In the plane, *slope* is used to determine the equation of a line. In space, it is more convenient to use *vectors* to determine the equation of a line.

In Figure 11.43, consider the line L through the point $P(x_1, y_1, z_1)$ and parallel to the vector $\mathbf{v} = \langle a, b, c \rangle$. The vector $\mathbf{v}$ is a **direction vector** for the line L, and a, b, and c are **direction numbers.** One way of describing the line L is to say that it consists of all points $Q(x, y, z)$ for which the vector $\overrightarrow{PQ}$ is parallel to $\mathbf{v}$. This means that $\overrightarrow{PQ}$ is a scalar multiple of $\mathbf{v}$ and you can write $\overrightarrow{PQ} = t\mathbf{v}$, where t is a scalar (a real number).

$$\overrightarrow{PQ} = \langle x - x_1, y - y_1, z - z_1 \rangle = \langle at, bt, ct \rangle = t\mathbf{v}$$

By equating corresponding components, you can obtain **parametric equations** of a line in space.



Line L and its direction vector $\mathbf{v}$
Figure 11.43

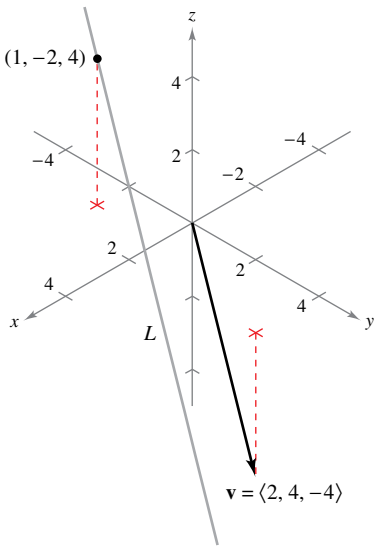
THEOREM 11.11 Parametric Equations of a Line in Space

A line L parallel to the vector $\mathbf{v} = \langle a, b, c \rangle$ and passing through the point $P(x_1, y_1, z_1)$ is represented by the **parametric equations**

$$x = x_1 + at, \quad y = y_1 + bt, \quad \text{and} \quad z = z_1 + ct.$$

If the direction numbers a, b, and c are all nonzero, then you can eliminate the parameter t in the parametric equations to obtain **symmetric equations** of the line.

$$\frac{x - x_1}{a} = \frac{y - y_1}{b} = \frac{z - z_1}{c} \qquad \text{Symmetric equations}$$



The vector $\mathbf{v}$ is parallel to the line L.
Figure 11.44

EXAMPLE 1 Finding Parametric and Symmetric Equations

Find parametric and symmetric equations of the line L that passes through the point $(1, -2, 4)$ and is parallel to $\mathbf{v} = \langle 2, 4, -4 \rangle$, as shown in Figure 11.44.

Solution To find a set of parametric equations of the line, use the coordinates $x_1 = 1$, $y_1 = -2$, and $z_1 = 4$ and direction numbers $a = 2$, $b = 4$, and $c = -4$.

$$x = 1 + 2t, \quad y = -2 + 4t, \quad z = 4 - 4t \qquad \text{Parametric equations}$$

Because a, b, and c are all nonzero, a set of symmetric equations is

$$\frac{x - 1}{2} = \frac{y + 2}{4} = \frac{z - 4}{-4}. \qquad \text{Symmetric equations}$$

Neither parametric equations nor symmetric equations of a given line are unique. For instance, in Example 1, by letting $t = 1$ in the parametric equations, you would obtain the point $(3, 2, 0)$. Using this point with the direction numbers $a = 2$, $b = 4$, and $c = -4$ would produce a different set of parametric equations

$$x = 3 + 2t, \quad y = 2 + 4t, \quad \text{and} \quad z = -4t.$$

EXAMPLE 2 **Parametric Equations of a Line Through Two Points**

See LarsonCalculus.com for an interactive version of this type of example.

Find a set of parametric equations of the line that passes through the points

$$(-2, 1, 0) \quad \text{and} \quad (1, 3, 5).$$

Solution Begin by using the points $P(-2, 1, 0)$ and $Q(1, 3, 5)$ to find a direction vector for the line passing through P and Q.

$$\mathbf{v} = \overrightarrow{PQ} = \langle 1 - (-2), 3 - 1, 5 - 0 \rangle = \langle 3, 2, 5 \rangle = \langle a, b, c \rangle$$

Using the direction numbers $a = 3$, $b = 2$, and $c = 5$ with the point $P(-2, 1, 0)$, you obtain the parametric equations

$$x = -2 + 3t, \quad y = 1 + 2t, \quad \text{and} \quad z = 5t.$$

REMARK As t varies over all real numbers, the parametric equations in Example 2 determine the points (x, y, z) on the line. In particular, note that $t = 0$ and $t = 1$ give the original points $(-2, 1, 0)$ and $(1, 3, 5)$.

Planes in Space

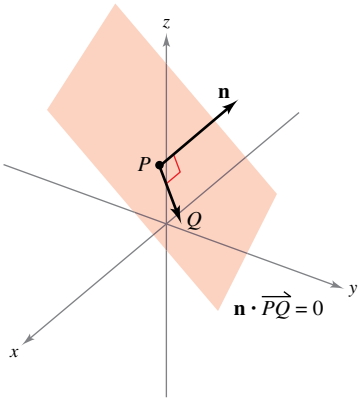
You have seen how an equation of a line in space can be obtained from a point on the line and a vector *parallel* to it. You will now see that an equation of a plane in space can be obtained from a point in the plane and a vector *normal* (perpendicular) to the plane.

Consider the plane containing the point $P(x_1, y_1, z_1)$ having a nonzero normal vector

$$\mathbf{n} = \langle a, b, c \rangle$$

as shown in Figure 11.45. This plane consists of all points $Q(x, y, z)$ for which vector $\overrightarrow{PQ}$ is orthogonal to $\mathbf{n}$. Using the dot product, you can write the following.

$$\mathbf{n} \cdot \overrightarrow{PQ} = 0$$
$$\langle a, b, c \rangle \cdot \langle x - x_1, y - y_1, z - z_1 \rangle = 0$$
$$a(x - x_1) + b(y - y_1) + c(z - z_1) = 0$$



The normal vector $\mathbf{n}$ is orthogonal to each vector $\overrightarrow{PQ}$ in the plane.
Figure 11.45

The third equation of the plane is said to be in **standard form.**

THEOREM 11.12 Standard Equation of a Plane in Space

The plane containing the point (x_1, y_1, z_1) and having normal vector

$$\mathbf{n} = \langle a, b, c \rangle$$

can be represented by the **standard form** of the equation of a plane

$$a(x - x_1) + b(y - y_1) + c(z - z_1) = 0.$$

By regrouping terms in the standard form of the equation of a plane, you obtain the **general form.**

$$ax + by + cz + d = 0$$ General form of equation of plane

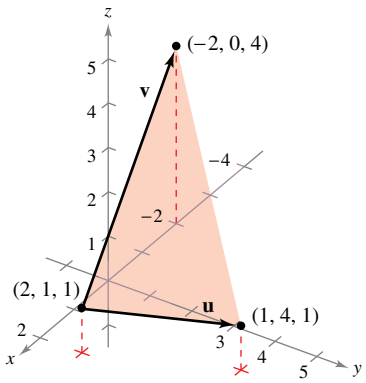
GO DIGITAL

Given the general form of the equation of a plane, it is easy to find a normal vector to the plane. Simply use the coefficients of x, y, and z and write $\mathbf{n} = \langle a, b, c \rangle$.

EXAMPLE 3 Finding an Equation of a Plane in Three-Space

Find an equation (in standard form and in general form) of the plane containing the points

$$(2, 1, 1), \quad (1, 4, 1), \quad \text{and} \quad (-2, 0, 4).$$



A plane determined by $\mathbf{u}$ and $\mathbf{v}$
Figure 11.46

Solution To apply Theorem 11.12, you need a point in the plane and a vector that is normal to the plane. There are three choices for the point, but no normal vector is given. To obtain a normal vector, use the cross product of vectors $\mathbf{u}$ and $\mathbf{v}$ extending from the point $(2, 1, 1)$ to the points $(1, 4, 1)$ and $(-2, 0, 4)$, as shown in Figure 11.46. The component forms of $\mathbf{u}$ and $\mathbf{v}$ are

$$\mathbf{u} = \langle 1 - 2, 4 - 1, 1 - 1 \rangle = \langle -1, 3, 0 \rangle$$

and

$$\mathbf{v} = \langle -2 - 2, 0 - 1, 4 - 1 \rangle = \langle -4, -1, 3 \rangle.$$

So, it follows that a vector normal to the given plane is

$$\begin{aligned} \mathbf{n} &= \mathbf{u} \times \mathbf{v} \\ &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -1 & 3 & 0 \\ -4 & -1 & 3 \end{vmatrix} \\ &= 9\mathbf{i} + 3\mathbf{j} + 13\mathbf{k}. \qquad \langle a, b, c \rangle \end{aligned}$$

The direction numbers for $\mathbf{n}$ are $a = 9$, $b = 3$, and $c = 13$. Using these numbers and the point $(x_1, y_1, z_1) = (2, 1, 1)$, you can determine an equation of the plane in standard form.

$$\begin{aligned} a(x - x_1) + b(y - y_1) + c(z - z_1) &= 0 \\ 9(x - 2) + 3(y - 1) + 13(z - 1) &= 0 \qquad \text{Standard form} \end{aligned}$$

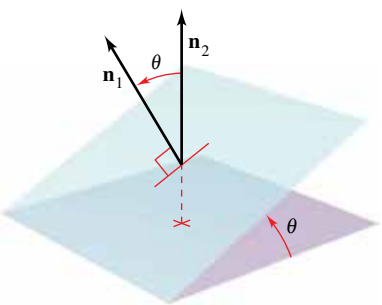
By regrouping terms, the general form is

$$\begin{aligned} 9x - 18 + 3y - 3 + 13z - 13 &= 0 \\ 9x + 3y + 13z - 34 &= 0. \qquad \text{General form} \end{aligned}$$

REMARK In Example 3, check to see that each of the three original points satisfies the equation $9x + 3y + 13z - 34 = 0$.

Two distinct planes in three-space either are parallel or intersect in a line. For two planes that intersect, you can determine the angle $(0 \le \theta \le \pi/2)$ between them from the angle between their normal vectors, as shown in Figure 11.47. Specifically, if vectors $\mathbf{n}_1$ and $\mathbf{n}_2$ are normal to two intersecting planes, then the angle θ between the normal vectors is equal to the angle between the two planes and is

$$\cos\theta = \frac{|\mathbf{n}_1 \cdot \mathbf{n}_2|}{\|\mathbf{n}_1\| \, \|\mathbf{n}_2\|}. \qquad \text{Angle between two planes}$$



The angle θ between two planes
Figure 11.47

Consequently, two planes with normal vectors $\mathbf{n}_1$ and $\mathbf{n}_2$ are

1. *perpendicular* when $\mathbf{n}_1 \cdot \mathbf{n}_2 = 0$.
2. *parallel* when $\mathbf{n}_1$ is a scalar multiple of $\mathbf{n}_2$.

GO DIGITAL

REMARK The three-dimensional rotatable graphs that are available at *LarsonCalculus.com* can help you visualize surfaces such as those shown in Figure 11.48. If you have access to these graphs, use them to help your spatial intuition when studying this section and other sections in the text that deal with vectors, curves, or surfaces in space.

EXAMPLE 4 Finding the Line of Intersection of Two Planes

In Figure 11.48, the equation for Plane 1 is $x - 2y + z = 0$ and the equation for Plane 2 is $2x + 3y - 2z = 0$. Find the angle between the two planes. Then find a set of parametric equations for the line of intersection of the planes.

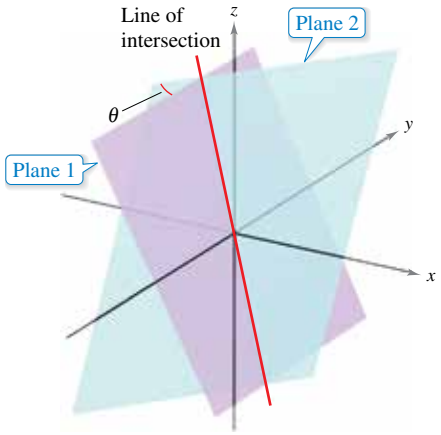

Figure 11.48

Solution Normal vectors for the planes are $\mathbf{n}_1 = \langle 1, -2, 1 \rangle$ and $\mathbf{n}_2 = \langle 2, 3, -2 \rangle$. Consequently, the angle between the two planes is determined as follows.

$$\cos\theta = \frac{|\mathbf{n}_1 \cdot \mathbf{n}_2|}{\|\mathbf{n}_1\|\,\|\mathbf{n}_2\|} = \frac{|-6|}{\sqrt{6}\sqrt{17}} = \frac{6}{\sqrt{102}} \quad \Rightarrow \quad \theta = \arccos\frac{6}{\sqrt{102}}$$

This implies that the angle between the two planes is $\theta \approx 53.55°$. You can find the line of intersection of the two planes by simultaneously solving the two linear equations representing the planes. One way to do this is to multiply the first equation by -2 and add the result to the second equation.

$$\begin{aligned} x - 2y + z = 0 \quad &\Rightarrow \quad -2x + 4y - 2z = 0 && \text{Multiply Equation 1 by } -2. \\ 2x + 3y - 2z = 0 \quad &\Rightarrow \quad \underline{2x + 3y - 2z = 0} && \text{Write Equation 2.} \\ & \qquad\qquad 7y - 4z = 0 && \text{Add equations.} \\ & \qquad\qquad y = \frac{4z}{7} && \text{Solve for } y. \end{aligned}$$

Substituting $y = 4z/7$ back into one of the original equations, you can determine that $x = z/7$. Finally, by letting $t = z/7$, you obtain the parametric equations

$$x = t, \quad y = 4t, \quad \text{and} \quad z = 7t \qquad \text{Line of intersection}$$

which indicate that 1, 4, and 7 are direction numbers for the line of intersection. ■

Note that the direction numbers in Example 4 can be obtained from the cross product of the two normal vectors as follows.

$$\begin{aligned} \mathbf{n}_1 \times \mathbf{n}_2 &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & -2 & 1 \\ 2 & 3 & -2 \end{vmatrix} \\ &= \begin{vmatrix} -2 & 1 \\ 3 & -2 \end{vmatrix}\mathbf{i} - \begin{vmatrix} 1 & 1 \\ 2 & -2 \end{vmatrix}\mathbf{j} + \begin{vmatrix} 1 & -2 \\ 2 & 3 \end{vmatrix}\mathbf{k} \\ &= \mathbf{i} + 4\mathbf{j} + 7\mathbf{k} \end{aligned}$$

This means that the line of intersection of the two planes is parallel to the cross product of their normal vectors.

Sketching Planes in Space

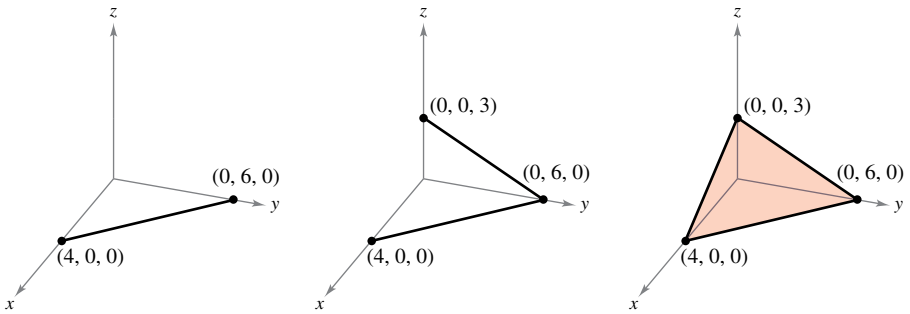
If a plane in space intersects one of the coordinate planes, then the line of intersection is called the **trace** of the given plane in the coordinate plane. To sketch a plane in space, it is helpful to find its points of intersection with the coordinate axes and its traces in the coordinate planes. For example, consider the plane

$$3x + 2y + 4z = 12.$$ Equation of plane

You can find the xy-trace by letting $z = 0$ and sketching the line

$$3x + 2y = 12$$ xy-trace

in the xy-plane. This line intersects the x-axis at $(4, 0, 0)$ and the y-axis at $(0, 6, 0)$. In Figure 11.49, this process is continued by finding the yz-trace and the xz-trace and then shading the triangular region lying in the first octant.



xy-trace ($z = 0$): $3x + 2y = 12$ | yz-trace ($x = 0$): $2y + 4z = 12$ | xz-trace ($y = 0$): $3x + 4z = 12$

Traces of the plane $3x + 2y + 4z = 12$

Figure 11.49

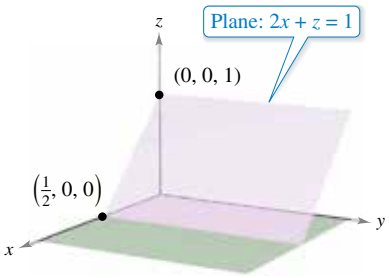
If an equation of a plane has a missing variable, such as

$$2x + z = 1$$

then the plane must be *parallel to the axis* represented by the missing variable, as shown in Figure 11.50. If two variables are missing from an equation of a plane, such as

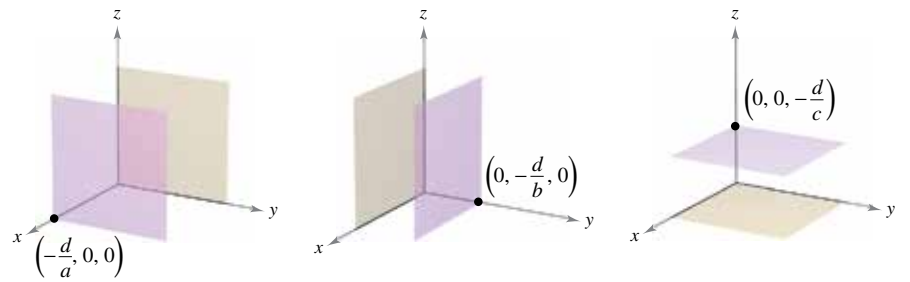
$$ax + d = 0$$

then it is *parallel to the coordinate plane* represented by the missing variables, as shown in Figure 11.51.



Plane $2x + z = 1$ is parallel to the y-axis.

Figure 11.50



Plane $ax + d = 0$ is parallel to the yz-plane. | Plane $by + d = 0$ is parallel to the xz-plane. | Plane $cz + d = 0$ is parallel to the xy-plane.

Figure 11.51

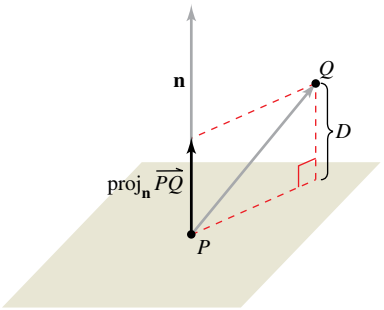
Distances Between Points, Planes, and Lines

Consider two types of problems involving distance in space: (1) finding the distance between a point and a plane and (2) finding the distance between a point and a line. The solutions of these problems illustrate the versatility and usefulness of vectors in coordinate geometry: the first problem uses the *dot product* of two vectors, and the second problem uses the *cross product.*

The distance D between a point Q and a plane is the length of the shortest line segment connecting Q to the plane, as shown in Figure 11.52. For *any* point P in the plane, you can find this distance by projecting the vector $\overrightarrow{PQ}$ onto the normal vector $\mathbf{n}$. The length of this projection is the desired distance.



$D = \|\text{proj}_{\mathbf{n}}\overrightarrow{PQ}\|$

The distance between a point and a plane

Figure 11.52

THEOREM 11.13 Distance Between a Point and a Plane

The distance between a plane and a point Q (not in the plane) is

$$D = \|\text{proj}_{\mathbf{n}}\overrightarrow{PQ}\| = \frac{|\overrightarrow{PQ} \cdot \mathbf{n}|}{\|\mathbf{n}\|}$$

where P is a point in the plane and $\mathbf{n}$ is normal to the plane.

To find a point in the plane $ax + by + cz + d = 0$, where $a \neq 0$, let $y = 0$ and $z = 0$. Then, from the equation $ax + d = 0$, you can conclude that the point

$$\left(-\frac{d}{a}, 0, 0\right)$$

lies in the plane.

EXAMPLE 5 Finding the Distance Between a Point and a Plane

Find the distance between the point $Q(1, 5, -4)$ and the plane $3x - y + 2z = 6$.

Solution You know that $\mathbf{n} = \langle 3, -1, 2\rangle$ is normal to the plane. To find a point in the plane, let $y = 0$ and $z = 0$, and obtain the point $P(2, 0, 0)$. The vector from P to Q is

$$\begin{aligned}\overrightarrow{PQ} &= \langle 1 - 2, 5 - 0, -4 - 0\rangle \\ &= \langle -1, 5, -4\rangle.\end{aligned}$$

Using the Distance Formula given in Theorem 11.13 produces

$$D = \frac{|\overrightarrow{PQ} \cdot \mathbf{n}|}{\|\mathbf{n}\|} = \frac{|\langle -1, 5, -4\rangle \cdot \langle 3, -1, 2\rangle|}{\sqrt{9 + 1 + 4}} = \frac{|-3 - 5 - 8|}{\sqrt{14}} = \frac{16}{\sqrt{14}} \approx 4.28.$$

REMARK In the solution to Example 5, note that the choice of the point P is arbitrary. Try choosing a different point in the plane to verify that you obtain the same distance.

From Theorem 11.13, you can determine that the distance between the point $Q(x_0, y_0, z_0)$ and the plane $ax + by + cz + d = 0$ is

$$D = \frac{|a(x_0 - x_1) + b(y_0 - y_1) + c(z_0 - z_1)|}{\sqrt{a^2 + b^2 + c^2}}$$

or

$$D = \frac{|ax_0 + by_0 + cz_0 + d|}{\sqrt{a^2 + b^2 + c^2}}$$ Distance between a point and a plane

where $P(x_1, y_1, z_1)$ is a point in the plane and $d = -(ax_1 + by_1 + cz_1)$.

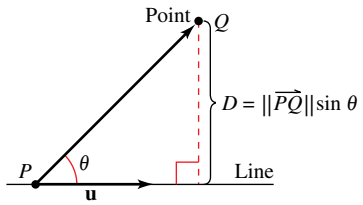
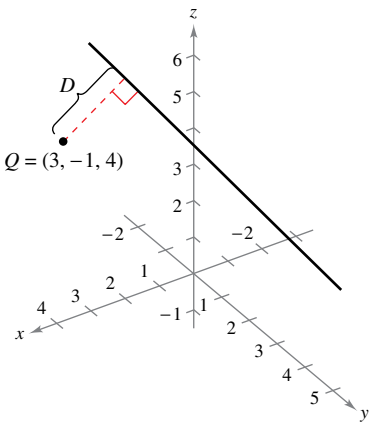
The distance between the parallel planes is approximately 2.14.
Figure 11.53

GO DIGITAL



The distance between a point and a line
Figure 11.54



The distance between the point Q and the line is $\sqrt{6} \approx 2.45$.
Figure 11.55

EXAMPLE 6 Finding the Distance Between Two Parallel Planes

Two parallel planes, $3x - y + 2z - 6 = 0$ and $6x - 2y + 4z + 4 = 0$, are shown in Figure 11.53. To find the distance between the planes, choose a point in the first plane, such as $(x_0, y_0, z_0) = (2, 0, 0)$. Then, from the second plane, you can determine that $a = 6$, $b = -2$, $c = 4$, and $d = 4$ and conclude that the distance is

$$D = \frac{|ax_0 + by_0 + cz_0 + d|}{\sqrt{a^2 + b^2 + c^2}}$$
$$= \frac{|6(2) + (-2)(0) + (4)(0) + 4|}{\sqrt{6^2 + (-2)^2 + 4^2}}$$
$$= \frac{16}{\sqrt{56}} = \frac{8}{\sqrt{14}} \approx 2.14.$$

The formula for the distance between a point and a line in space resembles that for the distance between a point and a plane—except that you replace the dot product with the length of the cross product and the normal vector $\mathbf{n}$ with a direction vector for the line.

THEOREM 11.14 Distance Between a Point and a Line in Space

The distance between a point Q and a line in space is

$$D = \frac{\|\overrightarrow{PQ} \times \mathbf{u}\|}{\|\mathbf{u}\|}$$

where $\mathbf{u}$ is a direction vector for the line and P is a point on the line.

Proof In Figure 11.54, let D be the distance between the point Q and the line. Then $D = \|\overrightarrow{PQ}\| \sin\theta$, where θ is the angle between $\mathbf{u}$ and $\overrightarrow{PQ}$. By Property 2 of Theorem 11.8, you have $\|\mathbf{u}\|\|\overrightarrow{PQ}\| \sin\theta = \|\mathbf{u} \times \overrightarrow{PQ}\| = \|\overrightarrow{PQ} \times \mathbf{u}\|$. Consequently,

$$D = \|\overrightarrow{PQ}\| \sin\theta = \frac{\|\overrightarrow{PQ} \times \mathbf{u}\|}{\|\mathbf{u}\|}.$$

EXAMPLE 7 Finding the Distance Between a Point and a Line

Find the distance between the point $Q(3, -1, 4)$ and the line

$$x = -2 + 3t, \quad y = -2t, \quad \text{and} \quad z = 1 + 4t.$$

Solution Using the direction numbers 3, −2, and 4, a direction vector for the line is $\mathbf{u} = \langle 3, -2, 4\rangle$. To find a point on the line, let $t = 0$ and obtain $P = (-2, 0, 1)$. So,

$$\overrightarrow{PQ} = \langle 3 - (-2), -1 - 0, 4 - 1\rangle = \langle 5, -1, 3\rangle$$

and you can form the cross product

$$\overrightarrow{PQ} \times \mathbf{u} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 5 & -1 & 3 \\ 3 & -2 & 4 \end{vmatrix} = 2\mathbf{i} - 11\mathbf{j} - 7\mathbf{k} = \langle 2, -11, -7\rangle.$$

Finally, using Theorem 11.14, you can find the distance to be

$$D = \frac{\|\overrightarrow{PQ} \times \mathbf{u}\|}{\|\mathbf{u}\|} = \frac{\sqrt{174}}{\sqrt{29}} = \sqrt{6} \approx 2.45.$$

See Figure 11.55.

11.5 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Give the parametric equations and the symmetric equations of a line in space. Describe what is required to find these equations.
2. Explain how to obtain the general form of the equation of a plane given the standard form.
3. Let $2(x-1)+4(y-3)-(z+5)=0$ represent a plane in space. What is the normal vector to this plane?
4. Write an equation of a plane in space that is parallel to the x-axis.

Checking Points on a Line

In Exercises 5 and 6, determine whether each point lies on the line.

5. $x=-2+t,\ y=3t,\ z=4+t$

(a) $(0,6,6)$ (b) $(2,3,5)$ (c) $(-4,-6,2)$

6. $\dfrac{x-3}{2}=\dfrac{y-7}{8}=z+2$

(a) $(7,23,0)$ (b) $(1,-1,-3)$ (c) $(-7,47,-7)$

Finding Parametric and Symmetric Equations

In Exercises 7–12, find sets of (a) parametric equations and (b) symmetric equations of the line that passes through the given point and is parallel to the given vector or line. (For each line, write the direction numbers as integers.)

	Point	Parallel to
7.	$(0,0,0)$	$\mathbf{v}=\langle 3,1,5\rangle$
8.	$(0,0,0)$	$\mathbf{v}=\langle -2,\frac{5}{2},1\rangle$
9.	$(-2,0,3)$	$\mathbf{v}=2\mathbf{i}+4\mathbf{j}-2\mathbf{k}$
10.	$(-3,0,2)$	$\mathbf{v}=6\mathbf{j}+3\mathbf{k}$
11.	$(1,0,1)$	$x=3+3t,\ y=5-2t,\ z=-7+t$
12.	$(-3,5,4)$	$\dfrac{x-1}{3}=\dfrac{y+1}{-2}=z-3$

Finding Parametric and Symmetric Equations

In Exercises 13–16, find sets of (a) parametric equations and (b) symmetric equations of the line that passes through the two points (if possible). (For each line, write the direction numbers as integers.)

13. $(5,-3,-2),\ \left(-\frac{2}{3},\frac{2}{3},1\right)$

14. $(0,4,3),\ (-1,2,5)$

15. $(7,-2,6),\ (-3,0,6)$

16. $(0,0,25),\ (10,10,0)$

Finding Parametric Equations

In Exercises 17–24, find a set of parametric equations of the line with the given characteristics.

17. The line passes through the point $(2,3,4)$ and is parallel to the xz-plane and the yz-plane.

18. The line passes through the point $(-4,5,2)$ and is parallel to the xy-plane and the yz-plane.

19. The line passes through the point $(2,3,4)$ and is perpendicular to the plane given by $3x+2y-z=6$.

20. The line passes through the point $(-4,5,2)$ and is perpendicular to the plane given by $-x+2y+z=5$.

21. The line passes through the point $(5,-3,-4)$ and is parallel to $\mathbf{v}=\langle 2,-1,3\rangle$.

22. The line passes through the point $(-1,4,-3)$ and is parallel to $\mathbf{v}=5\mathbf{i}-\mathbf{j}$.

23. The line passes through the point $(2,1,2)$ and is parallel to the line $x=-t,\ y=1+t,\ z=-2+t$.

24. The line passes through the point $(-6,0,8)$ and is parallel to the line $x=5-2t,\ y=-4+2t,\ z=0$.

Using Parametric and Symmetric Equations

In Exercises 25–28, find the coordinates of a point P on the line and a vector $\mathbf{v}$ parallel to the line.

25. $x=3-t,\quad y=-1+2t,\quad z=-2$

26. $x=4t,\quad y=5-t,\quad z=4+3t$

27. $\dfrac{x-7}{4}=\dfrac{y+6}{2}=z+2$

28. $\dfrac{x+3}{5}=\dfrac{y}{8}=\dfrac{z-3}{6}$

Determining Parallel Lines

In Exercises 29–32, determine whether the lines are parallel or identical.

29. $x=6-3t,\quad y=-2+2t,\quad z=5+4t$

$x=6t,\quad y=2-4t,\quad z=13-8t$

30. $x=1+2t,\quad y=-1-t,\quad z=3t$

$x=5+2t,\quad y=1-t,\quad z=8+3t$

31. $\dfrac{x-8}{4}=\dfrac{y+5}{-2}=\dfrac{z+9}{3}$

$\dfrac{x+4}{-8}=\dfrac{y-1}{4}=\dfrac{z+18}{-6}$

32. $\dfrac{x-1}{4}=\dfrac{y-1}{2}=\dfrac{z+3}{4}$

$\dfrac{x+2}{1}=\dfrac{y-1}{0.5}=\dfrac{z-3}{1}$

Finding a Point of Intersection

In Exercises 33–36, determine whether the lines intersect, and if so, find the point of intersection and the angle between the lines.

33. $x=4t+2,\quad y=3,\quad z=-t+1$

$x=2s+2,\quad y=2s+3,\quad z=s+1$

34. $x=-3t+1,\quad y=4t+1,\quad z=2t+4$

$x=3s+1,\quad y=2s+4,\quad z=-s+1$

35. $\dfrac{x}{3}=\dfrac{y-2}{-1}=z+1,\quad \dfrac{x-1}{4}=y+2=\dfrac{z+3}{-3}$

36. $\dfrac{x-2}{-3}=\dfrac{y-2}{6}=z-3,\quad \dfrac{x-3}{2}=y+5=\dfrac{z+2}{4}$

Checking Points in a Plane **In Exercises 37 and 38, determine whether each point lies in the plane.**

37. $x + 2y - 4z - 1 = 0$

(a) $(-7, 2, -1)$ (b) $(5, 2, 2)$ (c) $(-6, 1, -1)$

38. $2x + y + 3z - 6 = 0$

(a) $(3, 6, -2)$ (b) $(-1, 5, -1)$ (c) $(2, 1, 0)$

Finding an Equation of a Plane **In Exercises 39–44, find an equation of the plane that passes through the given point and is perpendicular to the given vector or line.**

	Point	Perpendicular to
39.	$(1, 3, -7)$	$\mathbf{n} = \mathbf{j}$
40.	$(0, -1, 4)$	$\mathbf{n} = \mathbf{k}$
41.	$(3, 2, 2)$	$\mathbf{n} = 2\mathbf{i} + 3\mathbf{j} - \mathbf{k}$
42.	$(0, 0, 0)$	$\mathbf{n} = -3\mathbf{i} + 2\mathbf{k}$
43.	$(-1, 4, 0)$	$x = -1 + 2t, y = 5 - t, z = 3 - 2t$
44.	$(3, 2, 2)$	$\frac{x-1}{4} = y + 2 = \frac{z+3}{-3}$

Finding an Equation of a Plane **In Exercises 45–56, find an equation of the plane with the given characteristics.**

45. The plane passes through $(0, 0, 0)$, $(2, 0, 3)$, and $(-3, -1, 5)$.

46. The plane passes through $(3, -1, 2)$, $(2, 1, 5)$, and $(1, -2, -2)$.

47. The plane passes through $(1, 2, 3)$, $(3, 2, 1)$, and $(-1, -2, 2)$.

48. The plane passes through the point $(1, 2, 3)$ and is parallel to the yz-plane.

49. The plane passes through the point $(1, 2, 3)$ and is parallel to the xy-plane.

50. The plane contains the y-axis and makes an angle of $\pi/6$ with the positive x-axis.

51. The plane contains the lines given by

$$\frac{x-1}{-2} = y - 4 = z \quad \text{and} \quad \frac{x-2}{-3} = \frac{y-1}{4} = \frac{z-2}{-1}.$$

52. The plane passes through the point $(2, 2, 1)$ and contains the line given by

$$\frac{x}{2} = \frac{y-4}{-1} = z.$$

53. The plane passes through the points $(2, 2, 1)$ and $(-1, 1, -1)$ and is perpendicular to the plane

$$2x - 3y + z = 3.$$

54. The plane passes through the points $(3, 2, 1)$ and $(3, 1, -5)$ and is perpendicular to the plane

$$6x + 7y + 2z = 10.$$

55. The plane passes through the points $(1, -2, -1)$ and $(2, 5, 6)$ and is parallel to the x-axis.

56. The plane passes through the points $(4, 2, 1)$ and $(-3, 5, 7)$ and is parallel to the z-axis.

Finding an Equation of a Plane **In Exercises 57–60, find an equation of the plane that contains all the points that are equidistant from the given points.**

57. $(2, 2, 0)$, $(0, 2, 2)$

58. $(1, 0, 2)$, $(2, 0, 1)$

59. $(-3, 1, 2)$, $(6, -2, 4)$

60. $(-5, 1, -3)$, $(2, -1, 6)$

Parallel Planes **In Exercises 61–64, determine whether the planes are parallel or identical.**

61. $-5x + 2y - 8z = 6$
$15x - 6y + 24z = 17$

62. $2x - y + 3z = 8$
$8x - 4y + 12z = 5$

63. $3x - 2y + 5z = 10$
$75x - 50y + 125z = 250$

64. $-x + 4y - z = 6$
$-\frac{5}{2}x + 10y - \frac{5}{2}z = 15$

Intersection of Planes **In Exercises 65–68, (a) find the angle between the two planes and (b) find a set of parametric equations for the line of intersection of the planes.**

65. $3x + 2y - z = 7$
$x - 4y + 2z = 0$

66. $-2x + y + z = 2$
$6x - 3y + 2z = 4$

67. $3x - y + z = 7$
$4x + 6y + 3z = 2$

68. $6x - 3y + z = 5$
$-x + y + 5z = 5$

Comparing Planes **In Exercises 69–74, determine whether the planes are parallel, orthogonal, or neither. If they are neither parallel nor orthogonal, find the angle between the planes.**

69. $5x - 3y + z = 4$
$x + 4y + 7z = 1$

70. $3x + y - 4z = 3$
$-9x - 3y + 12z = 4$

71. $x - 3y + 6z = 4$
$5x + y - z = 4$

72. $3x + 2y - z = 7$
$x - 4y + 2z = 0$

73. $x - 5y - z = 1$
$5x - 25y - 5z = -3$

74. $2x - z = 1$
$4x + y + 8z = 10$

Sketching a Graph of a Plane **In Exercises 75–82, sketch a graph of the plane and label any intercepts.**

75. $y = -2$

76. $z = 1$

77. $x + z = 6$

78. $2x + y = 8$

79. $4x + 2y + 6z = 12$

80. $3x + 6y + 2z = 6$

81. $2x - y + 3z = 4$

82. $2x - y + z = 4$

Intersection of a Plane and a Line **In Exercises 83–86, find the point(s) of intersection (if any) of the plane and the line. Also, determine whether the line lies in the plane.**

83. $x + 3y - z = 6$, $\frac{x+7}{2} = y - 4 = \frac{z+1}{5}$

84. $2x + 3y = -5$, $\frac{x-1}{4} = \frac{y}{2} = \frac{z-3}{6}$

85. $2x + 3y = 10$, $\frac{x-1}{3} = \frac{y+1}{-2} = z - 3$

86. $5x + 3y = 17$, $\frac{x-4}{2} = \frac{y+1}{-3} = \frac{z+2}{5}$

Finding the Distance Between a Point and a Plane

In Exercises 87–90, find the distance between the point and the plane.

87. $(0, 0, 0)$
$2x + 3y + z = 12$

88. $(0, 0, 0)$
$5x + y - z = 9$

89. $(2, 8, 4)$
$2x + y + z = 5$

90. $(1, 3, -1)$
$3x - 4y + 5z = 6$

Finding the Distance Between Two Parallel Planes

In Exercises 91–94, verify that the two planes are parallel and find the distance between the planes.

91. $x - 3y + 4z = 10$
$x - 3y + 4z = 6$

92. $2x + 7y + z = 13$
$2x + 7y + z = 9$

93. $-3x + 6y + 7z = 1$
$6x - 12y - 14z = 25$

94. $-x + 6y + 2z = 3$
$-\frac{1}{2}x + 3y + z = 4$

Finding the Distance Between a Point and a Line

In Exercises 95–98, find the distance between the point and the line given by the set of parametric equations.

95. $(1, 5, -2)$; $x = 4t - 2$, $y = 3$, $z = -t + 1$

96. $(1, -2, 4)$; $x = 2t$, $y = t - 3$, $z = 2t + 2$

97. $(-2, 1, 3)$; $x = 1 - t$, $y = 2 + t$, $z = -2t$

98. $(4, -1, 5)$; $x = 3$, $y = 1 + 3t$, $z = 1 + t$

Finding the Distance Between Two Parallel Lines

In Exercises 99 and 100, verify that the two lines are parallel and find the distance between the lines.

99. L_1: $x = 2 - t$, $y = 3 + 2t$, $z = 4 + t$
L_2: $x = 3t$, $y = 1 - 6t$, $z = 4 - 3t$

100. L_1: $x = 3 + 6t$, $y = -2 + 9t$, $z = 1 - 12t$
L_2: $x = -1 + 4t$, $y = 3 + 6t$, $z = -8t$

Exploring Concepts

101. Consider a line and a point not on the line. How many planes contain the line and the point? Explain.

102. How many planes are orthogonal to a given plane in space? Explain.

103. Do two distinct lines in space determine a unique plane? Explain.

104. HOW DO YOU SEE IT? Match the general equation with its graph. Then state what axis or plane the equation is parallel to.

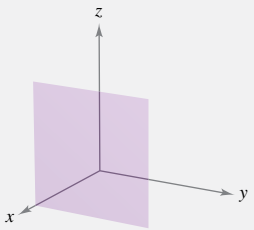
(a) $ax + by + d = 0$

(b) $ax + d = 0$

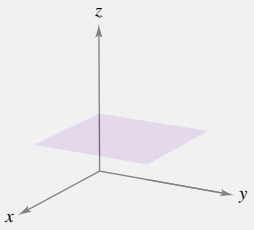
(c) $cz + d = 0$

(d) $ax + cz + d = 0$

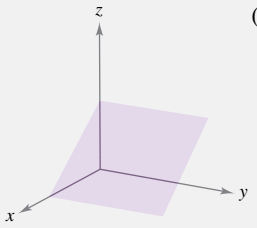
(i)



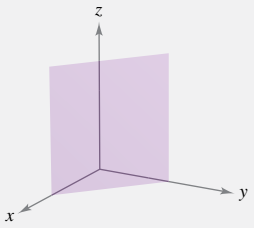
(ii)



(iii)



(iv)



105. Modeling Data

Personal consumption expenditures (in billions of dollars) for several types of recreation from 2012 through 2017 are shown in the table, where x is the expenditures on amusement parks and campgrounds, y is the expenditures on live entertainment (excluding sports), and z is the expenditures on spectator sports. *(Source: U.S. Bureau of Economic Analysis)*

Year	2012	2013	2014	2015	2016	2017
x	44.3	46.8	49.8	54.2	57.9	61.9
y	24.9	24.8	26.5	28.9	30.7	32.6
z	20.9	22.1	23.2	23.1	24.2	26.1

A model for the data is given by

$0.53x - 0.6y - z = -11.98.$

(a) Complete a fourth row in the table using the model to approximate z for the given values of x and y. Compare the approximations with the actual values of z.

(b) According to this model, an increase in expenditures on recreation type x and a decrease in expenditures on recreation type y would correspond to what kind of change in expenditures on recreation type z?

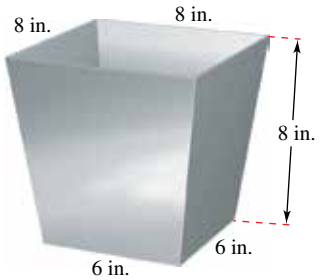
106. Mechanical Design The figure shows a chute at the top of a grain elevator of a combine that funnels the grain into a bin. Find the angle between two adjacent sides.



107. Distance Two insects are crawling along different lines in three-space. At time t (in minutes), the first insect is at the point (x, y, z) on the line $x = 6 + t$, $y = 8 - t$, $z = 3 + t$. Also, at time t, the second insect is at the point (x, y, z) on the line $x = 1 + t$, $y = 2 + t$, $z = 2t$. Assume that distances are given in inches.

(a) Find the distance between the two insects at time $t = 0$.

(b) Use a graphing utility to graph the distance between the insects from $t = 0$ to $t = 10$.

(c) Using the graph from part (b), what can you conclude about the distance between the insects?

(d) How close to each other do the insects get?

108. Finding an Equation of a Sphere Find the standard equation of the sphere with center $(-3, 2, 4)$ that is tangent to the plane given by $2x + 4y - 3z = 8$.

109. Finding a Point of Intersection Find the point of intersection of the plane $3x - y + 4z = 7$ and the line through $(5, 4, -3)$ that is perpendicular to this plane.

110. Finding the Distance Between a Plane and a Line Show that the plane $2x - y - 3z = 4$ is parallel to the line $x = -2 + 2t$, $y = -1 + 4t$, $z = 4$, and find the distance between them.

111. Finding Parametric Equations Find a set of parametric equations for the line passing through the point $(0, 1, 4)$ that is perpendicular to $\mathbf{u} = \langle 2, -5, 1 \rangle$ and $\mathbf{v} = \langle -3, 1, 4 \rangle$.

112. Finding Parametric Equations Find a set of parametric equations for the line passing through the point $(1, 0, 2)$ that is parallel to the plane given by $x + y + z = 5$ and perpendicular to the line $x = t$, $y = 1 + t$, $z = 1 + t$.

True or False? In Exercises 113–118, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.

113. If $\mathbf{v} = a_1\mathbf{i} + b_1\mathbf{j} + c_1\mathbf{k}$ is any vector in the plane given by $a_2x + b_2y + c_2z + d_2 = 0$, then $a_1a_2 + b_1b_2 + c_1c_2 = 0$.

114. Two lines in space are either intersecting or parallel.

115. Two planes in space are either intersecting or parallel.

116. If two lines L_1 and L_2 are each parallel to a plane, then L_1 and L_2 are parallel.

117. If two planes P_1 and P_2 are each perpendicular to a third plane in space, then P_1 and P_2 are parallel.

118. A plane and a line in space are either intersecting or parallel.

SECTION PROJECT

Distances in Space

You have learned two distance formulas in this section—one for the distance between a point and a plane, and one for the distance between a point and a line. In this project, you will study a third distance problem—the distance between two skew lines. Two lines in space are *skew* if they are neither parallel nor intersecting (see figure).

(a) Consider the following two lines in space.

L_1: $x = 4 + 5t$, $y = 5 + 5t$, $z = 1 - 4t$

L_2: $x = 4 + s$, $y = -6 + 8s$, $z = 7 - 3s$

(i) Show that these lines are not parallel.

(ii) Show that these lines do not intersect and therefore are skew lines.

(iii) Show that the two lines lie in parallel planes.

(iv) Find the distance between the parallel planes from part (iii). This is the distance between the original skew lines.

(b) Use the procedure in part (a) to find the distance between the lines.

L_1: $x = 2t$, $y = 4t$, $z = 6t$

L_2: $x = 1 - s$, $y = 4 + s$, $z = -1 + s$

(c) Use the procedure in part (a) to find the distance between the lines.

L_1: $x = 3t$, $y = 2 - t$, $z = -1 + t$

L_2: $x = 1 + 4s$, $y = -2 + s$, $z = -3 - 3s$

(d) Develop a formula for finding the distance between the skew lines.

L_1: $x = x_1 + a_1t$, $y = y_1 + b_1t$, $z = z_1 + c_1t$

L_2: $x = x_2 + a_2s$, $y = y_2 + b_2s$, $z = z_2 + c_2s$

11.6 Surfaces in Space

GO DIGITAL

- **Recognize and write equations of cylindrical surfaces.**
- **Recognize and write equations of quadric surfaces.**
- **Recognize and write equations of surfaces of revolution.**

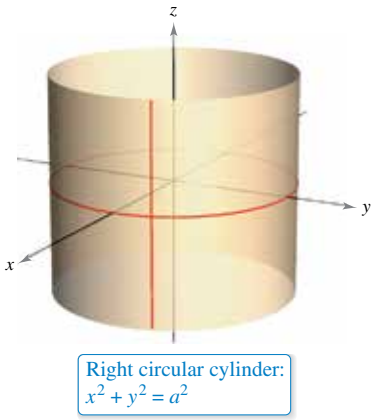
Cylindrical Surfaces

The first five sections of this chapter contained the vector portion of the preliminary work necessary to study vector calculus and the calculus of space. In this and the next section, you will study surfaces in space and alternative coordinate systems for space. You have already studied two special types of surfaces.

1. Spheres: $(x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2 = r^2$ Section 11.2

2. Planes: $ax + by + cz + d = 0$ Section 11.5

A third type of surface in space is a **cylindrical surface,** or simply a **cylinder.** To define a cylinder, consider the familiar right circular cylinder shown in Figure 11.56. The cylinder was generated by a vertical line moving around the circle $x^2 + y^2 = a^2$ in the xy-plane. This circle is a **generating curve** for the cylinder, as indicated in the next definition.



Rulings are parallel to z-axis
Figure 11.56

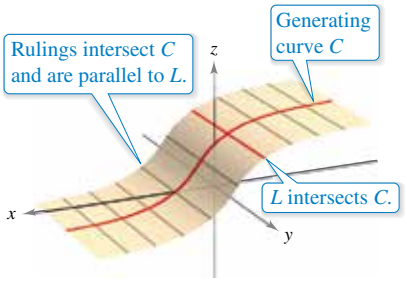
Definition of a Cylinder

Let C be a curve in a plane and let L be a line not in a parallel plane. The set of all lines parallel to L and intersecting C is a **cylinder.** The curve C is the **generating curve** (or **directrix**) of the cylinder, and the parallel lines are **rulings.**

Without loss of generality, you can assume that C lies in one of the three coordinate planes. Moreover, this text restricts the discussion to *right* cylinders—cylinders whose rulings are perpendicular to the coordinate plane containing C, as shown in Figure 11.57. Note that the rulings intersect C and are parallel to the line L.

For the right circular cylinder shown in Figure 11.56, the equation of the generating curve in the xy-plane is

$$x^2 + y^2 = a^2.$$



Right cylinder: A cylinder whose rulings are perpendicular to the coordinate plane containing C
Figure 11.57

To find an equation of the cylinder, note that you can generate any one of the rulings by fixing the values of x and y and then allowing z to take on all real values. In this sense, the value of z is arbitrary and so it is not included in the equation. In other words, the equation of this cylinder is simply the equation of its generating curve.

$$x^2 + y^2 = a^2$$ Equation of cylinder in space

Equations of Cylinders

The equation of a cylinder whose rulings are parallel to one of the coordinate axes contains only the variables corresponding to the other two axes.

EXAMPLE 1 **Sketching a Cylinder**

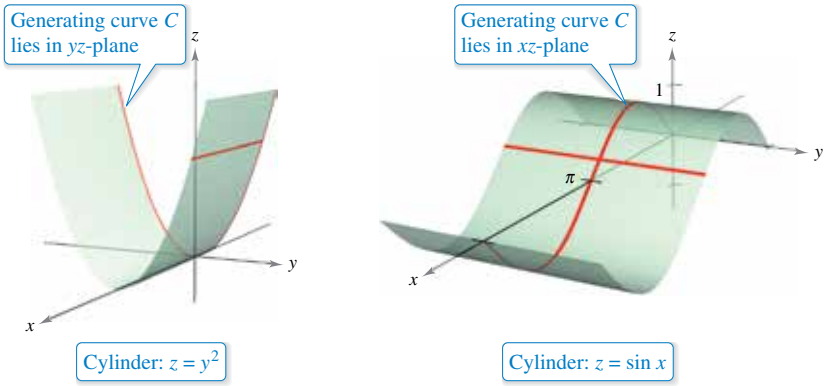
Sketch the surface represented by each equation.

a. $z = y^2$ **b.** $z = \sin x, \quad 0 \le x \le 2\pi$

Solution

a. The graph is a cylinder whose generating curve, $z = y^2$, is a parabola in the yz-plane. The rulings of the cylinder are parallel to the x-axis, as shown in Figure 11.58(a).

b. The graph is a cylinder generated by the sine curve in the xz-plane. The rulings are parallel to the y-axis, as shown in Figure 11.58(b).



(a) Rulings are parallel to x-axis. **(b)** Rulings are parallel to y-axis.

Figure 11.58

Quadric Surfaces

The fourth basic type of surface in space is a **quadric surface.** Quadric surfaces are the three-dimensional analogs of conic sections.

Quadric Surface

The equation of a **quadric surface** in space is a second-degree equation in three variables. The **general form** of the equation is

$$Ax^2 + By^2 + Cz^2 + Dxy + Exz + Fyz + Gx + Hy + Iz + J = 0.$$

There are six basic types of quadric surfaces: **ellipsoid, hyperboloid of one sheet, hyperboloid of two sheets, elliptic cone, elliptic paraboloid,** and **hyperbolic paraboloid.**

The intersection of a surface with a plane is called the **trace of the surface** in the plane. To visualize a surface in space, it is helpful to determine its traces in some well-chosen planes. The traces of quadric surfaces are conics. These traces, together with the **standard form** of the equation of each quadric surface, are shown in the table on the next two pages.

In the table on the next two pages, only one of several orientations of each quadric surface is shown. When the surface is oriented along a different axis, its standard equation will change accordingly, as illustrated in Examples 2 and 3. The fact that the two types of paraboloids have one variable raised to the first power can be helpful in classifying quadric surfaces. The other four types of basic quadric surfaces have equations that are of *second degree* in all three variables.

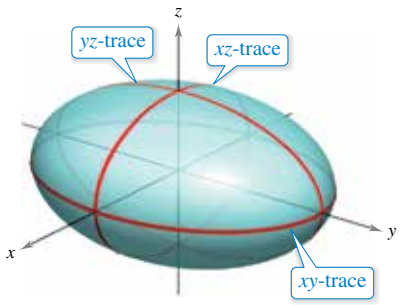
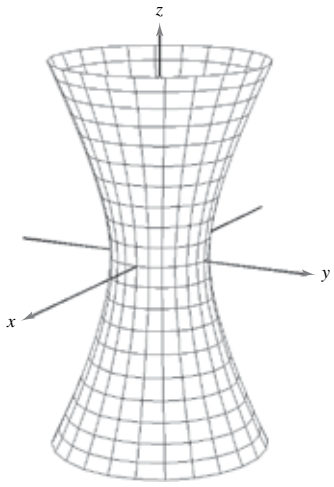
Ellipsoid

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}+\frac{z^2}{c^2}=1$$

Trace	Plane
Ellipse	Parallel to xy-plane
Ellipse	Parallel to xz-plane
Ellipse	Parallel to yz-plane

The surface is a sphere when $a = b = c \neq 0$.



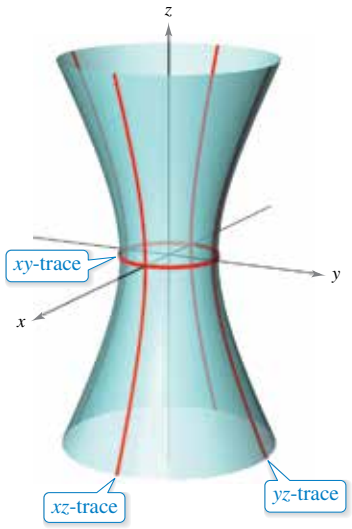


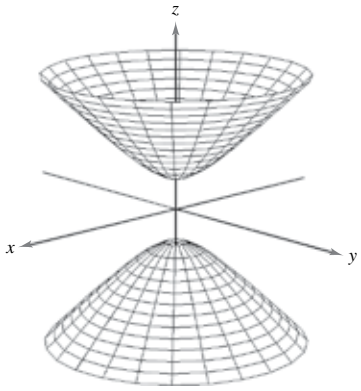
Hyperboloid of One Sheet

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}-\frac{z^2}{c^2}=1$$

Trace	Plane
Ellipse	Parallel to xy-plane
Hyperbola	Parallel to xz-plane
Hyperbola	Parallel to yz-plane

The axis of the hyperboloid corresponds to the variable whose coefficient is negative.





Hyperboloid of Two Sheets

$$\frac{z^2}{c^2}-\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$$

Trace	Plane
Ellipse	Parallel to xy-plane
Hyperbola	Parallel to xz-plane
Hyperbola	Parallel to yz-plane

The axis of the hyperboloid corresponds to the variable whose coefficient is positive. There is no trace in the coordinate plane perpendicular to this axis.

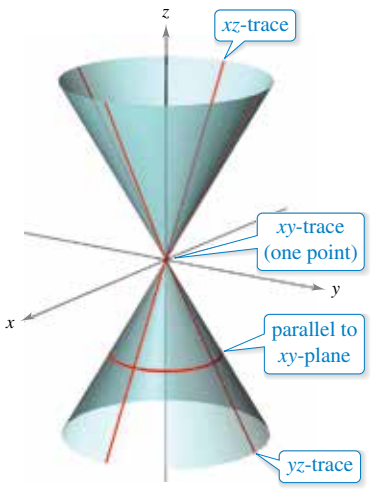
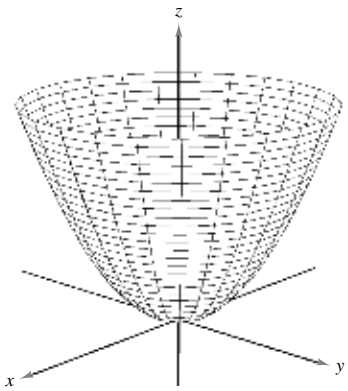
Elliptic Cone

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 0$$

Trace	Plane
Ellipse	Parallel to xy-plane
Hyperbola	Parallel to xz-plane
Hyperbola	Parallel to yz-plane

The axis of the cone corresponds to the variable whose coefficient is negative. The traces in the coordinate planes parallel to this axis are intersecting lines.



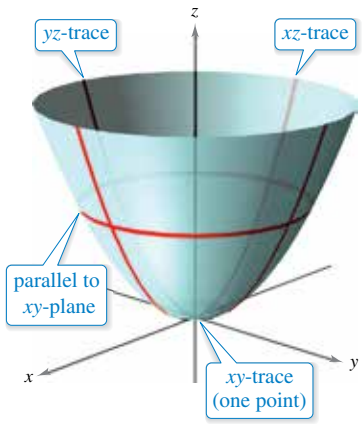


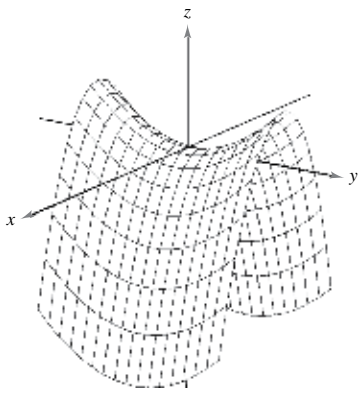
Elliptic Paraboloid

$$z = \frac{x^2}{a^2} + \frac{y^2}{b^2}$$

Trace	Plane
Ellipse	Parallel to xy-plane
Parabola	Parallel to xz-plane
Parabola	Parallel to yz-plane

The axis of the paraboloid corresponds to the variable raised to the first power.



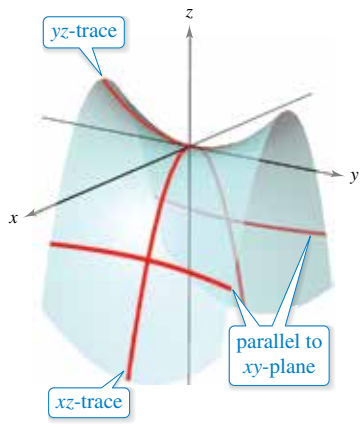


Hyperbolic Paraboloid

$$z = \frac{y^2}{b^2} - \frac{x^2}{a^2}$$

Trace	Plane
Hyperbola	Parallel to xy-plane
Parabola	Parallel to xz-plane
Parabola	Parallel to yz-plane

The axis of the paraboloid corresponds to the variable raised to the first power.



GO DIGITAL

To classify a quadric surface, begin by writing the equation of the surface in standard form. Then, determine several traces taken in the coordinate planes *or* taken in planes that are parallel to the coordinate planes.

EXAMPLE 2 Sketching a Quadric Surface

Classify and sketch the surface

$$4x^2 - 3y^2 + 12z^2 + 12 = 0.$$

Solution Begin by writing the equation in standard form.

$$4x^2 - 3y^2 + 12z^2 + 12 = 0 \qquad \text{Write original equation.}$$

$$\frac{x^2}{-3} + \frac{y^2}{4} - z^2 - 1 = 0 \qquad \text{Divide by } -12.$$

$$\frac{y^2}{4} - \frac{x^2}{3} - z^2 = 1 \qquad \text{Standard form}$$

From the table on pages 800 and 801, you can conclude that the surface is a hyperboloid of two sheets with the y-axis as its axis. To sketch the graph of this surface, it helps to find the traces in the coordinate planes.

$$xy\text{-trace } (z = 0): \quad \frac{y^2}{4} - \frac{x^2}{3} = 1 \qquad \text{Hyperbola}$$

$$xz\text{-trace } (y = 0): \quad \frac{x^2}{3} + \frac{z^2}{1} = -1 \qquad \text{No trace}$$

$$yz\text{-trace } (x = 0): \quad \frac{y^2}{4} - \frac{z^2}{1} = 1 \qquad \text{Hyperbola}$$

The graph is shown in Figure 11.59.

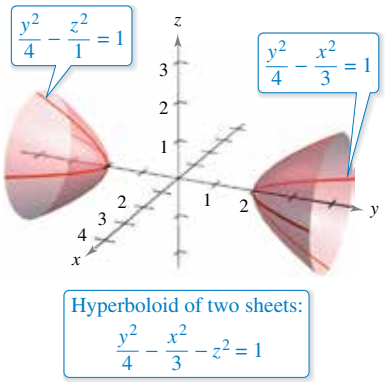

Figure 11.59

EXAMPLE 3 Sketching a Quadric Surface

Classify and sketch the surface

$$x - y^2 - 4z^2 = 0.$$

Solution Because x is raised only to the first power, the surface is a paraboloid. The axis of the paraboloid is the x-axis. In standard form, the equation is

$$x = y^2 + 4z^2. \qquad \text{Standard form}$$

Some convenient traces are listed below.

$$xy\text{-trace } (z = 0): \quad x = y^2 \qquad \text{Parabola}$$

$$xz\text{-trace } (y = 0): \quad x = 4z^2 \qquad \text{Parabola}$$

$$\text{parallel to } yz\text{-plane } (x = 4): \quad \frac{y^2}{4} + \frac{z^2}{1} = 1 \qquad \text{Ellipse}$$

The surface is an *elliptic* paraboloid, as shown in Figure 11.60.

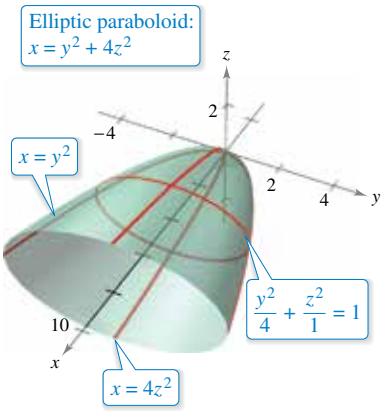

Figure 11.60

Some second-degree equations in x, y, and z do not represent any of the basic types of quadric surfaces. For example, the graph of

$$x^2 + y^2 + z^2 = 0 \qquad \text{Single point}$$

is a single point, and the graph of

$$x^2 + y^2 = 1 \qquad \text{Right circular cylinder}$$

is a right circular cylinder.

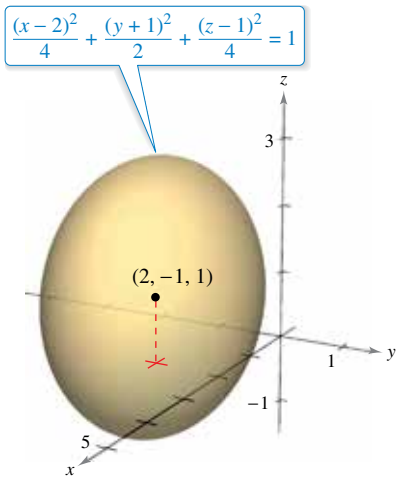
GO DIGITAL



An ellipsoid centered at $(2, -1, 1)$
Figure 11.61

For a quadric surface not centered at the origin, you can form the standard equation by completing the square, as demonstrated in Example 4.

EXAMPLE 4 A Quadric Surface Not Centered at the Origin

See LarsonCalculus.com for an interactive version of this type of example.

Classify and sketch the surface

$$x^2 + 2y^2 + z^2 - 4x + 4y - 2z + 3 = 0.$$

Solution Begin by grouping terms and factoring where possible.

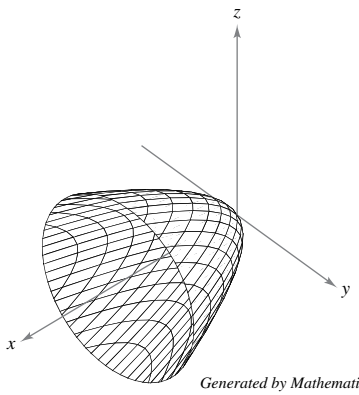
$$x^2 - 4x + 2(y^2 + 2y) + z^2 - 2z = -3$$

Next, complete the square for each variable and write the equation in standard form.

$$(x^2 - 4x + \ \ ) + 2(y^2 + 2y + \ \ ) + (z^2 - 2z + \ \ ) = -3$$
$$(x^2 - 4x + 4) + 2(y^2 + 2y + 1) + (z^2 - 2z + 1) = -3 + 4 + 2 + 1$$
$$(x - 2)^2 + 2(y + 1)^2 + (z - 1)^2 = 4$$
$$\frac{(x-2)^2}{4} + \frac{(y+1)^2}{2} + \frac{(z-1)^2}{4} = 1$$

From this equation, you can conclude that the quadric surface is an ellipsoid that is centered at $(2, -1, 1)$. Its graph is shown in Figure 11.61. ■

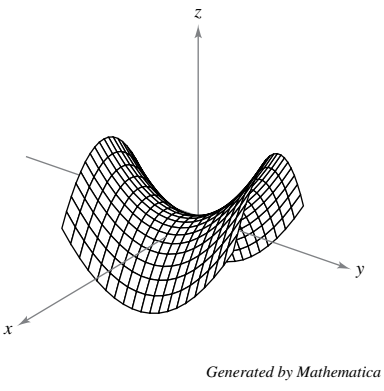
TECHNOLOGY A three-dimensional graphing utility can help you visualize a surface in space.* Such a graphing utility may create a three-dimensional graph by sketching several traces of the surface and then applying a "hidden-line" routine that blocks out portions of the surface that lie behind other portions of the surface. Two examples of figures that were generated by *Mathematica* are shown below.



Generated by Mathematica

Elliptic paraboloid

$$x = \frac{y^2}{2} + \frac{z^2}{2}$$



Generated by Mathematica

Hyperbolic paraboloid

$$z = \frac{y^2}{16} - \frac{x^2}{16}$$

Using a graphing utility to graph a surface in space requires practice. For one thing, you must know enough about the surface to be able to specify a *viewing window* that gives a representative view of the surface. Also, you can often improve the view of a surface by rotating the axes. For instance, note that the elliptic paraboloid in the figure is seen from a line of sight that is "higher" than the line of sight used to view the hyperbolic paraboloid.

* Some three-dimensional graphing utilities require surfaces to be entered with parametric equations. For a discussion of this technique, see Section 15.5.

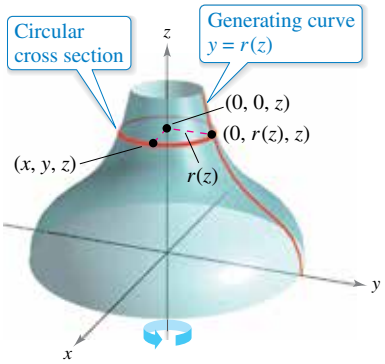

Figure 11.62

Surfaces of Revolution

The fifth special type of surface you will study is a **surface of revolution.** In Section 7.4, you studied a method for finding the *area* of such a surface. You will now look at a procedure for finding its *equation.* Consider the graph of the **radius function**

$$y = r(z) \qquad \text{Generating curve}$$

in the yz-plane. When this graph is revolved about the z-axis, it forms a surface of revolution, as shown in Figure 11.62. The trace of the surface in the plane $z = z_0$ is a circle whose radius is $r(z_0)$ and whose equation is

$$x^2 + y^2 = [r(z_0)]^2. \qquad \text{Circular trace in plane: } z = z_0$$

Replacing z_0 with z produces an equation that is valid for all values of z. In a similar manner, you can obtain equations for surfaces of revolution for the other two axes, and the results are summarized as follows.

GO DIGITAL

Surface of Revolution

If the graph of a radius function r is revolved about one of the coordinate axes, then the equation of the resulting surface of revolution has one of the forms listed below.

1. Revolved about the x-axis: $y^2 + z^2 = [r(x)]^2$
2. Revolved about the y-axis: $x^2 + z^2 = [r(y)]^2$
3. Revolved about the z-axis: $x^2 + y^2 = [r(z)]^2$

EXAMPLE 5 Finding an Equation for a Surface of Revolution

Find an equation for the surface of revolution formed by revolving (a) the graph of $y = 1/z$ about the z-axis and (b) the graph of $9x^2 = y^3$ about the y-axis.

Solution

a. An equation for the surface of revolution formed by revolving the graph of

$$y = \frac{1}{z} \qquad \text{Radius function}$$

about the z-axis is

$$x^2 + y^2 = [r(z)]^2 \qquad \text{Revolved about the } z\text{-axis}$$

$$x^2 + y^2 = \left(\frac{1}{z}\right)^2. \qquad \text{Substitute } 1/z \text{ for } r(z).$$

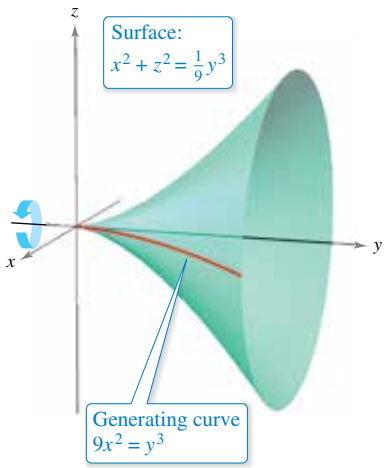

Figure 11.63

b. To find an equation for the surface formed by revolving the graph of $9x^2 = y^3$ about the y-axis, solve for x in terms of y to obtain

$$x = \frac{1}{3}y^{3/2} = r(y). \qquad \text{Radius function}$$

So, the equation for this surface is

$$x^2 + z^2 = [r(y)]^2 \qquad \text{Revolved about the } y\text{-axis}$$

$$x^2 + z^2 = \left(\frac{1}{3}y^{3/2}\right)^2 \qquad \text{Substitute } \tfrac{1}{3}y^{3/2} \text{ for } r(y).$$

$$x^2 + z^2 = \frac{1}{9}y^3. \qquad \text{Equation of surface}$$

The graph is shown in Figure 11.63. ■

GO DIGITAL

The generating curve for a surface of revolution is not unique. For instance, the surface

$$x^2 + z^2 = e^{-2y}$$

can be formed by revolving either the graph of

$$x = e^{-y}$$

about the y-axis or the graph of

$$z = e^{-y}$$

about the y-axis, as shown in Figure 11.64.

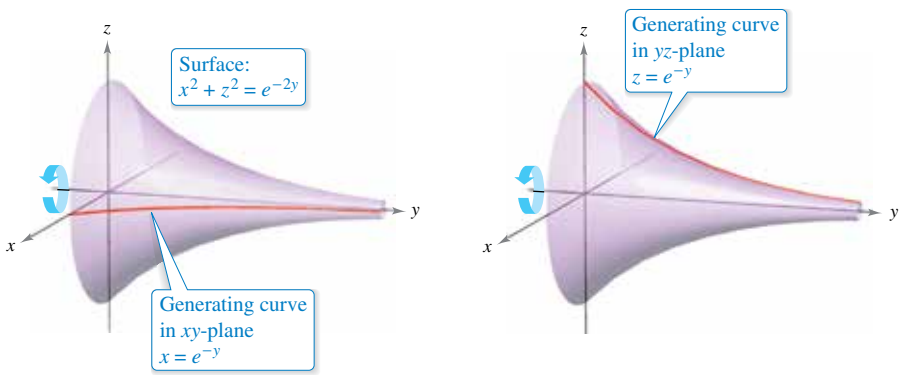

Figure 11.64

EXAMPLE 6 Finding a Generating Curve

Find a generating curve and the axis of revolution for the surface

$$x^2 + 3y^2 + z^2 = 9.$$

Solution The equation has one of the forms listed below.

$$x^2 + y^2 = [r(z)]^2 \quad \text{Revolved about } z\text{-axis}$$
$$y^2 + z^2 = [r(x)]^2 \quad \text{Revolved about } x\text{-axis}$$
$$x^2 + z^2 = [r(y)]^2 \quad \text{Revolved about } y\text{-axis}$$

Because the coefficients of x^2 and z^2 are equal, you should choose the third form and write

$$x^2 + z^2 = 9 - 3y^2.$$

The y-axis is the axis of revolution. You can choose a generating curve from either of the traces

$$x^2 = 9 - 3y^2 \quad \text{Trace in } xy\text{-plane}$$

or

$$z^2 = 9 - 3y^2. \quad \text{Trace in } yz\text{-plane}$$

For instance, using the first trace, the generating curve is the semiellipse

$$x = \sqrt{9 - 3y^2}. \quad \text{Generating curve}$$

The graph of this surface is shown in Figure 11.65.

11.6 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

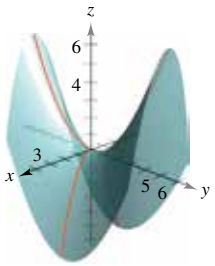
GO DIGITAL

Concept Check

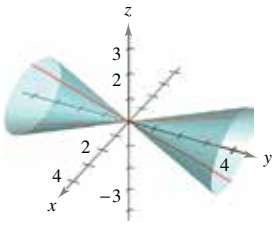
1. Explain how quadric surfaces and conic sections are related.
2. Explain what the equation $z = x^2$ represents in the xz-plane. What does it represent in three-space?
3. Explain what is meant by the trace of a surface. How do you find a trace?
4. Determine whether every second-degree equation in x, y, and z represents a quadric surface. Explain.

Matching In Exercises 5–10, match the equation with its graph. [The graphs are labeled (a), (b), (c), (d), (e), and (f).]

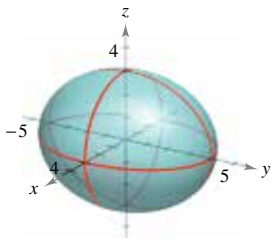
(a)



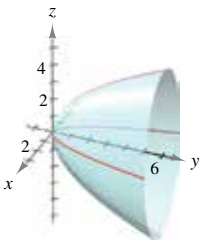
(b)



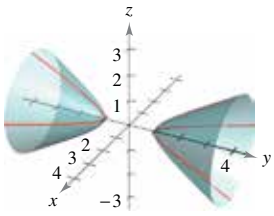
(c)



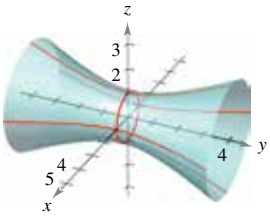
(d)



(e)



(f)



5. $\frac{x^2}{9} + \frac{y^2}{16} + \frac{z^2}{9} = 1$
6. $15x^2 - 4y^2 + 15z^2 = -4$
7. $4x^2 - y^2 + 4z^2 = 4$
8. $y^2 = 4x^2 + 9z^2$
9. $4x^2 - 4y + z^2 = 0$
10. $4x^2 - y^2 + 4z = 0$

Sketching a Surface in Space In Exercises 11–14, describe and sketch the surface.

11. $y^2 + z^2 = 9$
12. $y^2 + z = 6$
13. $4x^2 + y^2 = 4$
14. $y^2 - z^2 = 25$

Sketching a Quadric Surface In Exercises 15–26, classify and sketch the quadric surface. Use a graphing utility to confirm your sketch.

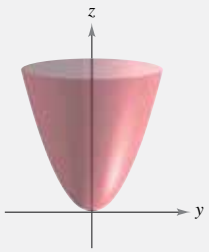
15. $4x^2 - y^2 - z^2 = 1$
16. $\frac{x^2}{16} + \frac{y^2}{25} + \frac{z^2}{25} = 1$
17. $16x^2 - y^2 + 16z^2 = 4$
18. $z = x^2 + 4y^2$
19. $x^2 + \frac{y^2}{4} + z^2 = 1$
20. $z^2 - x^2 - \frac{y^2}{4} = 1$
21. $z^2 = x^2 + \frac{y^2}{9}$
22. $3z = -y^2 + x^2$
23. $x^2 - y^2 + z = 0$
24. $x^2 = 2y^2 + 2z^2$
25. $x^2 - y + z^2 = 0$
26. $-8x^2 + 18y^2 + 18z^2 = 2$

Exploring Concepts

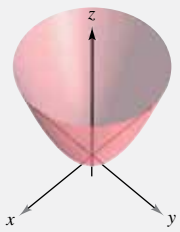
27. Explain how to determine whether a quadric surface is a hyperboloid of one sheet or a hyperboloid of two sheets.
28. Is every trace of an ellipsoid an ellipse? Explain.
29. Determine whether there exists a quadric surface whose traces are all parabolas. Explain.

30. **HOW DO YOU SEE IT?** The four figures below are graphs of the quadric surface $z = x^2 + y^2$. Match each of the four graphs with the point in space from which the paraboloid is viewed.

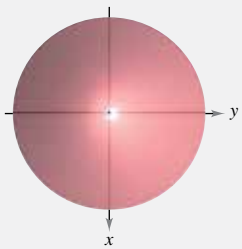
(a)



(b)



(c)



(d)

Finding an Equation for a Surface of Revolution **In Exercises 31–36, find an equation for the surface of revolution formed by revolving the curve in the indicated coordinate plane about the given axis.**

	Equation of Curve	Coordinate Plane	Axis of Revolution
31.	$z = 5y$	yz-plane	y-axis
32.	$z^2 = 9y$	yz-plane	y-axis
33.	$y^3 = 8z$	yz-plane	z-axis
34.	$z = \ln x$	xz-plane	z-axis
35.	$xy = 2$	xy-plane	x-axis
36.	$2z = \sqrt{4 - x^2}$	xz-plane	x-axis

Finding a Generating Curve **In Exercises 37–40, find an equation of a generating curve given the equation of its surface of revolution.**

37. $x^2 + y^2 - 2z = 0$
38. $x^2 + z^2 = \cos^2 y$
39. $8x^2 + y^2 + z^2 = 5$
40. $6x^2 + 2y^2 + 2z^2 = 1$

Finding the Volume of a Solid **In Exercises 41 and 42, use the shell method to find the volume of the solid below the surface of revolution and above the xy-plane.**

41. The curve $z = 4x - x^2$ in the xz-plane is revolved about the z-axis.
42. The curve

$$z = \sin y, \quad 0 \le y \le \pi$$

in the yz-plane is revolved about the z-axis.

Analyzing a Trace **In Exercises 43 and 44, analyze the trace when the surface**

$$z = \tfrac{1}{2}x^2 + \tfrac{1}{4}y^2$$

is intersected by the indicated planes.

43. Find the lengths of the major and minor axes and the coordinates of the foci of the ellipse generated when the surface is intersected by the planes given by

(a) $z = 2$ and (b) $z = 8$.

44. Find the coordinates of the focus of the parabola formed when the surface is intersected by the planes given by

(a) $y = 4$ and (b) $x = 2$.

Finding an Equation of a Surface **In Exercises 45 and 46, find an equation of the surface satisfying the conditions, and identify the surface.**

45. The set of all points equidistant from the point $(0, 2, 0)$ and the plane $y = -2$
46. The set of all points equidistant from the point $(0, 0, 4)$ and the xy-plane

47. Geography

Because of the forces caused by its rotation, Earth is an oblate ellipsoid rather than a sphere. The equatorial radius is 3963 miles and the polar radius is 3950 miles. Find an equation of the ellipsoid. (Assume that the center of Earth is at the origin and that the trace formed by the plane $z = 0$ corresponds to the equator.)

Denis Tabler/Shutterstock.com

48. **Machine Design** The top of a rubber bushing designed to absorb vibrations in an automobile is the surface of revolution generated by revolving the curve

$$z = \frac{1}{2}y^2 + 1$$

for $0 \le y \le 2$ in the yz-plane about the z-axis.

(a) Find an equation for the surface of revolution.

(b) All measurements are in centimeters and the bushing is set on the xy-plane. Use the shell method to find its volume.

(c) The bushing has a hole of diameter 1 centimeter through its center and parallel to the axis of revolution. Find the volume of the rubber bushing.

49. **Using a Hyperbolic Paraboloid** Determine the intersection of the hyperbolic paraboloid

$$z = \frac{y^2}{b^2} - \frac{x^2}{a^2}$$

with the plane $bx + ay - z = 0$. (Assume $a, b > 0$.)

50. **Intersection of Surfaces** Explain why the curve of intersection of the surfaces $x^2 + 3y^2 - 2z^2 + 2y = 4$ and $2x^2 + 6y^2 - 4z^2 - 3x = 2$ lies in a plane.

51. **Think About It** Three types of classic *topological surfaces* are shown below. The sphere and torus have both an "inside" and an "outside." Does the Klein bottle have both an "inside" and an "outside?" Explain.

Sphere

Torus

Klein bottle

Klein bottle

11.7 Cylindrical and Spherical Coordinates

GO DIGITAL

- **Use cylindrical coordinates to represent surfaces in space.**
- **Use spherical coordinates to represent surfaces in space.**

Cylindrical Coordinates

You have already seen that some two-dimensional graphs are easier to represent in polar coordinates than in rectangular coordinates. A similar situation exists for surfaces in space. In this section, you will study two alternative space-coordinate systems. The first, the **cylindrical coordinate system,** is an extension of polar coordinates in the plane to three-dimensional space.

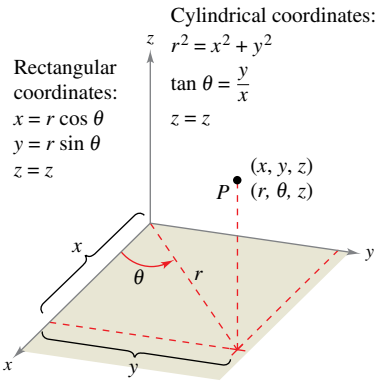

Figure 11.66

The Cylindrical Coordinate System

In a **cylindrical coordinate system,** a point P in space is represented by an ordered triple (r, θ, z).

1. (r, θ) is a polar representation of the projection of P in the xy-plane.
2. z is the directed distance from (r, θ) to P.

To convert from rectangular to cylindrical coordinates (or vice versa), use the conversion guidelines for polar coordinates listed below and illustrated in Figure 11.66.

Cylindrical to rectangular:

$$x = r\cos\theta, \quad y = r\sin\theta, \quad z = z$$

Rectangular to cylindrical:

$$r^2 = x^2 + y^2, \quad \tan\theta = \frac{y}{x}, \quad z = z$$

The point $(0, 0, 0)$ is called the **pole.** Moreover, because the representation of a point in the polar coordinate system is not unique, it follows that the representation in the cylindrical coordinate system is also not unique.

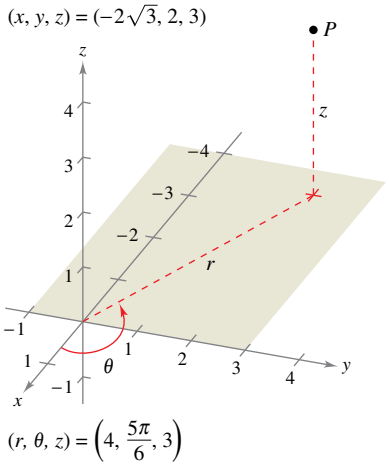

Figure 11.67

EXAMPLE 1 Cylindrical-to-Rectangular Conversion

Convert the point $(r, \theta, z) = (4, 5\pi/6, 3)$ to rectangular coordinates.

Solution Using the cylindrical-to-rectangular conversion equations produces

$$x = 4\cos\frac{5\pi}{6} = 4\left(-\frac{\sqrt{3}}{2}\right) = -2\sqrt{3} \qquad x\text{-coordinate}$$

$$y = 4\sin\frac{5\pi}{6} = 4\left(\frac{1}{2}\right) = 2 \qquad y\text{-coordinate}$$

and

$$z = 3. \qquad z\text{-coordinate}$$

So, in rectangular coordinates, the point is

$$(x, y, z) = \left(-2\sqrt{3}, 2, 3\right).$$ See Figure 11.67. ■

GO DIGITAL

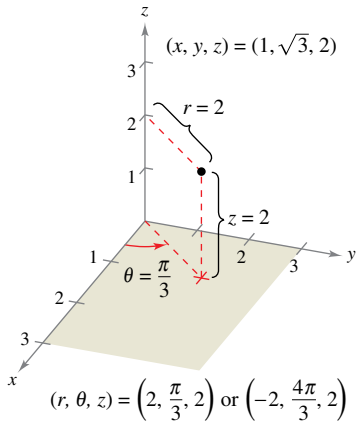

Figure 11.68

EXAMPLE 2 Rectangular-to-Cylindrical Conversion

Convert the point

$$(x, y, z) = \left(1, \sqrt{3}, 2\right)$$

to cylindrical coordinates.

Solution Use the rectangular-to-cylindrical conversion equations.

$$r = \pm\sqrt{1 + 3} = \pm 2$$

$$\tan\theta = \sqrt{3} \quad \Rightarrow \quad \theta = \arctan\sqrt{3} + n\pi = \frac{\pi}{3} + n\pi$$

$$z = 2$$

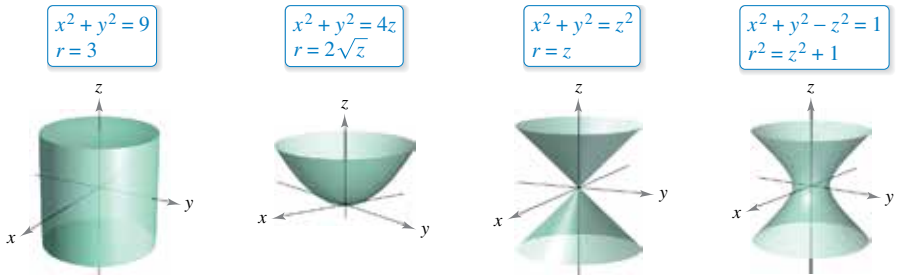
You have two choices for r and infinitely many choices for θ. As shown in Figure 11.68, two convenient representations of the point are

$$\left(2, \frac{\pi}{3}, 2\right) \qquad r > 0 \text{ and } \theta \text{ in Quadrant I}$$

and

$$\left(-2, \frac{4\pi}{3}, 2\right). \qquad r < 0 \text{ and } \theta \text{ in Quadrant III}$$

Cylindrical coordinates are especially convenient for representing cylindrical surfaces and surfaces of revolution with the z-axis as the axis of symmetry, as shown in Figure 11.69.



Cylinder | Paraboloid | Cone | Hyperboloid

Figure 11.69

Vertical planes containing the z-axis and horizontal planes also have simple cylindrical coordinate equations, as shown in Figure 11.70.

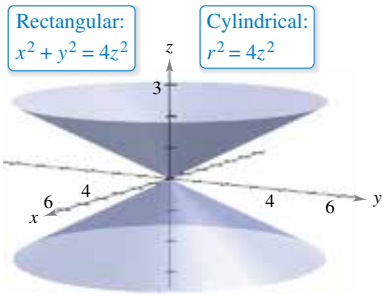

Figure 11.71

EXAMPLE 3 Rectangular-to-Cylindrical Conversion

Find an equation in cylindrical coordinates for the surface represented by each rectangular equation.

a. $x^2 + y^2 = 4z^2$

b. $y^2 = x$

Solution

a. From Section 11.6, you know that the graph of

$$x^2 + y^2 = 4z^2$$

is an elliptic cone with its axis along the z-axis, as shown in Figure 11.71. When you replace $x^2 + y^2$ with r^2, the equation in cylindrical coordinates is

$$x^2 + y^2 = 4z^2 \qquad \text{Rectangular equation}$$
$$r^2 = 4z^2. \qquad \text{Cylindrical equation}$$

b. The graph of the surface

$$y^2 = x$$

is a parabolic cylinder with rulings parallel to the z-axis, as shown in Figure 11.72. To obtain the equation in cylindrical coordinates, replace y^2 with $r^2 \sin^2 \theta$ and x with $r \cos \theta$, as shown.

$$y^2 = x \qquad \text{Rectangular equation}$$
$$r^2 \sin^2 \theta = r \cos \theta \qquad \text{Substitute } r \sin \theta \text{ for } y \text{ and } r \cos \theta \text{ for } x.$$
$$r(r \sin^2 \theta - \cos \theta) = 0 \qquad \text{Collect terms and factor.}$$
$$r \sin^2 \theta - \cos \theta = 0 \qquad \text{Divide each side by } r.$$
$$r = \frac{\cos \theta}{\sin^2 \theta} \qquad \text{Solve for } r.$$
$$r = \csc \theta \cot \theta \qquad \text{Cylindrical equation}$$

Note that this equation includes a point for which $r = 0$, so nothing was lost by dividing each side by the factor r. ■

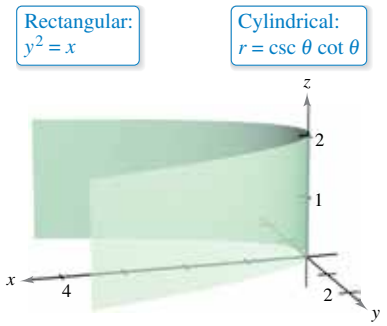

Figure 11.72

Converting from cylindrical coordinates to rectangular coordinates is less straightforward than converting from rectangular coordinates to cylindrical coordinates, as demonstrated in Example 4.

EXAMPLE 4 Cylindrical-to-Rectangular Conversion

Find an equation in rectangular coordinates for the surface represented by the cylindrical equation

$$r^2 \cos 2\theta + z^2 + 1 = 0.$$

Solution

$$r^2 \cos 2\theta + z^2 + 1 = 0 \qquad \text{Cylindrical equation}$$
$$r^2(\cos^2 \theta - \sin^2 \theta) + z^2 + 1 = 0 \qquad \text{Trigonometric identity}$$
$$r^2 \cos^2 \theta - r^2 \sin^2 \theta + z^2 = -1$$
$$x^2 - y^2 + z^2 = -1 \qquad \text{Replace } r \cos \theta \text{ with } x \text{ and } r \sin \theta \text{ with } y.$$
$$y^2 - x^2 - z^2 = 1 \qquad \text{Rectangular equation}$$

This is a hyperboloid of two sheets whose axis lies along the y-axis, as shown in Figure 11.73. ■

Spherical Coordinates

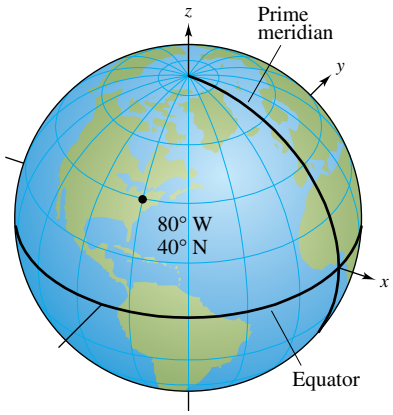

Figure 11.74

In the **spherical coordinate system,** each point is represented by an ordered triple: the first coordinate is a distance, and the second and third coordinates are angles. This system is similar to the latitude-longitude system used to identify points on the surface of Earth. For example, the point on the surface of Earth whose latitude is 40° North (of the equator) and whose longitude is 80° West (of the prime meridian) is shown in Figure 11.74. Assuming that Earth is spherical and has a radius of 4000 miles, you would label this point as

$$(4000, -80°, 50°).$$

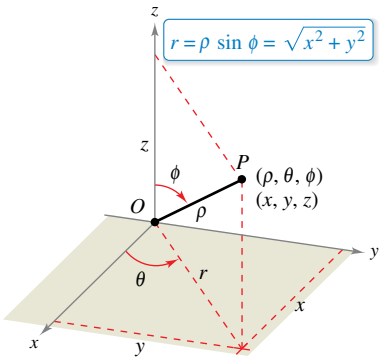
Radius; 80° clockwise from prime meridian; 50° down from North Pole

The Spherical Coordinate System

In a **spherical coordinate system,** a point P in space is represented by an ordered triple (ρ, θ, ϕ), where ρ is the lowercase Greek letter rho and ϕ is the lowercase Greek letter phi.

1. ρ is the distance between P and the origin, $\rho \geq 0$.
2. θ is the same angle used in cylindrical coordinates for $r \geq 0$.
3. ϕ is the angle *between* the positive z-axis and the line segment $\overrightarrow{OP}$, $0 \leq \phi \leq \pi$.

Note that the first and third coordinates, ρ and ϕ, are nonnegative.



Spherical coordinates

Figure 11.75

The relationship between rectangular and spherical coordinates is illustrated in Figure 11.75. To convert from one system to the other, use the conversion guidelines listed below.

Spherical to rectangular:

$$x = \rho \sin\phi \cos\theta, \quad y = \rho \sin\phi \sin\theta, \quad z = \rho \cos\phi$$

Rectangular to spherical:

$$\rho^2 = x^2 + y^2 + z^2, \quad \tan\theta = \frac{y}{x}, \quad \phi = \arccos \frac{z}{\sqrt{x^2 + y^2 + z^2}}$$

To change coordinates between the cylindrical and spherical systems, use the conversion guidelines listed below.

Spherical to cylindrical **($r \geq 0$):**

$$r^2 = \rho^2 \sin^2\phi, \quad \theta = \theta, \quad z = \rho \cos\phi$$

Cylindrical to spherical **($r \geq 0$):**

$$\rho = \sqrt{r^2 + z^2}, \quad \theta = \theta, \quad \phi = \arccos \frac{z}{\sqrt{r^2 + z^2}}$$

GO DIGITAL

The spherical coordinate system is useful primarily for surfaces in space that have a *point* or *center* of symmetry. For example, Figure 11.76 shows three surfaces with simple spherical equations.

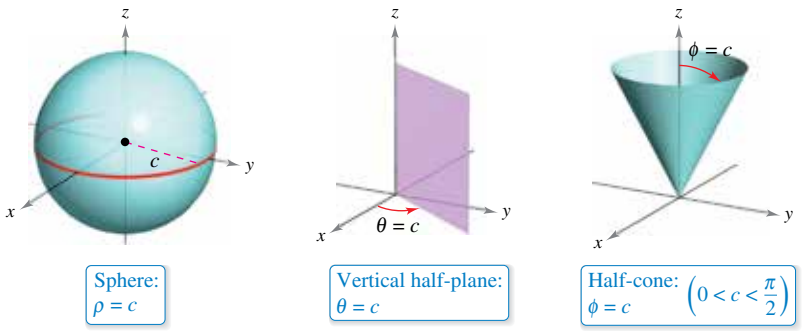

Figure 11.76

EXAMPLE 5 Rectangular-to-Spherical Conversion

See LarsonCalculus.com for an interactive version of this type of example.

Find an equation in spherical coordinates for the surface represented by each rectangular equation.

a. Cone: $x^2 + y^2 = z^2$ **b.** Sphere: $x^2 + y^2 + z^2 - 4z = 0$

Solution

a. Use the spherical-to-rectangular equations

$$x = \rho \sin\phi \cos\theta, \quad y = \rho \sin\phi \sin\theta, \quad \text{and} \quad z = \rho \cos\phi$$

and substitute in the rectangular equation as shown.

$$\begin{aligned} x^2 + y^2 &= z^2 \\ \rho^2 \sin^2\phi \cos^2\theta + \rho^2 \sin^2\phi \sin^2\theta &= \rho^2 \cos^2\phi \\ \rho^2 \sin^2\phi(\cos^2\theta + \sin^2\theta) &= \rho^2 \cos^2\phi \\ \rho^2 \sin^2\phi &= \rho^2 \cos^2\phi \\ \frac{\sin^2\phi}{\cos^2\phi} &= 1 \qquad \rho \geq 0 \\ \tan^2\phi &= 1 \\ \tan\phi &= \pm 1 \end{aligned}$$

So, you can conclude that

$$\phi = \frac{\pi}{4} \quad \text{or} \quad \phi = \frac{3\pi}{4}.$$

The equation $\phi = \pi/4$ represents the *upper* half-cone, and the equation $\phi = 3\pi/4$ represents the *lower* half-cone.

b. Because $\rho^2 = x^2 + y^2 + z^2$ and $z = \rho\cos\phi$, the rectangular equation has the following spherical form.

$$\rho^2 - 4\rho\cos\phi = 0 \quad \Rightarrow \quad \rho(\rho - 4\cos\phi) = 0$$

Temporarily discarding the possibility that $\rho = 0$, you have the spherical equation

$$\rho - 4\cos\phi = 0 \quad \text{or} \quad \rho = 4\cos\phi.$$

Note that the solution set for this equation includes a point for which $\rho = 0$, so nothing is lost by discarding the factor ρ. The sphere represented by the equation $\rho = 4\cos\phi$ is shown in Figure 11.77.

Rectangular: $x^2 + y^2 + z^2 - 4z = 0$

Spherical: $\rho = 4\cos\phi$

11.7 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Describe the cylindrical coordinate system in your own words.
2. Describe the position of the point $(2, 0°, 30°)$ given in spherical coordinates.

Cylindrical-to-Rectangular Conversion **In Exercises 3–8, convert the point from cylindrical coordinates to rectangular coordinates.**

3. $(-7, 0, 5)$
4. $(2, -\pi, -4)$
5. $\left(3, \frac{\pi}{4}, 1\right)$
6. $\left(6, -\frac{3\pi}{2}, 2\right)$
7. $\left(4, \frac{7\pi}{6}, -3\right)$
8. $\left(-\frac{2}{3}, \frac{4\pi}{3}, 8\right)$

Rectangular-to-Cylindrical Conversion **In Exercises 9–14, convert the point from rectangular coordinates to cylindrical coordinates.**

9. $(0, 5, 1)$
10. $\left(6, 2\sqrt{3}, -1\right)$
11. $(2, -2, -4)$
12. $(3, -3, 7)$
13. $\left(1, \sqrt{3}, 4\right)$
14. $\left(2\sqrt{3}, -2, 6\right)$

Rectangular-to-Cylindrical Conversion **In Exercises 15–22, find an equation in cylindrical coordinates for the surface represented by the rectangular equation.**

15. $z = 4$
16. $x = 9$
17. $x^2 + y^2 - 2z^2 = 5$
18. $z = x^2 + y^2 - 11$
19. $y = x^2$
20. $x^2 + y^2 = 8x$
21. $y^2 = 10 - z^2$
22. $x^2 + y^2 + z^2 - 3z = 0$

Cylindrical-to-Rectangular Conversion **In Exercises 23–30, find an equation in rectangular coordinates for the surface represented by the cylindrical equation, and sketch its graph.**

23. $r = 3$
24. $z = -2$
25. $\theta = \frac{\pi}{6}$
26. $r = \frac{1}{2}z$
27. $r^2 + z^2 = 5$
28. $z = r^2 \cos^2 \theta$
29. $r = 4 \sin \theta$
30. $r = 2 \cos \theta$

Rectangular-to-Spherical Conversion **In Exercises 31–36, convert the point from rectangular coordinates to spherical coordinates.**

31. $(4, 0, 0)$
32. $(-4, 0, 0)$
33. $\left(-2, 2\sqrt{3}, 4\right)$
34. $\left(-5, -5, \sqrt{2}\right)$
35. $\left(\sqrt{3}, 1, 2\sqrt{3}\right)$
36. $(-1, 2, 1)$

Spherical-to-Rectangular Conversion **In Exercises 37–42, convert the point from spherical coordinates to rectangular coordinates.**

37. $\left(4, \frac{\pi}{6}, \frac{\pi}{4}\right)$
38. $\left(6, \pi, \frac{\pi}{2}\right)$
39. $\left(12, -\frac{\pi}{4}, 0\right)$
40. $\left(9, \frac{\pi}{4}, \pi\right)$
41. $\left(5, \frac{\pi}{4}, \frac{\pi}{12}\right)$
42. $\left(7, \frac{3\pi}{4}, \frac{\pi}{9}\right)$

Rectangular-to-Spherical Conversion **In Exercises 43–50, find an equation in spherical coordinates for the surface represented by the rectangular equation.**

43. $y = 2$
44. $z = 6$
45. $x^2 + y^2 + z^2 = 49$
46. $x^2 + y^2 - 3z^2 = 0$
47. $x^2 + y^2 = 16$
48. $x = 13$
49. $x^2 + y^2 = 2z^2$
50. $x^2 + y^2 + z^2 - 9z = 0$

Spherical-to-Rectangular Conversion **In Exercises 51–58, find an equation in rectangular coordinates for the surface represented by the spherical equation, and sketch its graph.**

51. $\rho = 1$
52. $\theta = \frac{3\pi}{4}$
53. $\phi = \frac{\pi}{6}$
54. $\phi = \frac{\pi}{2}$
55. $\rho = 4 \cos \phi$
56. $\rho = 2 \sec \phi$
57. $\rho = \csc \phi$
58. $\rho = 4 \csc \phi \sec \theta$

Cylindrical-to-Spherical Conversion **In Exercises 59–64, convert the point from cylindrical coordinates to spherical coordinates.**

59. $\left(4, \frac{\pi}{4}, 0\right)$
60. $\left(3, -\frac{\pi}{4}, 0\right)$
61. $\left(6, \frac{\pi}{2}, -6\right)$
62. $\left(-4, \frac{\pi}{3}, 4\right)$
63. $(12, \pi, 5)$
64. $\left(4, \frac{\pi}{2}, 3\right)$

Spherical-to-Cylindrical Conversion **In Exercises 65–70, convert the point from spherical coordinates to cylindrical coordinates.**

65. $\left(10, \frac{\pi}{6}, \frac{\pi}{2}\right)$
66. $\left(4, \frac{\pi}{18}, \frac{\pi}{2}\right)$
67. $\left(6, -\frac{\pi}{6}, \frac{\pi}{3}\right)$
68. $\left(5, -\frac{5\pi}{6}, \pi\right)$
69. $\left(8, \frac{7\pi}{6}, \frac{\pi}{6}\right)$
70. $\left(7, \frac{\pi}{4}, \frac{3\pi}{4}\right)$

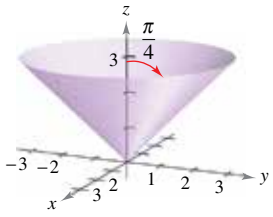
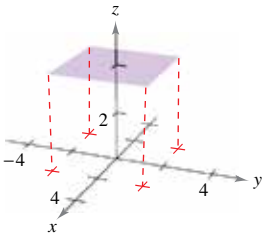
Matching **In Exercises 71–76, match the equation (written in terms of cylindrical or spherical coordinates) with its graph. [The graphs are labeled (a), (b), (c), (d), (e), and (f).]**

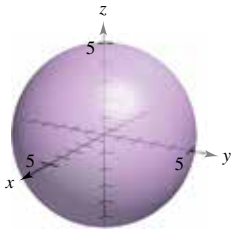
(a)



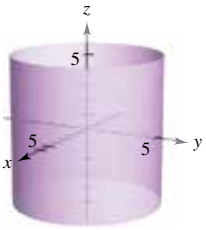
(b)



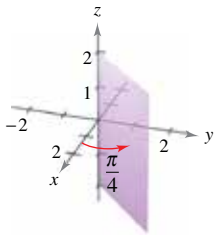
(c)



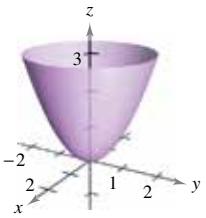
(d)



(e)



(f)



71. $r = 5$

72. $\theta = \dfrac{\pi}{4}$

73. $\rho = 5$

74. $\phi = \dfrac{\pi}{4}$

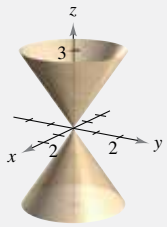
75. $r^2 = z$

76. $\rho = 4 \sec \phi$

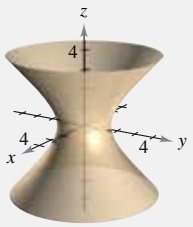
77. Spherical Coordinates Explain why in spherical coordinates the graph of $\theta = c$ is a half-plane and not an entire plane.

78. HOW DO YOU SEE IT? Identify the surface graphed and match the graph with its rectangular equation. Then find an equation in cylindrical coordinates for the equation given in rectangular coordinates.

(a)



(b)



(i) $x^2 + y^2 = \frac{4}{9}z^2$

(ii) $x^2 + y^2 - z^2 = 2$

Converting a Rectangular Equation **In Exercises 79–86, convert the rectangular equation to an equation in (a) cylindrical coordinates and (b) spherical coordinates.**

79. $x^2 + y^2 + z^2 = 27$

80. $4(x^2 + y^2) = z^2$

81. $x^2 + y^2 + z^2 - 2z = 0$

82. $x^2 + y^2 = z$

83. $x^2 + y^2 = 4y$

84. $x^2 + y^2 = 45$

85. $x^2 - y^2 = 9$

86. $y = 4$

Sketching a Solid **In Exercises 87–90, sketch the solid that has the given description in cylindrical coordinates.**

87. $0 \le \theta \le \pi/2, 0 \le r \le 2, 0 \le z \le 4$

88. $-\pi/2 \le \theta \le \pi/2, 0 \le r \le 3, 0 \le z \le r \cos\theta$

89. $0 \le \theta \le 2\pi, 0 \le r \le a, r \le z \le a$

90. $0 \le \theta \le 2\pi, 2 \le r \le 4, z^2 \le -r^2 + 6r - 8$

Sketching a Solid **In Exercises 91–94, sketch the solid that has the given description in spherical coordinates.**

91. $0 \le \theta \le 2\pi, 0 \le \phi \le \pi/6, 0 \le \rho \le a \sec\phi$

92. $0 \le \theta \le 2\pi, \pi/4 \le \phi \le \pi/2, 0 \le \rho \le 1$

93. $0 \le \theta \le \pi/2, 0 \le \phi \le \pi/2, 0 \le \rho \le 2$

94. $0 \le \theta \le \pi, 0 \le \phi \le \pi/2, 1 \le \rho \le 3$

Exploring Concepts

In Exercises 95–100, find inequalities that describe the solid and state the coordinate system used. Position the solid on the coordinate system such that the inequalities are as simple as possible.

95. A cube with each edge 10 centimeters long

96. A cylindrical shell 8 meters long with an inside diameter of 0.75 meter and an outside diameter of 1.25 meters

97. A spherical shell with inside and outside radii of 4 inches and 6 inches, respectively

98. The solid that remains after a hole 1 inch in diameter is drilled through the center of a sphere 6 inches in diameter

99. The solid inside both $x^2 + y^2 + z^2 = 9$ and $\left(x - \frac{3}{2}\right)^2 + y^2 = \frac{9}{4}$

100. The solid between the spheres $x^2 + y^2 + z^2 = 4$ and $x^2 + y^2 + z^2 = 9$, and inside the cone $z^2 = x^2 + y^2$

True or False? **In Exercises 101 and 102, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

101. The cylindrical coordinates of a point (x, y, z) are unique.

102. The spherical coordinates of a point (x, y, z) are unique.

103. Intersection of Surfaces Identify the curve of intersection of the surfaces (in cylindrical coordinates) $z = \sin\theta$ and $r = 1$.

104. Intersection of Surfaces Identify the curve of intersection of the surfaces (in spherical coordinates) $\rho = 2 \sec\phi$ and $\rho = 4$.

Review Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Exploring Concepts

This chapter showed you the importance of vectors in mathematics. You first learned that vector operations, such as the dot product and the cross product, are used to find many different quantities. For instance, you can find

- the angle between two vectors,
- the resultant force required to move an ocean liner,
- and the torque on a crankshaft.

You then used vectors to define lines and planes in space. The parametric equations for a line require a direction vector and a point on the line. The standard equation of a plane requires a point on the plane and a normal (perpendicular) vector to the plane. You also studied some of the basic surfaces that you will use in upcoming chapters, and two new coordinate systems: cylindrical coordinates and spherical coordinates.

1. Describe the difference between the point (x, y, z) and the vector $\langle x, y, z \rangle$.

2. The initial and terminal points of vector $\mathbf{v}$ are $(3, -4)$ and $(9, 1)$, respectively.

(a) Write $\mathbf{v}$ in component form.

(b) Write $\mathbf{v}$ as the linear combination of the standard unit vectors $\mathbf{i}$ and $\mathbf{j}$.

(c) Sketch $\mathbf{v}$ with its initial point at the origin.

(d) Find the magnitude of $\mathbf{v}$.

3. Describe how to do each of the following.

(a) Find the angle between two vectors.

(b) Find a vector perpendicular to a plane.

(c) Determine whether three points lie in the same plane.

(d) Find the distance between two parallel planes.

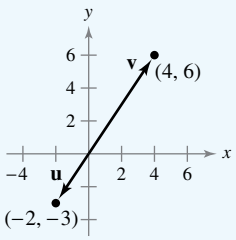
4. Determine whether each expression is defined for nonzero vectors $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$. Explain your reasoning.

(a) $\mathbf{u} \cdot (\mathbf{v} + \mathbf{w})$ (b) $(\mathbf{u} \cdot \mathbf{v})\mathbf{w}$

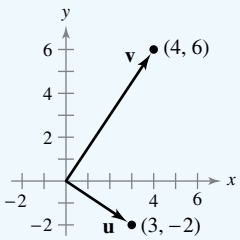
(c) $\mathbf{u} \cdot \mathbf{v} + \mathbf{w}$ (d) $\|\mathbf{u}\| \cdot (\mathbf{v} + \mathbf{w})$

5. For each figure, determine mentally the projection of $\mathbf{u}$ onto $\mathbf{v}$. (The coordinates of the terminal points of the vectors in standard position are given.) Verify your results analytically.

(a)



(b)



6. Consider the points

$A(1, 1, 1)$, $B(-2, 3, 1)$, and $C(-1, 0, 2)$.

(a) Which point lies closest to the xz-plane?

(b) What is the distance between A and B?

(c) What is the midpoint between B and C?

(d) Find an equation of all points that are equidistant from A and B. Describe this set of points.

Writing Vectors in Different Forms

In Exercises 7 and 8, let $\mathbf{u} = \overrightarrow{PQ}$ and $\mathbf{v} = \overrightarrow{PR}$ and (a) write $\mathbf{u}$ and $\mathbf{v}$ in component form, (b) write $\mathbf{u}$ and $\mathbf{v}$ as the linear combination of the standard unit vectors $\mathbf{i}$ and $\mathbf{j}$, (c) find the magnitudes of $\mathbf{u}$ and $\mathbf{v}$, and (d) find $-3\mathbf{u} + \mathbf{v}$.

7. $P = (1, 2)$, $Q = (4, 1)$, $R = (5, 4)$

8. $P = (-2, -1)$, $Q = (5, -1)$, $R = (2, 4)$

Finding a Vector

In Exercises 9 and 10, find the component form of $\mathbf{v}$ given its magnitude and the angle it makes with the positive x-axis.

9. $\|\mathbf{v}\| = 8$, $\theta = 60°$ **10.** $\|\mathbf{v}\| = \frac{1}{2}$, $\theta = 225°$

11. Finding Coordinates of a Point Find the coordinates of the point located in the xy-plane, four units to the right of the xz-plane, and five units behind the yz-plane.

12. Using the Three-Dimensional Coordinate System Determine the location of a point (x, y, z) that satisfies the condition $y = 3$.

Finding the Distance Between Two Points in Space

In Exercises 13 and 14, find the distance between the points.

13. $(1, 6, 3)$, $(-2, 3, 5)$

14. $(-2, 1, -5)$, $(4, -1, -1)$

Finding the Equation of a Sphere

In Exercises 15 and 16, find the standard equation of the sphere with the given characteristics.

15. Center: $(3, -2, 6)$; Radius: 4

16. Endpoints of a diameter: $(0, 0, 4)$, $(4, 6, 0)$

Finding the Equation of a Sphere **In Exercises 17 and 18, complete the square to write the equation of the sphere in standard form. Find the center and radius.**

17. $x^2 + y^2 + z^2 - 4x - 6y + 4 = 0$

18. $x^2 + y^2 + z^2 - 10x + 6y - 4z + 34 = 0$

Writing a Vector in Different Forms **In Exercises 19 and 20, the initial and terminal points of a vector v are given. (a) Sketch the directed line segment. (b) Find the component form of the vector. (c) Write the vector using standard unit vector notation. (d) Sketch the vector with its initial point at the origin.**

19. Initial point: $(2, -1, 3)$
Terminal point: $(4, 4, -7)$

20. Initial point: $(6, 2, 0)$
Terminal point: $(3, -3, 8)$

Finding a Vector **In Exercises 21 and 22, find the vector z, given that $\mathbf{u} = \langle 5, -2, 3\rangle$, $\mathbf{v} = \langle 0, 2, 1\rangle$, and $\mathbf{w} = \langle -6, -6, 2\rangle$.**

21. $\mathbf{z} = -\mathbf{u} + 3\mathbf{v} + \frac{1}{2}\mathbf{w}$

22. $\mathbf{u} - \mathbf{v} + \mathbf{w} - 2\mathbf{z} = \mathbf{0}$

Using Vectors to Determine Collinear Points **In Exercises 23 and 24, use vectors to determine whether the points are collinear.**

23. $(3, 4, -1)$, $(-1, 6, 9)$, $(5, 3, -6)$

24. $(5, -4, 7)$, $(8, -5, 5)$, $(11, 6, 3)$

25. Finding a Unit Vector Find a unit vector in the direction of $\mathbf{u} = \langle 2, 3, 5\rangle$.

26. Finding a Vector Find the vector $\mathbf{v}$ of magnitude 8 in the direction $\langle 6, -3, 2\rangle$.

Finding Dot Products **In Exercises 27 and 28, let $\mathbf{u} = \overrightarrow{PQ}$ and $\mathbf{v} = \overrightarrow{PR}$, and find (a) the component forms of u and v, (b) $\mathbf{u} \cdot \mathbf{v}$, and (c) $\mathbf{v} \cdot \mathbf{v}$.**

27. $P = (5, 0, 0)$, $Q = (4, 4, 0)$, $R = (2, 0, 6)$

28. $P = (2, -1, 3)$, $Q = (0, 5, 1)$, $R = (5, 5, 0)$

Finding the Angle Between Two Vectors **In Exercises 29 and 30, find the angle θ between the vectors (a) in radians and (b) in degrees.**

29. $\mathbf{u} = 5[\cos(3\pi/4)\mathbf{i} + \sin(3\pi/4)\mathbf{j}]$
$\mathbf{v} = 2[\cos(2\pi/3)\mathbf{i} + \sin(2\pi/3)\mathbf{j}]$

30. $\mathbf{u} = \langle 1, 0, -3\rangle$, $\mathbf{v} = \langle 2, -2, 1\rangle$

Comparing Vectors **In Exercises 31 and 32, determine whether u and v are orthogonal, parallel, or neither.**

31. $\mathbf{u} = \langle 7, -2, 3\rangle$
$\mathbf{v} = \langle -1, 4, 5\rangle$

32. $\mathbf{u} = \langle -3, 0, 9\rangle$
$\mathbf{v} = \langle 1, 0, -3\rangle$

Finding the Projection of u onto v **In Exercises 33 and 34, (a) find the projection of u onto v, and (b) find the vector component of u orthogonal to v.**

33. $\mathbf{u} = 4\mathbf{i} + 2\mathbf{j}$, $\mathbf{v} = 3\mathbf{i} + 4\mathbf{j}$

34. $\mathbf{u} = \langle 1, -1, 1\rangle$, $\mathbf{v} = \langle 2, 0, 2\rangle$

35. Orthogonal Vectors Find two vectors in opposite directions that are orthogonal to the vector $\mathbf{u} = \langle 5, 6, -3\rangle$.

36. Work An object is pulled 8 feet across a floor using a force of 75 pounds. The direction of the force is 30° above the horizontal. Find the work done.

Finding Cross Products **In Exercises 37 and 38, find (a) $\mathbf{u} \times \mathbf{v}$, (b) $\mathbf{v} \times \mathbf{u}$, and (c) $\mathbf{v} \times \mathbf{v}$.**

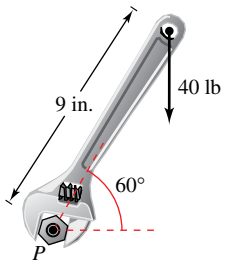
37. $\mathbf{u} = 4\mathbf{i} + 3\mathbf{j} + 6\mathbf{k}$
$\mathbf{v} = 5\mathbf{i} + 2\mathbf{j} + \mathbf{k}$

38. $\mathbf{u} = \langle 0, 2, 1\rangle$
$\mathbf{v} = \langle 1, -3, 4\rangle$

39. Finding a Unit Vector Find a unit vector that is orthogonal to both $\mathbf{u} = \langle 2, -10, 8\rangle$ and $\mathbf{v} = \langle 4, 6, -8\rangle$.

40. Area Find the area of the parallelogram that has the vectors $\mathbf{u} = \langle 3, -1, 5\rangle$ and $\mathbf{v} = \langle 2, -4, 1\rangle$ as adjacent sides.

41. Torque A vertical force of 40 pounds acts on a wrench, as shown in the figure. Find the torque at P.



42. Volume Use the triple scalar product to find the volume of the parallelepiped having adjacent edges $\mathbf{u} = 2\mathbf{i} + \mathbf{j}$, $\mathbf{v} = 2\mathbf{j} + \mathbf{k}$, and $\mathbf{w} = -\mathbf{j} + 2\mathbf{k}$.

Finding Parametric and Symmetric Equations **In Exercises 43 and 44, find sets of (a) parametric equations and (b) symmetric equations of the line that passes through the two points. (For each line, write the direction numbers as integers.)**

43. $(3, 0, 2)$, $(9, 11, 6)$

44. $(-1, 4, 3)$, $(8, 10, 5)$

Finding Parametric Equations **In Exercises 45 and 46, find a set of parametric equations of the line with the given characteristics.**

45. The line passes through the point $(-6, -8, 2)$ and is perpendicular to the xz-plane.

46. The line passes through the point $(1, 2, 3)$ and is parallel to the line given by $x = y = z$.

Finding an Equation of a Plane **In Exercises 47–50, find an equation of the plane with the given characteristics.**

47. The plane passes through $(-3, -4, 2)$, $(-3, 4, 1)$, and $(1, 1, -2)$.

48. The plane passes through the point $(-2, 3, 1)$ and is perpendicular to $\mathbf{n} = 3\mathbf{i} - \mathbf{j} + \mathbf{k}$.

49. The plane contains the lines given by

$$\frac{x-1}{-2} = y = z + 1 \quad \text{and} \quad \frac{x+1}{-2} = y - 1 = z - 2.$$

50. The plane passes through the points $(5, 1, 3)$ and $(2, -2, 1)$ and is perpendicular to the plane $2x + y - z = 4$.

51. Distance Find the distance between the point $(1, 0, 2)$ and the plane $2x - 3y + 6z = 6$.

52. Distance Find the distance between the point $(3, -2, 4)$ and the plane $2x - 5y + z = 10$.

53. Distance Find the distance between the planes $5x - 3y + z = 2$ and $5x - 3y + z = -3$.

54. Distance Find the distance between the point $(-5, 1, 3)$ and the line given by $x = 1 + t$, $y = 3 - 2t$, and $z = 5 - t$.

Sketching a Surface in Space **In Exercises 55–64, describe and sketch the surface.**

55. $x + 2y + 3z = 6$

56. $y = z^2$

57. $y = \frac{1}{2}z$

58. $y = \cos z$

59. $\frac{x^2}{16} + \frac{y^2}{9} + z^2 = 1$

60. $16x^2 + 16y^2 - 9z^2 = 0$

61. $\frac{x^2}{16} - \frac{y^2}{9} + z^2 = -1$

62. $\frac{x^2}{25} + \frac{y^2}{4} - \frac{z^2}{100} = 1$

63. $x^2 + z^2 = 4$

64. $y^2 + z^2 = 16$

65. Surface of Revolution Find an equation for the surface of revolution formed by revolving the curve $z^2 = 2y$ in the yz-plane about the y-axis.

66. Surface of Revolution Find an equation for the surface of revolution formed by revolving the curve $2x + 3z = 1$ in the xz-plane about the x-axis.

Cylindrical-to-Rectangular Conversion **In Exercises 67 and 68, convert the point from cylindrical coordinates to rectangular coordinates.**

67. $(5, \pi, 1)$

68. $\left(-2, \frac{\pi}{3}, 3\right)$

Cylindrical-to-Rectangular Conversion **In Exercises 69 and 70, find an equation in rectangular coordinates for the surface represented by the cylindrical equation, and sketch its graph.**

69. $z = r^2 \sin^2\theta + 3r\cos\theta$

70. $r = -5z$

Converting Rectangular Coordinates **In Exercises 71 and 72, convert the point from rectangular coordinates to (a) cylindrical coordinates and (b) spherical coordinates.**

71. $\left(-\sqrt{3}, 3, -5\right)$

72. $(8, 8, 1)$

Spherical-to-Rectangular Conversion **In Exercises 73 and 74, convert the point from spherical coordinates to rectangular coordinates.**

73. $\left(4, \pi, \frac{\pi}{4}\right)$

74. $\left(8, -\frac{\pi}{6}, \frac{\pi}{3}\right)$

Spherical-to-Rectangular Conversion **In Exercises 75 and 76, find an equation in rectangular coordinates for the surface represented by the spherical equation, and sketch its graph.**

75. $\phi = \frac{\pi}{4}$

76. $\rho = 9\sec\theta$

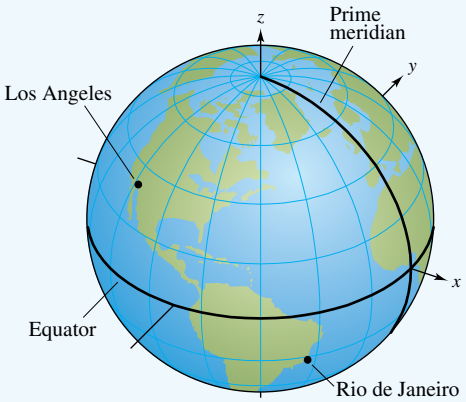
Converting a Rectangular Equation **In Exercises 77 and 78, convert the rectangular equation to an equation in (a) cylindrical coordinates and (b) spherical coordinates.**

77. $x^2 - y^2 = 2z$

78. $x^2 + y^2 + z^2 = 16$

Building on Concepts

In Exercises 79–82, use the following information. Los Angeles is located at 34.05° North latitude and 118.24° West longitude, and Rio de Janeiro, Brazil, is located at 22.90° South latitude and 43.23° West longitude (see figure). Assume that Earth is spherical and has a radius of 4000 miles.



79. Find the spherical coordinates for the location of each city.

80. Find the rectangular coordinates for the location of each city.

81. Find the angle (in radians) between the vectors from the center of Earth to the two cities.

82. Find the great-circle distance s between the cities. (*Hint:* $s = r\theta$)

83. Consider the points

$$Q(2, 0, 0), \quad P_1(0, 0, 1), \quad \text{and} \quad P_2(0, 1, 2).$$

(a) Find the shortest distance between Q and the line determined by the points P_1 and P_2.

(b) Find the shortest distance between Q and the line segment joining the points P_1 and P_2.

84. Consider the vectors

$$\mathbf{u} = \langle \cos\alpha, \sin\alpha, 0\rangle \quad \text{and} \quad \mathbf{v} = \langle \cos\beta, \sin\beta, 0\rangle$$

where $\alpha > \beta$. Find the cross product of the vectors and use the result to prove the identity

$$\sin(\alpha - \beta) = \sin\alpha\cos\beta - \cos\alpha\sin\beta.$$

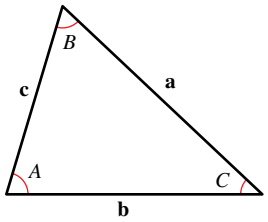
P.S. Problem Solving

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

1. Proof Using vectors, prove the Law of Sines: If **a**, **b**, and **c** are the three sides of the triangle shown in the figure, then

$$\frac{\sin A}{\|\mathbf{a}\|} = \frac{\sin B}{\|\mathbf{b}\|} = \frac{\sin C}{\|\mathbf{c}\|}.$$



2. Using an Equation Consider the function

$$f(x) = \int_0^x \sqrt{t^4 + 1}\, dt.$$

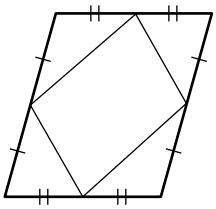
(a) Use a graphing utility to graph the function on the interval $-2 \le x \le 2$.

(b) Find a unit vector parallel to the graph of f at the point $(0, 0)$.

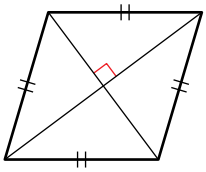
(c) Find a unit vector perpendicular to the graph of f at the point $(0, 0)$.

(d) Find the parametric equations of the tangent line to the graph of f at the point $(0, 0)$.

3. Proof Using vectors, prove that the line segments joining the midpoints of the sides of a parallelogram form a parallelogram (see figure).



4. Proof Using vectors, prove that the diagonals of a rhombus are perpendicular (see figure).



5. Sketching Graphs Sketch the graph of each equation given in spherical coordinates.

(a) $\rho = 2 \sin \phi$ (b) $\rho = 2 \cos \phi$

6. Orthogonal Vectors Let P_0 be a point in the plane with normal vector **n**. Describe the set of points P in the plane for which $\left(\mathbf{n} + \overrightarrow{PP_0}\right)$ is orthogonal to $\left(\mathbf{n} - \overrightarrow{PP_0}\right)$.

7. Volume

(a) Find the volume of the solid bounded below by the paraboloid

$$z = x^2 + y^2$$

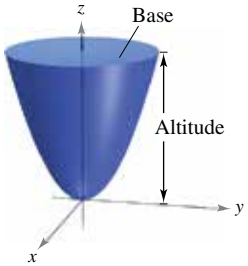
and above by the plane $z = 1$.

(b) Find the volume of the solid bounded below by the elliptic paraboloid

$$z = \frac{x^2}{a^2} + \frac{y^2}{b^2}$$

and above by the plane $z = k$, where $k > 0$.

(c) Show that the volume of the solid in part (b) is equal to one-half the product of the area of the base times the altitude, as shown in the figure.



8. Distance Between a Point and a Plane Consider the plane that passes through the points P, R, and S. Show that the distance from a point Q to this plane is

$$\text{Distance} = \frac{|\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})|}{\|\mathbf{u} \times \mathbf{v}\|}$$

where $\mathbf{u} = \overrightarrow{PR}$, $\mathbf{v} = \overrightarrow{PS}$, and $\mathbf{w} = \overrightarrow{PQ}$.

9. Proof Prove the following property of the cross product.

$$(\mathbf{u} \times \mathbf{v}) \times (\mathbf{w} \times \mathbf{z}) = [(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{z}]\mathbf{w} - [(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w}]\mathbf{z}$$

10. Using Parametric Equations Consider the line given by the parametric equations

$$x = -t + 3, \quad y = \tfrac{1}{2}t + 1, \quad z = 2t - 1$$

and the point $(4, 3, s)$ for any real number s.

(a) Write the distance between the point and the line as a function of s.

(b) Use a graphing utility to graph the function in part (a). Use the graph to find the value of s such that the distance between the point and the line is minimum.

(c) Use the *zoom* feature of a graphing utility to zoom out several times on the graph in part (b). Does it appear that the graph has slant asymptotes? Explain. If it appears to have slant asymptotes, find them.

11. Intersection of Planes Show that the curve of intersection of the plane $z = 2y$ and the cylinder $x^2 + y^2 = 1$ is an ellipse.

12.1 Vector-Valued Functions

GO DIGITAL

- **Analyze and sketch a space curve given by a vector-valued function.**
- **Extend the concepts of limits and continuity to vector-valued functions.**

Big Ideas of Calculus

This chapter combines the ideas of vectors and functions to introduce vector-valued functions. Interestingly, the domains of vector-valued functions are real numbers, but the ranges are vectors! When vector-valued functions change, the change can occur in both magnitude and direction. A key application of these functions is representing the motions of objects in the plane or in space. Using the first and second derivatives of an object's position vector, you can find the object's velocity and acceleration.

Space Curves and Vector-Valued Functions

In Section 10.2, a *plane curve* was defined as the set of ordered pairs $(f(t), g(t))$ together with their defining parametric equations $x = f(t)$ and $y = g(t)$, where f and g are continuous functions of t on an interval I. This definition can be extended naturally to three-dimensional space. A **space curve** C is the set of all ordered triples $(f(t), g(t), h(t))$ together with their defining parametric equations

$$x = f(t), \quad y = g(t), \quad \text{and} \quad z = h(t)$$

where f, g, and h are continuous functions of t on an interval I.

Before looking at examples of space curves, a new type of function, called a **vector-valued function,** is introduced. This type of function maps real numbers to vectors.

Definition of Vector-Valued Function

A function of the form

$$\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j} \qquad \text{Plane}$$

or

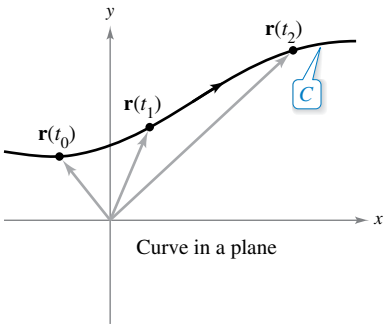
$$\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j} + h(t)\mathbf{k} \qquad \text{Space}$$

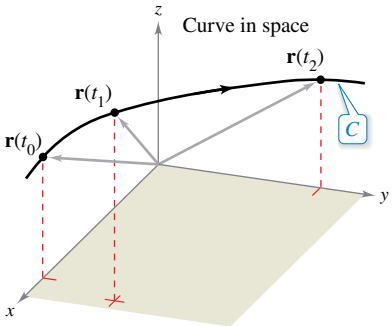
is a **vector-valued function,** where the **component functions** f, g, and h are real-valued functions of the parameter t. Vector-valued functions are sometimes denoted as

$$\mathbf{r}(t) = \langle f(t), g(t) \rangle \qquad \text{Plane}$$

or

$$\mathbf{r}(t) = \langle f(t), g(t), h(t) \rangle. \qquad \text{Space}$$





Curve C is traced out by the terminal point of position vector $\mathbf{r}(t)$.
Figure 12.1

Technically, a curve in a plane or in space consists of a collection of points and the defining parametric equations. Two different curves can have the same graph. For instance, each of the curves

$$\mathbf{r}(t) = \sin t\,\mathbf{i} + \cos t\,\mathbf{j} \quad \text{and} \quad \mathbf{r}(t) = \sin t^2\mathbf{i} + \cos t^2\mathbf{j}$$

has the unit circle as its graph, but these equations do not represent the same curve—because the circle is traced out in different ways on the graphs.

Be sure you understand the distinction between the vector-valued function $\mathbf{r}$ and the real-valued functions f, g, and h. All are functions of the real variable t, but $\mathbf{r}(t)$ is a vector, whereas $f(t)$, $g(t)$, and $h(t)$ are real numbers (for each specific value of t). Real-valued functions are sometimes called **scalar functions** to distinguish them from vector-valued functions.

Vector-valued functions serve dual roles in the representation of curves. By letting the parameter t represent time, you can use a vector-valued function to represent *motion* along a curve. Or, in the more general case, you can use a vector-valued function to *trace the graph* of a curve. In either case, the terminal point of the position vector $\mathbf{r}(t)$ coincides with the point (x, y) or (x, y, z) on the curve given by the parametric equations, as shown in Figure 12.1. The arrowhead on the curve indicates the curve's *orientation* by pointing in the direction of increasing values of t.

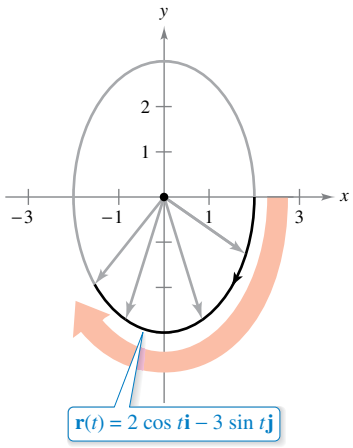
Unless stated otherwise, the **domain** of a vector-valued function $\mathbf{r}$ is considered to be the intersection of the domains of the component functions f, g, and h. For instance, the domain of $\mathbf{r}(t) = \ln t\,\mathbf{i} + \sqrt{1-t}\,\mathbf{j} + t\,\mathbf{k}$ is the interval $(0, 1]$.



The ellipse is traced clockwise as t increases from 0 to 2π.
Figure 12.2

EXAMPLE 1 Sketching a Plane Curve

Sketch the plane curve represented by the vector-valued function

$$\mathbf{r}(t) = 2\cos t\,\mathbf{i} - 3\sin t\,\mathbf{j}, \quad 0 \le t \le 2\pi.$$ Vector-valued function

Solution From the position vector $\mathbf{r}(t)$, you can write the parametric equations

$$x = 2\cos t \quad \text{and} \quad y = -3\sin t.$$ Parametric equations

Solving for $\cos t$ and $\sin t$ and using the identity $\cos^2 t + \sin^2 t = 1$, you get the rectangular equation

$$\frac{x^2}{2^2} + \frac{y^2}{3^2} = 1.$$ Rectangular equation

The graph of this rectangular equation is the ellipse shown in Figure 12.2. The curve has a *clockwise* orientation. That is, as t increases from 0 to 2π, the position vector $\mathbf{r}(t)$ moves clockwise, and its terminal point traces the ellipse.

EXAMPLE 2 Sketching a Space Curve

See LarsonCalculus.com for an interactive version of this type of example.

Sketch the space curve represented by the vector-valued function

$$\mathbf{r}(t) = 4\cos t\,\mathbf{i} + 4\sin t\,\mathbf{j} + t\,\mathbf{k}, \quad 0 \le t \le 4\pi.$$ Vector-valued function

Solution From the first two parametric equations

$$x = 4\cos t \quad \text{and} \quad y = 4\sin t$$

you can obtain

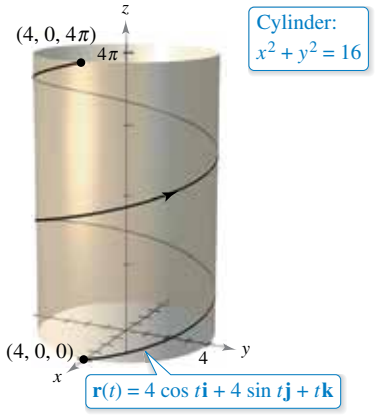
$$x^2 + y^2 = 16.$$ Rectangular equation

This means that the curve lies on a right circular cylinder of radius 4, centered about the z-axis. To locate the curve on this cylinder, you can use the third parametric equation

$$z = t.$$

In Figure 12.3, note that as t increases from 0 to 4π, the point (x, y, z) spirals up the cylinder to produce a **helix.** A real-life example of a helix is shown in the drawing at the left.

In 1953, Francis Crick and James D. Watson discovered the double helix structure of DNA.



As t increases from 0 to 4π, two spirals on the helix are traced out.
Figure 12.3

In Examples 1 and 2, you were given a vector-valued function and were asked to sketch the corresponding curve. The next two examples address the reverse problem—finding a vector-valued function to represent a given graph. Of course, when the graph is described parametrically, representation by a vector-valued function is straightforward. For instance, to represent the line in space given by $x = 2 + t$, $y = 3t$, and $z = 4 - t$, you can simply use the vector-valued function

$$\mathbf{r}(t) = (2 + t)\mathbf{i} + 3t\,\mathbf{j} + (4 - t)\mathbf{k}.$$

When a set of parametric equations for the graph is not given, the problem of representing the graph by a vector-valued function boils down to finding a set of parametric equations.

EXAMPLE 3 Representing a Graph: Vector-Valued Function

Represent the parabola

$$y = x^2 + 1$$ Rectangular equation

by a vector-valued function.

Solution Although there are many ways to choose the parameter t, a natural choice is to let $x = t$. Then $y = t^2 + 1$ and you have

$$\mathbf{r}(t) = t\mathbf{i} + (t^2 + 1)\mathbf{j}.$$ Vector-valued function

Note in Figure 12.4 the orientation produced by this particular choice of parameter. Had you chosen $x = -t$ as the parameter, the curve would have been oriented in the opposite direction.

EXAMPLE 4 Representing a Graph: Vector-Valued Function

Sketch the space curve C represented by the intersection of the semiellipsoid

$$\frac{x^2}{12} + \frac{y^2}{24} + \frac{z^2}{4} = 1, \quad z \geq 0$$ Rectangular equation

and the parabolic cylinder $y = x^2$. Then find a vector-valued function to represent the graph.

Solution The intersection of the two surfaces is shown in Figure 12.5. As in Example 3, a natural choice of parameter is $x = t$. For this choice, you can use the given equation $y = x^2$ to obtain $y = t^2$. Then it follows that

$$\frac{z^2}{4} = 1 - \frac{x^2}{12} - \frac{y^2}{24} = 1 - \frac{t^2}{12} - \frac{t^4}{24} = \frac{24 - 2t^2 - t^4}{24} = \frac{(6 + t^2)(4 - t^2)}{24}.$$

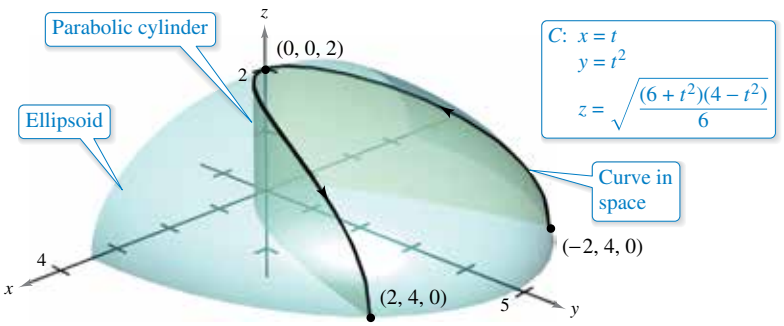
Because the curve lies above the xy-plane, you should choose the positive square root for z and obtain the parametric equations

$$x = t, \quad y = t^2, \quad \text{and} \quad z = \sqrt{\frac{(6 + t^2)(4 - t^2)}{6}}.$$ Parametric equations

The resulting vector-valued function is

$$\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + \sqrt{\frac{(6 + t^2)(4 - t^2)}{6}}\mathbf{k}, \quad -2 \leq t \leq 2.$$ Vector-valued function

(Note that the $\mathbf{k}$-component of $\mathbf{r}(t)$ implies $-2 \leq t \leq 2$.) From the points $(-2, 4, 0)$ and $(2, 4, 0)$ shown in Figure 12.5, notice that the curve is traced as t increases from -2 to 2.



The curve C is the intersection of the semiellipsoid and the parabolic cylinder.
Figure 12.5

REMARK Curves in space can be specified in various ways. For instance, the curve in Example 4 is described as the intersection of two surfaces in space.

Limits and Continuity

Many techniques and definitions used in the calculus of real-valued functions can be applied to vector-valued functions. For instance, you can add and subtract vector-valued functions, multiply a vector-valued function by a scalar, take the limit of a vector-valued function, differentiate a vector-valued function, and so on. The basic approach is to capitalize on the linearity of vector operations by extending the definitions on a component-by-component basis. For example, to add two vector-valued functions (in the plane), you can write

$$\begin{aligned}\mathbf{r}_1(t) + \mathbf{r}_2(t) &= [f_1(t)\mathbf{i} + g_1(t)\mathbf{j}] + [f_2(t)\mathbf{i} + g_2(t)\mathbf{j}] \\ &= [f_1(t) + f_2(t)]\mathbf{i} + [g_1(t) + g_2(t)]\mathbf{j}.\end{aligned}$$ Sum

To subtract two vector-valued functions, you can write

$$\begin{aligned}\mathbf{r}_1(t) - \mathbf{r}_2(t) &= [f_1(t)\mathbf{i} + g_1(t)\mathbf{j}] - [f_2(t)\mathbf{i} + g_2(t)\mathbf{j}] \\ &= [f_1(t) - f_2(t)]\mathbf{i} + [g_1(t) - g_2(t)]\mathbf{j}.\end{aligned}$$ Difference

Similarly, to multiply a vector-valued function by a scalar, you can write

$$\begin{aligned}c\mathbf{r}(t) &= c[f_1(t)\mathbf{i} + g_1(t)\mathbf{j}] \\ &= cf_1(t)\mathbf{i} + cg_1(t)\mathbf{j}.\end{aligned}$$ Scalar multiplication

To divide a vector-valued function by a scalar, you can write

$$\begin{aligned}\frac{\mathbf{r}(t)}{c} &= \frac{[f_1(t)\mathbf{i} + g_1(t)\mathbf{j}]}{c}, \quad c \neq 0 \\ &= \frac{f_1(t)}{c}\mathbf{i} + \frac{g_1(t)}{c}\mathbf{j}.\end{aligned}$$ Scalar division

This component-by-component extension of operations with real-valued functions to vector-valued functions is further illustrated in the definition of the limit of a vector-valued function.

Definition of the Limit of a Vector-Valued Function

1. If $\mathbf{r}$ is a vector-valued function such that $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j}$, then

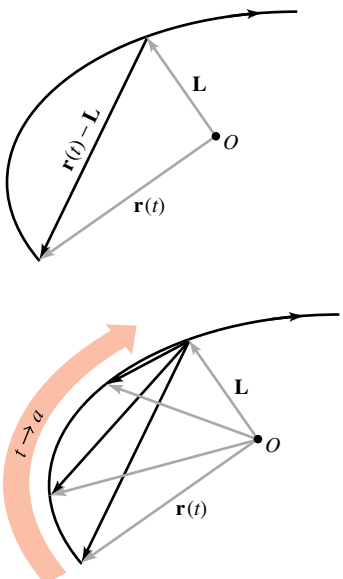
$$\lim_{t\to a} \mathbf{r}(t) = \left[\lim_{t\to a} f(t)\right]\mathbf{i} + \left[\lim_{t\to a} g(t)\right]\mathbf{j}$$ Plane

provided f and g have limits as $t \to a$.

2. If $\mathbf{r}$ is a vector-valued function such that $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j} + h(t)\mathbf{k}$, then

$$\lim_{t\to a} \mathbf{r}(t) = \left[\lim_{t\to a} f(t)\right]\mathbf{i} + \left[\lim_{t\to a} g(t)\right]\mathbf{j} + \left[\lim_{t\to a} h(t)\right]\mathbf{k}$$ Space

provided f, g, and h have limits as $t \to a$.



As t approaches a, $\mathbf{r}(t)$ approaches the limit $\mathbf{L}$. For the limit $\mathbf{L}$ to exist, it is not necessary that $\mathbf{r}(a)$ be defined or that $\mathbf{r}(a)$ be equal to $\mathbf{L}$.

Figure 12.6

If $\mathbf{r}(t)$ approaches the vector $\mathbf{L}$ as $t \to a$, then the length of the vector $\mathbf{r}(t) - \mathbf{L}$ approaches 0. That is,

$$\|\mathbf{r}(t) - \mathbf{L}\| \to 0 \quad \text{as} \quad t \to a.$$

This is illustrated graphically in Figure 12.6. With this definition of the limit of a vector-valued function, you can develop vector versions of most of the limit theorems given in Chapter 1. For example, the limit of the sum of two vector-valued functions is the sum of their individual limits. Also, you can use the orientation of the curve $\mathbf{r}(t)$ to define one-sided limits of vector-valued functions. The next definition extends the notion of continuity to vector-valued functions.

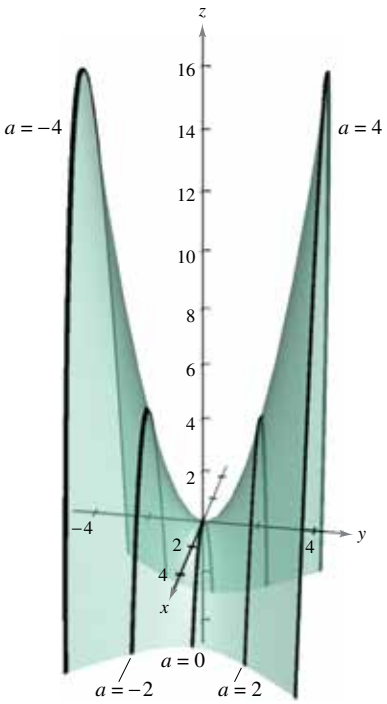
Definition of Continuity of a Vector-Valued Function

A vector-valued function $\mathbf{r}$ is **continuous at the point** given by $t = a$ when the limit of $\mathbf{r}(t)$ exists as $t \to a$ and

$$\lim_{t \to a} \mathbf{r}(t) = \mathbf{r}(a).$$

A vector-valued function $\mathbf{r}$ is **continuous on an interval** I when it is continuous at every point in the interval.

From this definition, it follows that a vector-valued function is continuous at $t = a$ if and only if each of its component functions is continuous at $t = a$.



For each value of a, the curve represented by the vector-valued function $\mathbf{r}(t) = t\mathbf{i} + a\mathbf{j} + (a^2 - t^2)\mathbf{k}$ is a parabola.

Figure 12.7

EXAMPLE 5 Continuity of a Vector-Valued Function

Discuss the continuity of the vector-valued function

$$\mathbf{r}(t) = t\mathbf{i} + a\mathbf{j} + (a^2 - t^2)\mathbf{k} \qquad a \text{ is a constant.}$$

at $t = 0$.

Solution As t approaches 0, the limit is

$$\begin{aligned}\lim_{t \to 0} \mathbf{r}(t) &= \left[\lim_{t \to 0} t\right]\mathbf{i} + \left[\lim_{t \to 0} a\right]\mathbf{j} + \left[\lim_{t \to 0} (a^2 - t^2)\right]\mathbf{k} \\ &= 0\mathbf{i} + a\mathbf{j} + a^2\mathbf{k} \\ &= a\mathbf{j} + a^2\mathbf{k}.\end{aligned}$$

Because

$$\begin{aligned}\mathbf{r}(0) &= (0)\mathbf{i} + (a)\mathbf{j} + (a^2)\mathbf{k} \\ &= a\mathbf{j} + a^2\mathbf{k}\end{aligned}$$

you can conclude that $\mathbf{r}$ is continuous at $t = 0$. By similar reasoning, you can conclude that the vector-valued function $\mathbf{r}$ is continuous at all real-number values of t. ■

For each value of a, the curve represented by the vector-valued function in Example 5

$$\mathbf{r}(t) = t\mathbf{i} + a\mathbf{j} + (a^2 - t^2)\mathbf{k} \qquad a \text{ is a constant.}$$

is a parabola. You can think of each parabola as the intersection of the vertical plane $y = a$ and the hyperbolic paraboloid

$$y^2 - x^2 = z$$

as shown in Figure 12.7.

EXAMPLE 6 Continuity of a Vector-Valued Function

Determine the interval(s) on which the vector-valued function

$$\mathbf{r}(t) = t\mathbf{i} + \sqrt{t + 1}\,\mathbf{j} + (t^2 + 1)\mathbf{k}$$

is continuous.

Solution The component functions are

$$f(t) = t, \quad g(t) = \sqrt{t + 1}, \quad \text{and} \quad h(t) = (t^2 + 1).$$

Both f and h are continuous for all real-number values of t. The function g, however, is continuous only for $t \geq -1$. So, $\mathbf{r}$ is continuous on the interval $[-1, \infty)$. ■

TECHNOLOGY

Almost any type of three-dimensional sketch is difficult to do without a graphing utility, but sketching curves in space is especially difficult. The problem is trying to create the illusion of three dimensions. Graphing utilities use a variety of techniques to add "three-dimensionality" to graphs of space curves. One way is to show the curve on a surface, as in Figure 12.7.

12.1 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Describe how you can use a vector-valued function to represent a curve.
2. Describe what it means for a vector-valued function $\mathbf{r}(t)$ to be continuous at a point.

Finding the Domain In Exercises 3–10, find the domain of the vector-valued function.

3. $\mathbf{r}(t) = \frac{1}{t+1}\mathbf{i} + \frac{t}{2}\mathbf{j} - 3t\mathbf{k}$
4. $\mathbf{r}(t) = \sqrt{4-t^2}\mathbf{i} + t^2\mathbf{j} - 6t\mathbf{k}$
5. $\mathbf{r}(t) = \ln t\,\mathbf{i} - e^t\mathbf{j} - t\mathbf{k}$
6. $\mathbf{r}(t) = \sin t\,\mathbf{i} + 4\cos t\,\mathbf{j} + t\mathbf{k}$
7. $\mathbf{r}(t) = \mathbf{F}(t) + \mathbf{G}(t)$, where
   $\mathbf{F}(t) = \cos t\,\mathbf{i} - \sin t\,\mathbf{j} + \sqrt{t}\,\mathbf{k}, \quad \mathbf{G}(t) = \cos t\,\mathbf{i} + \sin t\,\mathbf{j}$
8. $\mathbf{r}(t) = \mathbf{F}(t) - \mathbf{G}(t)$, where
   $\mathbf{F}(t) = \ln t\,\mathbf{i} + 5t\mathbf{j} - 3t^2\mathbf{k}, \quad \mathbf{G}(t) = \mathbf{i} + 4t\mathbf{j} - 3t^2\mathbf{k}$
9. $\mathbf{r}(t) = \mathbf{F}(t) \times \mathbf{G}(t)$, where
   $\mathbf{F}(t) = \sin t\,\mathbf{i} + \cos t\,\mathbf{j}, \quad \mathbf{G}(t) = \sin t\,\mathbf{j} + \cos t\,\mathbf{k}$
10. $\mathbf{r}(t) = \mathbf{F}(t) \times \mathbf{G}(t)$, where
    $\mathbf{F}(t) = t^3\mathbf{i} - t\mathbf{j} + t\mathbf{k},$
    $\mathbf{G}(t) = \sqrt[3]{t}\,\mathbf{i} + \frac{1}{t+1}\mathbf{j} + (t+2)\mathbf{k}$

Evaluating a Function In Exercises 11 and 12, evaluate the vector-valued function at each given value of t.

11. $\mathbf{r}(t) = \frac{1}{2}t^2\mathbf{i} - (t-1)\mathbf{j}$
    (a) $\mathbf{r}(1)$ (b) $\mathbf{r}(0)$ (c) $\mathbf{r}(s+1)$
    (d) $\mathbf{r}(2+\Delta t) - \mathbf{r}(2)$
12. $\mathbf{r}(t) = \cos t\,\mathbf{i} + 2\sin t\,\mathbf{j}$
    (a) $\mathbf{r}(0)$ (b) $\mathbf{r}(\pi/4)$ (c) $\mathbf{r}(\theta - \pi)$
    (d) $\mathbf{r}(\pi/6 + \Delta t) - \mathbf{r}(\pi/6)$

Writing a Vector-Valued Function In Exercises 13–16, represent the line segment from P to Q by a vector-valued function and by a set of parametric equations.

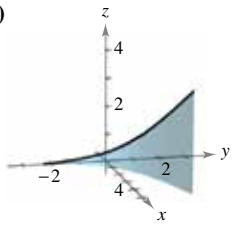
13. $P(0, 0, 0)$, $Q(5, 2, 2)$
14. $P(0, 2, -1)$, $Q(4, 7, 2)$
15. $P(-3, -6, -1)$, $Q(-1, -9, -8)$
16. $P(1, -6, 8)$, $Q(-3, -2, 5)$

Think About It In Exercises 17 and 18, find $\mathbf{r}(t) \cdot \mathbf{u}(t)$. Determine whether the result is a vector-valued function. Explain.

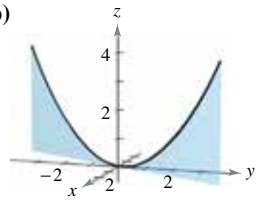
17. $\mathbf{r}(t) = (3t-1)\mathbf{i} + \frac{1}{4}t^3\mathbf{j} + 4\mathbf{k}, \quad \mathbf{u}(t) = t^2\mathbf{i} - 8\mathbf{j} + t^3\mathbf{k}$
18. $\mathbf{r}(t) = \langle 3\cos t, 2\sin t, t-2\rangle, \quad \mathbf{u}(t) = \langle 4\sin t, -6\cos t, t^2\rangle$

Matching In Exercises 19–22, match the equation with its graph. [The graphs are labeled (a), (b), (c), and (d).]

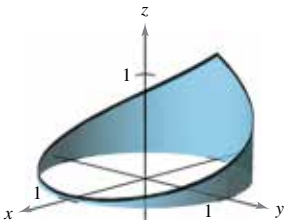
(a)



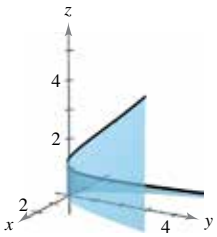
(b)



(c)



(d)



19. $\mathbf{r}(t) = t\mathbf{i} + 2t\mathbf{j} + t^2\mathbf{k}, \quad -2 \le t \le 2$
20. $\mathbf{r}(t) = \cos(\pi t)\mathbf{i} + \sin(\pi t)\mathbf{j} + t^2\mathbf{k}, \quad -1 \le t \le 1$
21. $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + e^{0.75t}\mathbf{k}, \quad -2 \le t \le 2$
22. $\mathbf{r}(t) = t\mathbf{i} + \ln t\,\mathbf{j} + \frac{2t}{3}\mathbf{k}, \quad 0.1 \le t \le 5$

Sketching a Plane Curve In Exercises 23–30, sketch the plane curve represented by the vector-valued function and give the orientation of the curve.

23. $\mathbf{r}(t) = \frac{t}{4}\mathbf{i} + (t-1)\mathbf{j}$
24. $\mathbf{r}(t) = (5-t)\mathbf{i} + \sqrt{t}\,\mathbf{j}$
25. $\mathbf{r}(t) = t^3\mathbf{i} + t^2\mathbf{j}$
26. $\mathbf{r}(t) = (t^2+t)\mathbf{i} + (t^2-t)\mathbf{j}$
27. $\mathbf{r}(\theta) = \cos\theta\,\mathbf{i} + 3\sin\theta\,\mathbf{j}$
28. $\mathbf{r}(t) = 2\cos t\,\mathbf{i} + 2\sin t\,\mathbf{j}$
29. $\mathbf{r}(\theta) = 3\sec\theta\,\mathbf{i} + 2\tan\theta\,\mathbf{j}$
30. $\mathbf{r}(t) = 2\cos^3 t\,\mathbf{i} + 2\sin^3 t\,\mathbf{j}$

Sketching a Space Curve In Exercises 31–38, sketch the space curve represented by the vector-valued function and give the orientation of the curve.

31. $\mathbf{r}(t) = (-t+1)\mathbf{i} + (4t+2)\mathbf{j} + (2t+3)\mathbf{k}$
32. $\mathbf{r}(t) = t\mathbf{i} + (2t-5)\mathbf{j} + 3t\mathbf{k}$
33. $\mathbf{r}(t) = 2\cos t\,\mathbf{i} + 2\sin t\,\mathbf{j} + t\mathbf{k}$
34. $\mathbf{r}(t) = t\mathbf{i} + 3\cos t\,\mathbf{j} + 3\sin t\,\mathbf{k}$
35. $\mathbf{r}(t) = 2\sin t\,\mathbf{i} + 2\cos t\,\mathbf{j} + e^{-t}\mathbf{k}$
36. $\mathbf{r}(t) = t^2\mathbf{i} + 2t\mathbf{j} + \frac{3}{2}t\mathbf{k}$
37. $\mathbf{r}(t) = \langle t, t^2, \frac{2}{3}t^3\rangle$
38. $\mathbf{r}(t) = \langle \cos t + t\sin t, \sin t - t\cos t, t\rangle$

Identifying a Common Curve **In Exercises 39 and 40, use a graphing utility to graph the vector-valued function and identify the common curve.**

39. $\mathbf{r}(t) = -\frac{1}{2}t^2\mathbf{i} + t\mathbf{j} - \frac{\sqrt{3}}{2}t^2\mathbf{k}$

40. $\mathbf{r}(t) = -\sqrt{2}\sin t\mathbf{i} + 2\cos t\mathbf{j} + \sqrt{2}\sin t\mathbf{k}$

Transformations of Vector-Valued Functions **In Exercises 41 and 42, use a graphing utility to graph the vector-valued function $\mathbf{r}(t)$. For each $\mathbf{u}(t)$, make a conjecture about the transformation (if any) of the graph of $\mathbf{r}(t)$. Use a graphing utility to verify your conjecture.**

41. $\mathbf{r}(t) = 2\cos t\mathbf{i} + 2\sin t\mathbf{j} + \frac{1}{2}t\mathbf{k}$

(a) $\mathbf{u}(t) = 2(\cos t - 1)\mathbf{i} + 2\sin t\mathbf{j} + \frac{1}{2}t\mathbf{k}$

(b) $\mathbf{u}(t) = 2\cos t\mathbf{i} + 2\sin t\mathbf{j} + 2t\mathbf{k}$

(c) $\mathbf{u}(t) = 2\cos(-t)\mathbf{i} + 2\sin(-t)\mathbf{j} + \frac{1}{2}(-t)\mathbf{k}$

(d) $\mathbf{u}(t) = 6\cos t\mathbf{i} + 6\sin t\mathbf{j} + \frac{1}{2}t\mathbf{k}$

42. $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + \frac{1}{2}t^3\mathbf{k}$

(a) $\mathbf{u}(t) = (-t)\mathbf{i} + (-t)^2\mathbf{j} + \frac{1}{2}(-t)^3\mathbf{k}$

(b) $\mathbf{u}(t) = t^2\mathbf{i} + t\mathbf{j} + \frac{1}{2}t^3\mathbf{k}$

(c) $\mathbf{u}(t) = t\mathbf{i} + t^2\mathbf{j} + \left(\frac{1}{2}t^3 + 4\right)\mathbf{k}$

(d) $\mathbf{u}(t) = t\mathbf{i} + t^2\mathbf{j} + \frac{1}{8}t^3\mathbf{k}$

Writing a Transformation **In Exercises 43–46, consider the vector-valued function $\mathbf{r}(t) = 3t^2\mathbf{i} + (t-1)\mathbf{j} + t\mathbf{k}$. Write a vector-valued function $\mathbf{u}(t)$ that is the specified transformation of $\mathbf{r}$.**

43. A vertical translation two units upward

44. A horizontal translation one unit in the direction of the positive x-axis

45. The y-value increases by a factor of two

46. The z-value increases by a factor of three

Representing a Graph by a Vector-Valued Function **In Exercises 47–54, represent the plane curve by a vector-valued function. (There are many correct answers.)**

47. $y = x + 5$

48. $2x - 3y + 5 = 0$

49. $y = (x-2)^2$

50. $y = 4 - x^2$

51. $x^2 + y^2 = 25$

52. $(x-2)^2 + y^2 = 4$

53. $\frac{x^2}{16} - \frac{y^2}{4} = 1$

54. $\frac{x^2}{9} + \frac{y^2}{16} = 1$

Representing a Graph by a Vector-Valued Function **In Exercises 55–62, sketch the space curve represented by the intersection of the surfaces. Then represent the curve by a vector-valued function using the given parameter.**

Surfaces	Parameter
55. $z = x^2 + y^2, \quad x + y = 0$	$x = t$
56. $z = x^2 + y^2, \quad z = 4$	$x = 2\cos t$
57. $x^2 + y^2 = 4, \quad z = x^2$	$x = 2\sin t$
58. $4x^2 + 4y^2 + z^2 = 16, \quad x = z^2$	$z = t$
59. $x^2 + y^2 + z^2 = 4, \quad x + z = 2$	$x = 1 + \sin t$
60. $x^2 + y^2 + z^2 = 10, \quad x + y = 4$	$x = 2 + \sin t$
61. $x^2 + z^2 = 4, \quad y^2 + z^2 = 4$	$x = t$ (first octant)
62. $x^2 + y^2 + z^2 = 16, \quad xy = 4$	$x = t$ (first octant)

63. Sketching a Curve Show that the vector-valued function

$\mathbf{r}(t) = t\mathbf{i} + 2t\cos t\mathbf{j} + 2t\sin t\mathbf{k}$

lies on the cone $4x^2 = y^2 + z^2$. Sketch the curve.

64. Sketching a Curve Show that the vector-valued function

$\mathbf{r}(t) = e^{-t}\cos t\mathbf{i} + e^{-t}\sin t\mathbf{j} + e^{-t}\mathbf{k}$

lies on the cone $z^2 = x^2 + y^2$. Sketch the curve.

Finding a Limit **In Exercises 65–70, find the limit (if it exists).**

65. $\lim_{t\to\pi}(t\mathbf{i} + \cos t\mathbf{j} + \sin t\mathbf{k})$

66. $\lim_{t\to 2}\left(3t\mathbf{i} + \frac{2}{t^2-1}\mathbf{j} + \frac{1}{t}\mathbf{k}\right)$

67. $\lim_{t\to 0}\left(t^2\mathbf{i} + 3t\mathbf{j} + \frac{1-\cos t}{t}\mathbf{k}\right)$

68. $\lim_{t\to 1}\left(\sqrt{t}\mathbf{i} + \frac{\ln t}{t^2-1}\mathbf{j} + \frac{1}{t-1}\mathbf{k}\right)$

69. $\lim_{t\to 0}\left(e^t\mathbf{i} + \frac{\sin t}{t}\mathbf{j} + e^{-t}\mathbf{k}\right)$

70. $\lim_{t\to\infty}\left(e^{-t}\mathbf{i} + \frac{1}{t}\mathbf{j} + t^{1/t}\mathbf{k}\right)$

Continuity of a Vector-Valued Function **In Exercises 71–76, determine the interval(s) on which the vector-valued function is continuous.**

71. $\mathbf{r}(t) = \frac{1}{2t+1}\mathbf{i} + \frac{1}{t}\mathbf{j}$

72. $\mathbf{r}(t) = \sqrt{t}\mathbf{i} + \sqrt{t-1}\mathbf{j}$

73. $\mathbf{r}(t) = t\mathbf{i} + \arcsin t\mathbf{j} + (t-1)\mathbf{k}$

74. $\mathbf{r}(t) = 2e^{-t}\mathbf{i} + e^{-t}\mathbf{j} + \ln(t-1)\mathbf{k}$

75. $\mathbf{r}(t) = \langle e^{-t}, t^2, \tan t\rangle$

76. $\mathbf{r}(t) = \langle 8, \sqrt{t}, \sqrt[3]{t}\rangle$

Exploring Concepts

77. Consider first-degree polynomial functions $f(t)$, $g(t)$, and $h(t)$. Determine whether the curve represented by $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j} + h(t)\mathbf{k}$ is a line. Explain.

78. The curve represented by $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j} + h(t)\mathbf{k}$ is a line. Are f, g, and h first-degree polynomial functions of t? Explain.

79. Give an example of a vector-valued function that is defined but not continuous at $t = 3$.

80. Comparing Functions Which of the following vector-valued functions represent the same graph?

(a) $\mathbf{r}(t) = (-3\cos t + 1)\mathbf{i} + (5\sin t + 2)\mathbf{j} + 4\mathbf{k}$

(b) $\mathbf{r}(t) = 4\mathbf{i} + (-3\cos t + 1)\mathbf{j} + (5\sin t + 2)\mathbf{k}$

(c) $\mathbf{r}(t) = (3\cos t - 1)\mathbf{i} + (-5\sin t - 2)\mathbf{j} + 4\mathbf{k}$

(d) $\mathbf{r}(t) = (-3\cos 2t + 1)\mathbf{i} + (5\sin 2t + 2)\mathbf{j} + 4\mathbf{k}$

81. Staircase

The outer bottom edge of a staircase is in the shape of a helix of radius 1 meter. The staircase has a height of 4 meters and makes two complete revolutions from top to bottom. Find a vector-valued function for the staircase. Use a graphing utility to graph your function. (There are many correct answers.)

82. HOW DO YOU SEE IT? The four figures below are graphs of the vector-valued function

$$\mathbf{r}(t) = 4\cos t\,\mathbf{i} + 4\sin t\,\mathbf{j} + \frac{t}{4}\mathbf{k}.$$

Match each of the four graphs with the point in space from which the helix is viewed.

83. Proof Let $\mathbf{r}(t)$ and $\mathbf{u}(t)$ be vector-valued functions whose limits exist as $t \to c$. Prove that

$$\lim_{t\to c}[\mathbf{r}(t) \times \mathbf{u}(t)] = \lim_{t\to c}\mathbf{r}(t) \times \lim_{t\to c}\mathbf{u}(t).$$

84. Proof Let $\mathbf{r}(t)$ and $\mathbf{u}(t)$ be vector-valued functions whose limits exist as $t \to c$. Prove that

$$\lim_{t\to c}[\mathbf{r}(t) \cdot \mathbf{u}(t)] = \lim_{t\to c}\mathbf{r}(t) \cdot \lim_{t\to c}\mathbf{u}(t).$$

85. Proof Prove that if $\mathbf{r}$ is a vector-valued function that is continuous at c, then $\|\mathbf{r}\|$ is continuous at c.

86. Verifying a Converse Verify that the converse of Exercise 85 is not true by finding a vector-valued function $\mathbf{r}$ such that $\|\mathbf{r}\|$ is continuous at c but $\mathbf{r}$ is not continuous at c.

Particle Motion **In Exercises 87 and 88, two particles travel along the space curves $\mathbf{r}(t)$ and $\mathbf{u}(t)$. Do the particles collide? Do their paths intersect?**

87. $\mathbf{r}(t) = t^2\mathbf{i} + (9t - 20)\mathbf{j} + t^2\mathbf{k}$

$\mathbf{u}(t) = (3t + 4)\mathbf{i} + t^2\mathbf{j} + (5t - 4)\mathbf{k}$

88. $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + t^3\mathbf{k}$

$\mathbf{u}(t) = (-2t + 3)\mathbf{i} + 8t\mathbf{j} + (12t + 2)\mathbf{k}$

Think About It **In Exercises 89 and 90, two particles travel along the space curves $\mathbf{r}(t)$ and $\mathbf{u}(t)$.**

89. If $\mathbf{r}(t)$ and $\mathbf{u}(t)$ intersect, will the particles collide?

90. If the particles collide, do their paths $\mathbf{r}(t)$ and $\mathbf{u}(t)$ intersect?

SECTION PROJECT

Witch of Agnesi

In Section 3.5, you studied a famous curve called the **Witch of Agnesi.** In this project, you will take a closer look at this function.

Consider a circle of radius a centered on the y-axis at $(0, a)$. Let A be a point on the horizontal line $y = 2a$, let O be the origin, and let B be the point where the segment OA intersects the circle. A point P is on the Witch of Agnesi when P lies on the horizontal line through B and on the vertical line through A.

(a) Show that the point A is traced out by the vector-valued function

$$\mathbf{r}_A(\theta) = 2a\cot\theta\,\mathbf{i} + 2a\mathbf{j}, \quad 0 < \theta < \pi$$

where θ is the angle that OA makes with the positive x-axis.

(b) Show that the point B is traced out by the vector-valued function $\mathbf{r}_B(\theta) = a\sin 2\theta\,\mathbf{i} + a(1 - \cos 2\theta)\mathbf{j}$, $0 < \theta < \pi$.

(c) Combine the results of parts (a) and (b) to find the vector-valued function $\mathbf{r}(\theta)$ for the Witch of Agnesi. Use a graphing utility to graph this curve for $a = 1$.

(d) Describe the limits $\lim_{\theta\to 0^+}\mathbf{r}(\theta)$ and $\lim_{\theta\to\pi^-}\mathbf{r}(\theta)$.

(e) Eliminate the parameter θ and determine the rectangular equation of the Witch of Agnesi. Use a graphing utility to graph this function for $a = 1$ and compare your graph with that obtained in part (c).

12.2 Differentiation and Integration of Vector-Valued Functions

GO DIGITAL

- **Differentiate a vector-valued function.**
- **Integrate a vector-valued function.**

Differentiation of Vector-Valued Functions

In Sections 12.3–12.5, you will study several important applications involving the calculus of vector-valued functions. In preparation for that study, this section is devoted to the mechanics of differentiation and integration of vector-valued functions.

The definition of the derivative of a vector-valued function parallels the definition for real-valued functions.

Definition of the Derivative of a Vector-Valued Function

The **derivative of a vector-valued function r** is

$$\mathbf{r}'(t) = \lim_{\Delta t \to 0} \frac{\mathbf{r}(t + \Delta t) - \mathbf{r}(t)}{\Delta t}$$

for all t for which the limit exists. If $\mathbf{r}'(t)$ exists, then $\mathbf{r}$ is **differentiable at *t*.** If $\mathbf{r}'(t)$ exists for all t in an open interval I, then $\mathbf{r}$ is **differentiable on the interval *I*.** Differentiability of vector-valued functions can be extended to closed intervals by considering one-sided limits.

REMARK In addition to $\mathbf{r}'(t)$, other notations for the derivative of a vector-valued function are

$$\frac{d}{dt}[\mathbf{r}(t)], \quad \frac{d\mathbf{r}}{dt}, \quad \text{and} \quad D_t[\mathbf{r}(t)].$$

Differentiation of vector-valued functions can be done on a *component-by-component basis*. To understand why this is true, let $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j}$. Applying the definition of the derivative produces the following.

$$\begin{aligned}
\mathbf{r}'(t) &= \lim_{\Delta t \to 0} \frac{\mathbf{r}(t + \Delta t) - \mathbf{r}(t)}{\Delta t} \\
&= \lim_{\Delta t \to 0} \frac{f(t + \Delta t)\mathbf{i} + g(t + \Delta t)\mathbf{j} - f(t)\mathbf{i} - g(t)\mathbf{j}}{\Delta t} \\
&= \lim_{\Delta t \to 0} \left\{ \left[\frac{f(t + \Delta t) - f(t)}{\Delta t} \right]\mathbf{i} + \left[\frac{g(t + \Delta t) - g(t)}{\Delta t} \right]\mathbf{j} \right\} \\
&= \left\{ \lim_{\Delta t \to 0} \left[\frac{f(t + \Delta t) - f(t)}{\Delta t} \right] \right\}\mathbf{i} + \left\{ \lim_{\Delta t \to 0} \left[\frac{g(t + \Delta t) - g(t)}{\Delta t} \right] \right\}\mathbf{j} \\
&= f'(t)\mathbf{i} + g'(t)\mathbf{j}
\end{aligned}$$

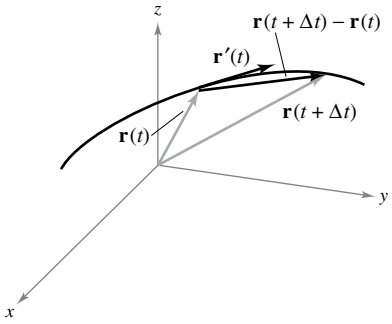

Figure 12.8

This important result is listed in Theorem 12.1. Note that the derivative of the vector-valued function $\mathbf{r}$ is itself a vector-valued function. Figure 12.8 shows that $\mathbf{r}'(t)$ is a vector tangent to the curve given by $\mathbf{r}(t)$ and pointing in the direction of increasing t-values.

THEOREM 12.1 Differentiation of Vector-Valued Functions

1. If $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j}$, where f and g are differentiable functions of t, then
$$\mathbf{r}'(t) = f'(t)\mathbf{i} + g'(t)\mathbf{j}.$$ Plane
2. If $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j} + h(t)\mathbf{k}$, where f, g, and h are differentiable functions of t, then
$$\mathbf{r}'(t) = f'(t)\mathbf{i} + g'(t)\mathbf{j} + h'(t)\mathbf{k}.$$ Space

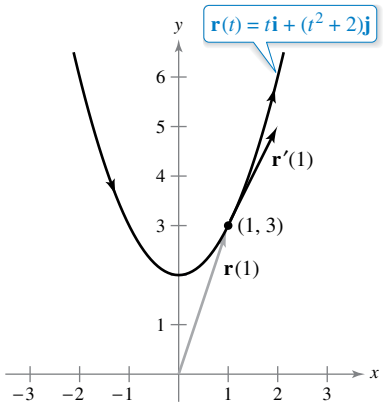

Figure 12.9

EXAMPLE 1 Differentiation of a Vector-Valued Function

See LarsonCalculus.com for an interactive version of this type of example.

For the vector-valued function

$$\mathbf{r}(t) = t\mathbf{i} + (t^2 + 2)\mathbf{j}$$

find $\mathbf{r}'(t)$. Then sketch the plane curve represented by $\mathbf{r}(t)$ and the graphs of $\mathbf{r}(1)$ and $\mathbf{r}'(1)$.

Solution Differentiate on a component-by-component basis to obtain

$$\mathbf{r}'(t) = \mathbf{i} + 2t\mathbf{j}. \qquad \text{Derivative}$$

From the position vector $\mathbf{r}(t)$, you can write the parametric equations $x = t$ and $y = t^2 + 2$. The corresponding rectangular equation is $y = x^2 + 2$. When $t = 1$,

$$\mathbf{r}(1) = \mathbf{i} + 3\mathbf{j} \quad \text{and} \quad \mathbf{r}'(1) = \mathbf{i} + 2\mathbf{j}.$$

In Figure 12.9, $\mathbf{r}(1)$ is drawn starting at the origin, and $\mathbf{r}'(1)$ is drawn starting at the terminal point of $\mathbf{r}(1)$. Note that at $(1, 3)$, the vector $\mathbf{r}'(1)$ is tangent to the curve given by $\mathbf{r}(t)$ and is pointing in the direction of increasing t-values. ■

Higher-order derivatives of vector-valued functions are obtained by successive differentiation of each component function.

EXAMPLE 2 Higher-Order Differentiation

For the vector-valued function

$$\mathbf{r}(t) = \cos t\mathbf{i} + \sin t\mathbf{j} + 2t\mathbf{k}$$

find each of the following.

a. $\mathbf{r}'(t)$ **b.** $\mathbf{r}''(t)$

c. $\mathbf{r}'(t) \cdot \mathbf{r}''(t)$ **d.** $\mathbf{r}'(t) \times \mathbf{r}''(t)$

Solution

a. $\mathbf{r}'(t) = -\sin t\mathbf{i} + \cos t\mathbf{j} + 2\mathbf{k}$ First derivative

b. $\mathbf{r}''(t) = -\cos t\mathbf{i} - \sin t\mathbf{j} + 0\mathbf{k}$

$= -\cos t\mathbf{i} - \sin t\mathbf{j}$ Second derivative

c. $\mathbf{r}'(t) \cdot \mathbf{r}''(t) = \sin t \cos t - \sin t \cos t = 0$ Dot product

d. $\mathbf{r}'(t) \times \mathbf{r}''(t) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -\sin t & \cos t & 2 \\ -\cos t & -\sin t & 0 \end{vmatrix}$ Cross product

$$= \begin{vmatrix} \cos t & 2 \\ -\sin t & 0 \end{vmatrix}\mathbf{i} - \begin{vmatrix} -\sin t & 2 \\ -\cos t & 0 \end{vmatrix}\mathbf{j} + \begin{vmatrix} -\sin t & \cos t \\ -\cos t & -\sin t \end{vmatrix}\mathbf{k}$$

$$= 2\sin t\mathbf{i} - 2\cos t\mathbf{j} + \mathbf{k}$$ ■

REMARK In Example 2(c), the dot product of $\mathbf{r}'$ and $\mathbf{r}''$ is 0. What does this result tell you about the angle between $\mathbf{r}'$ and $\mathbf{r}''$ for any value of t?

In Example 2(c), note that the dot product is a real-valued function, not a vector-valued function.

The parametrization of the curve represented by the vector-valued function

$$\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j} + h(t)\mathbf{k}$$

is **smooth on an open interval I** when f', g', and h' are continuous on I and $\mathbf{r}'(t) \neq \mathbf{0}$ for any value of t in the interval I.

The epicycloid is not smooth at the points where it intersects the axes.
Figure 12.10

EXAMPLE 3 Finding Intervals on Which a Curve Is Smooth

Consider the epicycloid C given by $\mathbf{r}(t) = (5 \cos t - \cos 5t)\mathbf{i} + (5 \sin t - \sin 5t)\mathbf{j}$, where $0 \le t \le 2\pi$. Find the intervals on which the epicycloid is smooth.

Solution The derivative of $\mathbf{r}$ is

$$\mathbf{r}'(t) = (-5 \sin t + 5 \sin 5t)\mathbf{i} + (5 \cos t - 5 \cos 5t)\mathbf{j}.$$

In the interval $[0, 2\pi]$, the only values of t for which $\mathbf{r}'(t) = 0\mathbf{i} + 0\mathbf{j}$ are $t = 0, \pi/2, \pi, 3\pi/2$, and 2π. So, C is smooth on the intervals

$$\left(0, \frac{\pi}{2}\right), \quad \left(\frac{\pi}{2}, \pi\right), \quad \left(\pi, \frac{3\pi}{2}\right), \quad \text{and} \quad \left(\frac{3\pi}{2}, 2\pi\right).$$

See Figure 12.10. ■

In Figure 12.10, note that the curve is not smooth at points at which the curve makes abrupt changes in direction. Such points are called cusps or **nodes.**

Most of the differentiation rules in Chapter 2 have counterparts for vector-valued functions, and several of these are listed in the next theorem. Note that the theorem contains three versions of "product rules." Property 3 gives the derivative of the product of a real-valued function w and a vector-valued function $\mathbf{r}$, Property 4 gives the derivative of the dot product of two vector-valued functions, and Property 5 gives the derivative of the cross product of two vector-valued functions (in space).

REMARK Note that Property 5 applies only to three-dimensional vector-valued functions because the cross product is not defined for two-dimensional vectors.

THEOREM 12.2 Properties of the Derivative

Let $\mathbf{r}$ and $\mathbf{u}$ be differentiable vector-valued functions of t, let w be a differentiable real-valued function of t, and let c be a scalar.

1. $\dfrac{d}{dt}[c\mathbf{r}(t)] = c\mathbf{r}'(t)$
2. $\dfrac{d}{dt}[\mathbf{r}(t) \pm \mathbf{u}(t)] = \mathbf{r}'(t) \pm \mathbf{u}'(t)$
3. $\dfrac{d}{dt}[w(t)\mathbf{r}(t)] = w(t)\mathbf{r}'(t) + w'(t)\mathbf{r}(t)$
4. $\dfrac{d}{dt}[\mathbf{r}(t) \cdot \mathbf{u}(t)] = \mathbf{r}(t) \cdot \mathbf{u}'(t) + \mathbf{r}'(t) \cdot \mathbf{u}(t)$
5. $\dfrac{d}{dt}[\mathbf{r}(t) \times \mathbf{u}(t)] = \mathbf{r}(t) \times \mathbf{u}'(t) + \mathbf{r}'(t) \times \mathbf{u}(t)$
6. $\dfrac{d}{dt}[\mathbf{r}(w(t))] = \mathbf{r}'(w(t))w'(t)$
7. If $\mathbf{r}(t) \cdot \mathbf{r}(t) = c$, then $\mathbf{r}(t) \cdot \mathbf{r}'(t) = 0$.

Proof To prove Property 4, let $\mathbf{r}(t) = f_1(t)\mathbf{i} + g_1(t)\mathbf{j}$ and $\mathbf{u}(t) = f_2(t)\mathbf{i} + g_2(t)\mathbf{j}$, where f_1, f_2, g_1, and g_2 are differentiable functions of t. Then

$$\mathbf{r}(t) \cdot \mathbf{u}(t) = f_1(t)f_2(t) + g_1(t)g_2(t)$$

and it follows that

$$\begin{aligned}\frac{d}{dt}[\mathbf{r}(t) \cdot \mathbf{u}(t)] &= f_1(t)f_2'(t) + f_1'(t)f_2(t) + g_1(t)g_2'(t) + g_1'(t)g_2(t) \\ &= [f_1(t)f_2'(t) + g_1(t)g_2'(t)] + [f_1'(t)f_2(t) + g_1'(t)g_2(t)] \\ &= \mathbf{r}(t) \cdot \mathbf{u}'(t) + \mathbf{r}'(t) \cdot \mathbf{u}(t).\end{aligned}$$

Proofs of the other properties are left as exercises (see Exercises 61–66). ■

Exploration

Let $\mathbf{r}(t) = \cos t\mathbf{i} + \sin t\mathbf{j}$. Sketch the graph of $\mathbf{r}(t)$. Explain why the graph is a circle of radius 1 centered at the origin. Calculate $\mathbf{r}(\pi/4)$ and $\mathbf{r}'(\pi/4)$. Position the vector $\mathbf{r}'(\pi/4)$ so that its initial point is at the terminal point of $\mathbf{r}(\pi/4)$. What do you observe? Show that $\mathbf{r}(t) \cdot \mathbf{r}(t)$ is constant and that $\mathbf{r}(t) \cdot \mathbf{r}'(t) = 0$ for all t. How does this example relate to Property 7 of Theorem 12.2?

EXAMPLE 4 Using Properties of the Derivative

For the vector-valued functions

$$\mathbf{r}(t) = \frac{1}{t}\mathbf{i} - \mathbf{j} + \ln t\mathbf{k} \quad \text{and} \quad \mathbf{u}(t) = t^2\mathbf{i} - 2t\mathbf{j} + \mathbf{k}$$

find each derivative.

a. $\dfrac{d}{dt}[\mathbf{r}(t) \cdot \mathbf{u}(t)]$ **b.** $\dfrac{d}{dt}[\mathbf{u}(t) \times \mathbf{u}'(t)]$

Solution

a. Note that the derivatives of $\mathbf{r}$ and $\mathbf{u}$ are

$$\mathbf{r}'(t) = -\frac{1}{t^2}\mathbf{i} + \frac{1}{t}\mathbf{k} \quad \text{and} \quad \mathbf{u}'(t) = 2t\mathbf{i} - 2\mathbf{j}.$$

Using Property 4 of Theorem 12.2, you have

$$\begin{aligned}
&\frac{d}{dt}[\mathbf{r}(t) \cdot \mathbf{u}(t)] \\
&\quad = \mathbf{r}(t) \cdot \mathbf{u}'(t) + \mathbf{r}'(t) \cdot \mathbf{u}(t) \\
&\quad = \left(\frac{1}{t}\mathbf{i} - \mathbf{j} + \ln t\mathbf{k}\right) \cdot (2t\mathbf{i} - 2\mathbf{j}) + \left(-\frac{1}{t^2}\mathbf{i} + \frac{1}{t}\mathbf{k}\right) \cdot (t^2\mathbf{i} - 2t\mathbf{j} + \mathbf{k}) \\
&\quad = 2 + 2 + (-1) + \frac{1}{t} \\
&\quad = 3 + \frac{1}{t}.
\end{aligned}$$

b. Note that the first and second derivatives of $\mathbf{u}$ are

$$\mathbf{u}'(t) = 2t\mathbf{i} - 2\mathbf{j} \quad \text{and} \quad \mathbf{u}''(t) = 2\mathbf{i}.$$

Using Property 5 of Theorem 12.2, you have

$$\begin{aligned}
\frac{d}{dt}[\mathbf{u}(t) \times \mathbf{u}'(t)] &= [\mathbf{u}(t) \times \mathbf{u}''(t)] + [\mathbf{u}'(t) \times \mathbf{u}'(t)] \\
&= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ t^2 & -2t & 1 \\ 2 & 0 & 0 \end{vmatrix} + \mathbf{0} \\
&= \begin{vmatrix} -2t & 1 \\ 0 & 0 \end{vmatrix}\mathbf{i} - \begin{vmatrix} t^2 & 1 \\ 2 & 0 \end{vmatrix}\mathbf{j} + \begin{vmatrix} t^2 & -2t \\ 2 & 0 \end{vmatrix}\mathbf{k} \\
&= 0\mathbf{i} - (-2)\mathbf{j} + 4t\mathbf{k} \\
&= 2\mathbf{j} + 4t\mathbf{k}.
\end{aligned}$$

Try reworking parts (a) and (b) in Example 4 by first forming the dot and cross products and then differentiating to show that you obtain the same results.

Integration of Vector-Valued Functions

The next definition is a consequence of the definition of the derivative of a vector-valued function.

Definition of Integration of Vector-Valued Functions

1. If $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j}$, where f and g are continuous on $[a, b]$, then the **indefinite integral (antiderivative)** of $\mathbf{r}$ is

$$\int \mathbf{r}(t)\,dt = \left[\int f(t)\,dt\right]\mathbf{i} + \left[\int g(t)\,dt\right]\mathbf{j}$$ Plane

and its **definite integral** over the interval $a \le t \le b$ is

$$\int_a^b \mathbf{r}(t)\,dt = \left[\int_a^b f(t)\,dt\right]\mathbf{i} + \left[\int_a^b g(t)\,dt\right]\mathbf{j}.$$

2. If $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j} + h(t)\mathbf{k}$, where f, g, and h are continuous on $[a, b]$, then the **indefinite integral (antiderivative)** of $\mathbf{r}$ is

$$\int \mathbf{r}(t)\,dt = \left[\int f(t)\,dt\right]\mathbf{i} + \left[\int g(t)\,dt\right]\mathbf{j} + \left[\int h(t)\,dt\right]\mathbf{k}$$ Space

and its **definite integral** over the interval $a \le t \le b$ is

$$\int_a^b \mathbf{r}(t)\,dt = \left[\int_a^b f(t)\,dt\right]\mathbf{i} + \left[\int_a^b g(t)\,dt\right]\mathbf{j} + \left[\int_a^b h(t)\,dt\right]\mathbf{k}.$$

The antiderivative of a vector-valued function is a family of vector-valued functions all differing by a constant vector $\mathbf{C}$. For instance, if $\mathbf{r}(t)$ is a three-dimensional vector-valued function, then for the indefinite integral $\int \mathbf{r}(t)\,dt$, you obtain three constants of integration

$$\int f(t)\,dt = F(t) + C_1, \quad \int g(t)\,dt = G(t) + C_2, \quad \int h(t)\,dt = H(t) + C_3$$

where $F'(t) = f(t)$, $G'(t) = g(t)$, and $H'(t) = h(t)$. These three *scalar* constants produce one *vector* constant of integration

$$\begin{aligned}\int \mathbf{r}(t)\,dt &= [F(t) + C_1]\mathbf{i} + [G(t) + C_2]\mathbf{j} + [H(t) + C_3]\mathbf{k} \\ &= [F(t)\mathbf{i} + G(t)\mathbf{j} + H(t)\mathbf{k}] + [C_1\mathbf{i} + C_2\mathbf{j} + C_3\mathbf{k}] \\ &= \mathbf{R}(t) + \mathbf{C}\end{aligned}$$

where $\mathbf{R}'(t) = \mathbf{r}(t)$.

EXAMPLE 5 Integrating a Vector-Valued Function

Find the indefinite integral

$$\int (t\mathbf{i} + 3\mathbf{j})\,dt.$$

Solution Integrating on a component-by-component basis produces

$$\int (t\mathbf{i} + 3\mathbf{j})\,dt = \frac{t^2}{2}\mathbf{i} + 3t\mathbf{j} + \mathbf{C}.$$

Example 6 shows how to evaluate the definite integral of a vector-valued function.

EXAMPLE 6 Definite Integral of a Vector-Valued Function

Evaluate the integral

$$\int_0^1 \mathbf{r}(t)\,dt = \int_0^1 \left(\sqrt[3]{t}\,\mathbf{i} + \frac{1}{t+1}\mathbf{j} + e^{-t}\mathbf{k}\right) dt.$$

Solution

$$\begin{aligned}\int_0^1 \mathbf{r}(t)\,dt &= \left(\int_0^1 t^{1/3}\,dt\right)\mathbf{i} + \left(\int_0^1 \frac{1}{t+1}\,dt\right)\mathbf{j} + \left(\int_0^1 e^{-t}\,dt\right)\mathbf{k} \\ &= \left[\left(\frac{3}{4}\right)t^{4/3}\right]_0^1\mathbf{i} + \left[\ln|t+1|\right]_0^1\mathbf{j} + \left[-e^{-t}\right]_0^1\mathbf{k} \\ &= \frac{3}{4}\mathbf{i} + (\ln 2)\mathbf{j} + \left(1 - \frac{1}{e}\right)\mathbf{k}\end{aligned}$$

As with real-valued functions, you can narrow the family of antiderivatives of a vector-valued function $\mathbf{r}'$ down to a single antiderivative by imposing an initial condition on the vector-valued function $\mathbf{r}$. This is demonstrated in the next example.

EXAMPLE 7 The Antiderivative of a Vector-Valued Function

Find the antiderivative of

$$\mathbf{r}'(t) = \cos 2t\,\mathbf{i} - 2\sin t\,\mathbf{j} + \frac{1}{1+t^2}\mathbf{k}$$

that satisfies the initial condition

$$\mathbf{r}(0) = 3\mathbf{i} - 2\mathbf{j} + \mathbf{k}.$$

Solution

$$\begin{aligned}\mathbf{r}(t) &= \int \mathbf{r}'(t)\,dt \\ &= \left(\int \cos 2t\,dt\right)\mathbf{i} + \left(\int -2\sin t\,dt\right)\mathbf{j} + \left(\int \frac{1}{1+t^2}\,dt\right)\mathbf{k} \\ &= \left(\frac{1}{2}\sin 2t + C_1\right)\mathbf{i} + (2\cos t + C_2)\mathbf{j} + (\arctan t + C_3)\mathbf{k}\end{aligned}$$

Letting $t = 0$, you can write

$$\mathbf{r}(0) = (0 + C_1)\mathbf{i} + (2 + C_2)\mathbf{j} + (0 + C_3)\mathbf{k}.$$

Using the fact that $\mathbf{r}(0) = 3\mathbf{i} - 2\mathbf{j} + \mathbf{k}$, you have

$$(0 + C_1)\mathbf{i} + (2 + C_2)\mathbf{j} + (0 + C_3)\mathbf{k} = 3\mathbf{i} - 2\mathbf{j} + \mathbf{k}.$$

Equating corresponding components produces

$$C_1 = 3, \quad 2 + C_2 = -2, \quad \text{and} \quad C_3 = 1.$$

So, the antiderivative that satisfies the initial condition is

$$\mathbf{r}(t) = \left(\frac{1}{2}\sin 2t + 3\right)\mathbf{i} + (2\cos t - 4)\mathbf{j} + (\arctan t + 1)\mathbf{k}.$$

12.2 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Describe the relationship between the graph of $\mathbf{r}'(t_0)$ and the curve represented by $\mathbf{r}(t)$.
2. Explain why the family of vector-valued functions that are the antiderivatives of a vector-valued function differ by a constant vector.

Differentiation of Vector-Valued Functions

In Exercises 3–10, find $\mathbf{r}'(t)$, $\mathbf{r}(t_0)$, and $\mathbf{r}'(t_0)$ for the given value of t_0. Then sketch the curve represented by the vector-valued function and sketch the vectors $\mathbf{r}(t_0)$ and $\mathbf{r}'(t_0)$.

3. $\mathbf{r}(t) = (1 - t^2)\mathbf{i} + t\mathbf{j}, \quad t_0 = 3$
4. $\mathbf{r}(t) = (1 + t)\mathbf{i} + t^3\mathbf{j}, \quad t_0 = 1$
5. $\mathbf{r}(t) = \cos t\,\mathbf{i} + \sin t\,\mathbf{j}, \quad t_0 = \dfrac{\pi}{2}$
6. $\mathbf{r}(t) = 3 \sin t\,\mathbf{i} + 4 \cos t\,\mathbf{j}, \quad t_0 = \dfrac{\pi}{2}$
7. $\mathbf{r}(t) = \langle e^t, e^{2t} \rangle, \quad t_0 = 0$
8. $\mathbf{r}(t) = \langle e^{-t}, e^t \rangle, \quad t_0 = 0$
9. $\mathbf{r}(t) = 2 \cos t\,\mathbf{i} + 2 \sin t\,\mathbf{j} + t\mathbf{k}, \quad t_0 = \dfrac{3\pi}{2}$
10. $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + \frac{3}{2}\mathbf{k}, \quad t_0 = 2$

Finding a Derivative

In Exercises 11–18, find $\mathbf{r}'(t)$.

11. $\mathbf{r}(t) = t^4\mathbf{i} - 5t\mathbf{j}$
12. $\mathbf{r}(t) = \sqrt{t}\,\mathbf{i} + (1 - t^3)\mathbf{j}$
13. $\mathbf{r}(t) = 3 \cos^3 t\,\mathbf{i} + 2 \sin^3 t\,\mathbf{j} + \mathbf{k}$
14. $\mathbf{r}(t) = 4\sqrt{t}\,\mathbf{i} + t^2\sqrt{t}\,\mathbf{j} + \ln t^2\mathbf{k}$
15. $\mathbf{r}(t) = e^{-t}\mathbf{i} + 4\mathbf{j} + 5te^t\mathbf{k}$
16. $\mathbf{r}(t) = \langle t^3, \cos 3t, \sin 3t \rangle$
17. $\mathbf{r}(t) = \langle t \sin t, t \cos t, t \rangle$
18. $\mathbf{r}(t) = \langle \arcsin t, \arccos t, 0 \rangle$

Higher-Order Differentiation

In Exercises 19–22, find (a) $\mathbf{r}'(t)$, (b) $\mathbf{r}''(t)$, and (c) $\mathbf{r}'(t) \cdot \mathbf{r}''(t)$.

19. $\mathbf{r}(t) = t^3\mathbf{i} + \frac{1}{2}t^2\mathbf{j}$
20. $\mathbf{r}(t) = (t^2 + t)\mathbf{i} + (t^2 - t)\mathbf{j}$
21. $\mathbf{r}(t) = 4 \cos t\,\mathbf{i} + 4 \sin t\,\mathbf{j}$
22. $\mathbf{r}(t) = 8 \cos t\,\mathbf{i} + 3 \sin t\,\mathbf{j}$

Higher-Order Differentiation

In Exercises 23–26, find (a) $\mathbf{r}'(t)$, (b) $\mathbf{r}''(t)$, (c) $\mathbf{r}'(t) \cdot \mathbf{r}''(t)$, and (d) $\mathbf{r}'(t) \times \mathbf{r}''(t)$.

23. $\mathbf{r}(t) = \frac{1}{2}t^2\mathbf{i} - t\mathbf{j} + \frac{1}{6}t^3\mathbf{k}$
24. $\mathbf{r}(t) = t^3\mathbf{i} + (2t^2 + 3)\mathbf{j} + (3t - 5)\mathbf{k}$
25. $\mathbf{r}(t) = \langle \cos t + t \sin t, \sin t - t \cos t, t \rangle$
26. $\mathbf{r}(t) = \langle e^{-t}, t^2, \tan t \rangle$

Finding Intervals on Which a Curve Is Smooth

In Exercises 27–34, find all the open intervals on which the curve given by the vector-valued function is smooth.

27. $\mathbf{r}(t) = t^2\mathbf{i} + t^3\mathbf{j}$
28. $\mathbf{r}(t) = 5t^5\mathbf{i} - t^4\mathbf{j}$
29. $\mathbf{r}(\theta) = 2 \cos^3 \theta\,\mathbf{i} + 3 \sin^3 \theta\,\mathbf{j}, \quad 0 \le \theta \le 2\pi$
30. $\mathbf{r}(\theta) = (\theta + \sin \theta)\mathbf{i} + (1 - \cos \theta)\mathbf{j}, \quad 0 \le \theta \le 2\pi$
31. $\mathbf{r}(t) = \dfrac{2t}{8 + t^3}\mathbf{i} + \dfrac{2t^2}{8 + t^3}\mathbf{j}$
32. $\mathbf{r}(t) = e^t\mathbf{i} - e^{-t}\mathbf{j} + 3t\mathbf{k}$
33. $\mathbf{r}(t) = t\mathbf{i} - 3t\mathbf{j} + \tan t\,\mathbf{k}$
34. $\mathbf{r}(t) = \sqrt{t}\,\mathbf{i} + (t^2 - 1)\mathbf{j} + \frac{1}{4}t\mathbf{k}$

Using Properties of the Derivative

In Exercises 35 and 36, use the properties of the derivative to find the following.

(a) $\mathbf{r}'(t)$ (b) $\dfrac{d}{dt}[3\mathbf{r}(t) - \mathbf{u}(t)]$ (c) $\dfrac{d}{dt}[(5t)\mathbf{u}(t)]$

(d) $\dfrac{d}{dt}[\mathbf{r}(t) \cdot \mathbf{u}(t)]$ (e) $\dfrac{d}{dt}[\mathbf{r}(t) \times \mathbf{u}(t)]$ (f) $\dfrac{d}{dt}[\mathbf{r}(2t)]$

35. $\mathbf{r}(t) = t\mathbf{i} + 3t\mathbf{j} + t^2\mathbf{k}, \quad \mathbf{u}(t) = 4t\mathbf{i} + t^2\mathbf{j} + t^3\mathbf{k}$
36. $\mathbf{r}(t) = \langle t, 2 \sin t, 2 \cos t \rangle, \quad \mathbf{u}(t) = \left\langle \dfrac{1}{t}, 2 \sin t, 2 \cos t \right\rangle$

Using Two Methods

In Exercises 37 and 38, find (a) $\dfrac{d}{dt}[\mathbf{r}(t) \cdot \mathbf{u}(t)]$ and (b) $\dfrac{d}{dt}[\mathbf{r}(t) \times \mathbf{u}(t)]$ in two different ways.

(i) Find the product first, then differentiate.
(ii) Apply the properties of Theorem 12.2.

37. $\mathbf{r}(t) = t\mathbf{i} + 2t^2\mathbf{j} + t^3\mathbf{k}, \quad \mathbf{u}(t) = t^4\mathbf{k}$
38. $\mathbf{r}(t) = \cos t\,\mathbf{i} + \sin t\,\mathbf{j} + t\mathbf{k}, \quad \mathbf{u}(t) = \mathbf{j} + t\mathbf{k}$

Finding an Indefinite Integral

In Exercises 39–46, find the indefinite integral.

39. $\displaystyle\int (2t\mathbf{i} + \mathbf{j} + 9\mathbf{k})\,dt$
40. $\displaystyle\int (4t^3\mathbf{i} + 6t\mathbf{j} - 4\sqrt{t}\,\mathbf{k})\,dt$
41. $\displaystyle\int \left(\frac{1}{t}\mathbf{i} + \mathbf{j} - t^{3/2}\mathbf{k}\right)dt$
42. $\displaystyle\int \left(\ln t\,\mathbf{i} + \frac{1}{t}\mathbf{j} + \mathbf{k}\right)dt$
43. $\displaystyle\int (\mathbf{i} + 4t^3\mathbf{j} + 5^t\mathbf{k})\,dt$
44. $\displaystyle\int \left(\sec^2 t\,\mathbf{i} + \frac{1}{1 + t^2}\mathbf{j}\right)dt$
45. $\displaystyle\int (e^t\mathbf{i} + \mathbf{j} + t \cos t\,\mathbf{k})\,dt$
46. $\displaystyle\int (e^{-t} \sin t\,\mathbf{i} + \cot t\,\mathbf{j})\,dt$

Evaluating a Definite Integral **In Exercises 47–52, evaluate the definite integral.**

47. $\int_0^1 (8t\mathbf{i} + t\mathbf{j} - \mathbf{k})\,dt$

48. $\int_{-1}^1 \left(t\mathbf{i} + t^3\mathbf{j} + \sqrt[3]{t}\,\mathbf{k}\right)dt$

49. $\int_0^{\pi/2} [(5\cos t)\mathbf{i} + (6\sin t)\mathbf{j} + \mathbf{k}]\,dt$

50. $\int_0^{\pi/4} [(\sec t \tan t)\mathbf{i} + (\tan t)\mathbf{j} + (2\sin t\cos t)\mathbf{k}]\,dt$

51. $\int_0^2 (t\mathbf{i} + e^t\mathbf{j} - te^t\mathbf{k})\,dt$

52. $\int_0^3 \|t\mathbf{i} + t^2\mathbf{j}\|\,dt$

Finding an Antiderivative **In Exercises 53–58, find $\mathbf{r}(t)$ that satisfies the initial conditions.**

53. $\mathbf{r}'(t) = 4e^{2t}\mathbf{i} + 3e^t\mathbf{j}, \quad \mathbf{r}(0) = 2\mathbf{i}$

54. $\mathbf{r}'(t) = 3t^2\mathbf{j} + 6\sqrt{t}\,\mathbf{k}, \quad \mathbf{r}(0) = \mathbf{i} + 2\mathbf{j}$

55. $\mathbf{r}''(t) = -32\mathbf{j}, \quad \mathbf{r}'(0) = 600\sqrt{3}\,\mathbf{i} + 600\mathbf{j}, \quad \mathbf{r}(0) = \mathbf{0}$

56. $\mathbf{r}''(t) = -4\cos t\,\mathbf{j} - 3\sin t\,\mathbf{k}, \quad \mathbf{r}'(0) = 3\mathbf{k}, \quad \mathbf{r}(0) = 4\mathbf{j}$

57. $\mathbf{r}'(t) = te^{-t^2}\mathbf{i} - e^{-t}\mathbf{j} + \mathbf{k}, \quad \mathbf{r}(0) = \frac{1}{2}\mathbf{i} - \mathbf{j} + \mathbf{k}$

58. $\mathbf{r}'(t) = \dfrac{1}{1+t^2}\mathbf{i} + \dfrac{1}{t^2}\mathbf{j} + \dfrac{1}{t}\mathbf{k}, \quad \mathbf{r}(1) = 2\mathbf{i}$

Exploring Concepts

59. The three components of the derivative of the vector-valued function $\mathbf{u}$ are positive at $t = t_0$. Describe the behavior of $\mathbf{u}$ at $t = t_0$.

60. Find two vector-valued functions $\mathbf{f}(t)$ and $\mathbf{g}(t)$ such that

$$\int_a^b [\mathbf{f}(t) \cdot \mathbf{g}(t)]\,dt \neq \left[\int_a^b \mathbf{f}(t)\,dt\right] \cdot \left[\int_a^b \mathbf{g}(t)\,dt\right].$$

Proof **In Exercises 61–68, prove the property. In each case, assume r, u, and v are differentiable vector-valued functions of t in space, w is a differentiable real-valued function of t, and c is a scalar.**

61. $\dfrac{d}{dt}[c\mathbf{r}(t)] = c\mathbf{r}'(t)$

62. $\dfrac{d}{dt}[\mathbf{r}(t) \pm \mathbf{u}(t)] = \mathbf{r}'(t) \pm \mathbf{u}'(t)$

63. $\dfrac{d}{dt}[w(t)\mathbf{r}(t)] = w(t)\mathbf{r}'(t) + w'(t)\mathbf{r}(t)$

64. $\dfrac{d}{dt}[\mathbf{r}(t) \times \mathbf{u}(t)] = \mathbf{r}(t) \times \mathbf{u}'(t) + \mathbf{r}'(t) \times \mathbf{u}(t)$

65. $\dfrac{d}{dt}[\mathbf{r}(w(t))] = \mathbf{r}'(w(t))w'(t)$

66. If $\mathbf{r}(t) \cdot \mathbf{r}(t)$ is a constant, then $\mathbf{r}(t) \cdot \mathbf{r}'(t) = 0$.

67. $\dfrac{d}{dt}\{\mathbf{r}(t) \cdot [\mathbf{u}(t) \times \mathbf{v}(t)]\} = \mathbf{r}'(t) \cdot [\mathbf{u}(t) \times \mathbf{v}(t)] + \mathbf{r}(t) \cdot [\mathbf{u}'(t) \times \mathbf{v}(t)] + \mathbf{r}(t) \cdot [\mathbf{u}(t) \times \mathbf{v}'(t)]$

68. $\dfrac{d}{dt}[\mathbf{r}(t) \times \mathbf{r}'(t)] = \mathbf{r}(t) \times \mathbf{r}''(t)$

69. **Particle Motion** A particle moves in the xy-plane along the curve represented by the vector-valued function $\mathbf{r}(t) = (t - \sin t)\mathbf{i} + (1 - \cos t)\mathbf{j}$.

(a) Use a graphing utility to graph $\mathbf{r}$. Describe the curve.

(b) Find the minimum and maximum values of $\|\mathbf{r}'\|$ and $\|\mathbf{r}''\|$.

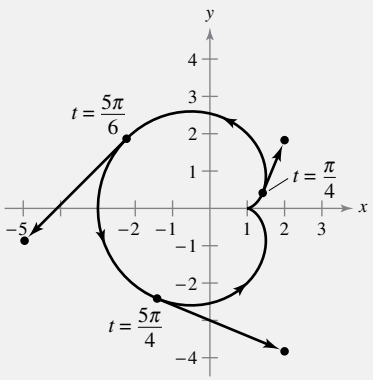
70. **Particle Motion** A particle moves in the yz-plane along the curve represented by the vector-valued function $\mathbf{r}(t) = (2\cos t)\mathbf{j} + (3\sin t)\mathbf{k}$.

(a) Describe the curve.

(b) Find the minimum and maximum values of $\|\mathbf{r}'\|$ and $\|\mathbf{r}''\|$.

71. **Perpendicular Vectors** Consider the vector-valued function $\mathbf{r}(t) = (e^t \sin t)\mathbf{i} + (e^t \cos t)\mathbf{j}$. Show that $\mathbf{r}(t)$ and $\mathbf{r}''(t)$ are always perpendicular to each other.

72. **HOW DO YOU SEE IT?** The graph shows a vector-valued function $\mathbf{r}(t)$ for $0 \le t \le 2\pi$ and its derivative $\mathbf{r}'(t)$ for several values of t.



(a) For each derivative shown in the graph, determine whether each component is positive or negative.

(b) Is the curve smooth on the interval $(0, 2\pi)$? Explain.

True or False? **In Exercises 73–76, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

73. If a particle moves along a sphere centered at the origin, then its derivative vector is always tangent to the sphere.

74. The definite integral of a vector-valued function is a real number.

75. $\dfrac{d}{dt}[\|\mathbf{r}(t)\|] = \|\mathbf{r}'(t)\|$

76. If $\mathbf{r}$ and $\mathbf{u}$ are differentiable vector-valued functions of t, then

$$\frac{d}{dt}[\mathbf{r}(t) \cdot \mathbf{u}(t)] = \mathbf{r}'(t) \cdot \mathbf{u}'(t).$$

12.3 Velocity and Acceleration

GO DIGITAL

- **Describe the velocity and acceleration associated with a vector-valued function.**
- **Use a vector-valued function to analyze projectile motion.**

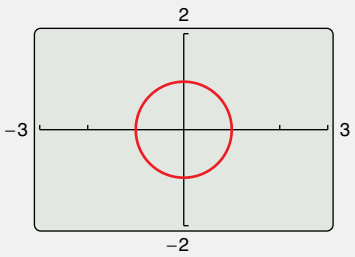
Exploration

Exploring Velocity

Consider the circle given by

$\mathbf{r}(t) = (\cos \omega t)\mathbf{i} + (\sin \omega t)\mathbf{j}$.

(The symbol ω is the Greek letter omega.) Use a graphing utility in *parametric* mode to graph this circle for several values of ω. How does ω affect the velocity of the terminal point as it traces out the curve? For a given value of ω, does the speed appear constant? Does the acceleration appear constant? Explain your reasoning.



Velocity and Acceleration

You are now ready to combine your study of parametric equations, curves, vectors, and vector-valued functions to form a model for motion along a curve. You will begin by looking at the motion of an object in the plane. (The motion of an object in space can be developed similarly.)

As an object moves along a curve in the plane, the coordinates x and y of its center of mass are each functions of time t. Rather than using the letters f and g to represent these two functions, it is convenient to write $x = x(t)$ and $y = y(t)$. So, the position vector $\mathbf{r}(t)$ takes the form

$$\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}. \qquad \text{Position vector}$$

The beauty of this vector model for representing motion is that you can use the first and second derivatives of the vector-valued function $\mathbf{r}$ to find the object's velocity and acceleration. (Recall from Chapter 11 that velocity and acceleration are both vector quantities having magnitude and direction.) To find the velocity and acceleration vectors at a given time t, consider a point $Q(x(t + \Delta t), y(t + \Delta t))$ that is approaching the point $P(x(t), y(t))$ along the curve C given by $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}$, as shown in Figure 12.11. As $\Delta t \to 0$, the direction of the vector $\overrightarrow{PQ}$ (denoted by $\Delta\mathbf{r}$) approaches the *direction of motion* at time t.

$$\Delta\mathbf{r} = \mathbf{r}(t + \Delta t) - \mathbf{r}(t)$$

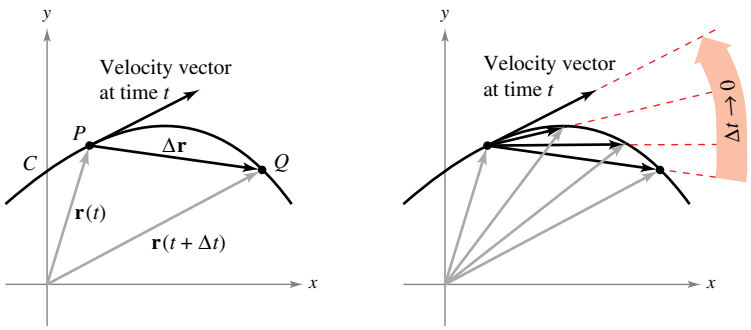
$$\frac{\Delta\mathbf{r}}{\Delta t} = \frac{\mathbf{r}(t + \Delta t) - \mathbf{r}(t)}{\Delta t}$$

$$\lim_{\Delta t \to 0} \frac{\Delta\mathbf{r}}{\Delta t} = \lim_{\Delta t \to 0} \frac{\mathbf{r}(t + \Delta t) - \mathbf{r}(t)}{\Delta t}$$

When this limit exists, it is defined as the **velocity vector** or **tangent vector** to the curve at point P. Note that this is the same limit used to define $\mathbf{r}'(t)$. So, the direction of $\mathbf{r}'(t)$ gives the direction of motion at time t. Moreover, the magnitude of the vector $\mathbf{r}'(t)$

$$\|\mathbf{r}'(t)\| = \|x'(t)\mathbf{i} + y'(t)\mathbf{j}\| = \sqrt{[x'(t)]^2 + [y'(t)]^2}$$

gives the **speed** of the object at time t.



As $\Delta t \to 0$, $\dfrac{\Delta\mathbf{r}}{\Delta t}$ approaches the velocity vector.

Figure 12.11

Similar to how $\mathbf{r}'(t)$ is used to find velocity, you can use $\mathbf{r}''(t)$ to find acceleration, as indicated in the definitions at the top of the next page.

Definitions of Velocity and Acceleration

If x and y are twice-differentiable functions of t, and $\mathbf{r}$ is a vector-valued function given by $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}$, then the velocity vector, acceleration vector, and speed at time t are as follows.

$$\begin{aligned}\textbf{Velocity} &= \mathbf{v}(t) = \mathbf{r}'(t) = x'(t)\mathbf{i} + y'(t)\mathbf{j}\\ \textbf{Acceleration} &= \mathbf{a}(t) = \mathbf{r}''(t) = x''(t)\mathbf{i} + y''(t)\mathbf{j}\\ \textbf{Speed} &= \|\mathbf{v}(t)\| = \|\mathbf{r}'(t)\| = \sqrt{[x'(t)]^2 + [y'(t)]^2}\end{aligned}$$

For motion along a space curve, the definitions are similar. That is, for

$$\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$$

you have the following.

$$\begin{aligned}\textbf{Velocity} &= \mathbf{v}(t) = \mathbf{r}'(t) = x'(t)\mathbf{i} + y'(t)\mathbf{j} + z'(t)\mathbf{k}\\ \textbf{Acceleration} &= \mathbf{a}(t) = \mathbf{r}''(t) = x''(t)\mathbf{i} + y''(t)\mathbf{j} + z''(t)\mathbf{k}\\ \textbf{Speed} &= \|\mathbf{v}(t)\| = \|\mathbf{r}'(t)\| = \sqrt{[x'(t)]^2 + [y'(t)]^2 + [z'(t)]^2}\end{aligned}$$

EXAMPLE 1 Velocity and Acceleration Along a Plane Curve

Find the (a) velocity vector, (b) speed, and (c) acceleration vector for the particle that moves along the plane curve C described by

$$\mathbf{r}(t) = 2\sin\frac{t}{2}\mathbf{i} + 2\cos\frac{t}{2}\mathbf{j}.$$ Position vector

Solution

a. $\mathbf{v}(t) = \mathbf{r}'(t) = \cos\frac{t}{2}\mathbf{i} - \sin\frac{t}{2}\mathbf{j}$ Velocity vector

b. $\|\mathbf{r}'(t)\| = \sqrt{\cos^2\frac{t}{2} + \sin^2\frac{t}{2}} = 1$ Speed (at any time)

c. $\mathbf{a}(t) = \mathbf{r}''(t) = -\frac{1}{2}\sin\frac{t}{2}\mathbf{i} - \frac{1}{2}\cos\frac{t}{2}\mathbf{j}$ Acceleration vector ■

REMARK In Example 1, note that the velocity and acceleration vectors are orthogonal at any point in time (see Figure 12.12). This is characteristic of motion at a constant speed. (See Exercise 61.)

The parametric equations for the curve in Example 1 are

$$x = 2\sin\frac{t}{2} \quad \text{and} \quad y = 2\cos\frac{t}{2}.$$

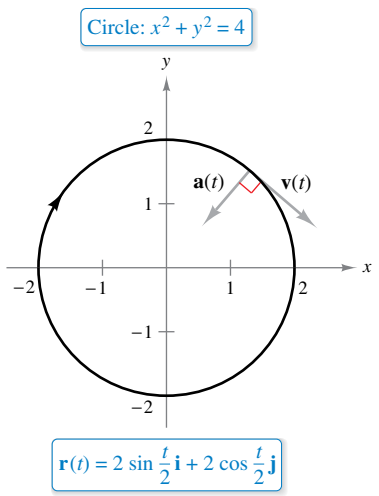
By eliminating the parameter t, you obtain the rectangular equation

$$x^2 + y^2 = 4.$$ Rectangular equation

So, the curve is a circle of radius 2 centered at the origin, as shown in Figure 12.12. Because the velocity vector

$$\mathbf{v}(t) = \cos\frac{t}{2}\mathbf{i} - \sin\frac{t}{2}\mathbf{j}$$

has a constant magnitude but a changing direction as t increases, the particle moves around the circle at a constant speed.



The particle moves around the circle at a constant speed.

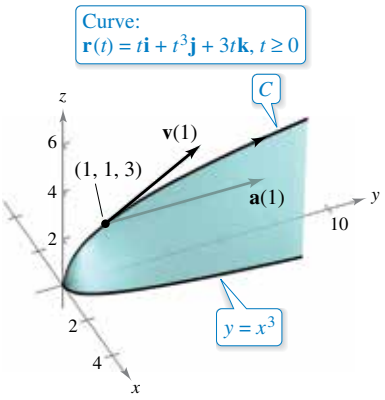

Figure 12.15

EXAMPLE 2 Velocity and Acceleration Vectors in the Plane

Sketch the path of an object moving along the plane curve given by

$$\mathbf{r}(t) = (t^2 - 4)\mathbf{i} + t\mathbf{j}$$ Position vector

and find the velocity and acceleration vectors when $t = 0$ and $t = 2$.

Solution Using the parametric equations $x = t^2 - 4$ and $y = t$, you can determine that the curve is a parabola given by

$$x = y^2 - 4$$ Rectangular equation

as shown in Figure 12.13. The velocity vector (at any time) is

$$\mathbf{v}(t) = \mathbf{r}'(t) = 2t\mathbf{i} + \mathbf{j}$$ Velocity vector

and the acceleration vector (at any time) is

$$\mathbf{a}(t) = \mathbf{r}''(t) = 2\mathbf{i}.$$ Acceleration vector

When $t = 0$, the velocity and acceleration vectors are

$$\mathbf{v}(0) = 2(0)\mathbf{i} + \mathbf{j} = \mathbf{j} \quad \text{and} \quad \mathbf{a}(0) = 2\mathbf{i}.$$

When $t = 2$, the velocity and acceleration vectors are

$$\mathbf{v}(2) = 2(2)\mathbf{i} + \mathbf{j} = 4\mathbf{i} + \mathbf{j} \quad \text{and} \quad \mathbf{a}(2) = 2\mathbf{i}.$$

For the object moving along the path shown in Figure 12.13, note that the acceleration vector is constant (it has a magnitude of 2 and points to the right). This implies that the speed of the object is decreasing as the object moves toward the vertex of the parabola, and the speed is increasing as the object moves away from the vertex of the parabola.

This type of motion is *not* characteristic of comets that travel on parabolic paths through our solar system. For such comets, the acceleration vector always points to the origin (the sun), which implies that the comet's speed increases as it approaches the vertex of the path and decreases as it moves away from the vertex. (See Figure 12.14.)

EXAMPLE 3 Velocity and Acceleration Vectors in Space

See LarsonCalculus.com for an interactive version of this type of example.

Sketch the path of an object moving along the space curve C given by

$$\mathbf{r}(t) = t\mathbf{i} + t^3\mathbf{j} + 3t\mathbf{k}, \quad t \geq 0$$ Position vector

and find the velocity and acceleration vectors when $t = 1$.

Solution Using the parametric equations $x = t$ and $y = t^3$, you can determine that the path of the object lies on the cubic cylinder given by

$$y = x^3.$$ Rectangular equation

Moreover, because $z = 3t$, the object starts at $(0, 0, 0)$ and moves upward as t increases, as shown in Figure 12.15. Because $\mathbf{r}(t) = t\mathbf{i} + t^3\mathbf{j} + 3t\mathbf{k}$, you have

$$\mathbf{v}(t) = \mathbf{r}'(t) = \mathbf{i} + 3t^2\mathbf{j} + 3\mathbf{k}$$ Velocity vector

and

$$\mathbf{a}(t) = \mathbf{r}''(t) = 6t\mathbf{j}.$$ Acceleration vector

When $t = 1$, the velocity and acceleration vectors are

$$\mathbf{v}(1) = \mathbf{r}'(1) = \mathbf{i} + 3\mathbf{j} + 3\mathbf{k} \quad \text{and} \quad \mathbf{a}(1) = \mathbf{r}''(1) = 6\mathbf{j}.$$

So far in this section, you have concentrated on finding the velocity and acceleration by differentiating the position vector. Many practical applications involve the reverse problem—finding the position vector for a given velocity or acceleration. This is demonstrated in the next example.

EXAMPLE 4 Finding a Position Vector by Integration

An object starts from rest at the point $(1, 2, 0)$ and moves with an acceleration of

$$\mathbf{a}(t) = \mathbf{j} + 2\mathbf{k}$$ Acceleration vector

where $\|\mathbf{a}(t)\|$ is measured in feet per second per second. Find the location of the object after $t = 2$ seconds.

Solution From the description of the object's motion, you can deduce the following *initial conditions*. Because the object starts from rest, you have

$$\mathbf{v}(0) = \mathbf{0}.$$

Moreover, because the object starts at the point $(x, y, z) = (1, 2, 0)$, you have

$$\mathbf{r}(0) = x(0)\mathbf{i} + y(0)\mathbf{j} + z(0)\mathbf{k} = 1\mathbf{i} + 2\mathbf{j} + 0\mathbf{k} = \mathbf{i} + 2\mathbf{j}.$$

To find the position vector, you should integrate twice, each time using one of the initial conditions to solve for the constant of integration. The velocity vector is

$$\begin{aligned}\mathbf{v}(t) &= \int \mathbf{a}(t)\,dt \\ &= \int (\mathbf{j} + 2\mathbf{k})\,dt \\ &= t\mathbf{j} + 2t\mathbf{k} + \mathbf{C}\end{aligned}$$

where $\mathbf{C} = C_1\mathbf{i} + C_2\mathbf{j} + C_3\mathbf{k}$. Letting $t = 0$ and applying the initial condition $\mathbf{v}(0) = \mathbf{0}$, you obtain

$$\mathbf{v}(0) = C_1\mathbf{i} + C_2\mathbf{j} + C_3\mathbf{k} = \mathbf{0} \quad \Rightarrow \quad C_1 = C_2 = C_3 = 0.$$

So, the *velocity* at any time t is

$$\mathbf{v}(t) = t\mathbf{j} + 2t\mathbf{k}.$$ Velocity vector

Integrating once more produces

$$\begin{aligned}\mathbf{r}(t) &= \int \mathbf{v}(t)\,dt \\ &= \int (t\mathbf{j} + 2t\mathbf{k})\,dt \\ &= \frac{t^2}{2}\mathbf{j} + t^2\mathbf{k} + \mathbf{C}\end{aligned}$$

where $\mathbf{C} = C_4\mathbf{i} + C_5\mathbf{j} + C_6\mathbf{k}$. Letting $t = 0$ and applying the initial condition $\mathbf{r}(0) = \mathbf{i} + 2\mathbf{j}$, you have

$$\mathbf{r}(0) = C_4\mathbf{i} + C_5\mathbf{j} + C_6\mathbf{k} = \mathbf{i} + 2\mathbf{j} \quad \Rightarrow \quad C_4 = 1, C_5 = 2, C_6 = 0.$$

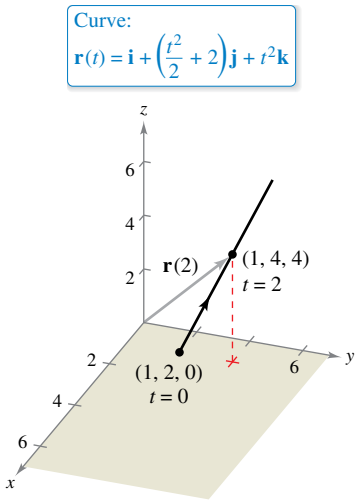
So, the *position* vector is

$$\mathbf{r}(t) = \mathbf{i} + \left(\frac{t^2}{2} + 2\right)\mathbf{j} + t^2\mathbf{k}.$$ Position vector

The location of the object after $t = 2$ seconds is given by

$$\mathbf{r}(2) = \mathbf{i} + 4\mathbf{j} + 4\mathbf{k}$$

as shown in Figure 12.16.



The object takes 2 seconds to move from point $(1, 2, 0)$ to point $(1, 4, 4)$ along the curve.

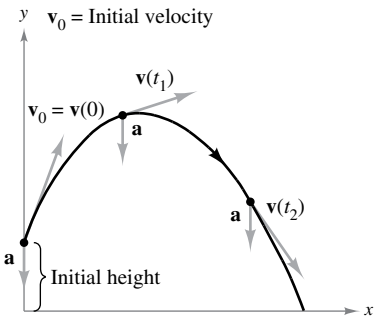

Figure 12.17

Projectile Motion

To derive the parametric equations for the path of a projectile, assume that gravity is the only force acting on the projectile after it is launched. So, the motion occurs in a vertical plane, which can be represented by the xy-coordinate system with the origin as a point on Earth's surface, as shown in Figure 12.17. For a projectile of mass m, the force due to gravity is

$$\mathbf{F} = -mg\mathbf{j}$$ Force due to gravity

where the acceleration due to gravity is $g = 32$ feet per second per second, or 9.8 meters per second per second. By **Newton's Second Law of Motion,** this same force produces an acceleration $\mathbf{a} = \mathbf{a}(t)$ and satisfies the equation $\mathbf{F} = m\mathbf{a}$. Consequently, the acceleration of the projectile is given by $m\mathbf{a} = -mg\mathbf{j}$, which implies that

$$\mathbf{a} = -g\mathbf{j}.$$ Acceleration of projectile

EXAMPLE 5 **Derivation of the Position Vector for a Projectile**

A projectile of mass m is launched from an initial position $\mathbf{r}_0$ with an initial velocity $\mathbf{v}_0$. Find its position vector as a function of time.

Solution Begin with the acceleration $\mathbf{a}(t) = -g\mathbf{j}$ and integrate twice.

$$\mathbf{v}(t) = \int \mathbf{a}(t)\,dt = \int -g\mathbf{j}\,dt = -gt\mathbf{j} + \mathbf{C}_1$$

$$\mathbf{r}(t) = \int \mathbf{v}(t)\,dt = \int (-gt\mathbf{j} + \mathbf{C}_1)\,dt = -\frac{1}{2}gt^2\mathbf{j} + \mathbf{C}_1 t + \mathbf{C}_2$$

You can use the initial conditions $\mathbf{v}(0) = \mathbf{v}_0$ and $\mathbf{r}(0) = \mathbf{r}_0$ to solve for the constant vectors $\mathbf{C}_1$ and $\mathbf{C}_2$. Doing this produces

$$\mathbf{C}_1 = \mathbf{v}_0 \quad \text{and} \quad \mathbf{C}_2 = \mathbf{r}_0.$$

So, the position vector is

$$\mathbf{r}(t) = -\frac{1}{2}gt^2\mathbf{j} + t\mathbf{v}_0 + \mathbf{r}_0.$$ Position vector

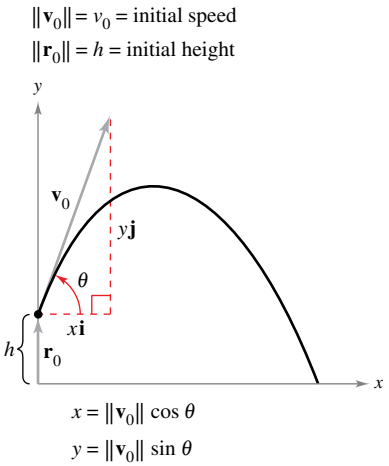

Figure 12.18

In many projectile problems, the constant vectors $\mathbf{r}_0$ and $\mathbf{v}_0$ are not given explicitly. Often you are given the initial height h, the initial speed v_0, and the angle θ at which the projectile is launched, as shown in Figure 12.18. From the given height, you can deduce that $\mathbf{r}_0 = h\mathbf{j}$. Because the speed gives the magnitude of the initial velocity, it follows that $v_0 = \|\mathbf{v}_0\|$ and you can write

$$\begin{aligned}\mathbf{v}_0 &= x\mathbf{i} + y\mathbf{j} \\ &= (\|\mathbf{v}_0\| \cos\theta)\mathbf{i} + (\|\mathbf{v}_0\| \sin\theta)\mathbf{j} \\ &= v_0 \cos\theta\mathbf{i} + v_0 \sin\theta\mathbf{j}.\end{aligned}$$

So, the position vector can be written in the form

$$\mathbf{r}(t) = -\frac{1}{2}gt^2\mathbf{j} + t\mathbf{v}_0 + \mathbf{r}_0$$ Position vector

$$= -\frac{1}{2}gt^2\mathbf{j} + tv_0 \cos\theta\mathbf{i} + tv_0 \sin\theta\mathbf{j} + h\mathbf{j}$$

$$= (v_0 \cos\theta)t\mathbf{i} + \left[h + (v_0 \sin\theta)t - \frac{1}{2}gt^2\right]\mathbf{j}.$$

THEOREM 12.3 Position Vector for a Projectile

Neglecting air resistance, the path of a projectile launched from an initial height h with initial speed v_0 and angle of elevation θ is described by the vector function

$$\mathbf{r}(t) = (v_0 \cos\theta)t\mathbf{i} + \left[h + (v_0 \sin\theta)t - \tfrac{1}{2}gt^2\right]\mathbf{j}$$

where g is the acceleration due to gravity.

EXAMPLE 6 Describing the Path of a Baseball

A baseball is hit 3 feet above ground level at 100 feet per second and at an angle of 45° with respect to the ground, as shown in Figure 12.19. Find the maximum height reached by the baseball. Will it clear a 10-foot-high fence located 300 feet from home plate?

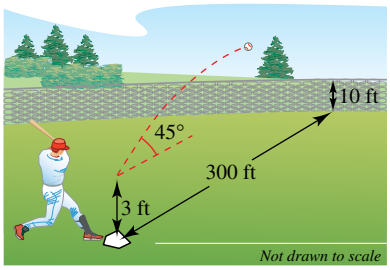

Figure 12.19

Solution You are given

$$h = 3, \quad v_0 = 100, \quad \text{and} \quad \theta = 45°.$$

So, using Theorem 12.3 with $g = 32$ feet per second per second produces

$$\mathbf{r}(t) = \left(100\cos\frac{\pi}{4}\right)t\mathbf{i} + \left[3 + \left(100\sin\frac{\pi}{4}\right)t - 16t^2\right]\mathbf{j}$$
$$= \left(50\sqrt{2}t\right)\mathbf{i} + \left(3 + 50\sqrt{2}t - 16t^2\right)\mathbf{j}.$$

The velocity vector is

$$\mathbf{v}(t) = \mathbf{r}'(t) = 50\sqrt{2}\mathbf{i} + \left(50\sqrt{2} - 32t\right)\mathbf{j}.$$

The maximum height occurs when

$$y'(t) = 50\sqrt{2} - 32t$$

is equal to 0, which implies that

$$t = \frac{25\sqrt{2}}{16} \approx 2.21 \text{ seconds}.$$

So, the maximum height reached by the ball is

$$y = 3 + 50\sqrt{2}\left(\frac{25\sqrt{2}}{16}\right) - 16\left(\frac{25\sqrt{2}}{16}\right)^2$$
$$= \frac{649}{8}$$
$$\approx 81 \text{ feet.} \qquad \text{Maximum height when } t \approx 2.21 \text{ seconds}$$

The ball is 300 feet from where it was hit when

$$x(t) = 300 \quad \Rightarrow \quad 50\sqrt{2}t = 300.$$

Solving this equation for t produces $t = 3\sqrt{2} \approx 4.24$ seconds. At this time, the height of the ball is

$$y = 3 + 50\sqrt{2}\left(3\sqrt{2}\right) - 16\left(3\sqrt{2}\right)^2$$
$$= 303 - 288$$
$$= 15 \text{ feet.} \qquad \text{Height when } t \approx 4.24 \text{ seconds}$$

Therefore, the ball clears the 10-foot fence for a home run. ■

12.3 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. An object moves along a curve in the plane. What information do you gain about the motion of the object from the velocity vector to the curve at time t?
2. For each scenario, describe the direction of the acceleration vectors. Explain your reasoning.
   (a) A comet traveling through our solar system in a parabolic path
   (b) An object thrown on Earth's surface

Finding Velocity and Acceleration Along a Plane Curve

In Exercises 3–12, the position vector r describes the path of an object moving in the xy-plane.

(a) Find the velocity vector, speed, and acceleration vector of the object.

(b) Evaluate the velocity vector and acceleration vector of the object at the given point.

(c) Sketch a graph of the path and sketch the velocity and acceleration vectors at the given point.

	Position Vector	Point
3.	$\mathbf{r}(t) = 3t\mathbf{i} + (t-1)\mathbf{j}$	$(3, 0)$
4.	$\mathbf{r}(t) = (6-t)\mathbf{i} + t\mathbf{j}$	$(3, 3)$
5.	$\mathbf{r}(t) = t^2\mathbf{i} + t^3\mathbf{j}$	$(1, 1)$
6.	$\mathbf{r}(t) = t\mathbf{i} + (-t^2+4)\mathbf{j}$	$(1, 3)$
7.	$\mathbf{r}(t) = t^2\mathbf{i} + t\mathbf{j}$	$(4, 2)$
8.	$\mathbf{r}(t) = (\frac{1}{4}t^3 + 1)\mathbf{i} + t\mathbf{j}$	$(3, 2)$
9.	$\mathbf{r}(t) = 2\cos t\mathbf{i} + 2\sin t\mathbf{j}$	$(\sqrt{2}, \sqrt{2})$
10.	$\mathbf{r}(t) = 3\cos t\mathbf{i} + 2\sin t\mathbf{j}$	$(3, 0)$
11.	$\mathbf{r}(t) = \langle t - \sin t, 1 - \cos t\rangle$	$(\pi, 2)$
12.	$\mathbf{r}(t) = \langle e^{-t}, e^t\rangle$	$(1, 1)$

Finding Velocity and Acceleration Vectors in Space

In Exercises 13–22, the position vector r describes the path of an object moving in space.

(a) Find the velocity vector, speed, and acceleration vector of the object.

(b) Evaluate the velocity vector and acceleration vector of the object at the given value of t.

	Position Vector	Time
13.	$\mathbf{r}(t) = t\mathbf{i} + 5t\mathbf{j} + 3t\mathbf{k}$	$t = 1$
14.	$\mathbf{r}(t) = 4t\mathbf{i} + 4t\mathbf{j} - 2t\mathbf{k}$	$t = 3$
15.	$\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + \frac{1}{2}t^2\mathbf{k}$	$t = 4$
16.	$\mathbf{r}(t) = 3t\mathbf{i} + t\mathbf{j} + \frac{1}{4}t^2\mathbf{k}$	$t = 2$
17.	$\mathbf{r}(t) = t\mathbf{i} - t\mathbf{j} + \sqrt{9-t^2}\,\mathbf{k}$	$t = 0$
18.	$\mathbf{r}(t) = t^2\mathbf{i} + t\mathbf{j} + 2t^{3/2}\mathbf{k}$	$t = 4$
19.	$\mathbf{r}(t) = \langle 4t, 3\cos t, 3\sin t\rangle$	$t = \pi$
20.	$\mathbf{r}(t) = \langle 2\cos t, \sin 3t, t^2\rangle$	$t = \frac{\pi}{4}$
21.	$\mathbf{r}(t) = \langle e^t\cos t, e^t\sin t, e^t\rangle$	$t = 0$
22.	$\mathbf{r}(t) = \left\langle \ln t, \frac{1}{t^2}, t^4\right\rangle$	$t = \sqrt{3}$

Finding a Position Vector by Integration

In Exercises 23–28, use the given acceleration vector and initial conditions to find the velocity and position vectors. Then find the position at time $t = 2$.

23. $\mathbf{a}(t) = \mathbf{i} + \mathbf{j} + \mathbf{k}, \quad \mathbf{v}(0) = \mathbf{0}, \quad \mathbf{r}(0) = \mathbf{0}$
24. $\mathbf{a}(t) = 2\mathbf{i} + 3\mathbf{k}, \quad \mathbf{v}(0) = 4\mathbf{j}, \quad \mathbf{r}(0) = \mathbf{0}$
25. $\mathbf{a}(t) = t\mathbf{j} + t\mathbf{k}, \quad \mathbf{v}(1) = 5\mathbf{j}, \quad \mathbf{r}(1) = \mathbf{0}$
26. $\mathbf{a}(t) = -32\mathbf{k}, \quad \mathbf{v}(0) = 3\mathbf{i} - 2\mathbf{j} + \mathbf{k}, \quad \mathbf{r}(0) = 5\mathbf{j} + 2\mathbf{k}$
27. $\mathbf{a}(t) = -\cos t\mathbf{i} - \sin t\mathbf{j}, \quad \mathbf{v}(0) = \mathbf{j} + \mathbf{k}, \quad \mathbf{r}(0) = \mathbf{i}$
28. $\mathbf{a}(t) = e^t\mathbf{i} - 8\mathbf{k}, \quad \mathbf{v}(0) = 2\mathbf{i} + 3\mathbf{j} + \mathbf{k}, \quad \mathbf{r}(0) = \mathbf{0}$

Projectile Motion

In Exercises 29–42, use the model for projectile motion, assuming there is no air resistance and $g = 32$ feet per second per second.

29. A baseball is hit from a height of 2.5 feet above the ground with an initial speed of 140 feet per second and at an angle of 22° above the horizontal. Find the maximum height reached by the baseball. Determine whether it will clear a 10-foot-high fence located 375 feet from home plate.
30. Determine the maximum height and range of a projectile fired at a height of 3 feet above the ground with an initial speed of 900 feet per second and at an angle of 45° above the horizontal.
31. A baseball, hit 3 feet above the ground, leaves the bat at an angle of 45° and is caught by an outfielder 3 feet above the ground and 300 feet from home plate. What is the initial speed of the ball, and how high does it rise?
32. A baseball player at second base throws a ball 90 feet to the player at first base. The ball is released at a point 5 feet above the ground with an initial speed of 50 miles per hour and at an angle of 15° above the horizontal. At what height does the player at first base catch the ball?
33. Eliminate the parameter t from the position vector for the motion of a projectile to show that the rectangular equation is

$$y = -\frac{g\sec^2\theta}{2v_0^2}x^2 + (\tan\theta)x + h.$$

34. The path of a ball is given by the rectangular equation

$$y = x - 0.005x^2.$$

Use the result of Exercise 33 to find the position vector. Then find the speed and direction of the ball at the point at which it has traveled 60 feet horizontally.

35. The Rogers Centre in Toronto, Ontario, has a center field fence that is 10 feet high and 400 feet from home plate. A ball is hit 3 feet above the ground and leaves the bat at a speed of 100 miles per hour.

(a) The ball leaves the bat at an angle of $\theta = \theta_0$ with the horizontal. Write the vector-valued function for the path of the ball.

(b) Use a graphing utility to graph the vector-valued function for $\theta_0 = 10°$, $\theta_0 = 15°$, $\theta_0 = 20°$, and $\theta_0 = 25°$. Use the graphs to approximate the minimum angle required for the hit to be a home run.

(c) Determine analytically the minimum angle required for the hit to be a home run.

36. Football

The quarterback of a football team releases a pass at a height of 7 feet above the playing field, and the football is caught by a receiver 30 yards directly downfield at a height of 4 feet. The pass is released at an angle of 35° with the horizontal.

(a) Find the speed of the football when it is released.

(b) Find the maximum height of the football.

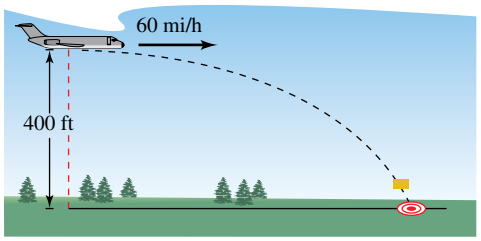
(c) Find the time the receiver has to reach the proper position after the quarterback releases the football.

37. A bale ejector consists of two variable-speed belts at the end of a baler. Its purpose is to toss bales into a trailing wagon. In loading the back of a wagon, a bale must be thrown to a position 8 feet above and 16 feet behind the ejector.

(a) Find the minimum initial speed of the bale and the corresponding angle at which it must be ejected from the baler.

(b) The ejector has a fixed angle of 45°. Find the initial speed required.

38. To test the impact speeds of different air supply drops, a pilot is flying horizontally at an altitude of 400 feet with a speed of 60 miles per hour (see figure). When should the package be released for it to hit the target? (Give your answer in terms of the angle of depression from the plane to the target.) What is the speed of the package at the time of impact?



39. A ball fired from a cannon with an exit speed of 1200 feet per second is to hit a target 3000 feet away. Determine the minimum angle of elevation of the cannon.

40. A projectile is fired from ground level at an angle of 12° with the horizontal. The projectile is to have a range of 200 feet. Find the minimum initial speed necessary.

41. Use a graphing utility to graph the paths of a projectile for the given values of θ and v_0. For each case, use the graph to approximate the maximum height and range of the projectile. (Assume that the projectile is launched from ground level.)

(a) $\theta = 10°$, $v_0 = 66$ ft/sec

(b) $\theta = 10°$, $v_0 = 146$ ft/sec

(c) $\theta = 45°$, $v_0 = 66$ ft/sec

(d) $\theta = 45°$, $v_0 = 146$ ft/sec

(e) $\theta = 60°$, $v_0 = 66$ ft/sec

(f) $\theta = 60°$, $v_0 = 146$ ft/sec

42. Find the angles at which an object must be thrown to obtain (a) the maximum range and (b) the maximum height.

Projectile Motion **In Exercises 43 and 44, use the model for projectile motion, assuming there is no air resistance and $g = 9.8$ meters per second per second.**

43. Determine the maximum height and range of a projectile fired at a height of 1.5 meters above the ground with an initial speed of 100 meters per second and at an angle of 30° above the horizontal.

44. A projectile is fired from ground level at an angle of 8° with the horizontal. The projectile is to have a range of 50 meters. Find the minimum initial speed necessary.

45. Shot-Put Throw The path of a shot thrown at an angle θ is

$$\mathbf{r}(t) = (v_0 \cos\theta)t\mathbf{i} + \left[h + (v_0 \sin\theta)t - \frac{1}{2}gt^2\right]\mathbf{j}$$

where v_0 is the initial speed, h is the initial height, t is the time in seconds, and g is the acceleration due to gravity. Verify that the shot will remain in the air for a total of

$$t = \frac{v_0 \sin\theta + \sqrt{v_0^2 \sin^2\theta + 2gh}}{g} \text{ seconds}$$

and will travel a horizontal distance of

$$\frac{v_0^2 \cos\theta}{g}\left(\sin\theta + \sqrt{\sin^2\theta + \frac{2gh}{v_0^2}}\right) \text{ feet.}$$

46. Shot-Put Throw

A shot is thrown from a height of $h = 5.75$ feet with an initial speed of $v_0 = 41$ feet per second and at an angle of $\theta = 42.5°$ with the horizontal. Use the result of Exercise 45 to find the total time of travel and the total horizontal distance traveled.

Cycloidal Motion **In Exercises 47 and 48, consider the motion of a point (or particle) on the circumference of a rolling circle. As the circle rolls, it generates the cycloid**

$$\mathbf{r}(t) = b(\omega t - \sin \omega t)\mathbf{i} + b(1 - \cos \omega t)\mathbf{j}$$

where ω is the constant angular speed of the circle and b is the radius of the circle.

47. Find the velocity and acceleration vectors of the particle. Use the results to determine the times at which the speed of the particle will be (a) zero and (b) maximized.

48. Find the maximum speed of a point on the circumference of an automobile tire of radius 1 foot when the automobile is traveling at 60 miles per hour. Compare this speed with the speed of the automobile.

Circular Motion **In Exercises 49–52, consider a particle moving on a circular path of radius b described by**

$$\mathbf{r}(t) = b \cos \omega t\mathbf{i} + b \sin \omega t\mathbf{j}$$

where $\omega = du/dt$ is the constant angular speed.

49. Find the velocity vector and show that it is orthogonal to $\mathbf{r}(t)$.

50. (a) Show that the speed of the particle is $b\omega$.

(b) Use a graphing utility in *parametric* mode to graph the circle for $b = 6$. Try different values of ω. Does the graphing utility draw the circle faster for greater values of ω?

51. Find the acceleration vector and show that its direction is always toward the center of the circle.

52. Show that the magnitude of the acceleration vector is $b\omega^2$.

Circular Motion **In Exercises 53 and 54, use the results of Exercises 49–52.**

53. A psychrometer (an instrument used to measure humidity) weighing 4 ounces is whirled horizontally using a six-inch string (see figure). The string will break under a force of 2 pounds. Find the maximum speed the instrument can attain without breaking the string. (Use $\mathbf{F} = m\mathbf{a}$, where $m = 1/128$.)

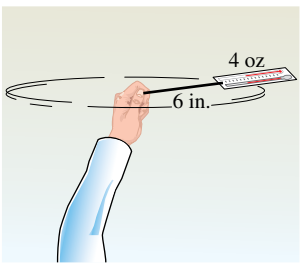

Figure for 53

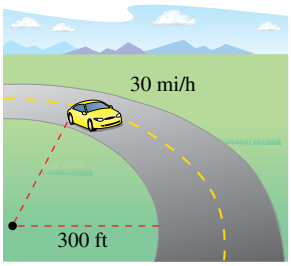

Figure for 54

54. A 3400-pound automobile is negotiating a circular interchange of radius 300 feet at 30 miles per hour (see figure). Assuming the roadway is level, find the force between the tires and the road such that the car stays on the circular path and does not skid. (Use $\mathbf{F} = m\mathbf{a}$, where $m = 3400/32$.) Find the angle at which the roadway should be banked so that no lateral frictional force is exerted on the tires of the automobile.

Exploring Concepts

55. Explain the difference between the velocity of an object and its speed.

56. Consider a particle that is moving along the space curve given by $\mathbf{r}_1(t) = t^3\mathbf{i} + (3 - t)\mathbf{j} + 2t^2\mathbf{k}$. Write a vector-valued function $\mathbf{r}_2$ for a particle that moves four times as fast as the particle represented by $\mathbf{r}_1$. Explain how you found the function.

57. Consider a particle that moves around a circle. Is the velocity vector of the particle always orthogonal to the acceleration vector of the particle? Explain.

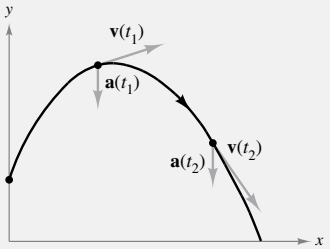
58. **Particle Motion** Consider a particle moving on an elliptical path described by $\mathbf{r}(t) = a \cos \omega t\mathbf{i} + b \sin \omega t\mathbf{j}$, where $\omega = d\theta/dt$ is the constant angular speed.

(a) Find the velocity vector. What is the speed of the particle?

(b) Find the acceleration vector and show that its direction is always toward the center of the ellipse.

59. **Path of an Object** When $t = 0$, an object is at the point $(0, 1)$ and has a velocity vector $\mathbf{v}(0) = -\mathbf{i}$. It moves with an acceleration of $\mathbf{a}(t) = \sin t\mathbf{i} - \cos t\mathbf{j}$. Show that the path of the object is a circle.

60. **HOW DO YOU SEE IT?** The graph shows the path of a projectile and the velocity and acceleration vectors at times t_1 and t_2. Classify the angle between the velocity vector and the acceleration vector at times t_1 and t_2. Using the vectors, is the speed increasing or decreasing at times t_1 and t_2? Explain your reasoning.



61. **Proof** Prove that when an object is traveling at a constant speed, its velocity and acceleration vectors are orthogonal.

62. **Proof** Prove that an object moving in a straight line at a constant speed has an acceleration of 0.

True or False? **In Exercises 63–65, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

63. The velocity vector points in the direction of motion.

64. If a particle moves along a straight line, then the velocity and acceleration vectors are orthogonal.

65. A velocity vector of variable magnitude cannot have a constant direction.

12.4 Tangent Vectors and Normal Vectors

GO DIGITAL

- **Find a unit tangent vector and a principal unit normal vector at a point on a space curve.**
- **Find the tangential and normal components of acceleration.**

Tangent Vectors and Normal Vectors

In the preceding section, you learned that the velocity vector points in the direction of motion. This observation leads to the next definition, which applies to any smooth curve—not just to those for which the parameter represents time.

Definition of Unit Tangent Vector

Let C be a smooth curve represented by $\mathbf{r}$ on an open interval I. The **unit tangent vector** $\mathbf{T}(t)$ at t is defined as

$$\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|}, \quad \mathbf{r}'(t) \neq \mathbf{0}.$$

Recall that a curve is *smooth* on an interval when $\mathbf{r}'$ is continuous and nonzero on the interval. So, "smoothness" is sufficient to guarantee that a curve has a unit tangent vector.

EXAMPLE 1 Finding the Unit Tangent Vector

Find the unit tangent vector to the curve given by

$$\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j}$$

when $t = 1$.

Solution The derivative of $\mathbf{r}$ is

$$\mathbf{r}'(t) = \mathbf{i} + 2t\mathbf{j}.$$ Derivative of $\mathbf{r}$

So, the unit tangent vector is

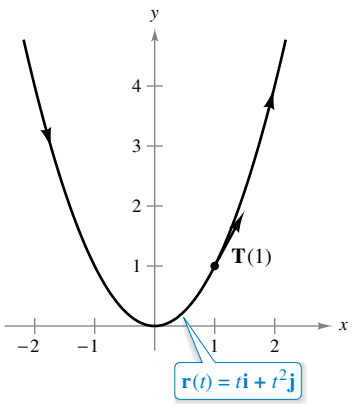
$$\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|}$$ Definition of unit tangent vector

$$= \frac{1}{\sqrt{1 + 4t^2}}(\mathbf{i} + 2t\mathbf{j}).$$ Substitute for $\mathbf{r}'(t)$.

When $t = 1$, the unit tangent vector is

$$\mathbf{T}(1) = \frac{1}{\sqrt{5}}(\mathbf{i} + 2\mathbf{j})$$

as shown in Figure 12.20. ■



The direction of the unit tangent vector depends on the orientation of the curve.
Figure 12.20

In Example 1, note that the direction of the unit tangent vector depends on the orientation of the curve. For the parabola described by

$$\mathbf{r}(t) = -(t - 2)\mathbf{i} + (t - 2)^2\mathbf{j}$$

$\mathbf{T}(1)$ would still represent the unit tangent vector at the point $(1, 1)$, but it would point in the opposite direction. Try verifying this.

GO DIGITAL

The **tangent line to a curve** at a point is the line that passes through the point and is parallel to the unit tangent vector. In Example 2, the unit tangent vector is used to find the tangent line at a point on a helix.

EXAMPLE 2 Finding the Tangent Line at a Point on a Curve

Find $\mathbf{T}(t)$ and then find a set of parametric equations for the tangent line to the helix given by

$$\mathbf{r}(t) = 2\cos t\mathbf{i} + 2\sin t\mathbf{j} + t\mathbf{k}$$

at the point $\left(\sqrt{2}, \sqrt{2}, \frac{\pi}{4}\right)$.

Solution The derivative of $\mathbf{r}$ is

$$\mathbf{r}'(t) = -2\sin t\mathbf{i} + 2\cos t\mathbf{j} + \mathbf{k}$$

which implies that $\|\mathbf{r}'(t)\| = \sqrt{4\sin^2 t + 4\cos^2 t + 1} = \sqrt{5}$. So, the unit tangent vector is

$$\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|} = \frac{1}{\sqrt{5}}(-2\sin t\mathbf{i} + 2\cos t\mathbf{j} + \mathbf{k}).$$ Unit tangent vector

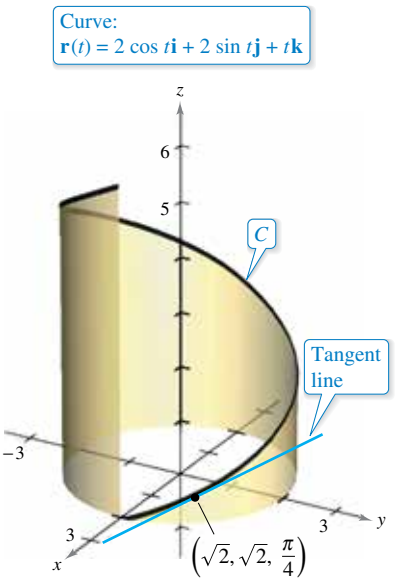
At the point $\left(\sqrt{2}, \sqrt{2}, \pi/4\right)$, $t = \pi/4$ and the unit tangent vector is

$$\mathbf{T}\left(\frac{\pi}{4}\right) = \frac{1}{\sqrt{5}}\left(-2\frac{\sqrt{2}}{2}\mathbf{i} + 2\frac{\sqrt{2}}{2}\mathbf{j} + \mathbf{k}\right) = \frac{1}{\sqrt{5}}\left(-\sqrt{2}\mathbf{i} + \sqrt{2}\mathbf{j} + \mathbf{k}\right).$$

Using the direction numbers $a = -\sqrt{2}$, $b = \sqrt{2}$, and $c = 1$, and the point $(x_1, y_1, z_1) = \left(\sqrt{2}, \sqrt{2}, \pi/4\right)$, you can obtain the parametric equations (given with parameter s) listed below.

$$x = x_1 + as = \sqrt{2} - \sqrt{2}s$$
$$y = y_1 + bs = \sqrt{2} + \sqrt{2}s$$
$$z = z_1 + cs = \frac{\pi}{4} + s$$

This tangent line is shown in Figure 12.21.



The tangent line to a curve at a point is determined by the unit tangent vector at the point.
Figure 12.21

In Example 2, there are infinitely many vectors that are orthogonal to the tangent vector $\mathbf{T}(t)$. One of these is the vector $\mathbf{T}'(t)$. This follows from Property 7 of Theorem 12.2. That is,

$$\mathbf{T}(t) \cdot \mathbf{T}(t) = \|\mathbf{T}(t)\|^2 = 1 \quad \Rightarrow \quad \mathbf{T}(t) \cdot \mathbf{T}'(t) = 0.$$

By normalizing the vector $\mathbf{T}'(t)$, you obtain a special vector called the **principal unit normal vector,** as indicated in the next definition.

Definition of Principal Unit Normal Vector

Let C be a smooth curve represented by $\mathbf{r}$ on an open interval I. If $\mathbf{T}'(t) \neq \mathbf{0}$, then the **principal unit normal vector** at t is defined as

$$\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|}.$$

GO DIGITAL

EXAMPLE 3 **Finding the Principal Unit Normal Vector**

Find $\mathbf{N}(t)$ and $\mathbf{N}(1)$ for the curve represented by $\mathbf{r}(t) = 3t\mathbf{i} + 2t^2\mathbf{j}$.

Solution By differentiating, you obtain

$$\mathbf{r}'(t) = 3\mathbf{i} + 4t\mathbf{j}$$

which implies that

$$\|\mathbf{r}'(t)\| = \sqrt{9 + 16t^2}.$$

So, the unit tangent vector is

$$\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|} = \frac{1}{\sqrt{9 + 16t^2}}(3\mathbf{i} + 4t\mathbf{j}).$$ Unit tangent vector

Using Theorem 12.2, differentiate $\mathbf{T}(t)$ with respect to t to obtain

$$\mathbf{T}'(t) = \frac{1}{\sqrt{9 + 16t^2}}(4\mathbf{j}) - \frac{16t}{(9 + 16t^2)^{3/2}}(3\mathbf{i} + 4t\mathbf{j}) = \frac{12}{(9 + 16t^2)^{3/2}}(-4t\mathbf{i} + 3\mathbf{j})$$

which implies that

$$\|\mathbf{T}'(t)\| = 12\sqrt{\frac{9 + 16t^2}{(9 + 16t^2)^3}} = \frac{12}{9 + 16t^2}.$$

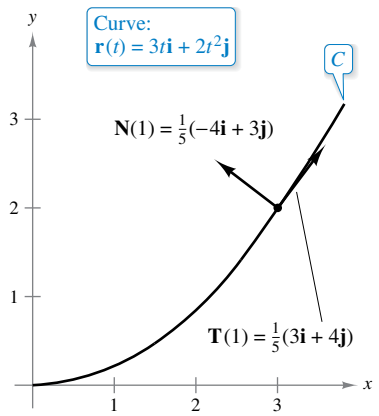
Therefore, the principal unit normal vector is

$$\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|} = \frac{1}{\sqrt{9 + 16t^2}}(-4t\mathbf{i} + 3\mathbf{j}).$$ Principal unit normal vector

When $t = 1$, the principal unit normal vector is

$$\mathbf{N}(1) = \frac{1}{5}(-4\mathbf{i} + 3\mathbf{j})$$

as shown in Figure 12.22.



The principal unit normal vector points toward the concave side of the curve.

GO DIGITAL

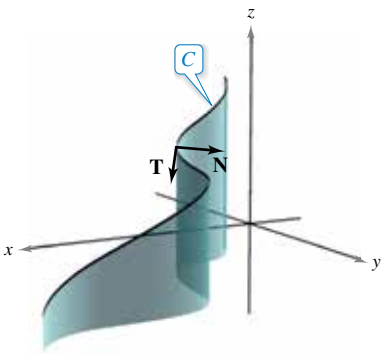
The principal unit normal vector can be difficult to evaluate algebraically. For plane curves, you can simplify the algebra by finding

$$\mathbf{T}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}$$ Unit tangent vector

and observing that $\mathbf{N}(t)$ must be either

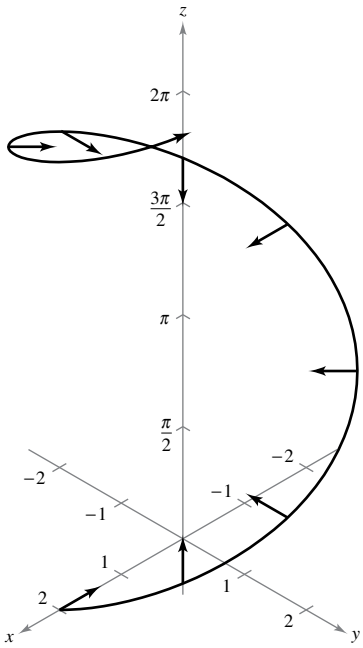
$$\mathbf{N}_1(t) = y(t)\mathbf{i} - x(t)\mathbf{j} \quad \text{or} \quad \mathbf{N}_2(t) = -y(t)\mathbf{i} + x(t)\mathbf{j}.$$

Because $\sqrt{[x(t)]^2 + [y(t)]^2} = 1$, it follows that both $\mathbf{N}_1(t)$ and $\mathbf{N}_2(t)$ are unit normal vectors. The *principal* unit normal vector $\mathbf{N}$ is the one that points toward the concave side of the curve, as shown in Figure 12.22 (see Exercise 72). This also holds for curves in space. That is, for an object moving along a curve C in space, the vector $\mathbf{T}(t)$ points in the direction the object is moving, whereas the vector $\mathbf{N}(t)$ is orthogonal to $\mathbf{T}(t)$ and points in the direction in which the object is turning, as shown in Figure 12.23.



At any point on a curve, a unit normal vector is orthogonal to the unit tangent vector. The *principal* unit normal vector points in the direction in which the curve is turning.
Figure 12.23

Helix:
$\mathbf{r}(t) = 2\cos t\mathbf{i} + 2\sin t\mathbf{j} + t\mathbf{k}$



$\mathbf{N}(t)$ is horizontal and points toward the z-axis.
Figure 12.24

EXAMPLE 4 Finding the Principal Unit Normal Vector

Find the principal unit normal vector for the helix $\mathbf{r}(t) = 2\cos t\mathbf{i} + 2\sin t\mathbf{j} + t\mathbf{k}$.

Solution From Example 2, you know that the unit tangent vector is

$$\mathbf{T}(t) = \frac{1}{\sqrt{5}}(-2\sin t\mathbf{i} + 2\cos t\mathbf{j} + \mathbf{k}).$$ Unit tangent vector

So, $\mathbf{T}'(t)$ is given by

$$\mathbf{T}'(t) = \frac{1}{\sqrt{5}}(-2\cos t\mathbf{i} - 2\sin t\mathbf{j}).$$

Because $\|\mathbf{T}'(t)\| = 2/\sqrt{5}$, it follows that the principal unit normal vector is

$$\begin{aligned}\mathbf{N}(t) &= \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|} \\ &= \frac{1}{2}(-2\cos t\mathbf{i} - 2\sin t\mathbf{j}) \\ &= -\cos t\mathbf{i} - \sin t\mathbf{j}.\end{aligned}$$ Principal unit normal vector

Note that this vector is horizontal and points toward the z-axis, as shown in Figure 12.24. ■

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Tangential and Normal Components of Acceleration

In the preceding section, you considered the problem of describing the motion of an object along a curve. You learned that for an object traveling at a *constant speed,* the velocity and acceleration vectors are perpendicular. This seems reasonable, because the speed would not be constant if any acceleration were acting in the direction of motion. You can verify this observation by noting that

$$\mathbf{r}''(t) \cdot \mathbf{r}'(t) = 0$$

when $\|\mathbf{r}'(t)\|$ is a constant. (See Property 7 of Theorem 12.2.)

For an object traveling at a *variable speed,* however, the velocity and acceleration vectors are not necessarily perpendicular. For instance, you learned that the acceleration vector for a projectile always points down, regardless of the direction of motion.

In general, part of the acceleration (the tangential component) acts in the line of motion, and part of it (the normal component) acts perpendicular to the line of motion. To determine these two components, you can use the unit vectors $\mathbf{T}(t)$ and $\mathbf{N}(t)$, which serve in much the same way as do $\mathbf{i}$ and $\mathbf{j}$ in representing vectors in the plane. The next theorem states that the acceleration vector lies in the plane determined by $\mathbf{T}(t)$ and $\mathbf{N}(t)$.

THEOREM 12.4 Acceleration Vector

If $\mathbf{r}(t)$ is the position vector for a smooth curve C and $\mathbf{N}(t)$ exists, then the acceleration vector $\mathbf{a}(t)$ lies in the plane determined by $\mathbf{T}(t)$ and $\mathbf{N}(t)$.

Proof To simplify the notation, write $\mathbf{T}$ for $\mathbf{T}(t)$, $\mathbf{T}'$ for $\mathbf{T}'(t)$, and so on. Because $\mathbf{T} = \mathbf{r}'/\|\mathbf{r}'\| = \mathbf{v}/\|\mathbf{v}\|$, it follows that

$$\mathbf{v} = \|\mathbf{v}\|\mathbf{T}.$$

By differentiating, you obtain

$$\begin{aligned}
\mathbf{a} &= \mathbf{v}' \\
&= \frac{d}{dt}\left[\|\mathbf{v}\|\right]\mathbf{T} + \|\mathbf{v}\|\mathbf{T}' && \text{Product Rule} \\
&= \frac{d}{dt}\left[\|\mathbf{v}\|\right]\mathbf{T} + \|\mathbf{v}\|\mathbf{T}'\left(\frac{\|\mathbf{T}'\|}{\|\mathbf{T}'\|}\right) \\
&= \frac{d}{dt}\left[\|\mathbf{v}\|\right]\mathbf{T} + \|\mathbf{v}\|\,\|\mathbf{T}'\|\mathbf{N}. && \mathbf{N} = \mathbf{T}'/\|\mathbf{T}'\|
\end{aligned}$$

Because $\mathbf{a}$ is written as a linear combination of $\mathbf{T}$ and $\mathbf{N}$, it follows that $\mathbf{a}$ lies in the plane determined by $\mathbf{T}$ and $\mathbf{N}$. ∎

The coefficients of $\mathbf{T}$ and $\mathbf{N}$ in the proof of Theorem 12.4 are called the **tangential and normal components of acceleration** and are denoted by

$$a_{\mathbf{T}} = \frac{d}{dt}\left[\|\mathbf{v}\|\right] \quad \text{and} \quad a_{\mathbf{N}} = \|\mathbf{v}\|\,\|\mathbf{T}'\|.$$

So, you can write

$$\mathbf{a}(t) = a_{\mathbf{T}}\mathbf{T}(t) + a_{\mathbf{N}}\mathbf{N}(t).$$

The next theorem lists some convenient formulas for $a_{\mathbf{T}}$ and $a_{\mathbf{N}}$.

The tangential and normal components of acceleration are obtained by projecting **a** onto **T** and **N**.
Figure 12.25

THEOREM 12.5 Tangential and Normal Components of Acceleration

If $\mathbf{r}(t)$ is the position vector for a smooth curve C [for which $\mathbf{N}(t)$ exists], then the tangential and normal components of acceleration are as follows.

$$a_{\mathbf{T}} = \frac{d}{dt}\left[\|\mathbf{v}\|\right] = \mathbf{a} \cdot \mathbf{T} = \frac{\mathbf{v} \cdot \mathbf{a}}{\|\mathbf{v}\|}$$

$$a_{\mathbf{N}} = \|\mathbf{v}\|\|\mathbf{T}'\| = \mathbf{a} \cdot \mathbf{N} = \frac{\|\mathbf{v} \times \mathbf{a}\|}{\|\mathbf{v}\|} = \sqrt{\|\mathbf{a}\|^2 - a_{\mathbf{T}}^2}$$

Note that $a_{\mathbf{N}} \geq 0$. The normal component of acceleration is also called the **centripetal component of acceleration.**

Proof Note that **a** lies in the plane of **T** and **N**. So, you can use Figure 12.25 to conclude that, for any time t, the components of the projection of the acceleration vector onto **T** and onto **N** are given by $a_{\mathbf{T}} = \mathbf{a} \cdot \mathbf{T}$ and $a_{\mathbf{N}} = \mathbf{a} \cdot \mathbf{N}$, respectively. Moreover, because $\mathbf{a} = \mathbf{v}'$ and $\mathbf{T} = \mathbf{v}/\|\mathbf{v}\|$, you have

$$a_{\mathbf{T}} = \mathbf{a} \cdot \mathbf{T} = \mathbf{T} \cdot \mathbf{a} = \frac{\mathbf{v}}{\|\mathbf{v}\|} \cdot \mathbf{a} = \frac{\mathbf{v} \cdot \mathbf{a}}{\|\mathbf{v}\|}.$$

In Exercises 74 and 75, you are asked to prove the other parts of the theorem. ■

EXAMPLE 5 Tangential and Normal Components of Acceleration

See LarsonCalculus.com for an interactive version of this type of example.

Find the tangential and normal components of acceleration for the position vector given by $\mathbf{r}(t) = 3t\mathbf{i} - t\mathbf{j} + t^2\mathbf{k}$.

Solution Begin by finding the velocity, speed, and acceleration.

$$\mathbf{v}(t) = \mathbf{r}'(t) = 3\mathbf{i} - \mathbf{j} + 2t\mathbf{k} \qquad \text{Velocity vector}$$

$$\|\mathbf{v}(t)\| = \sqrt{9 + 1 + 4t^2} = \sqrt{10 + 4t^2} \qquad \text{Speed}$$

$$\mathbf{a}(t) = \mathbf{r}''(t) = 2\mathbf{k} \qquad \text{Acceleration vector}$$

By Theorem 12.5, the tangential component of acceleration is

$$a_{\mathbf{T}} = \frac{\mathbf{v} \cdot \mathbf{a}}{\|\mathbf{v}\|} = \frac{4t}{\sqrt{10 + 4t^2}} \qquad \text{Tangential component of acceleration}$$

and because

$$\mathbf{v} \times \mathbf{a} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 3 & -1 & 2t \\ 0 & 0 & 2 \end{vmatrix} = -2\mathbf{i} - 6\mathbf{j}$$

the normal component of acceleration is

$$a_{\mathbf{N}} = \frac{\|\mathbf{v} \times \mathbf{a}\|}{\|\mathbf{v}\|} = \frac{\sqrt{4 + 36}}{\sqrt{10 + 4t^2}} = \frac{2\sqrt{10}}{\sqrt{10 + 4t^2}}. \qquad \text{Normal component of acceleration}$$

■

In Example 5, you could have used the alternative formula for $a_{\mathbf{N}}$ as follows.

$$a_{\mathbf{N}} = \sqrt{\|\mathbf{a}\|^2 - a_{\mathbf{T}}^2} = \sqrt{(2)^2 - \frac{16t^2}{10 + 4t^2}} = \frac{2\sqrt{10}}{\sqrt{10 + 4t^2}}$$

EXAMPLE 6 Finding a_T and a_N for a Circular Helix

Find the tangential and normal components of acceleration for the helix given by

$$\mathbf{r}(t) = b\cos t\mathbf{i} + b\sin t\mathbf{j} + ct\mathbf{k}, \quad b > 0.$$

Solution

$$\mathbf{v}(t) = \mathbf{r}'(t) = -b\sin t\mathbf{i} + b\cos t\mathbf{j} + c\mathbf{k}$$ Velocity vector

$$\|\mathbf{v}(t)\| = \sqrt{b^2\sin^2 t + b^2\cos^2 t + c^2} = \sqrt{b^2 + c^2}$$ Speed

$$\mathbf{a}(t) = \mathbf{r}''(t) = -b\cos t\mathbf{i} - b\sin t\mathbf{j}$$ Acceleration vector

By Theorem 12.5, the tangential component of acceleration is

$$a_T = \frac{\mathbf{v}\cdot\mathbf{a}}{\|\mathbf{v}\|} = \frac{b^2\sin t\cos t - b^2\sin t\cos t + 0}{\sqrt{b^2 + c^2}} = 0.$$ Tangential component of acceleration

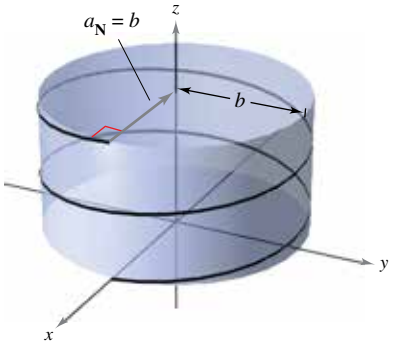
Moreover, because

$$\|\mathbf{a}\| = \sqrt{b^2\cos^2 t + b^2\sin^2 t} = b$$

you can use the alternative formula for the normal component of acceleration to obtain

$$a_N = \sqrt{\|\mathbf{a}\|^2 - a_T^2} = \sqrt{b^2 - 0^2} = b.$$ Normal component of acceleration

Note that the normal component of acceleration is equal to the magnitude of the acceleration. In other words, because the speed is constant, the acceleration is perpendicular to the velocity. See Figure 12.26.



The normal component of acceleration is equal to the radius of the cylinder around which the helix is spiraling.
Figure 12.26

EXAMPLE 7 Projectile Motion

The position vector for the projectile shown in Figure 12.27 is

$$\mathbf{r}(t) = \left(50\sqrt{2}t\right)\mathbf{i} + \left(50\sqrt{2}t - 16t^2\right)\mathbf{j}.$$ Position vector

Find the tangential components of acceleration when $t = 0$, 1, and $25\sqrt{2}/16$.

Solution

$$\mathbf{v}(t) = 50\sqrt{2}\mathbf{i} + \left(50\sqrt{2} - 32t\right)\mathbf{j}$$ Velocity vector

$$\|\mathbf{v}(t)\| = 2\sqrt{50^2 - 16(50)\sqrt{2}t + 16^2t^2}$$ Speed

$$\mathbf{a}(t) = -32\mathbf{j}$$ Acceleration vector

The tangential component of acceleration is

$$a_T(t) = \frac{\mathbf{v}(t)\cdot\mathbf{a}(t)}{\|\mathbf{v}(t)\|} = \frac{-32\left(50\sqrt{2} - 32t\right)}{2\sqrt{50^2 - 16(50)\sqrt{2}t + 16^2t^2}}.$$ Tangential component of acceleration

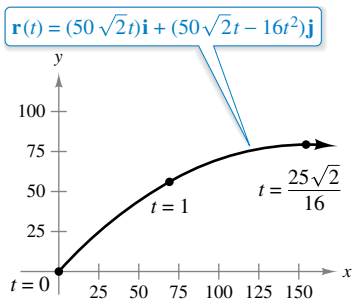
At the specified times, you have

$$a_T(0) = \frac{-32\left(50\sqrt{2}\right)}{100} = -16\sqrt{2} \approx -22.6$$

$$a_T(1) = \frac{-32\left(50\sqrt{2} - 32\right)}{2\sqrt{50^2 - 16(50)\sqrt{2} + 16^2}} \approx -15.4$$

$$a_T\left(\frac{25\sqrt{2}}{16}\right) = \frac{-32\left(50\sqrt{2} - 50\sqrt{2}\right)}{50\sqrt{2}} = 0.$$

Figure 12.27 shows that at the projectile's maximum height, when $t = 25\sqrt{2}/16$, the tangential component is 0. This is reasonable because the direction of motion is horizontal at the point, and the tangential component of the acceleration is equal to the horizontal component of the acceleration. ■



The path of a projectile

Concept Check

1. Explain how the unit tangent vector is related to the orientation of a curve.
2. In what direction does the principal unit normal vector point?

Finding the Unit Tangent Vector **In Exercises 3–8, find the unit tangent vector to the curve at the specified value of the parameter.**

3. $\mathbf{r}(t) = t^2\mathbf{i} + 2t\mathbf{j}, \quad t = 1$
4. $\mathbf{r}(t) = t^3\mathbf{i} + 2t^2\mathbf{j}, \quad t = 1$
5. $\mathbf{r}(t) = 5\cos t\,\mathbf{i} + 5\sin t\,\mathbf{j}, \quad t = \frac{\pi}{3}$
6. $\mathbf{r}(t) = 6\sin t\,\mathbf{i} - 2\cos t\,\mathbf{j}, \quad t = \frac{\pi}{6}$
7. $\mathbf{r}(t) = 3t\mathbf{i} - \ln t\,\mathbf{j}, \quad t = e$
8. $\mathbf{r}(t) = e^t\cos t\,\mathbf{i} + e^t\mathbf{j}, \quad t = 0$

Finding a Tangent Line **In Exercises 9–14, find the unit tangent vector $\mathbf{T}(t)$ and a set of parametric equations for the tangent line to the space curve at point P.**

9. $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + t\mathbf{k}, \quad P(0, 0, 0)$
10. $\mathbf{r}(t) = t^2\mathbf{i} + t\mathbf{j} + \frac{4}{3}\mathbf{k}, \quad P\left(1, 1, \frac{4}{3}\right)$
11. $\mathbf{r}(t) = \cos t\,\mathbf{i} + 3\sin t\,\mathbf{j} + (3t - 4)\mathbf{k}, \quad P(1, 0, -4)$
12. $\mathbf{r}(t) = \left\langle t, t, \sqrt{4 - t^2}\right\rangle, \quad P\left(1, 1, \sqrt{3}\right)$
13. $\mathbf{r}(t) = \langle 2\cos t, 2\sin t, 4\rangle, \quad P\left(\sqrt{2}, \sqrt{2}, 4\right)$
14. $\mathbf{r}(t) = \langle 2\sin t, 2\cos t, 4\sin^2 t\rangle, \quad P\left(1, \sqrt{3}, 1\right)$

Finding the Principal Unit Normal Vector **In Exercises 15–20, find the principal unit normal vector to the curve at the specified value of the parameter.**

15. $\mathbf{r}(t) = t\mathbf{i} + \frac{1}{2}t^2\mathbf{j}, \quad t = 2$
16. $\mathbf{r}(t) = t\mathbf{i} + \frac{6}{t}\mathbf{j}, \quad t = 3$
17. $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + \ln t\,\mathbf{k}, \quad t = 1$
18. $\mathbf{r}(t) = \sqrt{2}t\mathbf{i} + e^t\mathbf{j} + e^{-t}\mathbf{k}, \quad t = 0$
19. $\mathbf{r}(t) = 6\cos t\,\mathbf{i} + 6\sin t\,\mathbf{j} + \mathbf{k}, \quad t = \frac{3\pi}{4}$
20. $\mathbf{r}(t) = \cos 3t\,\mathbf{i} + 2\sin 3t\,\mathbf{j} + \mathbf{k}, \quad t = \pi$

Sketching a Graph and Vectors **In Exercises 21–24, sketch the graph of the plane curve $\mathbf{r}(t)$ and sketch the vectors $\mathbf{T}(t)$ and $\mathbf{N}(t)$ at the given value of t.**

21. $\mathbf{r}(t) = t\mathbf{i} + \frac{1}{t}\mathbf{j}, \quad t = 2$
22. $\mathbf{r}(t) = t\mathbf{i} - t^3\mathbf{j}, \quad t = 1$
23. $\mathbf{r}(t) = (2t + 1)\mathbf{i} - t^2\mathbf{j}, \quad t = 2$
24. $\mathbf{r}(t) = 2\cos t\,\mathbf{i} + 2\sin t\,\mathbf{j}, \quad t = \frac{7\pi}{6}$

Finding Tangential and Normal Components of Acceleration **In Exercises 25–30, find the tangential and normal components of acceleration at the given time t for the plane curve $\mathbf{r}(t)$.**

25. $\mathbf{r}(t) = t\mathbf{i} + \frac{1}{t}\mathbf{j}, \quad t = 1$
26. $\mathbf{r}(t) = t^2\mathbf{i} + 2t\mathbf{j}, \quad t = 1$
27. $\mathbf{r}(t) = e^t\mathbf{i} + e^{-2t}\mathbf{j}, \quad t = 0$
28. $\mathbf{r}(t) = e^t\mathbf{i} + e^{-t}\mathbf{j}, \quad t = 0$
29. $\mathbf{r}(t) = e^t\cos t\,\mathbf{i} + e^t\sin t\,\mathbf{j}, \quad t = \frac{\pi}{2}$
30. $\mathbf{r}(t) = 4\cos 3t\mathbf{i} + 4\sin 3t\mathbf{j}, \quad t = \pi$

Circular Motion **In Exercises 31–34, consider an object moving according to the position vector**

$$\mathbf{r}(t) = a\cos\omega t\,\mathbf{i} + a\sin\omega t\,\mathbf{j}.$$

31. Find $\mathbf{T}(t)$, $\mathbf{N}(t)$, $a_{\mathbf{T}}$, and $a_{\mathbf{N}}$.
32. Determine the directions of $\mathbf{T}$ and $\mathbf{N}$ relative to the position vector $\mathbf{r}$.
33. Determine the speed of the object at any time t and explain its value relative to the value of $a_{\mathbf{T}}$.
34. When the angular speed ω is halved, by what factor is $a_{\mathbf{N}}$ changed?

Finding Tangential and Normal Components of Acceleration **In Exercises 35–40, find the tangential and normal components of acceleration at the given time t for the space curve $\mathbf{r}(t)$.**

35. $\mathbf{r}(t) = t\mathbf{i} + 2t\mathbf{j} - 3t\mathbf{k}, \quad t = 1$
36. $\mathbf{r}(t) = \cos t\,\mathbf{i} + \sin t\,\mathbf{j} + 2t\mathbf{k}, \quad t = \frac{\pi}{3}$
37. $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + \frac{t^2}{2}\mathbf{k}, \quad t = 1$
38. $\mathbf{r}(t) = (2t - 1)\mathbf{i} + t^2\mathbf{j} - 4t\mathbf{k}, \quad t = 2$
39. $\mathbf{r}(t) = e^t\sin t\,\mathbf{i} + e^t\cos t\,\mathbf{j} + e^t\mathbf{k}, \quad t = 0$
40. $\mathbf{r}(t) = e^t\mathbf{i} + 2t\mathbf{j} + e^{-t}\mathbf{k}, \quad t = 0$

Exploring Concepts

41. Describe the motion of a particle when the normal component of acceleration is 0.
42. Describe the motion of a particle when the tangential component of acceleration is 0.

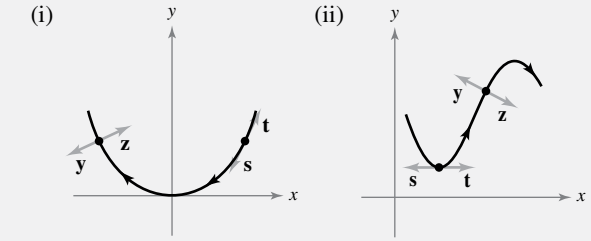
43. Finding Vectors An object moves along the path given by

$\mathbf{r}(t) = 3t\mathbf{i} + 4t\mathbf{j}$.

Find $\mathbf{v}(t)$, $\mathbf{a}(t)$, $\mathbf{T}(t)$, and $\mathbf{N}(t)$ (if it exists). What is the form of the path? Is the speed of the object constant or changing?

44. HOW DO YOU SEE IT? The figures show the paths of two particles.



(a) Which vector, $\mathbf{s}$ or $\mathbf{t}$, represents the unit tangent vector? Explain.

(b) Which vector, $\mathbf{y}$ or $\mathbf{z}$, represents the principal unit normal vector? Explain.

45. Cycloidal Motion The figure shows the path of a particle modeled by the vector-valued function

$\mathbf{r}(t) = \langle \pi t - \sin \pi t, 1 - \cos \pi t \rangle$.

The figure also shows the vectors $\mathbf{v}(t)/\|\mathbf{v}(t)\|$ and $\mathbf{a}(t)/\|\mathbf{a}(t)\|$ at the indicated values of t.

(a) Find $a_{\mathbf{T}}$ and $a_{\mathbf{N}}$ at $t = \frac{1}{2}$, $t = 1$, and $t = \frac{3}{2}$.

(b) Determine whether the speed of the particle is increasing or decreasing at each of the indicated values of t. Give reasons for your answers.

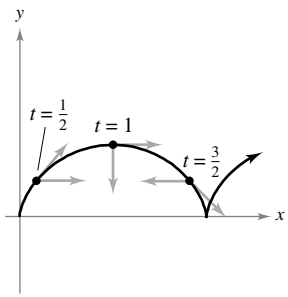


Figure for 45

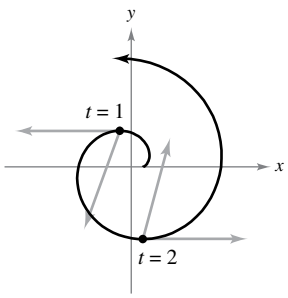

Figure for 46

46. Motion Along an Involute of a Circle The figure shows a particle moving along a path modeled by

$\mathbf{r}(t) = \langle \cos \pi t + \pi t \sin \pi t, \sin \pi t - \pi t \cos \pi t \rangle$.

The figure also shows the vectors $\mathbf{v}(t)$ and $\mathbf{a}(t)$ for $t = 1$ and $t = 2$.

(a) Find $a_{\mathbf{T}}$ and $a_{\mathbf{N}}$ at $t = 1$ and $t = 2$.

(b) Determine whether the speed of the particle is increasing or decreasing at each of the indicated values of t. Give reasons for your answers.

Finding a Binormal Vector **In Exercises 47–52, find the vectors T and N and the binormal vector $\mathbf{B} = \mathbf{T} \times \mathbf{N}$ for the vector-valued function $\mathbf{r}(t)$ at the given value of t.**

47. $\mathbf{r}(t) = 2\cos t\mathbf{i} + 2\sin t\mathbf{j} + \frac{t}{2}\mathbf{k}, \quad t = \frac{\pi}{2}$

48. $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + \frac{t^3}{3}\mathbf{k}, \quad t = 1$

49. $\mathbf{r}(t) = \mathbf{i} + \sin t\mathbf{j} + \cos t\mathbf{k}, \quad t = \frac{\pi}{4}$

50. $\mathbf{r}(t) = 2e^t\mathbf{i} + e^t\cos t\mathbf{j} + e^t\sin t\mathbf{k}, \quad t = 0$

51. $\mathbf{r}(t) = 4\sin t\mathbf{i} + 4\cos t\mathbf{j} + 2t\mathbf{k}, \quad t = \frac{\pi}{3}$

52. $\mathbf{r}(t) = 3\cos 2t\mathbf{i} + 3\sin 2t\mathbf{j} + t\mathbf{k}, \quad t = \frac{\pi}{4}$

Alternative Formula for the Principal Unit Normal Vector **In Exercises 53–56, use the vector-valued function $\mathbf{r}(t)$ to find the principal unit normal vector $\mathbf{N}(t)$ using the alternative formula**

$$\mathbf{N} = \frac{(\mathbf{v}\cdot\mathbf{v})\mathbf{a} - (\mathbf{v}\cdot\mathbf{a})\mathbf{v}}{\|(\mathbf{v}\cdot\mathbf{v})\mathbf{a} - (\mathbf{v}\cdot\mathbf{a})\mathbf{v}\|}.$$

53. $\mathbf{r}(t) = 3t\mathbf{i} + 2t^2\mathbf{j}$

54. $\mathbf{r}(t) = 3\cos 2t\mathbf{i} + 3\sin 2t\mathbf{j}$

55. $\mathbf{r}(t) = 2t\mathbf{i} + 4t\mathbf{j} + t^2\mathbf{k}$

56. $\mathbf{r}(t) = 5\cos t\mathbf{i} + 5\sin t\mathbf{j} + 3t\mathbf{k}$

57. Projectile Motion Find the tangential and normal components of acceleration for a projectile fired at an angle θ with the horizontal at an initial speed of v_0. What are the components when the projectile is at its maximum height?

58. Projectile Motion Use your results from Exercise 57 to find the tangential and normal components of acceleration for a projectile fired at an angle of 45° with the horizontal at an initial speed of 150 feet per second. What are the components when the projectile is at its maximum height?

59. Projectile Motion A projectile is launched with an initial speed of 120 feet per second at a height of 5 feet and at an angle of 30° with the horizontal.

(a) Determine the vector-valued function for the path of the projectile.

(b) Use a graphing utility to graph the path and approximate the maximum height and range of the projectile.

(c) Find $\mathbf{v}(t)$, $\|\mathbf{v}(t)\|$, and $\mathbf{a}(t)$.

(d) Use a graphing utility to complete the table.

t	0.5	1.0	1.5	2.0	2.5	3.0
Speed						

(e) Use a graphing utility to graph the scalar functions $a_{\mathbf{T}}$ and $a_{\mathbf{N}}$. How is the speed of the projectile changing when $a_{\mathbf{T}}$ and $a_{\mathbf{N}}$ have opposite signs?

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

60. Projectile Motion A projectile is launched with an initial speed of 220 feet per second at a height of 4 feet and at an angle of 45° with the horizontal.

(a) Determine the vector-valued function for the path of the projectile.

(b) Use a graphing utility to graph the path and approximate the maximum height and range of the projectile.

(c) Find $\mathbf{v}(t)$, $\|\mathbf{v}(t)\|$, and $\mathbf{a}(t)$.

(d) Use a graphing utility to complete the table.

t	0.5	1.0	1.5	2.0	2.5	3.0
Speed						

61. Air Traffic Control

Because of a storm, ground controllers instruct the pilot of a plane flying at an altitude of 4 miles to make a 90° turn and climb to an altitude of 4.2 miles. The model for the path of the plane during this maneuver is

$$\mathbf{r}(t) = \langle 10 \cos 10\pi t, 10 \sin 10\pi t, 4 + 4t \rangle, \quad 0 \le t \le \tfrac{1}{20}$$

where t is the time in hours and $\mathbf{r}$ is the distance in miles.

(a) Determine the speed of the plane.

(b) Calculate $a_{\mathbf{T}}$ and $a_{\mathbf{N}}$. Why is one of these equal to 0?

62. Projectile Motion A plane flying at an altitude of 36,000 feet at a speed of 600 miles per hour releases a supply package. Find the tangential and normal components of acceleration acting on the supply package.

63. Centripetal Acceleration An object is spinning at a constant speed on the end of a string, according to the position vector $\mathbf{r}(t) = a \cos \omega t\mathbf{i} + a \sin \omega t\mathbf{j}$.

(a) When the angular speed ω is doubled, how is the centripetal component of acceleration changed?

(b) When the angular speed is unchanged but the length of the string is halved, how is the centripetal component of acceleration changed?

64. Centripetal Force An object of mass m moves at a constant speed v in a circular path of radius r, according to the position vector $\mathbf{r}(t) = r \cos \omega t\mathbf{i} + r \sin \omega t\mathbf{j}$.

(a) The force required to produce the centripetal component of acceleration is called the *centripetal force* and is given by $F = mv^2/r$. Use $\mathbf{F} = m\mathbf{a}$ to verify the centripetal force.

(b) Newton's Law of Universal Gravitation is given by $F = GMm/d^2$, where d is the distance between the centers of the two bodies of masses M and m, and G is the gravitational constant. Use this law to show that the speed required for circular motion is $v = \sqrt{GM/r}$.

Orbital Speed **In Exercises 65–68, use the result of Exercise 64 to find the speed necessary for the given circular orbit around Earth. Let $GM = 9.56 \times 10^4$ cubic miles per second per second, and assume the radius of Earth is 4000 miles.**

65. The orbit of the International Space Station 255 miles above the surface of Earth

66. The orbit of the Hubble telescope 340 miles above the surface of Earth

67. The orbit of a heat capacity mapping satellite 385 miles above the surface of Earth

68. The orbit of a communications satellite r miles above the surface of Earth that is in geosynchronous orbit. [The satellite completes one orbit per sidereal day (approximately 23 hours, 56 minutes) and therefore appears to remain stationary above a point on Earth.]

True or False? **In Exercises 69 and 70, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

69. The velocity and acceleration vectors of a moving object are always perpendicular.

70. If $a_{\mathbf{N}} = 0$ for a moving object, then the object is moving in a straight line.

71. Motion of a Particle A particle moves along a path modeled by

$$\mathbf{r}(t) = \cosh(bt)\mathbf{i} + \sinh(bt)\mathbf{j}$$

where b is a positive constant.

(a) Show that the path of the particle is a hyperbola.

(b) Show that $\mathbf{a}(t) = b^2\mathbf{r}(t)$.

72. Proof Prove that the principal unit normal vector $\mathbf{N}$ points toward the concave side of a plane curve.

73. Proof Prove that the vector $\mathbf{T}'(t)$ is 0 for an object moving in a straight line.

74. Proof Prove that $a_{\mathbf{N}} = \dfrac{\|\mathbf{v} \times \mathbf{a}\|}{\|\mathbf{v}\|}$.

75. Proof Prove that $a_{\mathbf{N}} = \sqrt{\|\mathbf{a}\|^2 - a_{\mathbf{T}}^2}$.

PUTNAM EXAM CHALLENGE

76. A particle of unit mass moves on a straight line under the action of a force which is a function $f(v)$ of the velocity v of the particle, but the form of this function is not known. A motion is observed, and the distance x covered in time t is found to be connected with t by the formula

$$x = at + bt^2 + ct^3$$

where a, b, and c have numerical values determined by observation of the motion. Find the function $f(v)$ for the range of v covered by the experiment.

This problem was composed by the Committee on the Putnam Prize Competition.

12.5 Arc Length and Curvature

GO DIGITAL

- Find the arc length of a space curve.
- Use the arc length parameter to describe a plane curve or space curve.
- Find the curvature of a curve at a point on the curve.
- Use a vector-valued function to find frictional force.

Arc Length

In Section 10.3, you learned that the arc length of a smooth *plane* curve C given by the parametric equations $x = x(t)$ and $y = y(t)$, $a \le t \le b$, is

$$s = \int_a^b \sqrt{[x'(t)]^2 + [y'(t)]^2}\, dt.$$

In vector form, where C is given by $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}$, you can rewrite this equation for arc length as

$$s = \int_a^b \|\mathbf{r}'(t)\|\, dt.$$

The formula for the arc length of a plane curve has a natural extension to a smooth curve in *space,* as stated in the next theorem.

THEOREM 12.6 Arc Length of a Space Curve

If C is a smooth curve given by $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$ on an interval $[a, b]$, then the arc length of C on the interval is

$$s = \int_a^b \sqrt{[x'(t)]^2 + [y'(t)]^2 + [z'(t)]^2}\, dt = \int_a^b \|\mathbf{r}'(t)\|\, dt.$$

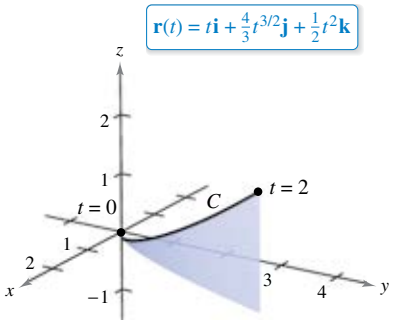
Exploration

Arc Length Formula The formula for the arc length of a space curve is given in terms of the parametric equations used to represent the curve. Does this mean that the arc length of the curve depends on the parameter being used? Would you want this to be true? Explain your reasoning.

Here is a different parametric representation of the curve in Example 1.

$$\mathbf{r}(t) = t^2\mathbf{i} + \frac{4}{3}t^3\mathbf{j} + \frac{1}{2}t^4\mathbf{k}$$

Find the arc length from $t = 0$ to $t = \sqrt{2}$ and compare the result with that found in Example 1.



As t increases from 0 to 2, the vector $\mathbf{r}(t)$ traces out a curve.
Figure 12.28

EXAMPLE 1 Finding the Arc Length of a Curve in Space

See LarsonCalculus.com for an interactive version of this type of example.

Find the arc length of the curve given by

$$\mathbf{r}(t) = t\mathbf{i} + \frac{4}{3}t^{3/2}\mathbf{j} + \frac{1}{2}t^2\mathbf{k}$$

from $t = 0$ to $t = 2$, as shown in Figure 12.28.

Solution Using $x(t) = t$, $y(t) = \frac{4}{3}t^{3/2}$, and $z(t) = \frac{1}{2}t^2$, you obtain $x'(t) = 1$, $y'(t) = 2t^{1/2}$, and $z'(t) = t$. So, the arc length from $t = 0$ to $t = 2$ is given by

$$\begin{aligned}
s &= \int_0^2 \sqrt{[x'(t)]^2 + [y'(t)]^2 + [z'(t)]^2}\, dt && \text{Formula for arc length} \\
&= \int_0^2 \sqrt{1 + 4t + t^2}\, dt \\
&= \int_0^2 \sqrt{(t+2)^2 - 3}\, dt && \text{Integration tables (Appendix B), Formula 26} \\
&= \left[\frac{t+2}{2}\sqrt{(t+2)^2 - 3} - \frac{3}{2}\ln\left|(t+2) + \sqrt{(t+2)^2 - 3}\right|\right]_0^2 \\
&= 2\sqrt{13} - \frac{3}{2}\ln\left(4 + \sqrt{13}\right) - 1 + \frac{3}{2}\ln 3 \\
&\approx 4.816.
\end{aligned}$$

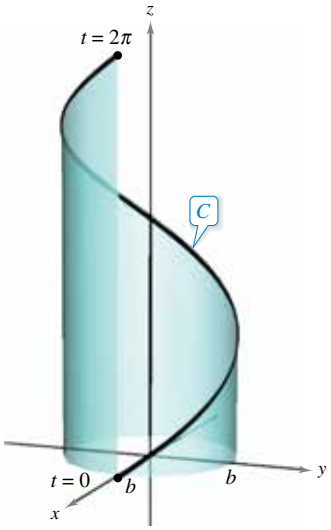
$\mathbf{r}(t) = b\cos t\mathbf{i} + b\sin t\mathbf{j} + \sqrt{1-b^2}\,t\mathbf{k}$



One turn of a helix
Figure 12.29

EXAMPLE 2 Finding the Arc Length of a Helix

Find the length of one turn of the helix given by

$$\mathbf{r}(t) = b\cos t\mathbf{i} + b\sin t\mathbf{j} + \sqrt{1-b^2}\,t\mathbf{k}$$

as shown in Figure 12.29.

Solution Begin by finding the derivative.

$$\mathbf{r}'(t) = -b\sin t\mathbf{i} + b\cos t\mathbf{j} + \sqrt{1-b^2}\mathbf{k}$$ Derivative

Now, using the formula for arc length, you can find the length of one turn of the helix by integrating $\|\mathbf{r}'(t)\|$ from 0 to 2π.

$$\begin{aligned} s &= \int_0^{2\pi} \|\mathbf{r}'(t)\|\,dt && \text{Formula for arc length} \\ &= \int_0^{2\pi} \sqrt{b^2(\sin^2 t + \cos^2 t) + (1-b^2)}\,dt \\ &= \int_0^{2\pi} dt \\ &= t\Big]_0^{2\pi} \\ &= 2\pi \end{aligned}$$

So, the length is 2π units. ■

Arc Length Parameter

You have learned that curves can be represented by vector-valued functions in different ways, depending on the choice of parameter. For *motion* along a curve, the convenient parameter is time t. For studying the *geometric properties* of a curve, however, the convenient parameter is often arc length s.

$s(t) = \int_a^t \sqrt{[x'(u)]^2 + [y'(u)]^2 + [z'(u)]^2}\,du$

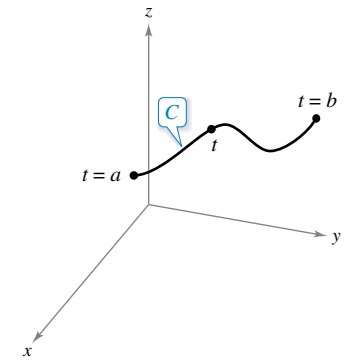


Figure 12.30

Definition of Arc Length Function

Let C be a smooth curve given by $\mathbf{r}(t)$ defined on the closed interval $[a, b]$. For $a \le t \le b$, the **arc length function** is

$$s(t) = \int_a^t \|\mathbf{r}'(u)\|\,du = \int_a^t \sqrt{[x'(u)]^2 + [y'(u)]^2 + [z'(u)]^2}\,du.$$

The arc length s is called the **arc length parameter.** (See Figure 12.30.)

Note that the arc length function s is *nonnegative*. It measures the distance along C from the initial point $(x(a), y(a), z(a))$ to the point $(x(t), y(t), z(t))$.

Using the definition of the arc length function and the Second Fundamental Theorem of Calculus, you can conclude that

$$\frac{ds}{dt} = \|\mathbf{r}'(t)\|.$$ Derivative of arc length function

In differential form, you can write

$$ds = \|\mathbf{r}'(t)\|\,dt.$$ Differential form of arc length function

The line segment from (3, 0) to (0, 4) can be parametrized using the arc length parameter s.
Figure 12.31

EXAMPLE 3 Finding the Arc Length Function for a Line

Find the arc length function $s(t)$ for the line segment given by

$$\mathbf{r}(t) = (3 - 3t)\mathbf{i} + 4t\mathbf{j}, \quad 0 \le t \le 1$$

and write $\mathbf{r}$ as a function of the parameter s. (See Figure 12.31.)

Solution Because $\mathbf{r}'(t) = -3\mathbf{i} + 4\mathbf{j}$ and

$$\|\mathbf{r}'(t)\| = \sqrt{(-3)^2 + 4^2} = 5$$

you have

$$\begin{aligned} s(t) &= \int_0^t \|\mathbf{r}'(u)\|\, du \\ &= \int_0^t 5\, du \\ &= 5t. \end{aligned}$$

Using $s = 5t$ (or $t = s/5$), you can rewrite $\mathbf{r}$ using the arc length parameter as follows.

$$\mathbf{r}(s) = \left(3 - \frac{3}{5}s\right)\mathbf{i} + \frac{4}{5}s\mathbf{j}, \quad 0 \le s \le 5$$

One of the advantages of writing a vector-valued function in terms of the arc length parameter is that $\|\mathbf{r}'(s)\| = 1$. For instance, in Example 3, you have

$$\|\mathbf{r}'(s)\| = \sqrt{\left(-\frac{3}{5}\right)^2 + \left(\frac{4}{5}\right)^2} = 1.$$

So, for a smooth curve C represented by $\mathbf{r}(s)$, where s is the arc length parameter, the arc length between a and b is

$$\begin{aligned} \text{Length of arc} &= \int_a^b \|\mathbf{r}'(s)\|\, ds \\ &= \int_a^b ds \\ &= b - a \\ &= \text{length of interval.} \end{aligned}$$

Furthermore, if t is *any* parameter such that $\|\mathbf{r}'(t)\| = 1$, then t must be the arc length parameter. These results are summarized in the next theorem, which is stated without proof.

THEOREM 12.7 Arc Length Parameter

If C is a smooth curve given by

$$\mathbf{r}(s) = x(s)\mathbf{i} + y(s)\mathbf{j} \qquad \text{Plane curve}$$

or

$$\mathbf{r}(s) = x(s)\mathbf{i} + y(s)\mathbf{j} + z(s)\mathbf{k} \qquad \text{Space curve}$$

where s is the arc length parameter, then

$$\|\mathbf{r}'(s)\| = 1.$$

Moreover, if t is *any* parameter for the vector-valued function $\mathbf{r}$ such that $\|\mathbf{r}'(t)\| = 1$, then t must be the arc length parameter.

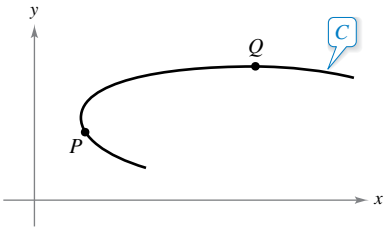
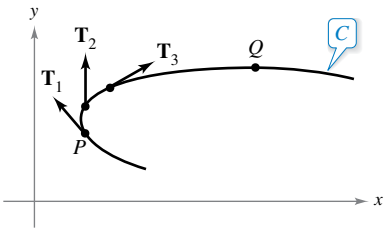
Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.



Curvature at P is greater than at Q.
Figure 12.32



The magnitude of the rate of change of **T** with respect to the arc length is the curvature of a curve.
Figure 12.33

Curvature

An important use of the arc length parameter is to find **curvature**—the measure of how sharply a curve bends. For instance, in Figure 12.32, the curve bends more sharply at P than at Q, and you can say that the curvature is greater at P than at Q. You can calculate curvature by calculating the magnitude of the rate of change of the unit tangent vector $\mathbf{T}$ with respect to the arc length s, as shown in Figure 12.33.

Definition of Curvature

Let C be a smooth curve (in the plane *or* in space) given by $\mathbf{r}(s)$, where s is the arc length parameter. The **curvature** K at s is

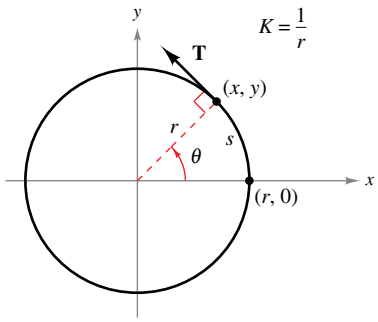
$$K = \left\| \frac{d\mathbf{T}}{ds} \right\| = \|\mathbf{T}'(s)\|.$$

A circle has the same curvature at any point. Moreover, the curvature and the radius of the circle are inversely related. That is, a circle with a large radius has a small curvature, and a circle with a small radius has a large curvature. This inverse relationship is made explicit in the next example.

EXAMPLE 4 Finding the Curvature of a Circle

Show that the curvature of a circle of radius r is

$$K = \frac{1}{r}.$$



The curvature of a circle is constant.
Figure 12.34

Solution Without loss of generality, you can consider the circle to be centered at the origin. Let (x, y) be any point on the circle and let s be the length of the arc from $(r, 0)$ to (x, y), as shown in Figure 12.34. By letting θ be the central angle of the circle, you can represent the circle by

$$\mathbf{r}(\theta) = r\cos\theta\mathbf{i} + r\sin\theta\mathbf{j}. \qquad \theta \text{ is the parameter.}$$

Using the formula for the length of a circular arc $s = r\theta$, you can rewrite $\mathbf{r}(\theta)$ in terms of the arc length parameter as follows.

$$\mathbf{r}(s) = r\cos\frac{s}{r}\mathbf{i} + r\sin\frac{s}{r}\mathbf{j} \qquad \text{Arc length } s \text{ is the parameter.}$$

So, $\mathbf{r}'(s) = -\sin\frac{s}{r}\mathbf{i} + \cos\frac{s}{r}\mathbf{j}$, and it follows that $\|\mathbf{r}'(s)\| = 1$, which implies that the unit tangent vector is

$$\mathbf{T}(s) = \frac{\mathbf{r}'(s)}{\|\mathbf{r}'(s)\|} = -\sin\frac{s}{r}\mathbf{i} + \cos\frac{s}{r}\mathbf{j}$$

and the curvature is

$$K = \|\mathbf{T}'(s)\| = \left\| -\frac{1}{r}\cos\frac{s}{r}\mathbf{i} - \frac{1}{r}\sin\frac{s}{r}\mathbf{j} \right\| = \frac{1}{r}$$

at every point on the circle. ■

Because a straight line does not curve, you would expect its curvature to be 0. Try checking this by finding the curvature of the line given by

$$\mathbf{r}(s) = \left(3 - \frac{3}{5}s\right)\mathbf{i} + \frac{4}{5}s\mathbf{j}.$$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

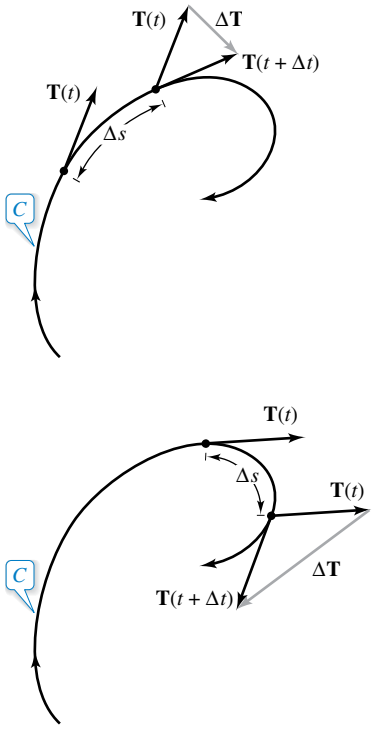

Figure 12.35

In Example 4, the curvature was found by applying the definition directly. This requires that the curve be written in terms of the arc length parameter s. The next theorem gives two other formulas for finding the curvature of a curve written in terms of an arbitrary parameter t. The proof of this theorem is left as an exercise [see Exercise 82, parts (a) and (b)].

THEOREM 12.8 Formulas for Curvature

If C is a smooth curve given by $\mathbf{r}(t)$, then the curvature K of C at t is

$$K = \frac{\|\mathbf{T}'(t)\|}{\|\mathbf{r}'(t)\|} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3}.$$

Because $\|\mathbf{r}'(t)\| = ds/dt$, the first formula implies that curvature is the ratio of the rate of change of the unit tangent vector $\mathbf{T}$ to the rate of change of the arc length. To show that this is reasonable, let Δt be a "small number." Then,

$$\frac{\mathbf{T}'(t)}{ds/dt} \approx \frac{[\mathbf{T}(t + \Delta t) - \mathbf{T}(t)]/\Delta t}{[s(t + \Delta t) - s(t)]/\Delta t} = \frac{\mathbf{T}(t + \Delta t) - \mathbf{T}(t)}{s(t + \Delta t) - s(t)} = \frac{\Delta \mathbf{T}}{\Delta s}.$$

In other words, for a given Δs, the greater the length of $\Delta \mathbf{T}$, the more the curve bends at t, as shown in Figure 12.35.

EXAMPLE 5 Finding the Curvature of a Space Curve

Find the curvature of the curve given by

$$\mathbf{r}(t) = 2t\mathbf{i} + t^2\mathbf{j} - \frac{1}{3}t^3\mathbf{k}.$$

Solution It is not apparent whether this parameter represents arc length, so you should use the formula $K = \|\mathbf{T}'(t)\|/\|\mathbf{r}'(t)\|$.

$$\begin{aligned}
\mathbf{r}'(t) &= 2\mathbf{i} + 2t\mathbf{j} - t^2\mathbf{k} \\
\|\mathbf{r}'(t)\| &= \sqrt{4 + 4t^2 + t^4} && \text{Length of } \mathbf{r}'(t) \\
&= t^2 + 2 \\
\mathbf{T}(t) &= \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|} \\
&= \frac{2\mathbf{i} + 2t\mathbf{j} - t^2\mathbf{k}}{t^2 + 2} \\
\mathbf{T}'(t) &= \frac{(t^2 + 2)(2\mathbf{j} - 2t\mathbf{k}) - (2t)(2\mathbf{i} + 2t\mathbf{j} - t^2\mathbf{k})}{(t^2 + 2)^2} \\
&= \frac{-4t\mathbf{i} + (4 - 2t^2)\mathbf{j} - 4t\mathbf{k}}{(t^2 + 2)^2} \\
\|\mathbf{T}'(t)\| &= \frac{\sqrt{16t^2 + 16 - 16t^2 + 4t^4 + 16t^2}}{(t^2 + 2)^2} \\
&= \frac{2(t^2 + 2)}{(t^2 + 2)^2} \\
&= \frac{2}{t^2 + 2} && \text{Length of } \mathbf{T}'(t)
\end{aligned}$$

So, the curvature is

$$K = \frac{\|\mathbf{T}'(t)\|}{\|\mathbf{r}'(t)\|} = \frac{2}{(t^2 + 2)^2}.$$ Curvature ■

The next theorem presents a formula for calculating the curvature of a plane curve given by $y = f(x)$.

THEOREM 12.9 Curvature in Rectangular Coordinates

If C is the graph of a twice-differentiable function given by $y = f(x)$, then the curvature K at the point (x, y) is

$$K = \frac{|y''|}{[1 + (y')^2]^{3/2}}.$$

Proof By representing the curve C by $\mathbf{r}(x) = x\mathbf{i} + f(x)\mathbf{j} + 0\mathbf{k}$, where x is the parameter, you obtain $\mathbf{r}'(x) = \mathbf{i} + f'(x)\mathbf{j}$,

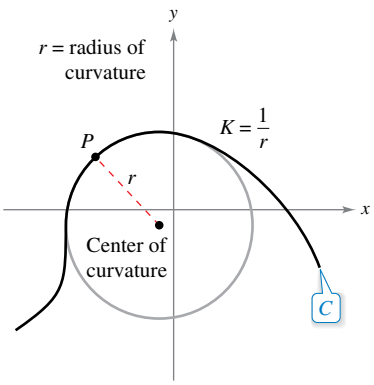
$$\|\mathbf{r}'(x)\| = \sqrt{1 + [f'(x)]^2}$$

and $\mathbf{r}''(x) = f''(x)\mathbf{j}$. Because $\mathbf{r}'(x) \times \mathbf{r}''(x) = f''(x)\mathbf{k}$, it follows that the curvature is

$$K = \frac{\|\mathbf{r}'(x) \times \mathbf{r}''(x)\|}{\|\mathbf{r}'(x)\|^3} \qquad \text{Theorem 12.8}$$

$$= \frac{|f''(x)|}{\{1 + [f'(x)]^2\}^{3/2}}$$

$$= \frac{|y''|}{[1 + (y')^2]^{3/2}}.$$



The circle of curvature

Figure 12.36

Let C be a curve with curvature K at point P. The circle passing through point P with radius $r = 1/K$ is called the **circle of curvature** when the circle lies on the concave side of the curve and shares a common tangent line with the curve at point P. The radius is called the **radius of curvature** at P, and the center of the circle is called the **center of curvature.**

The circle of curvature gives you a nice way to estimate the curvature K at a point P on a curve graphically. Using a compass, you can sketch a circle that lies against the concave side of the curve at point P, as shown in Figure 12.36. If the circle has a radius of r, then you can estimate the curvature to be $K = 1/r$.

EXAMPLE 6 Finding Curvature in Rectangular Coordinates

Find the curvature of the parabola given by

$$y = x - \frac{1}{4}x^2$$

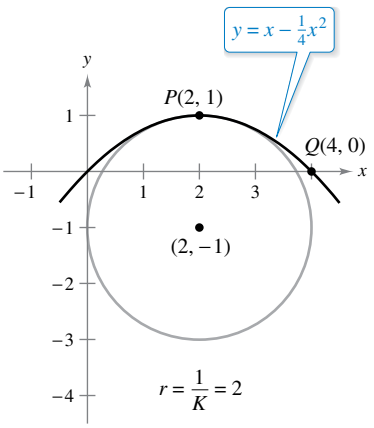
at $x = 2$. Sketch the circle of curvature at $(2, 1)$.

Solution The curvature at $x = 2$ is as follows.

$$y' = 1 - \frac{x}{2} \qquad y' = 0 \qquad \text{First derivative}$$

$$y'' = -\frac{1}{2} \qquad y'' = -\frac{1}{2} \qquad \text{Second derivative}$$

$$K = \frac{|y''|}{[1 + (y')^2]^{3/2}} \qquad K = \frac{1}{2} \qquad \text{Curvature}$$



The circle of curvature

Figure 12.37

Because the curvature at $P(2, 1)$ is $\frac{1}{2}$, it follows that the radius of the circle of curvature at that point is 2. So, the center of curvature is $(2, -1)$, as shown in Figure 12.37. [In the figure, note that the curve has the greatest curvature at P. Try showing that the curvature at $Q(4, 0)$ is $1/2^{5/2} \approx 0.177$.]

The amount of thrust felt by passengers in a car that is turning depends on two things—the speed of the car and the sharpness of the turn.
Figure 12.38

Arc length and curvature are closely related to the tangential and normal components of acceleration. The tangential component of acceleration is the rate of change of the speed, which in turn is the rate of change of the arc length. This component is negative as a moving object slows down and positive as it speeds up—regardless of whether the object is turning or traveling in a straight line. So, the tangential component is solely a function of the arc length and is independent of the curvature.

On the other hand, the normal component of acceleration is a function of *both* speed and curvature. This component measures the acceleration acting perpendicular to the direction of motion. To understand why the normal component is affected by both speed and curvature, imagine that you are driving a car around a turn, as shown in Figure 12.38. When your speed is high and the turn is sharp, you feel yourself thrown against the car door. By lowering your speed *or* taking a more gentle turn, you are able to lessen this sideways thrust.

The next theorem explicitly states the relationships among speed, curvature, and the components of acceleration.

REMARK Note that Theorem 12.10 gives additional formulas for $a_{\mathbf{T}}$ and $a_{\mathbf{N}}$.

THEOREM 12.10 Acceleration, Speed, and Curvature

If $\mathbf{r}(t)$ is the position vector for a smooth curve C, then the acceleration vector is given by

$$\mathbf{a}(t) = \frac{d^2s}{dt^2}\mathbf{T} + K\left(\frac{ds}{dt}\right)^2\mathbf{N}$$

where K is the curvature of C and ds/dt is the speed.

Proof For the position vector $\mathbf{r}(t)$, you have

$$\begin{aligned}\mathbf{a}(t) &= a_{\mathbf{T}}\mathbf{T} + a_{\mathbf{N}}\mathbf{N} \\ &= \frac{d}{dt}\left[\|\mathbf{v}\|\right]\mathbf{T} + \|\mathbf{v}\|\,\|\mathbf{T}'\|\mathbf{N} \\ &= \frac{d^2s}{dt^2}\mathbf{T} + \frac{ds}{dt}\left(\|\mathbf{v}\|K\right)\mathbf{N} \\ &= \frac{d^2s}{dt^2}\mathbf{T} + K\left(\frac{ds}{dt}\right)^2\mathbf{N}.\end{aligned}$$

EXAMPLE 7 Tangential and Normal Components of Acceleration

Find $a_{\mathbf{T}}$ and $a_{\mathbf{N}}$ for the curve given by

$$\mathbf{r}(t) = 2t\mathbf{i} + t^2\mathbf{j} - \tfrac{1}{3}t^3\mathbf{k}.$$

Solution From Example 5, you know that

$$\frac{ds}{dt} = \|\mathbf{r}'(t)\| = t^2 + 2 \quad \text{and} \quad K = \frac{2}{(t^2+2)^2}.$$

Therefore, the tangential component of acceleration is

$$a_{\mathbf{T}} = \frac{d^2s}{dt^2} = 2t \qquad \text{Tangential component}$$

and the normal component of acceleration is

$$a_{\mathbf{N}} = K\left(\frac{ds}{dt}\right)^2 = \frac{2}{(t^2+2)^2}(t^2+2)^2 = 2. \qquad \text{Normal component}$$

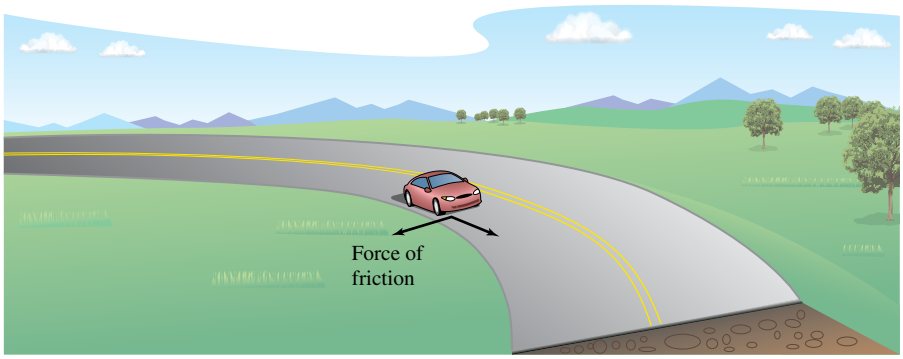
Application

There are many applications in physics and engineering dynamics that involve the relationships among speed, arc length, curvature, and acceleration. One such application concerns frictional force.

A moving object with mass m is in contact with a stationary object. The total force required to produce an acceleration $\mathbf{a}$ along a given path is

$$\begin{aligned}\mathbf{F} &= m\mathbf{a} \\ &= m\left(\frac{d^2s}{dt^2}\right)\mathbf{T} + mK\left(\frac{ds}{dt}\right)^2\mathbf{N} \\ &= ma_{\mathbf{T}}\mathbf{T} + ma_{\mathbf{N}}\mathbf{N}.\end{aligned}$$

The portion of this total force that is supplied by the stationary object is called the **force of friction.** For example, when a car moving with constant speed is rounding a turn, the roadway exerts a frictional force that keeps the car from sliding off the road. If the car is not sliding, the frictional force is perpendicular to the direction of motion and has magnitude equal to the normal component of acceleration, as shown in Figure 12.39. The potential frictional force of a road around a turn can be increased by banking the roadway.



The force of friction is perpendicular to the direction of motion.
Figure 12.39

EXAMPLE 8 Frictional Force

A 360-kilogram go-cart is driven at a speed of 60 kilometers per hour around a circular racetrack of radius 12 meters, as shown in Figure 12.40. To keep the cart from skidding off course, what frictional force must the track surface exert on the tires?

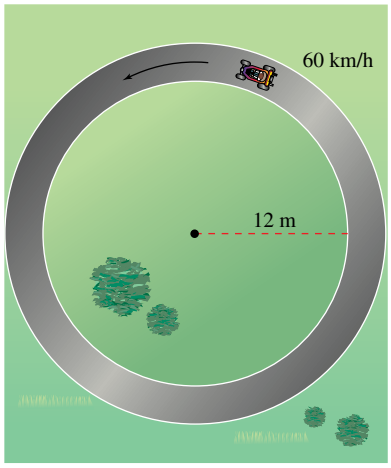


Figure 12.40

Solution The frictional force must equal the mass times the normal component of acceleration. For this circular path, you know that the curvature is

$$K = \frac{1}{12}.$$ Curvature of circular racetrack

So, the frictional force is

$$\begin{aligned}ma_{\mathbf{N}} &= mK\left(\frac{ds}{dt}\right)^2 \\ &= (360\text{ kg})\left(\frac{1}{12\text{ m}}\right)\left(\frac{60{,}000\text{ m}}{3600\text{ sec}}\right)^2 \\ &\approx 8333\ (\text{kg})(\text{m})/\text{sec}^2.\end{aligned}$$

Summary of Velocity, Acceleration, and Curvature

Unless noted otherwise, let C be a curve (in the plane or in space) given by the position vector

$$\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} \qquad \text{Curve in the plane}$$

or

$$\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k} \qquad \text{Curve in space}$$

where x, y, and z are twice-differentiable functions of t.

Velocity vector, speed, and acceleration vector

$$\mathbf{v}(t) = \mathbf{r}'(t) \qquad \text{Velocity vector}$$

$$\|\mathbf{v}(t)\| = \|\mathbf{r}'(t)\| = \frac{ds}{dt} \qquad \text{Speed}$$

$$\begin{aligned}\mathbf{a}(t) &= \mathbf{r}''(t) \qquad \text{Acceleration vector}\\ &= a_{\mathbf{T}}\mathbf{T}(t) + a_{\mathbf{N}}\mathbf{N}(t)\\ &= \frac{d^2s}{dt^2}\mathbf{T}(t) + K\left(\frac{ds}{dt}\right)^2\mathbf{N}(t) \qquad K \text{ is curvature and } \frac{ds}{dt} \text{ is speed.}\end{aligned}$$

Unit tangent vector and principal unit normal vector

$$\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|} \qquad \text{Unit tangent vector}$$

$$\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|} \qquad \text{Principal unit normal vector}$$

Components of acceleration

$$a_{\mathbf{T}} = \mathbf{a} \cdot \mathbf{T} = \frac{\mathbf{v} \cdot \mathbf{a}}{\|\mathbf{v}\|} = \frac{d^2s}{dt^2} \qquad \text{Tangential component of acceleration}$$

$$\begin{aligned}a_{\mathbf{N}} &= \mathbf{a} \cdot \mathbf{N} \qquad \text{Normal component of acceleration}\\ &= \frac{\|\mathbf{v} \times \mathbf{a}\|}{\|\mathbf{v}\|}\\ &= \sqrt{\|\mathbf{a}\|^2 - a_{\mathbf{T}}^2}\\ &= K\left(\frac{ds}{dt}\right)^2 \qquad K \text{ is curvature and } \frac{ds}{dt} \text{ is speed.}\end{aligned}$$

Formulas for curvature in the plane

$$K = \frac{|y''|}{[1 + (y')^2]^{3/2}} \qquad C \text{ given by } y = f(x)$$

$$K = \frac{|x'y'' - y'x''|}{[(x')^2 + (y')^2]^{3/2}} \qquad C \text{ given by } x = x(t),\ y = y(t)$$

Formulas for curvature in the plane or in space

$$K = \|\mathbf{T}'(s)\| = \|\mathbf{r}''(s)\| \qquad s \text{ is arc length parameter.}$$

$$K = \frac{\|\mathbf{T}'(t)\|}{\|\mathbf{r}'(t)\|} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} \qquad t \text{ is general parameter.}$$

$$K = \frac{\mathbf{a}(t) \cdot \mathbf{N}(t)}{\|\mathbf{v}(t)\|^2}$$

Cross product formulas apply only to curves in space.

Concept Check

1. Consider points P and Q on a curve. Explain what it means for the curvature at P to be less than the curvature at Q.
2. Let $\mathbf{r}(t)$ be a space curve. Explain how to determine whether t is the arc length parameter.

Finding the Arc Length of a Plane Curve **In Exercises 3–8, sketch the plane curve and find its length over the given interval.**

3. $\mathbf{r}(t) = 3t\mathbf{i} - t\mathbf{j}, \quad [0, 3]$
4. $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j}, \quad [0, 4]$
5. $\mathbf{r}(t) = t^3\mathbf{i} + t^2\mathbf{j}, \quad [0, 1]$
6. $\mathbf{r}(t) = t^2\mathbf{i} - 4t\mathbf{j}, \quad [0, 5]$
7. $\mathbf{r}(t) = a\cos^3 t\mathbf{i} + a\sin^3 t\mathbf{j}, \quad [0, 2\pi]$
8. $\mathbf{r}(t) = a\cos t\mathbf{i} + a\sin t\mathbf{j}, \quad [0, 2\pi]$
9. **Projectile Motion** The position of a baseball is represented by $\mathbf{r}(t) = 50\sqrt{2}t\mathbf{i} + (3 + 50\sqrt{2}t - 16t^2)\mathbf{j}$. Find the arc length of the trajectory of the baseball.
10. **Projectile Motion** The position of a baseball is represented by $\mathbf{r}(t) = 40\sqrt{3}t\mathbf{i} + (4 + 40t - 16t^2)\mathbf{j}$. Find the arc length of the trajectory of the baseball.

Finding the Arc Length of a Curve in Space **In Exercises 11–16, sketch the space curve and find its length over the given interval.**

11. $\mathbf{r}(t) = -t\mathbf{i} + 4t\mathbf{j} + 3t\mathbf{k}, \quad [0, 1]$
12. $\mathbf{r}(t) = \mathbf{i} + t^2\mathbf{j} + t^3\mathbf{k}, \quad [0, 2]$
13. $\mathbf{r}(t) = \langle 4t, -\cos t, \sin t\rangle, \quad \left[0, \frac{3\pi}{2}\right]$
14. $\mathbf{r}(t) = \langle 2\sin t, 5t, 2\cos t\rangle, \quad [0, \pi]$
15. $\mathbf{r}(t) = a\cos t\mathbf{i} + a\sin t\mathbf{j} + bt\mathbf{k}, \quad [0, 2\pi]$
16. $\mathbf{r}(t) = \langle \cos t + t\sin t, \sin t - t\cos t, t^2\rangle, \quad \left[0, \frac{\pi}{2}\right]$
17. **Investigation** Consider the graph of the vector-valued function $\mathbf{r}(t) = t\mathbf{i} + (4 - t^2)\mathbf{j} + t^3\mathbf{k}$ on the interval $[0, 2]$.
    (a) Approximate the length of the curve by finding the length of the line segment connecting its endpoints.
    (b) Approximate the length of the curve by summing the lengths of the line segments connecting the terminal points of the vectors $\mathbf{r}(0)$, $\mathbf{r}(0.5)$, $\mathbf{r}(1)$, $\mathbf{r}(1.5)$, and $\mathbf{r}(2)$.
    (c) Describe how you could obtain a more accurate approximation by continuing the processes in parts (a) and (b).
    (d) Use the integration capabilities of a graphing utility to approximate the length of the curve. Compare this result with the answers in parts (a) and (b).
18. **Investigation** Consider the helix represented by the vector-valued function $\mathbf{r}(t) = \langle 2\cos t, 2\sin t, t\rangle$.
    (a) Write the length of the arc s on the helix as a function of t by evaluating the integral
    $$s = \int_0^t \sqrt{[x'(u)]^2 + [y'(u)]^2 + [z'(u)]^2}\, du.$$
    (b) Solve for t in the relationship derived in part (a), and substitute the result into the original vector-valued function. This yields a parametrization of the curve in terms of the arc length parameter s.
    (c) Find the coordinates of the point on the helix for arc lengths $s = \sqrt{5}$ and $s = 4$.
    (d) Verify that $\|\mathbf{r}'(s)\| = 1$.

Finding Curvature **In Exercises 19–22, find the curvature of the curve, where s is the arc length parameter.**

19. $\mathbf{r}(s) = \left(1 + \frac{\sqrt{2}}{2}s\right)\mathbf{i} + \left(1 - \frac{\sqrt{2}}{2}s\right)\mathbf{j}$
20. $\mathbf{r}(s) = (3 + s)\mathbf{i} + \mathbf{j}$
21. $\mathbf{r}(s) = \cos\frac{1}{2}s\mathbf{i} + \frac{\sqrt{3}}{2}s\mathbf{j} + \sin\frac{1}{2}s\mathbf{k}$
22. $\mathbf{r}(s) = \cos s\mathbf{i} + \sin s\mathbf{j} + 5\mathbf{k}$

Finding Curvature **In Exercises 23–28, find the curvature of the plane curve at the given value of the parameter.**

23. $\mathbf{r}(t) = 4t\mathbf{i} - 2t\mathbf{j}, \quad t = 1$
24. $\mathbf{r}(t) = t^2\mathbf{i} + \mathbf{j}, \quad t = 2$
25. $\mathbf{r}(t) = t\mathbf{i} + \frac{1}{t}\mathbf{j}, \quad t = 1$
26. $\mathbf{r}(t) = t\mathbf{i} + \frac{1}{9}t^3\mathbf{j}, \quad t = 2$
27. $\mathbf{r}(t) = \langle t, \sin t\rangle, \quad t = \frac{\pi}{2}$
28. $\mathbf{r}(t) = \langle 5\cos t, 4\sin t\rangle, \quad t = \frac{\pi}{3}$

Finding Curvature **In Exercises 29–36, find the curvature of the curve.**

29. $\mathbf{r}(t) = 4\cos 2\pi t\mathbf{i} + 4\sin 2\pi t\mathbf{j}$
30. $\mathbf{r}(t) = 2\cos \pi t\mathbf{i} + \sin \pi t\mathbf{j}$
31. $\mathbf{r}(t) = a\cos \omega t\mathbf{i} + a\sin \omega t\mathbf{j}$
32. $\mathbf{r}(t) = a\cos \omega t\mathbf{i} + b\sin \omega t\mathbf{j}$
33. $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + \frac{t^2}{2}\mathbf{k}$
34. $\mathbf{r}(t) = 2t^2\mathbf{i} + t\mathbf{j} + \frac{1}{2}t^2\mathbf{k}$
35. $\mathbf{r}(t) = 4t\mathbf{i} + 3\cos t\mathbf{j} + 3\sin t\mathbf{k}$
36. $\mathbf{r}(t) = e^{2t}\mathbf{i} + e^{2t}\cos t\mathbf{j} + e^{2t}\sin t\mathbf{k}$

Finding Curvature **In Exercises 37–40, find the curvature of the curve at the point P.**

37. $\mathbf{r}(t) = 3t\mathbf{i} + 2t^2\mathbf{j}, \quad P(-3, 2)$

38. $\mathbf{r}(t) = e^t\mathbf{i} + 4t\mathbf{j}, \quad P(1, 0)$

39. $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + \frac{t^3}{4}\mathbf{k}, \quad P(2, 4, 2)$

40. $\mathbf{r}(t) = e^t \cos t\mathbf{i} + e^t \sin t\mathbf{j} + e^t\mathbf{k}, \quad P(1, 0, 1)$

Finding Curvature in Rectangular Coordinates **In Exercises 41–48, find the curvature and radius of curvature of the plane curve at the given value of x.**

41. $y = 6x, \quad x = 3$

42. $y = x - \frac{4}{x}, \quad x = 2$

43. $y = 5x^2 + 7, \quad x = -1$

44. $y = 2\sqrt{9 - x^2}, \quad x = 0$

45. $y = \sin 2x, \quad x = \frac{\pi}{4}$

46. $y = e^{-x/4}, \quad x = 8$

47. $y = x^3, \quad x = 2$

48. $y = x^n, \quad x = 1, \quad n \geq 2$

Maximum Curvature **In Exercises 49–54, (a) find the point on the curve at which the curvature is a maximum and (b) find the limit of the curvature as $x \to \infty$.**

49. $y = (x - 1)^2 + 3$

50. $y = x^3$

51. $y = x^{2/3}$

52. $y = \frac{1}{x}$

53. $y = \ln x$

54. $y = e^x$

Curvature **In Exercises 55–58, find all points on the graph of the function such that the curvature is zero.**

55. $y = 1 - x^4$

56. $y = (x - 2)^6 + 3x$

57. $y = \cos\frac{x}{2}$

58. $y = \sin x$

Exploring Concepts

59. Consider the function $f(x) = e^{cx}$. What value(s) of c produce a maximum curvature at $x = 0$?

60. Given a twice-differentiable function $y = f(x)$, determine its curvature at a relative extremum. Can the curvature ever be greater than it is at a relative extremum? Explain.

61. Investigation Consider the function $f(x) = x^4 - x^2$.

(a) Use a graphing utility to find the curvature K of the curve as a function of x.

(b) Use the result of part (a) to find the circles of curvature to the graph of f when $x = 0$ and $x = 1$. Use a graphing utility to graph the function and the two circles of curvature.

(c) Graph the function $K(x)$ and compare it with the graph of $f(x)$. For example, do the extrema of f and K occur at the same critical numbers? Explain your reasoning.

62. Motion of a Particle A particle moves along the plane curve C described by $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j}$.

(a) Find the length of C on the interval $0 \leq t \leq 2$.

(b) Find the curvature of C at $t = 0$, $t = 1$, and $t = 2$.

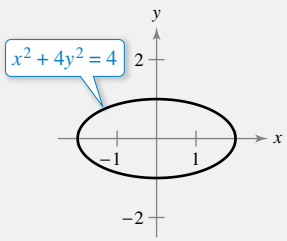
(c) Describe the curvature of C as t changes from $t = 0$ to $t = 2$.

63. Investigation Find all a and b such that the two curves given by

$$y_1 = ax(b - x) \quad \text{and} \quad y_2 = \frac{x}{x + 2}$$

intersect at only one point and have a common tangent line and equal curvature at that point. Sketch a graph for each set of values of a and b.

64. HOW DO YOU SEE IT? Using the graph of the ellipse, at what point(s) is the curvature the least and the greatest?



65. Sphere and Paraboloid A sphere of radius 4 is dropped into the paraboloid given by $z = x^2 + y^2$.

(a) How close will the sphere come to the vertex of the paraboloid?

(b) What is the radius of the largest sphere that will touch the vertex?

66. Speed

The smaller the curvature of a bend in a road, the faster a car can travel. Assume that the maximum speed around a turn is inversely proportional to the square root of the curvature. A car moving on the path $y = \frac{1}{3}x^3$, where x and y are measured in miles, can safely go 30 miles per hour at $\left(1, \frac{1}{3}\right)$. How fast can it go at $\left(\frac{3}{2}, \frac{9}{8}\right)$?

67. Center of Curvature Let C be a curve given by $y = f(x)$. Let K be the curvature $(K \neq 0)$ at the point $P(x_0, y_0)$ and let

$$z = \frac{1 + f'(x_0)^2}{f''(x_0)}.$$

Show that the coordinates (α, β) of the center of curvature at P are $(\alpha, \beta) = (x_0 - f'(x_0)z, y_0 + z)$.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

68. Center of Curvature Use the result of Exercise 67 to find the center of curvature for the curve at the given point.

(a) $y = e^x$, $(0, 1)$ (b) $y = \frac{x^2}{2}$, $\left(1, \frac{1}{2}\right)$ (c) $y = x^2$, $(0, 0)$

69. Curvature A curve C is given by the polar equation $r = f(\theta)$. Show that the curvature K at the point (r, θ) is

$$K = \frac{|2(r')^2 - rr'' + r^2|}{[(r')^2 + r^2]^{3/2}}.$$

[*Hint:* Represent the curve by $\mathbf{r}(\theta) = r\cos\theta\mathbf{i} + r\sin\theta\mathbf{j}$.]

70. Curvature Use the result of Exercise 69 to find the curvature of each polar curve.

(a) $r = 1 + \sin\theta$ (b) $r = \theta$

(c) $r = a\sin\theta$ (d) $r = e^{\theta}$

71. Curvature Given the polar curve $r = e^{a\theta}$, $a > 0$, use the result of Exercise 69 to find the curvature K and determine the limit of K as (a) $\theta \to \infty$ and (b) $a \to \infty$.

72. Curvature at the Pole Show that the formula for the curvature of a polar curve $r = f(\theta)$ given in Exercise 69 reduces to $K = 2/|r'|$ for the curvature at the pole.

Curvature at the Pole **In Exercises 73 and 74, use the result of Exercise 72 to find the curvature of the rose curve at the pole.**

73. $r = 4\sin 2\theta$ **74.** $r = \cos 3\theta$

75. Proof For a smooth curve given by the parametric equations $x = f(t)$ and $y = g(t)$, prove that the curvature is given by

$$K = \frac{|f'(t)g''(t) - g'(t)f''(t)|}{\{[f'(t)]^2 + [g'(t)]^2\}^{3/2}}.$$

76. Horizontal Asymptotes Use the result of Exercise 75 to find the curvature K of the curve represented by the parametric equations $x(t) = t^3$ and $y(t) = \frac{1}{2}t^2$. Use a graphing utility to graph K and determine any horizontal asymptotes. Interpret the asymptotes in the context of the problem.

77. Curvature of a Cycloid Use the result of Exercise 75 to find the curvature K of the cycloid represented by the parametric equations

$$x(\theta) = a(\theta - \sin\theta) \quad \text{and} \quad y(\theta) = a(1 - \cos\theta).$$

What are the minimum and maximum values of K?

78. Tangential and Normal Components of Acceleration Use Theorem 12.10 to find $a_{\mathbf{T}}$ and $a_{\mathbf{N}}$ for each curve given by the vector-valued function.

(a) $\mathbf{r}(t) = 3t^2\mathbf{i} + (3t - t^3)\mathbf{j}$

(b) $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + \frac{1}{2}t^2\mathbf{k}$

79. Frictional Force A 5500-pound vehicle is driven at a speed of 30 miles per hour on a circular interchange of radius 100 feet. To keep the vehicle from skidding off course, what frictional force must the road surface exert on the tires?

80. Frictional Force A 6400-pound vehicle is driven at a speed of 35 miles per hour on a circular interchange of radius 250 feet. To keep the vehicle from skidding off course, what frictional force must the road surface exert on the tires?

81. Curvature Verify that the curvature at any point (x, y) on the graph of $y = \cosh x$ is $1/y^2$.

82. Formulas for Curvature Use the definition of curvature in space, $K = \|\mathbf{T}'(s)\| = \|\mathbf{r}''(s)\|$, to verify each formula.

(a) $K = \dfrac{\|\mathbf{T}'(t)\|}{\|\mathbf{r}'(t)\|}$

(b) $K = \dfrac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3}$

(c) $K = \dfrac{\mathbf{a}(t) \cdot \mathbf{N}(t)}{\|\mathbf{v}(t)\|^2}$

True or False? **In Exercises 83–86, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

83. The arc length of a space curve depends on the parametrization.

84. The curvature of a plane curve at an inflection point is zero.

85. The curvature of a parabola is a maximum at its vertex.

86. The normal component of acceleration is a function of both speed and curvature.

Kepler's Laws **In Exercises 87–94, you are asked to verify Kepler's Laws of Planetary Motion. For these exercises, assume that each planet moves in an orbit given by the vector-valued function r. Let $r = \|\mathbf{r}\|$, let G represent the universal gravitational constant, let M represent the mass of the sun, and let m represent the mass of the planet.**

87. Prove that $\mathbf{r} \cdot \mathbf{r}' = r\dfrac{dr}{dt}$.

88. Using Newton's Second Law of Motion, $\mathbf{F} = m\mathbf{a}$, and Newton's Second Law of Gravitation

$$\mathbf{F} = -\frac{GmM}{r^3}\mathbf{r}$$

show that $\mathbf{a}$ and $\mathbf{r}$ are parallel, and that $\mathbf{r}(t) \times \mathbf{r}'(t) = \mathbf{L}$ is a constant vector. So, $\mathbf{r}(t)$ moves *in a fixed plane,* orthogonal to $\mathbf{L}$.

89. Prove that $\dfrac{d}{dt}\left[\dfrac{\mathbf{r}}{r}\right] = \dfrac{1}{r^3}[(\mathbf{r} \times \mathbf{r}') \times \mathbf{r}]$.

90. Show that $\dfrac{\mathbf{r}'}{GM} \times \mathbf{L} - \dfrac{\mathbf{r}}{r} = \mathbf{e}$ is a constant vector.

91. Prove Kepler's First Law: Each planet moves in an elliptical orbit with the sun as a focus.

92. Assume that the elliptical orbit

$$r = \frac{ed}{1 + e\cos\theta}$$

is in the xy-plane, with $\mathbf{L}$ along the z-axis. Prove that

$$\|\mathbf{L}\| = r^2\frac{d\theta}{dt}.$$

93. Prove Kepler's Second Law: Each ray from the sun to a planet sweeps out equal areas of the ellipse in equal times.

94. Prove Kepler's Third Law: The square of the period of a planet's orbit is proportional to the cube of the mean distance between the planet and the sun.

Exploring Concepts

This chapter combined your knowledge of vectors with that of functions. For a real-valued function f, the derivative $f'(x)$ is a scalar that indicates the rate of change of f at x. Contrast this with a vector-valued function $\mathbf{r}(t)$, where the derivative $\mathbf{r}'(t)$ is a vector that indicates the magnitude *and* the rate of change of $\mathbf{r}$ at t. The calculus of real-valued functions, limits, derivatives, and integrals also applies to vector-valued functions. One of the most important applications of vector-valued functions is modeling velocity and acceleration, whether in a plane or in space.

Vector	In the Plane	In Space
Position	$\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}$	$\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$
Velocity	$\mathbf{v}(t) = x'(t)\mathbf{i} + y'(t)\mathbf{j}$	$\mathbf{v}(t) = x'(t)\mathbf{i} + y'(t)\mathbf{j} + z'(t)\mathbf{k}$
Acceleration	$\mathbf{a}(t) = x''(t)\mathbf{i} + y''(t)\mathbf{j}$	$\mathbf{a}(t) = x''(t)\mathbf{i} + y''(t)\mathbf{j} + z''(t)\mathbf{k}$

Vector-valued functions are also useful when investigating the features of space curves, such as arc length, curvature, and tangent and normal vectors.

1. In your own words, describe the domain and range of a vector-valued function.

2. Define the derivative of a vector-valued function.

3. Explain how a particle can be accelerating even though its speed is constant.

4. Consider the vector-valued function

$\mathbf{r}(t) = t\mathbf{i} + (4 - t^2)\mathbf{j}$.

(a) Sketch the graph of $\mathbf{r}(t)$. Use a graphing utility to verify your sketch.

(b) Sketch the vectors $\mathbf{r}(1)$, $\mathbf{r}(1.25)$, and $\mathbf{r}(1.25) - \mathbf{r}(1)$ on the graph in part (a).

(c) Compare the vector $\mathbf{r}'(1)$ with the vector

$$\frac{\mathbf{r}(1.25) - \mathbf{r}(1)}{1.25 - 1}.$$

5. Two circles of curvature to the graph of $f(x) = \sin x$ are shown in the figure. (a) Find the equation of the smaller circle, and (b) write a short paragraph explaining why the circles have different radii.

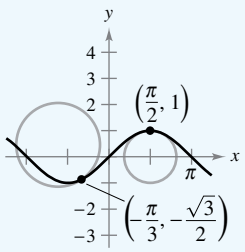

Figure for 5

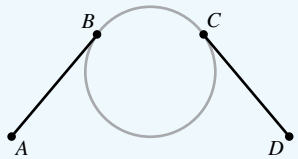

Figure for 6

6. A civil engineer designs a highway as shown in the figure. BC is an arc of the circle. AB and CD are straight lines tangent to the circular arc. Criticize the design.

Domain and Continuity

In Exercises 7–10, (a) find the domain of r, and (b) determine the interval(s) on which the function is continuous.

7. $\mathbf{r}(t) = \tan t\mathbf{i} + \mathbf{j} + t\mathbf{k}$

8. $\mathbf{r}(t) = \sqrt{t}\mathbf{i} + \dfrac{1}{t-4}\mathbf{j} + \mathbf{k}$

9. $\mathbf{r}(t) = \sqrt{t^2 - 9}\mathbf{i} - \mathbf{j} + \ln(t-1)\mathbf{k}$

10. $\mathbf{r}(t) = (2t+1)\mathbf{i} + t^2\mathbf{j} + t\mathbf{k}$

Evaluating a Function

In Exercises 11 and 12, evaluate the vector-valued function at each given value of t.

11. $\mathbf{r}(t) = (2t+1)\mathbf{i} + t^2\mathbf{j} - \sqrt{t+2}\mathbf{k}$

(a) $\mathbf{r}(0)$ (b) $\mathbf{r}(-2)$ (c) $\mathbf{r}(c-1)$

(d) $\mathbf{r}(1 + \Delta t) - \mathbf{r}(1)$

12. $\mathbf{r}(t) = 3\cos t\mathbf{i} + (1 - \sin t)\mathbf{j} - t\mathbf{k}$

(a) $\mathbf{r}(0)$ (b) $\mathbf{r}\left(\dfrac{\pi}{2}\right)$ (c) $\mathbf{r}(s - \pi)$

(d) $\mathbf{r}(\pi + \Delta t) - \mathbf{r}(\pi)$

Writing a Vector-Valued Function

In Exercises 13 and 14, represent the line segment from P to Q by a vector-valued function and by a set of parametric equations.

13. $P(3, 0, 5)$, $Q(2, -2, 3)$ **14.** $P(-2, -3, 8)$, $Q(5, 1, -2)$

Sketching a Curve

In Exercises 15–18, sketch the curve represented by the vector-valued function and give the orientation of the curve.

15. $\mathbf{r}(t) = \langle \pi\cos t, \pi\sin t \rangle$ **16.** $\mathbf{r}(t) = \langle t + 2, t^2 - 1 \rangle$

17. $\mathbf{r}(t) = (t+1)\mathbf{i} + (3t-1)\mathbf{j} + 2t\mathbf{k}$

18. $\mathbf{r}(t) = 2\cos t\mathbf{i} + t\mathbf{j} + 2\sin t\mathbf{k}$

Representing a Graph by a Vector-Valued Function

In Exercises 19 and 20, represent the plane curve by a vector-valued function. (There are many correct answers.)

19. $3x + 4y - 12 = 0$ **20.** $y = 9 - x^2$

Representing a Graph by a Vector-Valued Function

In Exercises 21 and 22, sketch the space curve represented by the intersection of the surfaces. Then use the parameter $x = t$ to find a vector-valued function for the space curve.

21. $z = x^2 + y^2, \quad y = 2$ **22.** $x^2 + z^2 = 4, \quad x - y = 0$

Finding a Limit

In Exercises 23 and 24, find the limit.

23. $\lim_{t\to 3}\left(\sqrt{3-t}\,\mathbf{i} + \ln t\,\mathbf{j} - \frac{1}{t}\mathbf{k}\right)$

24. $\lim_{t\to 0}\left(\frac{\sin 2t}{t}\mathbf{i} + e^{-t}\mathbf{j} + 4\mathbf{k}\right)$

Higher-Order Differentiation

In Exercises 25 and 26, find (a) $\mathbf{r}'(t)$, (b) $\mathbf{r}''(t)$, and (c) $\mathbf{r}'(t) \cdot \mathbf{r}''(t)$.

25. $\mathbf{r}(t) = (t^2 + 4t)\mathbf{i} - 3t^2\mathbf{j}$ **26.** $\mathbf{r}(t) = 5\cos t\,\mathbf{i} + 2\sin t\,\mathbf{j}$

Higher-Order Differentiation

In Exercises 27 and 28, find (a) $\mathbf{r}'(t)$, (b) $\mathbf{r}''(t)$, (c) $\mathbf{r}'(t) \cdot \mathbf{r}''(t)$, and (d) $\mathbf{r}'(t) \times \mathbf{r}''(t)$.

27. $\mathbf{r}(t) = 2t^3\mathbf{i} + 4t\mathbf{j} - t^2\mathbf{k}$

28. $\mathbf{r}(t) = (4t + 3)\mathbf{i} + t^2\mathbf{j} + (2t^2 + 4)\mathbf{k}$

Finding Intervals on Which a Curve Is Smooth

In Exercises 29 and 30, find all open intervals on which the curve given by the vector-valued function is smooth.

29. $\mathbf{r}(t) = (t - 1)^3\mathbf{i} + (t - 1)^4\mathbf{j}$

30. $\mathbf{r}(t) = \frac{t}{t-2}\mathbf{i} + t\mathbf{j} + \sqrt{1+t}\,\mathbf{k}$

Using Properties of the Derivative

In Exercises 31 and 32, use the properties of the derivative to find the following.

(a) $\mathbf{r}'(t)$ **(b)** $\frac{d}{dt}[\mathbf{u}(t) - 2\mathbf{r}(t)]$ **(c)** $\frac{d}{dt}[(3t)\mathbf{r}(t)]$

(d) $\frac{d}{dt}[\mathbf{r}(t) \cdot \mathbf{u}(t)]$ **(e)** $\frac{d}{dt}[\mathbf{r}(t) \times \mathbf{u}(t)]$ **(f)** $\frac{d}{dt}[\mathbf{u}(2t)]$

31. $\mathbf{r}(t) = 3t\mathbf{i} + (t - 1)\mathbf{j}, \quad \mathbf{u}(t) = t\mathbf{i} + t^2\mathbf{j} + \frac{2}{3}t^3\mathbf{k}$

32. $\mathbf{r}(t) = \sin t\,\mathbf{i} + \cos t\,\mathbf{j} + t\mathbf{k}, \quad \mathbf{u}(t) = \sin t\,\mathbf{i} + \cos t\,\mathbf{j} + \frac{1}{t}\mathbf{k}$

Finding an Indefinite Integral

In Exercises 33–36, find the indefinite integral.

33. $\int (t^2\mathbf{i} + 5t\mathbf{j} + 8t^3\mathbf{k})\,dt$

34. $\int (6\mathbf{i} - 2t\mathbf{j} + \ln t\,\mathbf{k})\,dt$

35. $\int \left(3\sqrt{t}\,\mathbf{i} + \frac{2}{t}\mathbf{j} + \mathbf{k}\right)dt$

36. $\int (\sin t\,\mathbf{i} + \mathbf{j} + e^{2t}\,\mathbf{k})\,dt$

Evaluating a Definite Integral

In Exercises 37–40, evaluate the definite integral.

37. $\int_{-2}^{2} (3t\mathbf{i} + 2t^2\mathbf{j} - t^3\mathbf{k})\,dt$ **38.** $\int_{0}^{3} \left(t\mathbf{i} + \sqrt{t}\,\mathbf{j} + 4t\mathbf{k}\right)dt$

39. $\int_{0}^{2} (e^{t/2}\mathbf{i} - 3t^2\mathbf{j} - \mathbf{k})\,dt$

40. $\int_{0}^{\pi/3} (2\cos t\,\mathbf{i} + \sin t\,\mathbf{j} + 3\mathbf{k})\,dt$

Finding an Antiderivative

In Exercises 41 and 42, find $\mathbf{r}(t)$ that satisfies the initial condition.

41. $\mathbf{r}'(t) = 2t\mathbf{i} + e^t\mathbf{j} + e^{-t}\mathbf{k}, \quad \mathbf{r}(0) = \mathbf{i} + 3\mathbf{j} - 5\mathbf{k}$

42. $\mathbf{r}'(t) = \sec t\,\mathbf{i} + \tan t\,\mathbf{j} + t^2\mathbf{k}, \quad r(0) = 3\mathbf{k}$

Finding Velocity and Acceleration Vectors in Space

In Exercises 43–46, the position vector $\mathbf{r}$ describes the path of an object moving in space. (a) Find the velocity vector, speed, and acceleration vector of the object. (b) Evaluate the velocity vector and acceleration vector of the object at the given value of t.

	Position Vector	Time
43.	$\mathbf{r}(t) = 4t\mathbf{i} + t^3\mathbf{j} - t\mathbf{k}$	$t = 1$
44.	$\mathbf{r}(t) = \sqrt{t}\,\mathbf{i} + 5t\mathbf{j} + 2t^2\mathbf{k}$	$t = 4$
45.	$\mathbf{r}(t) = \langle \cos^3 t, \sin^3 t, 3t\rangle$	$t = \pi$
46.	$\mathbf{r}(t) = \langle t, -\tan t, e^t\rangle$	$t = 0$

Projectile Motion

In Exercises 47 and 48, use the model for projectile motion, assuming there is no air resistance and $g = 32$ feet per second per second.

47. A baseball is hit from a height of 3.5 feet above the ground with an initial speed of 120 feet per second and at an angle of 30° above the horizontal. Find the maximum height reached by the baseball. Determine whether it will clear an eight-foot-high fence located 375 feet from home plate.

48. Determine the maximum height and range of a projectile fired at a height of 6 feet above the ground with an initial speed of 400 feet per second and an angle of 60° above the horizontal.

Finding the Unit Tangent Vector

In Exercises 49 and 50, find the unit tangent vector to the curve at the specified value of the parameter.

49. $\mathbf{r}(t) = 6t\mathbf{i} - t^2\mathbf{j}, \quad t = 2$

50. $\mathbf{r}(t) = 2\sin t\,\mathbf{i} + 4\cos t\,\mathbf{j}, \quad t = \pi/6$

Finding a Tangent Line

In Exercises 51 and 52, find the unit tangent vector $\mathbf{T}(t)$ and a set of parametric equations for the tangent line to the space curve at point P.

51. $\mathbf{r}(t) = e^{2t}\mathbf{i} + \cos t\,\mathbf{j} - \sin 3t\,\mathbf{k}, \quad P(1, 1, 0)$

52. $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + \frac{2}{3}t^3\mathbf{k}, \quad P\left(2, 4, \frac{16}{3}\right)$

Finding the Principal Unit Normal Vector

In Exercises 53–56, find the principal unit normal vector to the curve at the specified value of the parameter.

53. $\mathbf{r}(t) = 2t\mathbf{i} + 3t^2\mathbf{j}, \quad t = 1$ **54.** $\mathbf{r}(t) = t\mathbf{i} + \ln t\,\mathbf{j}, \quad t = 2$

55. $\mathbf{r}(t) = 3\cos 2t\mathbf{i} + 3\sin 2t\mathbf{j} + 3\mathbf{k}, \quad t = \dfrac{\pi}{4}$

56. $\mathbf{r}(t) = 4\cos t\mathbf{i} + 4\sin t\mathbf{j} + \mathbf{k}, \quad t = \dfrac{2\pi}{3}$

Finding Tangential and Normal Components of Acceleration **In Exercises 57 and 58, find the tangential and normal components of acceleration at the given time t for the plane curve $\mathbf{r}(t)$.**

57. $\mathbf{r}(t) = \dfrac{3}{t}\mathbf{i} - 6t\mathbf{j}, \quad t = 3$

58. $\mathbf{r}(t) = 3\cos 2t\mathbf{i} + 3\sin 2t\mathbf{j}, \quad t = \dfrac{\pi}{6}$

Finding Tangential and Normal Components of Acceleration **In Exercises 59 and 60, find the tangential and normal components of acceleration at the given time t for the space curve $\mathbf{r}(t)$.**

59. $\mathbf{r}(t) = \sin t\mathbf{i} - 3t\mathbf{j} + \cos t\mathbf{k}, \quad t = \dfrac{\pi}{6}$

60. $\mathbf{r}(t) = \dfrac{t^3}{3}\mathbf{i} - 6t\mathbf{j} + t^2\mathbf{k}, \quad t = 2$

Finding the Arc Length of a Plane Curve **In Exercises 61–64, sketch the plane curve and find its length over the given interval.**

61. $\mathbf{r}(t) = 2t\mathbf{i} - 3t\mathbf{j}, \quad [0, 5]$

62. $\mathbf{r}(t) = t^2\mathbf{i} + 2t\mathbf{k}, \quad [0, 3]$

63. $\mathbf{r}(t) = 2\sin t\mathbf{i} + \mathbf{j}, \quad \left[\dfrac{\pi}{2}, \pi\right]$

64. $\mathbf{r}(t) = 10\cos t\mathbf{i} + 10\sin t\mathbf{j}, \quad [0, 2\pi]$

Finding the Arc Length of a Curve in Space **In Exercises 65–68, sketch the space curve and find its length over the given interval.**

65. $\mathbf{r}(t) = -3t\mathbf{i} + 2t\mathbf{j} + 4t\mathbf{k}, \quad [0, 3]$

66. $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + 2t\mathbf{k}, \quad [0, 2]$

67. $\mathbf{r}(t) = \langle 8\cos t, 8\sin t, t\rangle, \quad \left[0, \dfrac{\pi}{2}\right]$

68. $\mathbf{r}(t) = \langle 2(\sin t - t\cos t), 2(\cos t + t\sin t), t\rangle, \quad \left[0, \dfrac{\pi}{2}\right]$

Finding Curvature **In Exercises 69–72, find the curvature of the curve.**

69. $\mathbf{r}(t) = 3t\mathbf{i} + 2t\mathbf{j}$

70. $\mathbf{r}(t) = 2\sqrt{t}\mathbf{i} + 3t\mathbf{j}$

71. $\mathbf{r}(t) = 2t\mathbf{i} + \frac{1}{2}t^2\mathbf{j} + t^2\mathbf{k}$

72. $\mathbf{r}(t) = 2t\mathbf{i} + 5\cos t\mathbf{j} + 5\sin t\mathbf{k}$

Finding Curvature **In Exercises 73 and 74, find the curvature of the curve at the point P.**

73. $\mathbf{r}(t) = \frac{1}{2}t^2\mathbf{i} + t\mathbf{j} + \frac{1}{3}t^3\mathbf{k}, \quad P\left(\frac{1}{2}, 1, \frac{1}{3}\right)$

74. $\mathbf{r}(t) = 4\cos t\mathbf{i} + 3\sin t\mathbf{j} + t\mathbf{k}, \quad P(-4, 0, \pi)$

Finding Curvature in Rectangular Coordinates **In Exercises 75–78, find the curvature and radius of curvature of the plane curve at the given value of x.**

75. $y = \frac{1}{2}x^2 + x, \quad x = 4$

76. $y = e^{-x/2}, \quad x = 0$

77. $y = \ln x, \quad x = 1$

78. $y = \tan x, \quad x = \dfrac{\pi}{4}$

Building on Concepts

In Exercises 79–81, use the *binormal vector* defined by the equation $\mathbf{B} = \mathbf{T} \times \mathbf{N}$.

79. Find the unit tangent, principal unit normal, and binormal vectors for the helix

$\mathbf{r}(t) = 4\cos t\mathbf{i} + 4\sin t\mathbf{j} + 3t\mathbf{k}$

at $t = \pi/2$. Sketch the helix together with these three mutually orthogonal unit vectors.

80. Find the unit tangent, principal unit normal, and binormal vectors for the curve

$\mathbf{r}(t) = \cos t\mathbf{i} + \sin t\mathbf{j} - \mathbf{k}$

at $t = \pi/4$. Sketch the curve together with these three mutually orthogonal unit vectors.

81. (a) Prove that there exists a scalar τ, called the **torsion,** such that $d\mathbf{B}/ds = -\tau\mathbf{N}$.

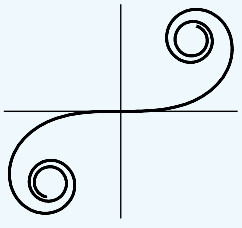
(b) Prove that $d\mathbf{N}/ds = -K\mathbf{T} + \tau\mathbf{B}$.

(The three equations $d\mathbf{T}/ds = K\mathbf{N}$, $d\mathbf{N}/ds = -K\mathbf{T} + \tau\mathbf{B}$, and $d\mathbf{B}/ds = -\tau\mathbf{N}$ are called the *Frenet-Serret formulas*.)

82. The **cornu spiral** is given by

$$x(t) = \int_0^t \cos\left(\frac{\pi u^2}{2}\right) du \quad \text{and} \quad y(t) = \int_0^t \sin\left(\frac{\pi u^2}{2}\right) du.$$

The spiral shown in the figure was graphed over the interval $-\pi \le t \le \pi$.



Generated by Mathematica

(a) Find the arc length of this curve from $t = 0$ to $t = a$.

(b) Find the curvature of the graph when $t = a$.

(c) The cornu spiral was discovered by James Bernoulli. He found that the spiral has an amazing relationship between curvature and arc length. What is this relationship?

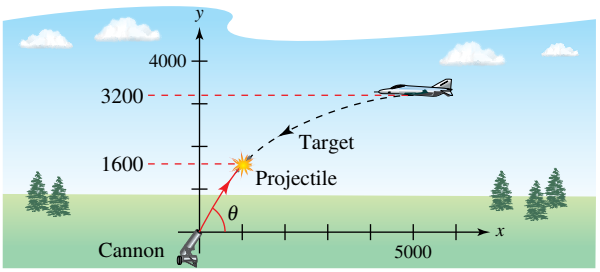
P.S. Problem Solving

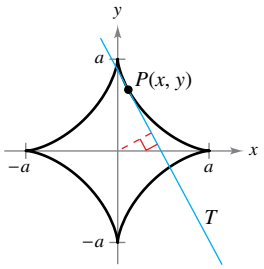
See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

1. Projectile Motion During an air show, a plane is flying horizontally at an altitude of 3200 feet with a speed of 400 feet per second when it releases a heavy target. A projectile is launched 5 seconds later from a cannon at a site facing the plane and 5000 feet from the point that was directly beneath the plane when the target was released, as shown in the figure. The projectile is to intercept the target at an altitude of 1600 feet. Determine the required initial speed and angle of inclination of the projectile. (Ignore air resistance.)



2. Radius of Curvature Let T be the tangent line at the point $P(x, y)$ on the graph of the curve $x^{2/3} + y^{2/3} = a^{2/3}$, $a > 0$, as shown in the figure. Show that the radius of curvature at P is three times the distance from the origin to the tangent line T.



3. Proof If $\mathbf{r}(t)$ is a nonzero differentiable function of t, prove that

$$\frac{d}{dt}\left[\|\mathbf{r}(t)\|\right] = \frac{\mathbf{r}(t) \cdot \mathbf{r}'(t)}{\|\mathbf{r}(t)\|}.$$

4. Satellite A communications satellite moves in a circular orbit around Earth at a distance of 42,000 kilometers from the center of Earth. The angular speed

$$\frac{d\theta}{dt} = \omega = \frac{\pi}{12} \text{ radian per hour}$$

is constant.

(a) Use polar coordinates to show that the acceleration vector is given by

$$\mathbf{a} = \frac{d^2\mathbf{r}}{dt^2} = \left[\frac{d^2r}{dt^2} - r\left(\frac{d\theta}{dt}\right)^2\right]\mathbf{u}_r + \left[r\frac{d^2\theta}{dt^2} + 2\frac{dr}{dt}\frac{d\theta}{dt}\right]\mathbf{u}_\theta$$

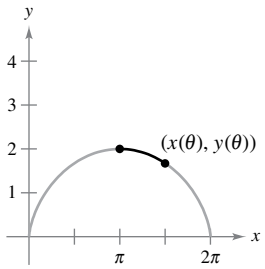
where $\mathbf{u}_r = \cos\theta\mathbf{i} + \sin\theta\mathbf{j}$ is the unit vector in the radial direction and $\mathbf{u}_\theta = -\sin\theta\mathbf{i} + \cos\theta\mathbf{j}$.

(b) Find the radial and angular components of acceleration for the satellite.

5. Cycloid Consider one arch of the cycloid

$$\mathbf{r}(\theta) = (\theta - \sin\theta)\mathbf{i} + (1 - \cos\theta)\mathbf{j}, \quad 0 \le \theta \le 2\pi$$

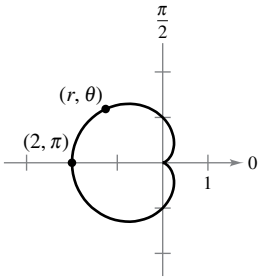
as shown in the figure. Let $s(\theta)$ be the arc length from the highest point on the arch to the point $(x(\theta), y(\theta))$, and let $\rho(\theta) = 1/K$ be the radius of curvature at the point $(x(\theta), y(\theta))$. Show that s and ρ are related by the equation $s^2 + \rho^2 = 16$. (This equation is called a *natural equation* for the curve.)



6. Cardioid Consider the cardioid

$$r = 1 - \cos\theta, \quad 0 \le \theta \le 2\pi$$

as shown in the figure. Let $s(\theta)$ be the arc length from the point $(2, \pi)$ on the cardioid to the point (r, θ), and let $p(\theta) = 1/K$ be the radius of curvature at the point (r, θ). Show that s and ρ are related by the equation $s^2 + 9\rho^2 = 16$. (This equation is called a *natural equation* for the curve.)



7. Exit Ramp A highway has an exit ramp that begins at the origin of a coordinate system and follows the curve

$$y = \frac{1}{32}x^{5/2}$$

to the point (4, 1) (see figure). Then it follows a circular path whose curvature is that given by the curve at (4, 1). What is the radius of the circular arc? Explain why the curve and the circular arc should have the same curvature at (4, 1).

13.1 Introduction to Functions of Several Variables

GO DIGITAL

- Describe the notation for a function of several variables.
- Sketch the graph of a function of two variables.
- Sketch level curves for a function of two variables.
- Sketch level surfaces for a function of three variables.
- Use a graphing utility to graph a function of two variables.

Big Ideas of Calculus

Calculus was originally developed to study functions of a single variable. It was later discovered that the two basic operations of calculus—differentiation and integration—can be meaningfully extended to functions of two or more variables.

Graphically, functions of *one* variable are represented by curves in the plane. Graphs of functions of *two* variables are represented by surfaces in space.

Functions of Several Variables

So far in this text, you have dealt only with functions of a single (independent) variable. Many familiar quantities, however, are functions of two or more variables. Here are three examples.

1. The work done by a force, $W = FD$, is a function of two variables.
2. The volume of a right circular cylinder, $V = \pi r^2 h$, is a function of two variables.
3. The volume of a rectangular solid, $V = lwh$, is a function of three variables.

The notation for a function of two or more variables is similar to that for a function of a single variable. Here are two examples.

$$z = \underbrace{f(x, y)}_{\text{2 variables}} = x^2 + xy \qquad \text{Function of two variables}$$

and

$$w = \underbrace{f(x, y, z)}_{\text{3 variables}} = x + 2y - 3z \qquad \text{Function of three variables}$$

Definition of a Function of Two Variables

Let D be a set of ordered pairs of real numbers. If to each ordered pair (x, y) in D there corresponds a unique real number $f(x, y)$, then f is a **function of x and y.** The set D is the **domain** of f, and the corresponding set of values for $f(x, y)$ is the **range** of f. For the function

$$z = f(x, y)$$

x and y are called the **independent variables** and z is called the **dependent variable.**

Exploration

Without using a graphing utility, describe the graph of each function of two variables.

a. $z = x^2 + y^2$
b. $z = x + y$
c. $z = x^2 + y$
d. $z = \sqrt{x^2 + y^2}$
e. $z = \sqrt{1 - x^2 + y^2}$

Similar definitions can be given for functions of three, four, or n variables, where the domains consist of ordered triples (x_1, x_2, x_3), quadruples (x_1, x_2, x_3, x_4), and n-tuples $(x_1, x_2, \ldots, x_n)$. In all cases, the range is a set of real numbers. In this chapter, you will study only functions of two or three variables.

As with functions of one variable, the most common way to describe a function of several variables is with an *equation*, and unless it is otherwise restricted, you can assume that the domain is the set of all points for which the equation is defined. For instance, the domain of the function

$$f(x, y) = x^2 + y^2$$

is the entire xy-plane. Similarly, the domain of

$$f(x, y) = \ln xy$$

is the set of all points (x, y) in the plane for which $xy > 0$. This consists of all points in the first and third quadrants.

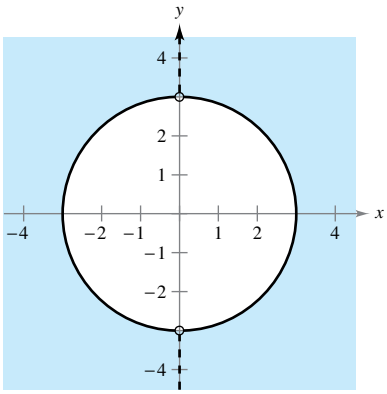

Figure 13.1

EXAMPLE 1 Domains of Functions of Several Variables

Find the domain of each function.

a. $f(x, y) = \dfrac{\sqrt{x^2 + y^2 - 9}}{x}$ **b.** $g(x, y, z) = \dfrac{x}{\sqrt{9 - x^2 - y^2 - z^2}}$

Solution

a. The function f is defined for all points (x, y) such that $x \neq 0$ and

$$x^2 + y^2 \geq 9.$$

So, the domain is the set of all points lying on or outside the circle $x^2 + y^2 = 9$ *except* those points on the y-axis, as shown in Figure 13.1.

b. The function g is defined for all points (x, y, z) such that

$$x^2 + y^2 + z^2 < 9.$$

Consequently, the domain is the set of all points (x, y, z) lying inside a sphere of radius 3 that is centered at the origin. ■

Functions of several variables can be combined in the same ways as functions of single variables. For instance, you can form the sum, difference, product, and quotient of two functions of two variables as follows.

$$(f \pm g)(x, y) = f(x, y) \pm g(x, y) \quad \text{Sum or difference}$$
$$(fg)(x, y) = f(x, y)g(x, y) \quad \text{Product}$$
$$\frac{f}{g}(x, y) = \frac{f(x, y)}{g(x, y)}, \quad g(x, y) \neq 0 \quad \text{Quotient}$$

MARY FAIRFAX SOMERVILLE (1780–1872)

Somerville was interested in the problem of creating geometric models for functions of several variables. Her most well-known book, *The Mechanics of the Heavens*, was published in 1831.

See LarsonCalculus.com to read more of this biography.

You cannot form the composite of two functions of several variables. You can, however, form the **composite** function $(g \circ h)(x, y)$, where g is a function of a single variable and h is a function of two variables.

$$(g \circ h)(x, y) = g(h(x, y)) \quad \text{Composition}$$

The domain of this composite function consists of all (x, y) in the domain of h such that $h(x, y)$ is in the domain of g. For example, the function

$$f(x, y) = \sqrt{16 - 4x^2 - y^2}$$

can be viewed as the composite of the function of two variables given by

$$h(x, y) = 16 - 4x^2 - y^2$$

and the function of a single variable given by

$$g(u) = \sqrt{u}.$$

The domain of this function is the set of all points lying on or inside the ellipse $4x^2 + y^2 = 16$.

A function that can be written as a sum of functions of the form $cx^m y^n$ (where c is a real number and m and n are nonnegative integers) is called a **polynomial function** of two variables. For instance, the functions

$$f(x, y) = x^2 + y^2 - 2xy + x + 2 \quad \text{and} \quad g(x, y) = 3xy^2 + x - 2$$

are polynomial functions of two variables. A **rational function** is the quotient of two polynomial functions. Similar terminology is used for functions of more than two variables.

The Graph of a Function of Two Variables

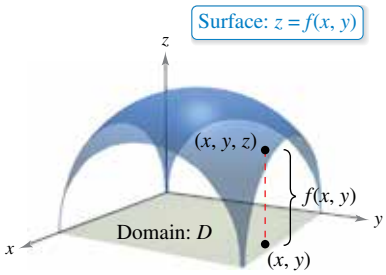

Figure 13.2

As with functions of a single variable, you can learn a lot about the behavior of a function of two variables by sketching its graph. The **graph** of a function f of two variables is the set of all points (x, y, z) for which $z = f(x, y)$ and (x, y) is in the domain of f. This graph can be interpreted geometrically as a *surface in space,* as discussed in Sections 11.5 and 11.6. In Figure 13.2, note that the graph of $z = f(x, y)$ is a surface whose projection onto the xy-plane is D, the domain of f. To each point (x, y) in D there corresponds a point (x, y, z) on the surface, and, conversely, to each point (x, y, z) on the surface there corresponds a point (x, y) in D.

EXAMPLE 2 Describing the Graph of a Function of Two Variables

Consider the function given by

$$f(x, y) = \sqrt{16 - 4x^2 - y^2}.$$

a. Find the domain and range of the function.

b. Describe the graph of f.

Solution

a. The domain D implied by the equation of f is the set of all points (x, y) such that

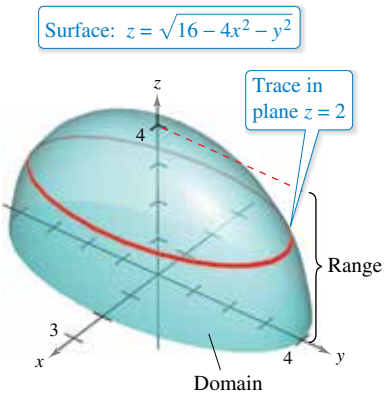
$$16 - 4x^2 - y^2 \geq 0. \qquad \text{Quantity inside radical must be nonnegative.}$$

So, D is the set of all points lying on or inside the ellipse

$$\frac{x^2}{4} + \frac{y^2}{16} = 1. \qquad \text{Ellipse in the } xy\text{-plane}$$

The range of f is all values $z = f(x, y)$ such that $0 \leq z \leq \sqrt{16}$, or

$$0 \leq z \leq 4. \qquad \text{Range of } f$$



The graph of $f(x, y) = \sqrt{16 - 4x^2 - y^2}$ is the upper half of an ellipsoid.

Figure 13.3

b. A point (x, y, z) is on the graph of f if and only if

$$z = \sqrt{16 - 4x^2 - y^2}$$
$$z^2 = 16 - 4x^2 - y^2$$
$$4x^2 + y^2 + z^2 = 16$$
$$\frac{x^2}{4} + \frac{y^2}{16} + \frac{z^2}{16} = 1, \quad 0 \leq z \leq 4.$$

From Section 11.6, you know that the graph of f is the upper half of an ellipsoid, as shown in Figure 13.3. ■

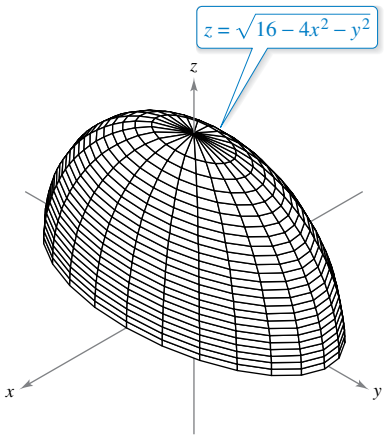


Figure 13.4

To sketch a surface in space without a graphing utility, it helps to use traces in planes parallel to the coordinate planes, as shown in Figure 13.3. For example, to find the trace of the surface in the plane $z = 2$, substitute $z = 2$ in the equation $z = \sqrt{16 - 4x^2 - y^2}$ and obtain

$$2 = \sqrt{16 - 4x^2 - y^2} \quad \Rightarrow \quad \frac{x^2}{3} + \frac{y^2}{12} = 1.$$

So, the trace is an ellipse centered at the point $(0, 0, 2)$ with major and minor axes of lengths $4\sqrt{3}$ and $2\sqrt{3}$.

Traces are also used with most three-dimensional graphing utilities. For instance, Figure 13.4 shows a computer-generated version of the surface given in Example 2. For this graph, the computer took 25 traces parallel to the xy-plane and 12 traces in vertical planes.

If you have access to a three-dimensional graphing utility, use it to graph several surfaces.

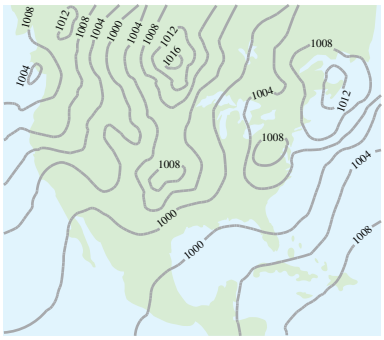
Level Curves

A second way to visualize a function of two variables is to use a **scalar field** in which the scalar

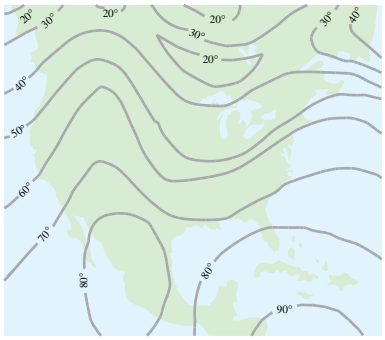
$$z = f(x, y)$$

is assigned to the point (x, y). A scalar field can be characterized by **level curves** (or **contour lines**) along which the value of $f(x, y)$ is constant. For instance, the weather map in Figure 13.5 shows level curves of equal pressure called **isobars.** In weather maps for which the level curves represent points of equal temperature, the level curves are called **isotherms,** as shown in Figure 13.6. Another common use of level curves is in representing electric potential fields. In this type of map, the level curves are called **equipotential lines.**



Level curves show the lines of equal pressure (isobars), measured in millibars.

Figure 13.5



Level curves show the lines of equal temperature (isotherms), measured in degrees Fahrenheit.

Figure 13.6

Contour maps are commonly used to show regions on Earth's surface, with the level curves representing the height above sea level. This type of map is called a **topographic map.** For example, the mountain shown in Figure 13.7 is represented by the topographic map in Figure 13.8.

Figure 13.7

Figure 13.8

A contour map depicts the variation of z with respect to x and y by the spacing between level curves. Much space between level curves indicates that z is changing slowly, whereas little space indicates a rapid change in z. Furthermore, to produce a good three-dimensional illusion in a contour map, it is important to choose c-values that are *evenly spaced.*

EXAMPLE 3 Sketching a Contour Map

The hemisphere

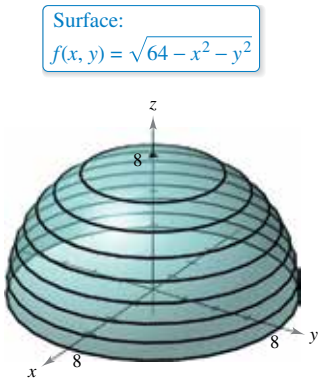
$$f(x, y) = \sqrt{64 - x^2 - y^2}$$

is shown in Figure 13.9. Sketch a contour map of this surface using level curves corresponding to $c = 0, 1, 2, \ldots, 8$.

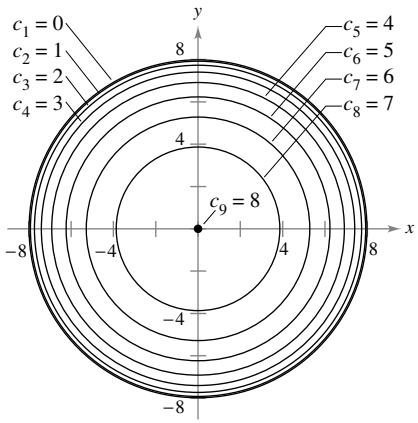
Solution For each value of c, the equation $f(x, y) = c$ is a circle (or point) in the xy-plane. For example, when $c_1 = 0$, the level curve is

$$x^2 + y^2 = 64 \qquad \text{Circle of radius 8}$$

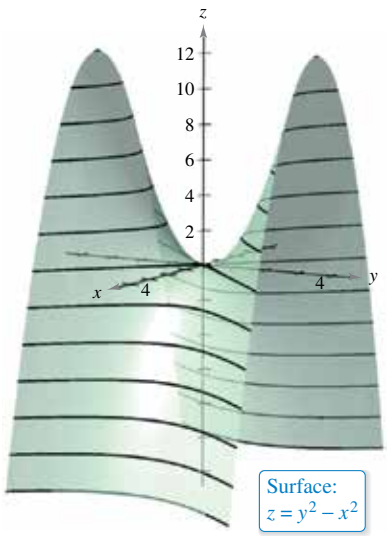
which is a circle of radius 8. Figure 13.10 shows the nine level curves for the hemisphere.



Hemisphere
Figure 13.9



Contour map
Figure 13.10



Hyperbolic paraboloid
Figure 13.11

EXAMPLE 4 Sketching a Contour Map

See LarsonCalculus.com for an interactive version of this type of example.

The hyperbolic paraboloid

$$z = y^2 - x^2$$

is shown in Figure 13.11. Sketch a contour map of this surface.

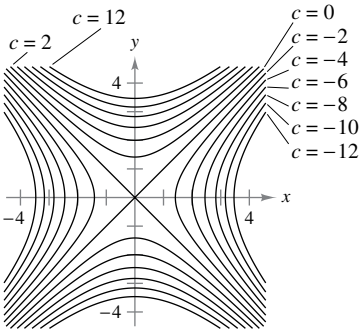
Solution For each value of c, let $f(x, y) = c$ and sketch the resulting level curve in the xy-plane. For this function, each of the level curves ($c \neq 0$) is a hyperbola whose asymptotes are the lines $y = \pm x$. When $c < 0$, the transverse axis is horizontal. For instance, the level curve for $c = -4$ is

$$\frac{x^2}{2^2} - \frac{y^2}{2^2} = 1.$$

When $c > 0$, the transverse axis is vertical. For instance, the level curve for $c = 4$ is

$$\frac{y^2}{2^2} - \frac{x^2}{2^2} = 1.$$

When $c = 0$, the level curve is the degenerate conic representing the intersecting asymptotes, as shown in Figure 13.12.



Hyperbolic level curves (at increments of 2)

GO DIGITAL

One example of a function of two variables used in economics is the **Cobb-Douglas production function.** This function is used as a model to represent the numbers of units produced by varying amounts of labor and capital. If x measures the units of labor and y measures the units of capital, then the number of units produced is

$$f(x, y) = Cx^a y^{1-a}$$

where C and a are constants with $0 < a < 1$.

EXAMPLE 5 The Cobb-Douglas Production Function

A manufacturer estimates a production function to be

$$f(x, y) = 100x^{0.6}y^{0.4}$$

where x is the number of units of labor and y is the number of units of capital. Compare the production level when $x = 1000$ and $y = 500$ with the production level when $x = 2000$ and $y = 1000$.

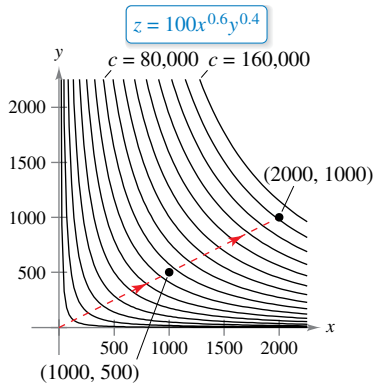
Solution When $x = 1000$ and $y = 500$, the production level is

$$f(1000, 500) = 100(1000^{0.6})(500^{0.4}) \approx 75{,}786.$$

When $x = 2000$ and $y = 1000$, the production level is

$$f(2000, 1000) = 100(2000^{0.6})(1000^{0.4}) \approx 151{,}572.$$

The level curves of $z = f(x, y)$ are shown in Figure 13.13. Note that by doubling both x and y, you double the production level (see Exercise 83).



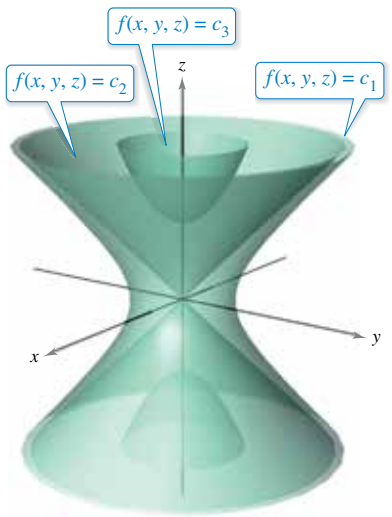
Level curves (at increments of 10,000)
Figure 13.13

Level Surfaces

The concept of a level curve can be extended by one dimension to define a **level surface.** If f is a function of three variables and c is a constant, then the graph of the equation

$$f(x, y, z) = c$$

is a **level surface** of f, as shown in Figure 13.14.



Level surfaces of f

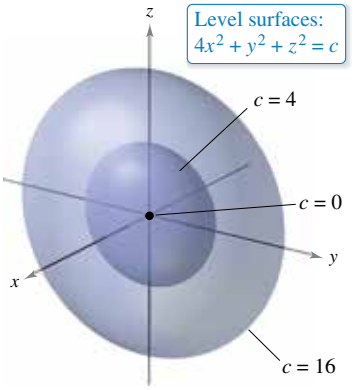

Figure 13.15

EXAMPLE 6 **Level Surfaces**

Describe the level surfaces of

$$f(x, y, z) = 4x^2 + y^2 + z^2.$$

Solution Each level surface has an equation of the form

$$4x^2 + y^2 + z^2 = c. \qquad \text{Equation of level surface}$$

So, the level surfaces are ellipsoids (whose cross sections parallel to the yz-plane are circles). As c increases, the radii of the circular cross sections increase according to the square root of c. For example, the level surfaces corresponding to the values $c = 0$, $c = 4$, and $c = 16$ are as follows.

$$4x^2 + y^2 + z^2 = 0 \qquad \text{Level surface for } c = 0 \text{ (single point)}$$

$$\frac{x^2}{1} + \frac{y^2}{4} + \frac{z^2}{4} = 1 \qquad \text{Level surface for } c = 4 \text{ (ellipsoid)}$$

$$\frac{x^2}{4} + \frac{y^2}{16} + \frac{z^2}{16} = 1 \qquad \text{Level surface for } c = 16 \text{ (ellipsoid)}$$

These level surfaces are shown in Figure 13.15. ■

If the function in Example 6 represented the *temperature* at the point (x, y, z), then the level surfaces shown in Figure 13.15 would be called **isothermal surfaces.**

Graphing Utilities and Surfaces

The problem of sketching the graph of a surface in space can be simplified by using a graphing utility. Although there are several types of three-dimensional graphing utilities, most use some form of trace analysis to give the illusion of three dimensions. To use such a graphing utility, you usually need to enter the equation of the surface and the region in the xy-plane over which the surface is to be plotted. (You might also need to enter the number of traces to be taken.) For instance, to graph the surface

$$f(x, y) = (x^2 + y^2)e^{1-x^2-y^2}$$

you might choose the following bounds for x, y, and z.

$$-3 \le x \le 3 \qquad \text{Bounds for } x$$

$$-3 \le y \le 3 \qquad \text{Bounds for } y$$

$$0 \le z \le 3 \qquad \text{Bounds for } z$$

Figure 13.16 shows a computer-generated graph of this surface using 26 traces taken parallel to the yz-plane. To heighten the three-dimensional effect, the graphing utility uses a "hidden line" routine. That is, it begins by plotting the traces in the foreground (those corresponding to the largest x-values), and then, as each new trace is plotted, the graphing utility determines whether all or only part of the next trace should be shown.

The graphs on the next page show a variety of surfaces. Use a graphing utility to reproduce these surfaces. Remember also that the three-dimensional graphics in this text can be viewed and rotated. These rotatable graphs are available at *LarsonCalculus.com.*

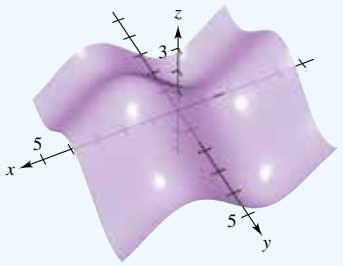
13.1 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Explain why $z^2 = x + 3y$ is not a function of x and y.
2. What is a graph of a function of two variables? How is it interpreted geometrically?
3. Use the graph to determine whether z is a function of x and y. Explain.



4. Explain how to sketch a contour map of a function of x and y.

Determining Whether an Equation Is a Function

In Exercises 5–8, determine whether z is a function of x and y.

5. $x^2z + 3y^2 - xy = 10$
6. $xz^2 + 2xy - y^2 = 4$
7. $\frac{x^2}{4} + \frac{y^2}{9} + z^2 = 1$
8. $z + x \ln y - 8yz = 0$

Evaluating a Function

In Exercises 9–20, evaluate the function at the given values of the independent variables. Simplify the results.

9. $f(x, y) = 2x - y + 3$
   (a) $f(0, 2)$ (b) $f(-1, 0)$
   (c) $f(5, 30)$ (d) $f(3, y)$
   (e) $f(x, 4)$ (f) $f(5, t)$
10. $f(x, y) = 4 - x^2 - 4y^2$
   (a) $f(0, 0)$ (b) $f(0, 1)$
   (c) $f(2, 3)$ (d) $f(1, y)$
   (e) $f(x, 0)$ (f) $f(t, 1)$
11. $f(x, y) = xe^y$
   (a) $f(-1, 0)$ (b) $f(0, 2)$
   (c) $f(x, 3)$ (d) $f(t, -y)$
12. $g(x, y) = \ln|x + y|$
   (a) $g(1, 0)$ (b) $g(0, -t^2)$
   (c) $g(e, 0)$ (d) $g(e, e)$
13. $h(x, y, z) = \frac{xy}{z}$
   (a) $h(-1, 3, -1)$
   (b) $h(2, 2, 2)$
   (c) $h(4, 4t, t^2)$
   (d) $h(-3, 2, 5)$
14. $f(x, y, z) = \sqrt{x + y + z}$
   (a) $f(2, 2, 5)$
   (b) $f(0, 6, -2)$
   (c) $f(8, -7, 2)$
   (d) $f(0, 1, -1)$
15. $f(x, y) = x \sin y$
   (a) $f(2, \pi/4)$
   (b) $f(3, 1)$
   (c) $f(-3, 0)$
   (d) $f(4, \pi/2)$
16. $V(r, h) = \pi r^2 h$
   (a) $V(3, 10)$
   (b) $V(5, 2)$
   (c) $V(4, 8)$
   (d) $V(6, \pi)$
17. $g(x, y) = \int_x^y (2t - 3)\, dt$
   (a) $g(4, 0)$ (b) $g(4, 1)$ (c) $g\left(4, \frac{3}{2}\right)$ (d) $g\left(\frac{3}{2}, 0\right)$
18. $g(x, y) = \int_x^y \frac{1}{t}\, dt$
   (a) $g(4, 1)$ (b) $g(6, 3)$ (c) $g(2, 5)$ (d) $g\left(\frac{1}{2}, 7\right)$
19. $f(x, y) = 2x + y^2$
   (a) $\frac{f(x + \Delta x, y) - f(x, y)}{\Delta x}$ (b) $\frac{f(x, y + \Delta y) - f(x, y)}{\Delta y}$
20. $f(x, y) = 3x^2 - 2y$
   (a) $\frac{f(x + \Delta x, y) - f(x, y)}{\Delta x}$ (b) $\frac{f(x, y + \Delta y) - f(x, y)}{\Delta y}$

Finding the Domain and Range of a Function

In Exercises 21–32, find the domain and range of the function.

21. $f(x, y) = 3x^2 - y$
22. $f(x, y) = e^{xy}$
23. $g(x, y) = x\sqrt{y}$
24. $g(x, y) = \frac{y}{\sqrt{x}}$
25. $z = \frac{x + y}{xy}$
26. $z = \frac{xy}{x + y}$
27. $f(x, y) = \sqrt{4 - x^2 - y^2}$
28. $f(x, y) = \sqrt{9 - 6x^2 + y^2}$
29. $f(x, y) = \arccos(x + y)$
30. $f(x, y) = \arcsin(y/x)$
31. $f(x, y) = \ln(5 - x - y)$
32. $f(x, y) = \ln(xy - 6)$

33. **Think About It** The graphs labeled (a), (b), (c), and (d) are graphs of the function

$$f(x, y) = \frac{-4x}{x^2 + y^2 + 1}.$$

Match each of the four graphs with the point in space from which the surface is viewed. The four points are $(20, 15, 25)$, $(-15, 10, 20)$, $(20, 20, 0)$, and $(20, 0, 0)$.

34. Think About It Use the function given in Exercise 33.

(a) Find the domain and range of the function.

(b) Identify the points in the xy-plane at which the function value is 0.

(c) Does the surface pass through all the octants of the rectangular coordinate system? Give reasons for your answer.

Sketching a Surface **In Exercises 35–42, describe and sketch the surface given by the function.**

35. $f(x, y) = 4$

36. $f(x, y) = 6 - 2x - 3y$

37. $f(x, y) = y^2$

38. $g(x, y) = \frac{1}{2}y$

39. $z = -x^2 - y^2$

40. $z = \frac{1}{2}\sqrt{x^2 + y^2}$

41. $f(x, y) = e^{-x}$

42. $f(x, y) = \begin{cases} xy, & x \geq 0, y \geq 0 \\ 0, & x < 0 \text{ or } y < 0 \end{cases}$

Graphing a Function Using Technology **In Exercises 43–46, use a graphing utility to graph the function.**

43. $z = y^2 - x^2 + 1$

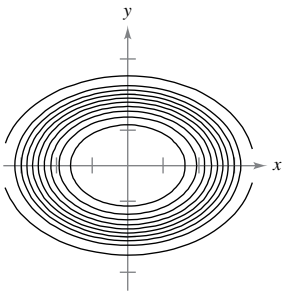
44. $z = \frac{1}{12}\sqrt{144 - 16x^2 - 9y^2}$

45. $f(x, y) = x^2e^{(-xy/2)}$

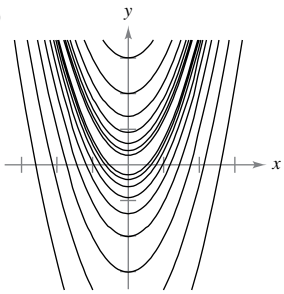
46. $f(x, y) = x \sin y$

Matching **In Exercises 47–50, match the graph of the surface with one of the contour maps. [The contour maps are labeled (a), (b), (c), and (d).]**

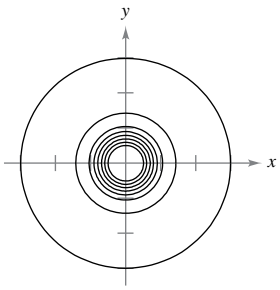
(a)



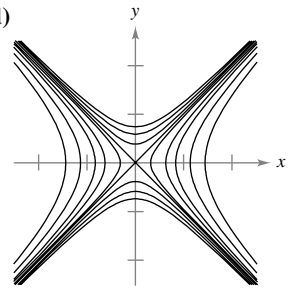
(b)



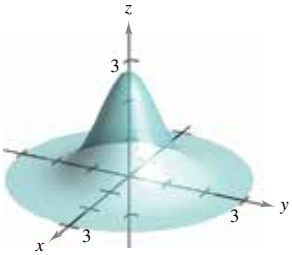
(c)



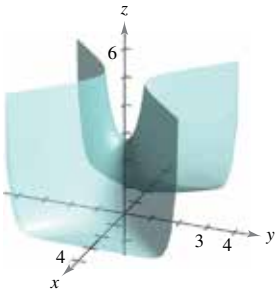
(d)



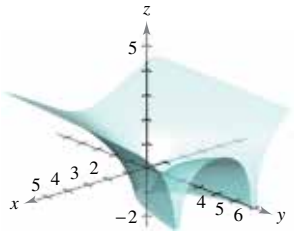
47. $f(x, y) = e^{1-x^2-y^2}$



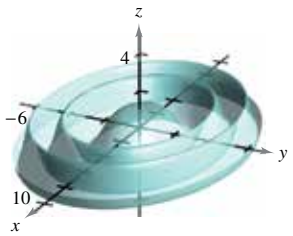
48. $f(x, y) = e^{1-x^2+y^2}$



49. $f(x, y) = \ln|y - x^2|$



50. $f(x, y) = \cos\left(\frac{x^2 + 2y^2}{4}\right)$



Sketching a Contour Map **In Exercises 51–58, describe the level curves of the function. Sketch a contour map of the surface using level curves for the given c-values.**

51. $z = x + y$, $c = -1, 0, 2, 4$

52. $z = 6 - 2x - 3y$, $c = 0, 2, 4, 6, 8, 10$

53. $z = x^2 + 4y^2$, $c = 0, 1, 2, 3, 4$

54. $f(x, y) = \sqrt{9 - x^2 - y^2}$, $c = 0, 1, 2, 3$

55. $f(x, y) = xy$, $c = \pm 1, \pm 2, \ldots, \pm 6$

56. $f(x, y) = e^{xy/2}$, $c = 2, 3, 4, \frac{1}{2}, \frac{1}{3}, \frac{1}{4}$

57. $f(x, y) = x/(x^2 + y^2)$, $c = \pm\frac{1}{2}, \pm 1, \pm\frac{3}{2}, \pm 2$

58. $f(x, y) = \ln(x - y)$, $c = 0, \pm\frac{1}{2}, \pm 1, \pm\frac{3}{2}, \pm 2$

Graphing Level Curves Using Technology **In Exercises 59–62, use a graphing utility to graph six level curves of the function.**

59. $f(x, y) = x^2 - y^2 + 2$

60. $f(x, y) = |xy|$

61. $g(x, y) = \dfrac{8}{1 + x^2 + y^2}$

62. $h(x, y) = 3 \sin(|x| + |y|)$

Exploring Concepts

63. Does the Vertical Line Test apply to functions of two variables? Explain your reasoning.

64. All of the level curves of the surface given by $z = f(x, y)$ are concentric circles. Does this imply that the graph of f is a hemisphere? Give an example that supports your answer.

65. Construct a function whose level curves are lines passing through the origin.

66. Consider the function $f(x, y) = xy$ for $x \geq 0$ and $y \geq 0$.

(a) Sketch the graph of the surface given by f.

(b) Make a conjecture about the relationship between the graphs of f and $g(x, y) = f(x, y) - 3$. Explain your reasoning.

(c) Repeat part (b) for $g(x, y) = -f(x, y)$.

(d) Repeat part (b) for $g(x, y) = \frac{1}{2}f(x, y)$.

(e) On the surface in part (a), sketch the graph of $z = f(x, x)$.

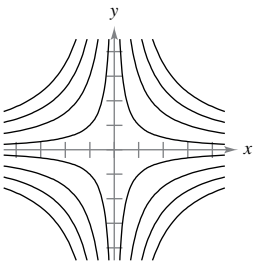
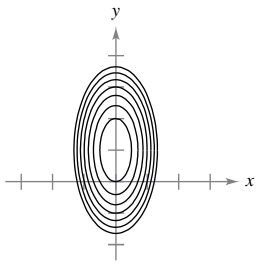
Writing **In Exercises 67 and 68, use the graphs of the level curves (c-values evenly spaced) of the function f to write a description of a possible graph of f. Is the graph of f unique? Explain.**

67.



68.



69. Investment In 2020, an investment of \$1000 was made in a bond earning 6% compounded annually. Assume that the buyer pays tax at rate R and the annual rate of inflation is I. In the year 2030, the value V of the investment in constant 2020 dollars is

$$V(I, R) = 1000\left[\frac{1 + 0.06(1 - R)}{1 + I}\right]^{10}.$$

Use this function of two variables to complete the table.

	Inflation Rate		
Tax Rate	0	0.03	0.05
0			
0.28			
0.35			

70. Investment A principal of \$5000 is deposited in a savings account that earns interest at a rate of r (written as a decimal), compounded continuously. The amount $A(r, t)$ after t years is

$$A(r, t) = 5000e^{rt}.$$

Use this function of two variables to complete the table.

	Number of Years			
Rate	5	10	15	20
0.02				
0.03				
0.04				
0.05				

Sketching a Level Surface **In Exercises 71–76, describe and sketch the graph of the level surface $f(x, y, z) = c$ at the given value of c.**

71. $f(x, y, z) = x - y + z,\ c = 1$

72. $f(x, y, z) = 4x + y + 2z,\ c = 4$

73. $f(x, y, z) = x^2 + y^2 + z^2,\ c = 9$

74. $f(x, y, z) = x^2 + \frac{1}{4}y^2 - z,\ c = 1$

75. $f(x, y, z) = 4x^2 + 4y^2 - z^2,\ c = 0$

76. $f(x, y, z) = \sin x - z,\ c = 0$

77. Forestry

The *Doyle Log Rule* is one of several methods used to determine the lumber yield of a log (in board-feet) in terms of its diameter d (in inches) and its length L (in feet). The number of board-feet is

$$N(d, L) = \left(\frac{d - 4}{4}\right)^2 L.$$

(a) Find the number of board-feet of lumber in a log 22 inches in diameter and 12 feet in length.

(b) Find $N(30, 12)$.

78. Queuing Model The average length of time that a customer waits in line for service is

$$W(x, y) = \frac{1}{x - y}, \quad x > y$$

where y is the average arrival rate, written as the number of customers per unit of time, and x is the average service rate, written in the same units. Evaluate each of the following.

(a) $W(15, 9)$ (b) $W(15, 13)$

(c) $W(12, 7)$ (d) $W(5, 2)$

79. Temperature Distribution The temperature T (in degrees Celsius) at any point (x, y) on a circular steel plate of radius 10 meters is

$$T = 600 - 0.75x^2 - 0.75y^2$$

where x and y are measured in meters. Sketch the isothermal curves for $T = 0, 100, 200, \ldots, 600$.

80. Electric Potential The electric potential V at any point (x, y) is

$$V(x, y) = \frac{5}{\sqrt{25 + x^2 + y^2}}.$$

Sketch the equipotential curves for $V = \frac{1}{2}$, $V = \frac{1}{3}$, and $V = \frac{1}{4}$.

Cobb-Douglas Production Function **In Exercises 81 and 82, use the Cobb-Douglas production function to find the production level when $x = 600$ units of labor and $y = 350$ units of capital.**

81. $f(x, y) = 80x^{0.5}y^{0.5}$

82. $f(x, y) = 100x^{0.65}y^{0.35}$

83. Cobb-Douglas Production Function Use the Cobb-Douglas production function, $f(x, y) = Cx^a y^{1-a}$, to show that when the number of units of labor and the number of units of capital are doubled, the production level is also doubled.

84. Cobb-Douglas Production Function Show that the Cobb-Douglas production function $z = Cx^a y^{1-a}$ can be rewritten as

$$\ln \frac{z}{y} = \ln C + a \ln \frac{x}{y}.$$

85. Ideal Gas Law According to the Ideal Gas Law, $PV = kT$, where P is pressure, V is volume, T is temperature (in kelvins), and k is a constant of proportionality. A tank contains 2000 cubic inches of nitrogen at a pressure of 26 pounds per square inch and a temperature of 300 K.

(a) Determine k.

(b) Write P as a function of V and T and describe the level curves.

86. Modeling Data The table shows the net sales x (in billions of dollars), the total assets y (in billions of dollars), and the shareholder's equity z (in billions of dollars) for Walmart for the years 2015 through 2020. *(Source: Wal-Mart Stores, Inc.)*

Year	2015	2016	2017	2018	2019	2020
x	482.2	478.6	481.3	495.8	510.3	519.9
y	203.7	199.6	198.8	204.5	219.3	236.5
z	81.4	80.5	77.8	77.9	72.5	74.7

A model for the data is $z = f(x, y) = -0.328x + 0.195y + 198.7$.

(a) Complete a fourth row in the table using the model to approximate z for the given values of x and y. Compare the approximations with the actual values of z.

(b) Which of the two variables in this model has more influence on shareholder's equity? Explain.

(c) Simplify the expression for $f(x, 150)$ and interpret its meaning in the context of the problem.

87. Meteorology Meteorologists measure the atmospheric pressure in millibars. From these observations, they create weather maps on which the curves of equal atmospheric pressure (isobars) are drawn (see figure). On the map, the closer the isobars, the higher the wind speed. Match points A, B, and C with (a) highest pressure, (b) lowest pressure, and (c) highest wind velocity.

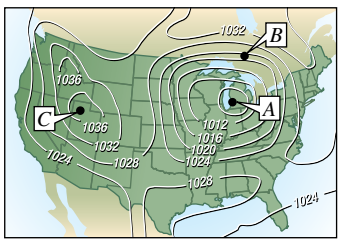

Figure for 87

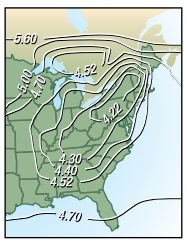

Figure for 88

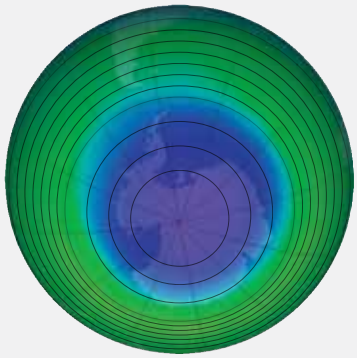
88. Acid Rain The acidity of rainwater is measured in units called pH. A pH of 7 is neutral, smaller values are increasingly acidic, and larger values are increasingly alkaline. The map shows curves of equal pH and gives evidence that downwind of heavily industrialized areas, the acidity has been increasing. Using the level curves on the map, determine the direction of the prevailing winds in the northeastern United States.

NASA

89. Construction Cost A rectangular storage box with an open top has a length of x feet, a width of y feet, and a height of z feet. It costs \$4.50 per square foot to build the base and \$2.50 per square foot to build the sides. Write the cost C of constructing the box as a function of x, y, and z.

90. HOW DO YOU SEE IT? The contour map of the Southern Hemisphere shown in the figure was computer generated using data collected by satellite instrumentation. Color and contour lines are used to show the "ozone hole" in Earth's atmosphere. The purple and blue areas with larger spaced contour lines represent the lowest levels of ozone, and the green areas with smaller spaced contour lines represent the highest levels. *(Source: NASA)*



(a) Do the level curves correspond to equally spaced ozone levels? Explain.

(b) Describe how to obtain a more detailed contour map.

True or False? In Exercises 91–94, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.

91. If $f(x_0, y_0) = f(x_1, y_1)$, then $x_0 = x_1$ and $y_0 = y_1$.

92. If f is a function, then $f(ax, ay) = a^2 f(x, y)$.

93. The equation for a sphere is a function of three variables.

94. Two different level curves of the graph of $z = f(x, y)$ can intersect.

PUTNAM EXAM CHALLENGE

95. Let $f\colon \mathbb{R}^2 \to \mathbb{R}$ be a function such that

$$f(x, y) + f(y, z) + f(z, x) = 0$$

for all real numbers x, y, and z. Prove that there exists a function $g\colon \mathbb{R} \to \mathbb{R}$ such that

$$f(x, y) = g(x) - g(y)$$

for all real numbers x and y.

13.2 Limits and Continuity

GO DIGITAL

- Define a neighborhood in the plane.
- Use the definition of the limit of a function of two variables.
- Extend the concept of continuity to a function of two variables.
- Extend the concept of continuity to a function of three variables.

SONYA KOVALEVSKY (1850–1891)

Much of the terminology used to define limits and continuity of a function of two or three variables was introduced by the German mathematician Karl Weierstrass (1815–1897). Weierstrass's rigorous approach to limits and other topics in calculus gained him the reputation as the "father of modern analysis." Weierstrass was a gifted teacher. One of his best-known students was the Russian mathematician Sonya Kovalevsky, who applied many of Weierstrass's techniques to problems in mathematical physics and became one of the first women to gain acceptance as a research mathematician. *See LarsonCalculus.com to read more of this biography.*

Neighborhoods in the Plane

In this section, you will study limits and continuity involving functions of two or three variables. The section begins with functions of two variables. At the end of the section, the concepts are extended to functions of three variables.

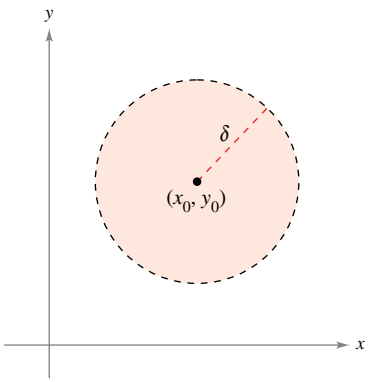
Your study of the limit of a function of two variables begins by defining a two-dimensional analog to an interval on the real number line. Using the formula for the distance between two points

$$(x, y) \quad \text{and} \quad (x_0, y_0)$$

in the plane, you can define the **δ-neighborhood** about (x_0, y_0) to be the **disk** centered at (x_0, y_0) with radius $\delta > 0$

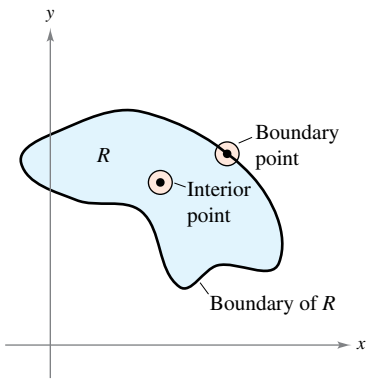
$$\{(x, y): \sqrt{(x - x_0)^2 + (y - y_0)^2} < \delta\} \qquad \text{Open disk}$$

as shown in Figure 13.17. When this formula contains the *less than* inequality sign, $<$, the disk is called **open,** and when it contains the *less than or equal to* inequality sign, $\leq$, the disk is called **closed.** This corresponds to the use of $<$ and $\leq$ to define open and closed intervals.



An open disk

Figure 13.17



The boundary and interior points of a region R

Figure 13.18

Let the region R be a set of points in the plane. A point (x_0, y_0) in R is an **interior point** of R if there exists a δ-neighborhood about (x_0, y_0) that lies entirely in R, as shown in Figure 13.18. If every point in R is an interior point, then R is an **open region.** A point (x_0, y_0) is a **boundary point** of R if every open disk centered at (x_0, y_0) contains points inside R *and* points outside R. If R contains all its boundary points, then R is a **closed region.**

Limit of a Function of Two Variables

Definition of the Limit of a Function of Two Variables

Let f be a function of two variables defined, except possibly at (x_0, y_0), on an open disk centered at (x_0, y_0), and let L be a real number. Then

$$\lim_{(x, y)\to(x_0, y_0)} f(x, y) = L$$

if for each $\varepsilon > 0$ there corresponds a $\delta > 0$ such that

$$|f(x, y) - L| < \varepsilon \quad \text{whenever} \quad 0 < \sqrt{(x - x_0)^2 + (y - y_0)^2} < \delta.$$

Graphically, the definition of the limit of a function of two variables implies that for any point $(x, y) \neq (x_0, y_0)$ in the disk of radius δ, the value $f(x, y)$ lies between $L + \varepsilon$ and $L - \varepsilon$, as shown in Figure 13.19.

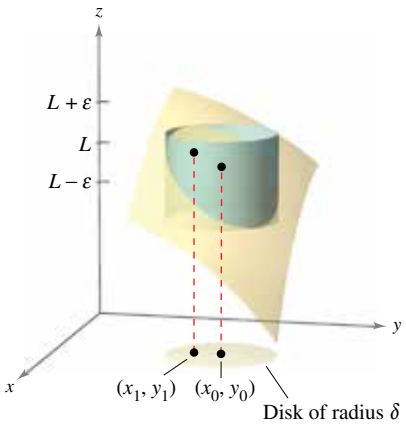
The definition of the limit of a function of two variables is similar to the definition of the limit of a function of a single variable, yet there is a critical difference. To determine whether a function of a single variable has a limit, you need only test the approach from two directions—from the right and from the left. When the function approaches the same limit from the right and from the left, you can conclude that the limit exists. For a function of two variables, however, the statement

$$(x, y) \to (x_0, y_0)$$

means that the point (x, y) is allowed to approach (x_0, y_0) from any direction. If the value of

$$\lim_{(x, y)\to(x_0, y_0)} f(x, y)$$

is not the same for all possible approaches, or **paths,** to (x_0, y_0), then the limit does not exist.



For any (x, y) in the disk of radius δ, the value $f(x, y)$ lies between $L + \varepsilon$ and $L - \varepsilon$.

Figure 13.19

EXAMPLE 1 Verifying a Limit by the Definition

Show that $\lim_{(x, y)\to(a, b)} x = a$.

Solution Let $f(x, y) = x$ and $L = a$. You need to show that for each $\varepsilon > 0$, there exists a δ-neighborhood about (a, b) such that

$$|f(x, y) - L| = |x - a| < \varepsilon$$

whenever $(x, y) \neq (a, b)$ lies in the neighborhood. You can first observe that from

$$0 < \sqrt{(x - a)^2 + (y - b)^2} < \delta$$

it follows that

$$\begin{aligned} |f(x, y) - L| &= |x - a| \\ &= \sqrt{(x - a)^2} \\ &\leq \sqrt{(x - a)^2 + (y - b)^2} \\ &< \delta. \end{aligned}$$

So, you can choose $\delta = \varepsilon$, and the limit is verified.

GO DIGITAL

Limits of functions of several variables have the same properties regarding sums, differences, products, and quotients as do limits of functions of single variables. (See Theorem 1.2 in Section 1.3.) Some of these properties are used in the next example.

EXAMPLE 2 Finding a Limit

Find the limit.

$$\lim_{(x, y)\to(1, 2)} \frac{5x^2y}{x^2 + y^2}$$

Solution By using the properties of limits of products and sums, you obtain

$$\lim_{(x, y)\to(1, 2)} 5x^2y = 5(1^2)(2) = 10$$

and

$$\lim_{(x, y)\to(1, 2)} (x^2 + y^2) = (1^2 + 2^2) = 5.$$

Because the limit of a quotient is equal to the quotient of the limits (and the denominator is not 0), you have

$$\lim_{(x, y)\to(1, 2)} \frac{5x^2y}{x^2 + y^2} = \frac{10}{5} = 2.$$

EXAMPLE 3 Finding a Limit

Find the limit: $\lim_{(x, y)\to(0, 0)} \frac{5x^2y}{x^2 + y^2}$.

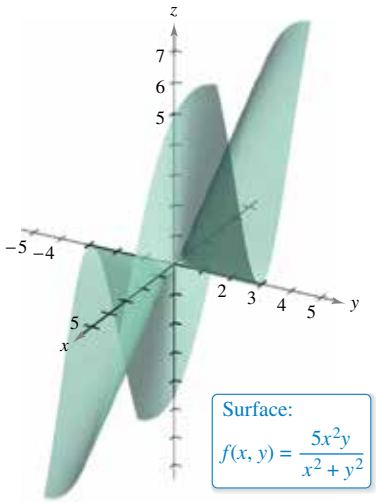

Figure 13.20

Solution In this case, the limits of the numerator and of the denominator are both 0, so you cannot determine the existence (or nonexistence) of a limit by taking the limits of the numerator and denominator separately and then dividing. From the graph of f in Figure 13.20, however, it seems reasonable that the limit might be 0. So, you can try applying the definition to $L = 0$. First, note that

$$|y| \le \sqrt{x^2 + y^2}$$

and

$$\frac{x^2}{x^2 + y^2} \le 1.$$

Then, in a δ-neighborhood about $(0, 0)$, you have

$$0 < \sqrt{x^2 + y^2} < \delta$$

and it follows that, for $(x, y) \neq (0, 0)$,

$$\begin{aligned} |f(x, y) - 0| &= \left|\frac{5x^2y}{x^2 + y^2}\right| \\ &= 5|y|\left(\frac{x^2}{x^2 + y^2}\right) \\ &\le 5|y| \\ &\le 5\sqrt{x^2 + y^2} \\ &< 5\delta. \end{aligned}$$

So, you can choose $\delta = \varepsilon/5$ and conclude that

$$\lim_{(x, y)\to(0, 0)} \frac{5x^2y}{x^2 + y^2} = 0.$$

$\lim_{(x, y)\to(0, 0)} \frac{1}{x^2 + y^2}$ does not exist.

Figure 13.21

For some functions, it is easy to recognize that a limit does not exist. For instance, it is clear that the limit

$$\lim_{(x, y)\to(0, 0)} \frac{1}{x^2 + y^2}$$

does not exist because the values of $f(x, y)$ increase without bound as (x, y) approaches $(0, 0)$ along *any* path (see Figure 13.21).

For other functions, it is not so easy to recognize that a limit does not exist. For instance, the next example describes a limit that does not exist because the function approaches different values along different paths.

EXAMPLE 4 A Limit That Does Not Exist

See LarsonCalculus.com for an interactive version of this type of example.

Show that the limit does not exist.

$$\lim_{(x, y)\to(0, 0)} \left(\frac{x^2 - y^2}{x^2 + y^2}\right)^2$$

Solution The domain of the function

$$f(x, y) = \left(\frac{x^2 - y^2}{x^2 + y^2}\right)^2$$

consists of all points in the xy-plane except for the point $(0, 0)$. To show that the limit as (x, y) approaches $(0, 0)$ does not exist, consider approaching $(0, 0)$ along two different "paths," as shown in Figure 13.22. Along the x-axis, every point is of the form

$$(x, 0)$$

and the limit along this approach is

$$\lim_{(x, 0)\to(0, 0)} \left(\frac{x^2 - 0^2}{x^2 + 0^2}\right)^2 = \lim_{(x, 0)\to(0, 0)} 1^2 = 1. \qquad \text{Limit along } x\text{-axis}$$

However, when (x, y) approaches $(0, 0)$ along the line $y = x$, you obtain

$$\lim_{(x, x)\to(0, 0)} \left(\frac{x^2 - x^2}{x^2 + x^2}\right)^2 = \lim_{(x, x)\to(0, 0)} \left(\frac{0}{2x^2}\right)^2 = 0. \qquad \text{Limit along line } y = x$$

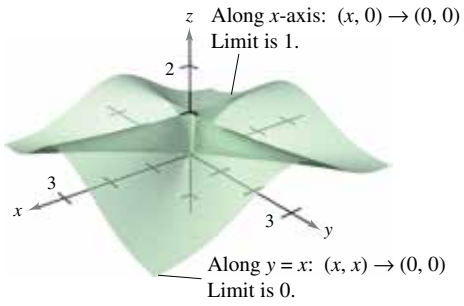
This means that in any open disk centered at $(0, 0)$, there are points (x, y) at which f takes on the value 1 and other points at which f takes on the value 0. For instance,

$$f(x, y) = 1$$

at $(1, 0)$, $(0.1, 0)$, $(0.01, 0)$, and $(0.001, 0)$, and

$$f(x, y) = 0$$

at $(1, 1)$, $(0.1, 0.1)$, $(0.01, 0.01)$, and $(0.001, 0.001)$. So, f does not have a limit as (x, y) approaches $(0, 0)$.



$\lim_{(x, y)\to(0, 0)} \left(\frac{x^2 - y^2}{x^2 + y^2}\right)^2$ does not exist.

Figure 13.22

In Example 4, you could conclude that the limit does not exist because you found two approaches that produced different limits. Be sure you understand that when two approaches produce the same limit, you *cannot* conclude that the limit exists. To form such a conclusion, you must show that the limit is the same along *all* possible approaches.

Continuity of a Function of Two Variables

Notice in Example 2 that the limit of $f(x, y) = 5x^2y/(x^2 + y^2)$ as $(x, y) \to (1, 2)$ can be evaluated by direct substitution. That is, the limit is $f(1, 2) = 2$. In such cases, the function f is said to be **continuous** at the point $(1, 2)$.

REMARK This definition of continuity can be extended to *boundary points* of the open region R by considering a special type of limit in which (x, y) is allowed to approach (x_0, y_0) along paths lying in the region R. This notion is similar to that of one-sided limits, as discussed in Chapter 1.

Definition of Continuity of a Function of Two Variables

A function f of two variables is **continuous at a point (x_0, y_0)** in an open region R if $f(x_0, y_0)$ is defined and is equal to the limit of $f(x, y)$ as (x, y) approaches (x_0, y_0). That is,

$$\lim_{(x, y) \to (x_0, y_0)} f(x, y) = f(x_0, y_0).$$

The function f is **continuous in the open region R** if it is continuous at every point in R.

In Example 3, it was shown that the function

$$f(x, y) = \frac{5x^2y}{x^2 + y^2}$$

is not continuous at $(0, 0)$. Because the limit at this point exists, however, you can remove the discontinuity by defining f at $(0, 0)$ as being equal to its limit there. Such a discontinuity is called **removable.** In Example 4, the function

$$f(x, y) = \left(\frac{x^2 - y^2}{x^2 + y^2}\right)^2$$

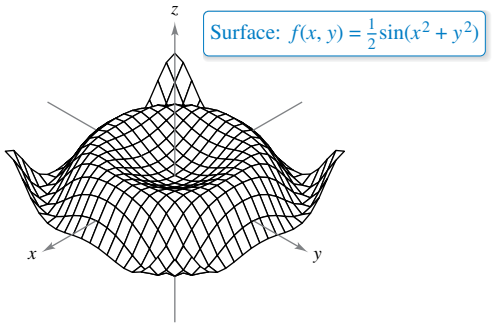
was also shown not to be continuous at $(0, 0)$, but this discontinuity is **nonremovable.**

THEOREM 13.1 Continuous Functions of Two Variables

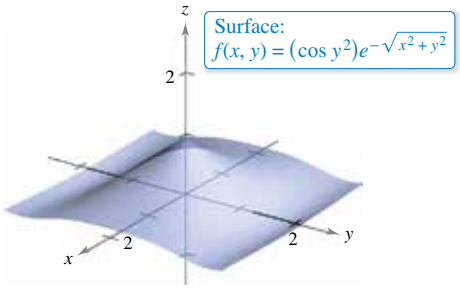
If k is a real number and $f(x, y)$ and $g(x, y)$ are continuous at (x_0, y_0), then the following functions are also continuous at (x_0, y_0).

1. Scalar multiple: kf
2. Sum or difference: $f \pm g$
3. Product: fg
4. Quotient: $f/g, g(x_0, y_0) \neq 0$

Theorem 13.1 establishes the continuity of *polynomial* and *rational* functions at every point in their domains. Furthermore, the continuity of other types of functions can be extended naturally from one to two variables. For instance, the functions whose graphs are shown in Figures 13.23 and 13.24 are continuous at every point in the plane.



The function f is continuous at every point in the plane.
Figure 13.23



The function f is continuous at every point in the plane.

GO DIGITAL

The next theorem states conditions under which a composite function is continuous.

THEOREM 13.2 Continuity of a Composite Function

If h is continuous at (x_0, y_0) and g is continuous at $h(x_0, y_0)$, then the composite function given by $(g \circ h)(x, y) = g(h(x, y))$ is continuous at (x_0, y_0). That is,

$$\lim_{(x, y)\to(x_0, y_0)} g(h(x, y)) = g(h(x_0, y_0)).$$

Note in Theorem 13.2 that h is a function of two variables and g is a function of one variable.

EXAMPLE 5 Testing for Continuity

Discuss the continuity of each function.

a. $f(x, y) = \dfrac{x - 2y}{x^2 + y^2}$ **b.** $g(x, y) = \dfrac{2}{y - x^2}$

Solution

a. Because a rational function is continuous at every point in its domain, you can conclude that f is continuous at each point in the xy-plane except at $(0, 0)$, as shown in Figure 13.25.

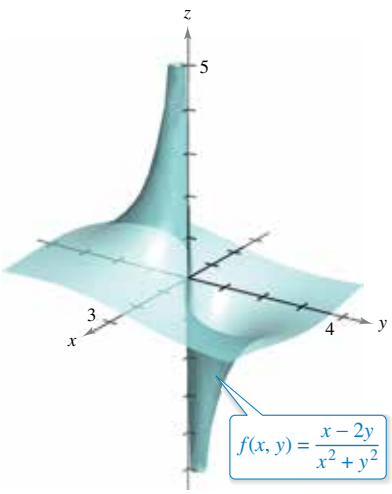
b. The function

$$g(x, y) = \frac{2}{y - x^2}$$

is continuous except at the points at which the denominator is 0. These points are given by the equation

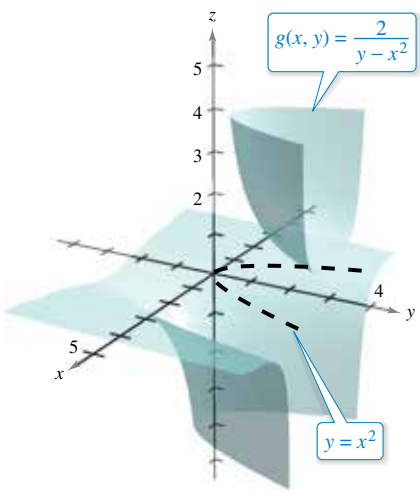
$$y - x^2 = 0.$$

So, you can conclude that the function is continuous at all points except those lying on the parabola $y = x^2$. Inside this parabola, $y > x^2$ and the surface represented by the function lies above the xy-plane, as shown in Figure 13.26. Outside the parabola, $y < x^2$ and the surface lies below the xy-plane.



The function f is not continuous at $(0, 0)$.

Figure 13.25



The function g is not continuous on the parabola $y = x^2$.

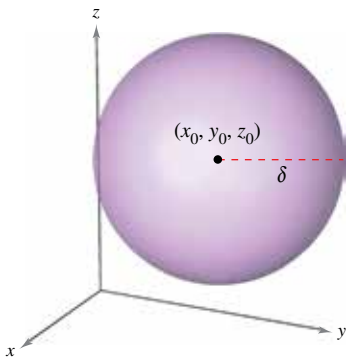
Continuity of a Function of Three Variables

The preceding definitions of limits and continuity can be extended to functions of three variables by considering points (x, y, z) within the *open sphere*

$$(x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2 < \delta^2. \qquad \text{Open sphere}$$

The radius of this sphere is δ, and the sphere is centered at (x_0, y_0, z_0), as shown in Figure 13.27.



Open sphere in space

Figure 13.27

A point (x_0, y_0, z_0) in a region R in space is an **interior point** of R if there exists a δ-sphere about (x_0, y_0, z_0) that lies entirely in R. If every point in R is an interior point, then R is called **open.**

Definition of Continuity of a Function of Three Variables

A function f of three variables is **continuous at a point (x_0, y_0, z_0)** in an open region R if $f(x_0, y_0, z_0)$ is defined and is equal to the limit of $f(x, y, z)$ as (x, y, z) approaches (x_0, y_0, z_0). That is,

$$\lim_{(x, y, z) \to (x_0, y_0, z_0)} f(x, y, z) = f(x_0, y_0, z_0).$$

The function f is **continuous in the open region R** if it is continuous at every point in R.

EXAMPLE 6 Testing Continuity of a Function of Three Variables

Discuss the continuity of

$$f(x, y, z) = \frac{1}{x^2 + y^2 - z}.$$

Solution The function f is continuous except at the points at which the denominator is 0, which are given by the equation

$$x^2 + y^2 - z = 0.$$

So, f is continuous at each point in space except at the points on the paraboloid

$$z = x^2 + y^2.$$

GO DIGITAL

Concept Check

1. Write a brief description of the meaning of the notation $\lim_{(x, y)\to(-1, 3)} f(x, y) = 1$.

2. Explain how examining limits along different paths might show that a limit does not exist. Does this type of examination show that a limit does exist? Explain.

Verifying a Limit by the Definition **In Exercises 3–6, use the definition of the limit of a function of two variables to verify the limit.**

3. $\lim_{(x, y)\to(1, 0)} x = 1$
4. $\lim_{(x, y)\to(4, -1)} x = 4$
5. $\lim_{(x, y)\to(1, -3)} y = -3$
6. $\lim_{(x, y)\to(a, b)} y = b$

Using Properties of Limits **In Exercises 7–10, find the indicated limit by using the limits**

$$\lim_{(x,y)\to(a,b)} f(x, y) = 4 \quad \text{and} \quad \lim_{(x,y)\to(a,b)} g(x, y) = -5.$$

7. $\lim_{(x, y)\to(a, b)} [f(x, y) - g(x, y)]$
8. $\lim_{(x, y)\to(a, b)} \left[\frac{3f(x, y)}{g(x, y)}\right]$
9. $\lim_{(x, y)\to(a, b)} [f(x, y)g(x, y)]$
10. $\lim_{(x, y)\to(a, b)} \left[\frac{f(x, y) + g(x, y)}{f(x, y)}\right]$

Limit and Continuity **In Exercises 11–24, find the limit and discuss the continuity of the function.**

11. $\lim_{(x, y)\to(3, 1)} (x^2 - 2y)$
12. $\lim_{(x, y)\to(-1, 1)} (x + 4y^2 + 5)$
13. $\lim_{(x, y)\to(1, 2)} e^{xy}$
14. $\lim_{(x, y)\to(2, 4)} \frac{x + y}{x^2 + 1}$
15. $\lim_{(x, y)\to(0, 2)} \frac{x}{y}$
16. $\lim_{(x, y)\to(-1, 2)} \frac{x + y}{x - y}$
17. $\lim_{(x, y)\to(1, 1)} \frac{xy}{x^2 + y^2}$
18. $\lim_{(x, y)\to(1, 1)} \frac{x}{\sqrt{x + y}}$
19. $\lim_{(x, y)\to(\pi/3, 2)} y \cos xy$
20. $\lim_{(x, y)\to(\pi, -4)} \sin \frac{x}{y}$
21. $\lim_{(x, y)\to(0, 1)} \frac{\arcsin xy}{1 - xy}$
22. $\lim_{(x, y)\to(0, 1)} \frac{\arccos(x/y)}{1 + xy}$
23. $\lim_{(x, y, z)\to(1, 3, 4)} \sqrt{x + y + z}$
24. $\lim_{(x, y, z)\to(-2, 1, 0)} xe^{yz}$

Finding a Limit **In Exercises 25–36, find the limit (if it exists). If the limit does not exist, explain why.**

25. $\lim_{(x, y)\to(1, 1)} \frac{xy - 1}{1 + xy}$
26. $\lim_{(x, y)\to(1, -1)} \frac{x^2y}{1 + xy^2}$
27. $\lim_{(x, y)\to(0, 0)} \frac{1}{x + y}$
28. $\lim_{(x, y)\to(0, 0)} \frac{1}{x^2y^2}$
29. $\lim_{(x, y)\to(0, 0)} \frac{x - y}{\sqrt{x} - \sqrt{y}}$
30. $\lim_{(x, y)\to(2, 1)} \frac{x - y - 1}{\sqrt{x - y} - 1}$
31. $\lim_{(x, y)\to(0, 0)} \frac{x + y}{x^2 + y}$
32. $\lim_{(x, y)\to(0, 0)} \frac{x}{x^2 - y^2}$
33. $\lim_{(x, y)\to(0, 0)} \frac{x^2}{(x^2 + 1)(y^2 + 1)}$
34. $\lim_{(x, y)\to(0, 0)} \ln(x^2 + y^2)$
35. $\lim_{(x, y, z)\to(0, 0, 0)} \frac{xy + yz + xz}{x^2 + y^2 + z^2}$
36. $\lim_{(x, y, z)\to(0, 0, 0)} \frac{xy + yz^2 + xz^2}{x^2 + y^2 + z^2}$

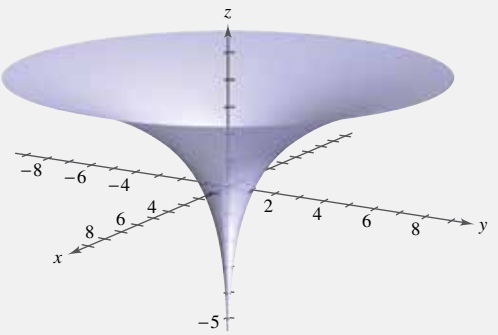
Exploring Concepts

37. Can you conclude anything about $\lim_{(x, y)\to(2, 3)} f(x, y)$ when $f(2, 3) = 4$? Explain.

38. Can you conclude anything about $f(2, 3)$ when $\lim_{(x, y)\to(2, 3)} f(x, y) = 4$? Explain.

39. Let $\lim_{(x, y)\to(0, 0)} f(x, y) = 0$. Does $\lim_{(x, 0)\to(0, 0)} f(x, 0) = 0$? Explain your reasoning.

40. **HOW DO YOU SEE IT?** The figure shows the graph of $f(x, y) = \ln(x^2 + y^2)$. From the graph, does it appear that the limit at each point exists?



(a) $(-1, -1)$ (b) $(0, 3)$ (c) $(0, 0)$ (d) $(2, 0)$

Continuity **In Exercises 41 and 42, discuss the continuity of the function and evaluate the limit of $f(x, y)$ (if it exists) as $(x, y) \to (0, 0)$.**

41. $f(x, y) = e^{xy}$

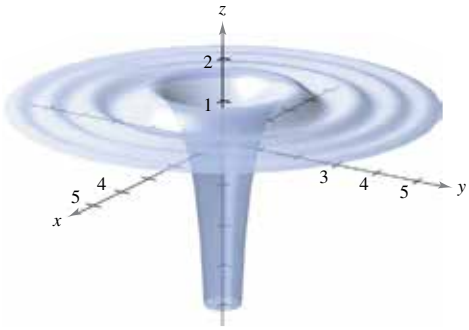
42. $f(x, y) = 1 - \dfrac{\cos(x^2 + y^2)}{x^2 + y^2}$



Limit and Continuity **In Exercises 43–46, use a graphing utility to make a table showing the values of $f(x, y)$ at the given points for each path. Use the result to make a conjecture about the limit of $f(x, y)$ as $(x, y) \to (0, 0)$. Determine analytically whether the limit exists and discuss the continuity of the function.**

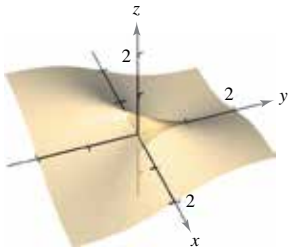
43. $f(x, y) = \dfrac{xy}{x^2 + y^2}$

Path: $y = 0$

Points: $(1, 0), (0.5, 0), (0.1, 0), (0.01, 0), (0.001, 0)$

Path: $y = x$

Points: $(1, 1), (0.5, 0.5), (0.1, 0.1), (0.01, 0.01), (0.001, 0.001)$



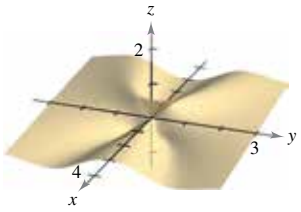
44. $f(x, y) = -\dfrac{xy^2}{x^2 + y^4}$

Path: $x = y^2$

Points: $(1, 1), (0.25, 0.5), (0.01, 0.1), (0.0001, 0.01), (0.000001, 0.001)$

Path: $x = -y^2$

Points: $(-1, 1), (-0.25, 0.5), (-0.01, 0.1), (-0.0001, 0.01), (-0.000001, 0.001)$



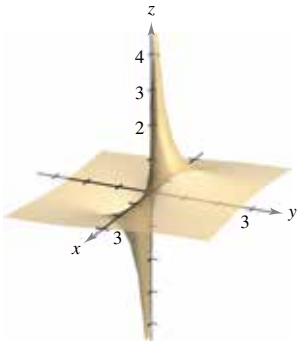
45. $f(x, y) = \dfrac{y}{x^2 + y^2}$

Path: $y = 0$

Points: $(1, 0), (0.5, 0), (0.1, 0), (0.01, 0), (0.001, 0)$

Path: $y = x$

Points: $(1, 1), (0.5, 0.5), (0.1, 0.1), (0.01, 0.01), (0.001, 0.001)$



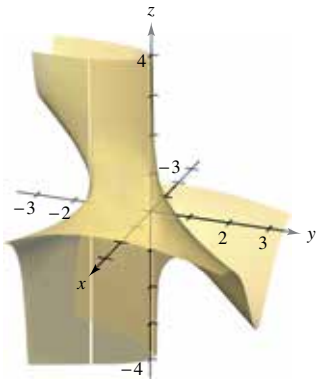
46. $f(x, y) = \dfrac{2x - y^2}{2x^2 + y}$

Path: $y = 0$

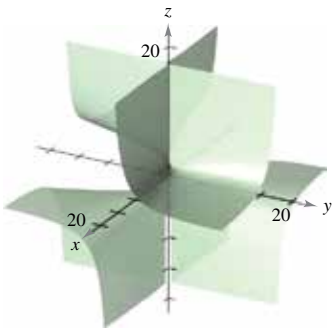
Points: $(1, 0), (0.25, 0), (0.01, 0), (0.001, 0), (0.000001, 0)$

Path: $y = x$

Points: $(1, 1), (0.25, 0.25), (0.01, 0.01), (0.001, 0.001), (0.0001, 0.0001)$



47. Limit Consider $\lim\limits_{(x, y) \to (0, 0)} \dfrac{x^2 + y^2}{xy}$ (see figure).

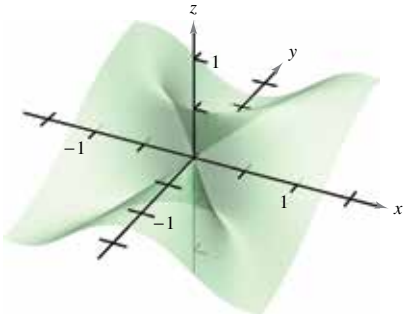


(a) Determine (if possible) the limit along any line of the form $y = ax$.

(b) Determine (if possible) the limit along the parabola $y = x^2$.

(c) Does the limit exist? Explain.

48. Limit Consider $\lim\limits_{(x, y) \to (0, 0)} \dfrac{x^2y}{x^4 + y^2}$ (see figure).



(a) Determine (if possible) the limit along any line of the form $y = ax$.

(b) Determine (if possible) the limit along the parabola $y = x^2$.

(c) Does the limit exist? Explain.

Comparing Continuity **In Exercises 49 and 50, discuss the continuity of the functions f and g. Explain any differences.**

49.
$$f(x,y)=\begin{cases}\dfrac{x^4-y^4}{x^2+y^2}, & (x,y)\neq(0,0)\\ 0, & (x,y)=(0,0)\end{cases}$$
$$g(x,y)=\begin{cases}\dfrac{x^4-y^4}{x^2+y^2}, & (x,y)\neq(0,0)\\ 1, & (x,y)=(0,0)\end{cases}$$

50.
$$f(x,y)=\begin{cases}\dfrac{x^2+2xy^2+y^2}{x^2+y^2}, & (x,y)\neq(0,0)\\ 0, & (x,y)=(0,0)\end{cases}$$
$$g(x,y)=\begin{cases}\dfrac{x^2+2xy^2+y^2}{x^2+y^2}, & (x,y)\neq(0,0)\\ 1, & (x,y)=(0,0)\end{cases}$$

Finding a Limit Using Polar Coordinates **In Exercises 51–56, use polar coordinates to find the limit. [*Hint:* Let $x=r\cos\theta$ and $y=r\sin\theta$, and note that $(x,y)\to(0,0)$ implies $r\to 0$.]**

51. $\lim\limits_{(x,y)\to(0,0)}\dfrac{xy^2}{x^2+y^2}$

52. $\lim\limits_{(x,y)\to(0,0)}\dfrac{x^3+y^3}{x^2+y^2}$

53. $\lim\limits_{(x,y)\to(0,0)}\dfrac{x^2y^2}{x^2+y^2}$

54. $\lim\limits_{(x,y)\to(0,0)}\dfrac{x^2-y^2}{\sqrt{x^2+y^2}}$

55. $\lim\limits_{(x,y)\to(0,0)}\cos(x^2+y^2)$

56. $\lim\limits_{(x,y)\to(0,0)}\sin\sqrt{x^2+y^2}$

Finding a Limit Using Polar Coordinates **In Exercises 57–60, use polar coordinates and L'Hôpital's Rule to find the limit.**

57. $\lim\limits_{(x,y)\to(0,0)}\dfrac{\sin\sqrt{x^2+y^2}}{\sqrt{x^2+y^2}}$

58. $\lim\limits_{(x,y)\to(0,0)}\dfrac{\sin(x^2+y^2)}{x^2+y^2}$

59. $\lim\limits_{(x,y)\to(0,0)}\dfrac{1-\cos(x^2+y^2)}{x^2+y^2}$

60. $\lim\limits_{(x,y)\to(0,0)}(x^2+y^2)\ln(x^2+y^2)$

Continuity **In Exercises 61–66, discuss the continuity of the function.**

61. $f(x,y,z)=\dfrac{1}{\sqrt{x^2+y^2+z^2}}$

62. $f(x,y,z)=\dfrac{z}{x^2+y^2-4}$

63. $f(x,y,z)=\dfrac{\sin z}{e^x+e^y}$

64. $f(x,y,z)=xy\sin z$

65.
$$f(x,y)=\begin{cases}\dfrac{\sin xy}{xy}, & xy\neq 0\\ 1, & xy=0\end{cases}$$

66.
$$f(x,y)=\begin{cases}\dfrac{\sin(x^2-y^2)}{x^2-y^2}, & x^2\neq y^2\\ 1, & x^2=y^2\end{cases}$$

Continuity of a Composite Function **In Exercises 67–70, discuss the continuity of the composite function $f\circ g$.**

67. $f(t)=t^2$, $g(x,y)=2x-3y$

68. $f(t)=\dfrac{1}{t}$, $g(x,y)=x^2+y^2$

69. $f(t)=\dfrac{1}{t}$, $g(x,y)=2x-3y$

70. $f(t)=\dfrac{1}{1-t}$, $g(x,y)=x^2+y^2$

Finding a Limit **In Exercises 71–76, find each limit.**

(a) $\lim\limits_{\Delta x\to 0}\dfrac{f(x+\Delta x,y)-f(x,y)}{\Delta x}$

(b) $\lim\limits_{\Delta y\to 0}\dfrac{f(x,y+\Delta y)-f(x,y)}{\Delta y}$

71. $f(x,y)=x^2-4y$

72. $f(x,y)=3x^2+y^2$

73. $f(x,y)=\dfrac{x}{y}$

74. $f(x,y)=\dfrac{1}{x+y}$

75. $f(x,y)=3x+xy-2y$

76. $f(x,y)=\sqrt{y}(y+1)$

Finding a Limit Using Spherical Coordinates **In Exercises 77 and 78, use spherical coordinates to find the limit. [*Hint:* Let $x=\rho\sin\phi\cos\theta$, $y=\rho\sin\phi\sin\theta$, and $z=\rho\cos\phi$, and note that $(x,y,z)\to(0,0,0)$ implies $\rho\to 0^+$.]**

77. $\lim\limits_{(x,y)\to(0,0,0)}\dfrac{xyz}{x^2+y^2+z^2}$

78. $\lim\limits_{(x,y)\to(0,0,0)}\tan^{-1}\left(\dfrac{1}{x^2+y^2+z^2}\right)$

True or False? **In Exercises 79–82, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

79. A closed region contains all of its boundary points.

80. Every point in an open region is an interior point.

81. If f is continuous for all nonzero x and y, and $f(0,0)=0$, then $\lim\limits_{(x,y)\to(0,0)}f(x,y)=0$.

82. If g is a continuous function of x, h is a continuous function of y, and $f(x,y)=g(x)+h(y)$, then f is continuous.

83. Finding a Limit Find the following limit.

$$\lim_{(x,y)\to(0,1)}\tan^{-1}\left[\frac{x^2+1}{x^2+(y-1)^2}\right]$$

84. Continuity For the function

$$f(x,y)=xy\left(\frac{x^2-y^2}{x^2+y^2}\right)$$

define $f(0,0)$ such that f is continuous at the origin.

85. Proof Prove that $\lim\limits_{(x,y)\to(a,b)}[f(x,y)+g(x,y)]=L_1+L_2$ where $f(x,y)$ approaches L_1 and $g(x,y)$ approaches L_2 as $(x,y)\to(a,b)$.

86. Proof Prove that if f is continuous and $f(a,b)<0$, then there exists a δ-neighborhood about (a,b) such that $f(x,y)<0$ for every point (x,y) in the neighborhood.

13.3 Partial Derivatives

GO DIGITAL

- Find and use partial derivatives of a function of two variables.
- Find and use partial derivatives of a function of three or more variables.
- Find higher-order partial derivatives of a function of two or three variables.

JEAN LE ROND D'ALEMBERT (1717–1783)

The introduction of partial derivatives followed Newton's and Leibniz's work in calculus by several years. Between 1730 and 1760, Leonhard Euler and Jean Le Rond d'Alembert separately published several papers on dynamics, in which they established much of the theory of partial derivatives. These papers used functions of two or more variables to study problems involving equilibrium, fluid motion, and vibrating strings.

See LarsonCalculus.com to read more of this biography.

Partial Derivatives of a Function of Two Variables

In applications of functions of several variables, the question often arises, "How will the value of a function be affected by a change in one of its independent variables?" You can answer this by considering the independent variables one at a time. For example, to determine the effect of a catalyst in an experiment, a chemist could conduct the experiment several times using varying amounts of the catalyst while keeping constant other variables such as temperature and pressure. You can use a similar procedure to determine the rate of change of a function f with respect to one of its several independent variables. This process is called **partial differentiation,** and the result is referred to as the **partial derivative** of f with respect to the chosen independent variable.

Definition of Partial Derivatives of a Function of Two Variables

If $z = f(x, y)$, then the **first partial derivatives** of f with respect to x and y are the functions f_x and f_y defined by

$$f_x(x, y) = \lim_{\Delta x \to 0} \frac{f(x + \Delta x, y) - f(x, y)}{\Delta x}$$ Partial derivative with respect to x

and

$$f_y(x, y) = \lim_{\Delta y \to 0} \frac{f(x, y + \Delta y) - f(x, y)}{\Delta y}$$ Partial derivative with respect to y

provided the limits exist.

This definition indicates that if $z = f(x, y)$, then to find f_x, *consider y to be constant* and differentiate with respect to x. Similarly, to find f_y, *consider x to be constant* and differentiate with respect to y.

EXAMPLE 1 Finding Partial Derivatives

a. To find f_x for $f(x, y) = 3x - x^2y^2 + 2x^3y$, consider y to be constant and differentiate with respect to x.

$$f_x(x, y) = 3 - 2xy^2 + 6x^2y$$ Partial derivative with respect to x

To find f_y, consider x to be constant and differentiate with respect to y.

$$f_y(x, y) = -2x^2y + 2x^3$$ Partial derivative with respect to y

b. To find f_x for $f(x, y) = (\ln x)(\sin x^2y)$, consider y to be constant and differentiate with respect to x.

$$f_x(x, y) = (\ln x)(\cos x^2y)(2xy) + \frac{\sin x^2y}{x}$$ Partial derivative with respect to x

To find f_y, consider x to be constant and differentiate with respect to y.

$$f_y(x, y) = (\ln x)(\cos x^2y)(x^2)$$ Partial derivative with respect to y

REMARK The notation $\partial z/\partial x$ is read as "the partial derivative of z with respect to x," and $\partial z/\partial y$ is read as "the partial derivative of z with respect to y."

GO DIGITAL

Notation for First Partial Derivatives

For $z = f(x, y)$, the partial derivatives f_x and f_y are denoted by

$$\frac{\partial}{\partial x}f(x, y) = f_x(x, y) = z_x = \frac{\partial z}{\partial x}$$ Partial derivative with respect to x

and

$$\frac{\partial}{\partial y}f(x, y) = f_y(x, y) = z_y = \frac{\partial z}{\partial y}.$$ Partial derivative with respect to y

The first partials evaluated at the point (a, b) are denoted by

$$\left.\frac{\partial z}{\partial x}\right|_{(a, b)} = f_x(a, b) \quad \text{and} \quad \left.\frac{\partial z}{\partial y}\right|_{(a, b)} = f_y(a, b).$$

EXAMPLE 2 Finding and Evaluating Partial Derivatives

For $f(x, y) = xe^{x^2y}$, find f_x and f_y, and evaluate each at the point $(1, \ln 2)$.

Solution To find the first partial derivative with respect to x, hold y constant and differentiate using the Product Rule.

$$\begin{aligned} f_x(x, y) &= (x)\frac{\partial}{\partial x}[e^{x^2y}] + (e^{x^2y})\frac{\partial}{\partial x}[x] && \text{Apply Product Rule.} \\ &= xe^{x^2y}(2xy) + e^{x^2y} && y \text{ is held constant.} \end{aligned}$$

The value of f_x at the point $(1, \ln 2)$ is

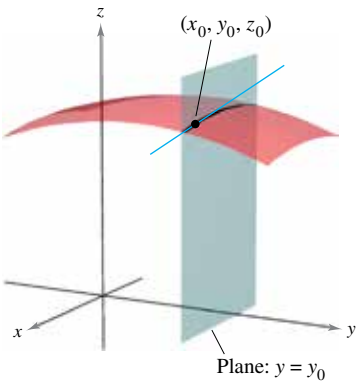
$$f_x(1, \ln 2) = e^{\ln 2}(2 \ln 2) + e^{\ln 2} = 4 \ln 2 + 2.$$

To find the first partial derivative with respect to y, hold x constant and differentiate using the Constant Multiple Rule.

$$\begin{aligned} f_y(x, y) &= (x)\frac{\partial}{\partial y}[e^{x^2y}] && \text{Apply Constant Multiple Rule.} \\ &= xe^{x^2y}(x^2) && x \text{ is held constant.} \\ &= x^3e^{x^2y} && \text{Simplify.} \end{aligned}$$

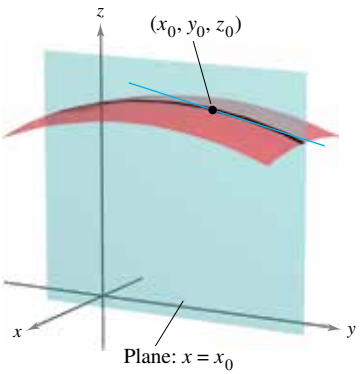
The value of f_y at the point $(1, \ln 2)$ is

$$f_y(1, \ln 2) = e^{\ln 2} = 2.$$ ■



$f_x(x_0, y_0)$ = slope in x-direction

Figure 13.28



$f_y(x_0, y_0)$ = slope in y-direction

Figure 13.29

The partial derivatives of a function of two variables, $z = f(x, y)$, have a useful geometric interpretation. If $y = y_0$, then $z = f(x, y_0)$ represents the curve formed by intersecting the surface $z = f(x, y)$ with the plane $y = y_0$, as shown in Figure 13.28. So,

$$f_x(x_0, y_0) = \lim_{\Delta x \to 0}\frac{f(x_0 + \Delta x, y_0) - f(x_0, y_0)}{\Delta x}$$

represents the slope of this curve at the point $(x_0, y_0, f(x_0, y_0))$. Note that both the curve and the tangent line lie in the plane $y = y_0$. Similarly,

$$f_y(x_0, y_0) = \lim_{\Delta y \to 0}\frac{f(x_0, y_0 + \Delta y) - f(x_0, y_0)}{\Delta y}$$

represents the slope of the curve given by the intersection of $z = f(x, y)$ and the plane $x = x_0$ at $(x_0, y_0, f(x_0, y_0))$, as shown in Figure 13.29.

Informally, the values of $\partial f/\partial x$ and $\partial f/\partial y$ at the point (x_0, y_0, z_0) denote the **slopes of the surface in the x- and y-directions,** respectively.

EXAMPLE 3 Finding the Slopes of a Surface

See LarsonCalculus.com for an interactive version of this type of example.

Find the slopes in the x-direction and in the y-direction of the surface

$$f(x, y) = -\frac{x^2}{2} - y^2 + \frac{25}{8}$$

at the point $\left(\frac{1}{2}, 1, 2\right)$.

Solution The partial derivatives of f with respect to x and y are

$$f_x(x, y) = -x \quad \text{and} \quad f_y(x, y) = -2y.$$ Partial derivatives

At the point $\left(\frac{1}{2}, 1, 2\right)$, the slope in the x-direction is

$$f_x\left(\frac{1}{2}, 1\right) = -\frac{1}{2}$$ Figure 13.30

and the slope in the y-direction is

$$f_y\left(\frac{1}{2}, 1\right) = -2.$$ Figure 13.31

REMARK The guidelines below may help you find the slopes of a surface in the x- and y-directions. Let (x_0, y_0, z_0) be a point on the surface of $z = f(x, y)$.

1. Find the partial derivatives of f with respect to x and y.
2. The slope in the x-direction at (x_0, y_0, z_0) is $f_x(x_0, y_0)$.
3. The slope in the y-direction at (x_0, y_0, z_0) is $f_y(x_0, y_0)$.

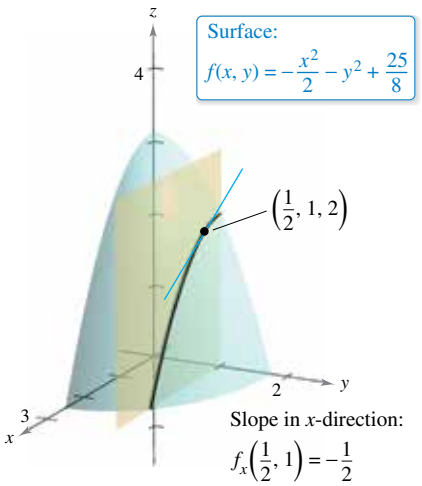

Figure 13.30

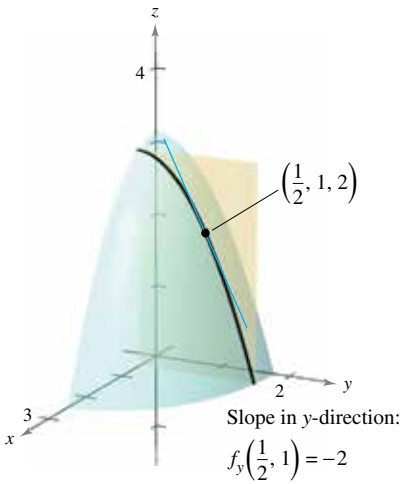

Figure 13.31

EXAMPLE 4 Finding the Slopes of a Surface

Find the slopes of the surface

$$f(x, y) = 1 - (x - 1)^2 - (y - 2)^2$$

at the point $(1, 2, 1)$ in the x-direction and in the y-direction.

Solution The partial derivatives of f with respect to x and y are

$$f_x(x, y) = -2(x - 1) \quad \text{and} \quad f_y(x, y) = -2(y - 2).$$ Partial derivatives

At the point $(1, 2, 1)$, the slope in the x-direction is

$$f_x(1, 2) = -2(1 - 1) = 0$$

and the slope in the y-direction is

$$f_y(1, 2) = -2(2 - 2) = 0$$

as shown in Figure 13.32.

The area of the parallelogram is $ab \sin \theta$.
Figure 13.33

No matter how many variables are involved, partial derivatives can be interpreted as *rates of change.*

EXAMPLE 5 **Using Partial Derivatives to Find Rates of Change**

The area of a parallelogram with adjacent sides a and b and included angle θ is given by $A = ab \sin \theta$, as shown in Figure 13.33.

a. Find the rate of change of A with respect to a for $a = 10$, $b = 20$, and $\theta = \pi/6$.

b. Find the rate of change of A with respect to θ for $a = 10$, $b = 20$, and $\theta = \pi/6$.

Solution

a. To find the rate of change of the area with respect to a, hold b and θ constant and differentiate with respect to a to obtain

$$\frac{\partial A}{\partial a} = b \sin \theta.$$ Find partial derivative with respect to a.

For $a = 10$, $b = 20$, and $\theta = \pi/6$, the rate of change of the area with respect to a is

$$\frac{\partial A}{\partial a} = 20 \sin \frac{\pi}{6} = 10.$$ Substitute for b and θ.

b. To find the rate of change of the area with respect to θ, hold a and b constant and differentiate with respect to θ to obtain

$$\frac{\partial A}{\partial \theta} = ab \cos \theta.$$ Find partial derivative with respect to θ.

For $a = 10$, $b = 20$, and $\theta = \pi/6$, the rate of change of the area with respect to θ is

$$\frac{\partial A}{\partial \theta} = (10)(20) \cos \frac{\pi}{6} = 100\sqrt{3}.$$ Substitute for a, b, and θ. ■

Partial Derivatives of a Function of Three or More Variables

The concept of a partial derivative can be extended naturally to functions of three or more variables. For instance, the function

$$w = f(x, y, z)$$ Function of three variables

has three partial derivatives, each of which is formed by holding two of the variables constant. That is, to define the partial derivative of w with respect to x, consider y and z to be constant and differentiate with respect to x. A similar process is used to find the derivatives of w with respect to y and with respect to z.

$$\frac{\partial w}{\partial x} = f_x(x, y, z) = \lim_{\Delta x \to 0} \frac{f(x + \Delta x, y, z) - f(x, y, z)}{\Delta x}$$

$$\frac{\partial w}{\partial y} = f_y(x, y, z) = \lim_{\Delta y \to 0} \frac{f(x, y + \Delta y, z) - f(x, y, z)}{\Delta y}$$

$$\frac{\partial w}{\partial z} = f_z(x, y, z) = \lim_{\Delta z \to 0} \frac{f(x, y, z + \Delta z) - f(x, y, z)}{\Delta z}$$

In general, if $w = f(x_1, x_2, \ldots, x_n)$, then there are n partial derivatives denoted by

$$\frac{\partial w}{\partial x_k} = f_{x_k}(x_1, x_2, \ldots, x_n), \quad k = 1, 2, \ldots, n.$$

To find the partial derivative with respect to one of the variables, hold the other variables constant and differentiate with respect to the given variable.

EXAMPLE 6 Finding Partial Derivatives

a. To find the partial derivative of $f(x, y, z) = xy + yz^2 + xz$ with respect to z, consider x and y to be constant and obtain

$$\frac{\partial}{\partial z}[xy + yz^2 + xz] = 2yz + x.$$

b. To find the partial derivative of $f(x, y, z) = z \sin(xy^2 + 2z)$ with respect to z, consider x and y to be constant. Then, using the Product Rule, you obtain

$$\begin{aligned}\frac{\partial}{\partial z}[z \sin(xy^2 + 2z)] &= (z)\frac{\partial}{\partial z}[\sin(xy^2 + 2z)] + \sin(xy^2 + 2z)\frac{\partial}{\partial z}[z] \\ &= (z)[\cos(xy^2 + 2z)](2) + \sin(xy^2 + 2z) \\ &= 2z \cos(xy^2 + 2z) + \sin(xy^2 + 2z).\end{aligned}$$

c. To find the partial derivative of

$$f(x, y, z, w) = \frac{x + y + z}{w}$$

with respect to w, consider x, y, and z to be constant and obtain

$$\frac{\partial}{\partial w}\left[\frac{x + y + z}{w}\right] = -\frac{x + y + z}{w^2}.$$

Higher-Order Partial Derivatives

As is true for ordinary derivatives, it is possible to take second, third, and higher-order partial derivatives of a function of several variables, provided such derivatives exist. Higher-order derivatives are denoted by the order in which the differentiation occurs. For instance, the function $z = f(x, y)$ has the following second partial derivatives.

1. Differentiate twice with respect to x:

$$\frac{\partial}{\partial x}\left(\frac{\partial f}{\partial x}\right) = \frac{\partial^2 f}{\partial x^2} = f_{xx}.$$

2. Differentiate twice with respect to y:

$$\frac{\partial}{\partial y}\left(\frac{\partial f}{\partial y}\right) = \frac{\partial^2 f}{\partial y^2} = f_{yy}.$$

3. Differentiate first with respect to x and then with respect to y:

$$\frac{\partial}{\partial y}\left(\frac{\partial f}{\partial x}\right) = \frac{\partial^2 f}{\partial y \partial x} = f_{xy}.$$

4. Differentiate first with respect to y and then with respect to x:

$$\frac{\partial}{\partial x}\left(\frac{\partial f}{\partial y}\right) = \frac{\partial^2 f}{\partial x \partial y} = f_{yx}.$$

The third and fourth cases are called **mixed partial derivatives.**

REMARK Note that the two types of notation for mixed partials have different conventions for indicating the order of differentiation.

$$\frac{\partial}{\partial y}\left(\frac{\partial f}{\partial x}\right) = \frac{\partial^2 f}{\partial y \partial x} \quad \text{Right-to-left order}$$

$$(f_x)_y = f_{xy} \quad \text{Left-to-right order}$$

You can remember the order by observing that in both notations you differentiate first with respect to the variable "nearest" f.

EXAMPLE 7 Finding Second Partial Derivatives

Find the second partial derivatives of

$$f(x, y) = 3xy^2 - 2y + 5x^2y^2$$

and determine the value of $f_{xy}(-1, 2)$.

Solution Begin by finding the first partial derivatives with respect to x and y.

$$f_x(x, y) = 3y^2 + 10xy^2 \quad \text{and} \quad f_y(x, y) = 6xy - 2 + 10x^2y$$

Then, differentiate each of these with respect to x and y.

$$f_{xx}(x, y) = 10y^2 \quad \text{and} \quad f_{yy}(x, y) = 6x + 10x^2$$
$$f_{xy}(x, y) = 6y + 20xy \quad \text{and} \quad f_{yx}(x, y) = 6y + 20xy$$

At $(-1, 2)$, the value of f_{xy} is

$$f_{xy}(-1, 2) = 6(2) + 20(-1)(2) = 12 - 40 = -28.$$

Notice in Example 7 that the two mixed partials are equal. Sufficient conditions for this occurrence are given in Theorem 13.3.

THEOREM 13.3 Equality of Mixed Partial Derivatives

If f is a function of x and y such that f_{xy} and f_{yx} are continuous on an open disk R, then, for every (x, y) in R,

$$f_{xy}(x, y) = f_{yx}(x, y).$$

Theorem 13.3 also applies to a function f of *three or more variables* as long as all second partial derivatives are continuous. For example, if

$$w = f(x, y, z) \qquad \text{Function of three variables}$$

and all the second partial derivatives are continuous in an open region R, then at each point in R, the order of differentiation in the mixed second partial derivatives is irrelevant. If the third partial derivatives of f are also continuous, then the order of differentiation of the mixed third partial derivatives is irrelevant.

EXAMPLE 8 Finding Higher-Order Partial Derivatives

Show that $f_{xz} = f_{zx}$ and $f_{xzz} = f_{zxz} = f_{zzx}$ for the function

$$f(x, y, z) = ye^x + x \ln z.$$

Solution Begin by finding the first partial derivatives with respect to x and z.

$$f_x(x, y, z) = ye^x + \ln z, \quad f_z(x, y, z) = \frac{x}{z}$$

Next, find the second partial derivatives with respect to x and z. Note that $f_{xz} = f_{zx}$.

$$f_{xz}(x, y, z) = \frac{1}{z}, \quad f_{zx}(x, y, z) = \frac{1}{z}, \quad f_{zz}(x, y, z) = -\frac{x}{z^2}$$

Finally, find the third partial derivatives with respect to x and z. Note that all three are equal.

$$f_{xzz}(x, y, z) = -\frac{1}{z^2}, \quad f_{zxz}(x, y, z) = -\frac{1}{z^2}, \quad f_{zzx}(x, y, z) = -\frac{1}{z^2}$$

Concept Check

1. List three ways of writing the first partial derivative with respect to x of $z = f(x, y)$.
2. Sketch a surface representing a function f of two variables x and y. Use the sketch to give geometric interpretations of $\partial f/\partial x$ and $\partial f/\partial y$.
3. Describe the order in which the differentiation of $f(x, y, z)$ occurs for (a) f_{yxz} and (b) $\partial^2 f/\partial x \partial z$.
4. If f is a function of x and y such that f_{xy} and f_{yx} are continuous, what is the relationship between the mixed partial derivatives?

Examining a Partial Derivative **In Exercises 5–10, explain whether the Quotient Rule should be used to find the partial derivative. Do not differentiate.**

5. $\dfrac{\partial}{\partial x}\left(\dfrac{x^2y}{y^2 - 3}\right)$
6. $\dfrac{\partial}{\partial y}\left(\dfrac{x^2y}{y^2 - 3}\right)$
7. $\dfrac{\partial}{\partial y}\left(\dfrac{x - y}{x^2 + 1}\right)$
8. $\dfrac{\partial}{\partial x}\left(\dfrac{x - y}{x^2 + 1}\right)$
9. $\dfrac{\partial}{\partial x}\left(\dfrac{xy}{x^2 + 1}\right)$
10. $\dfrac{\partial}{\partial y}\left(\dfrac{xy}{x^2 + 1}\right)$

Finding Partial Derivatives **In Exercises 11–40, find both first partial derivatives.**

11. $f(x, y) = 2x - 5y + 3$
12. $f(x, y) = x^2 - 2y^2 + 4$
13. $z = 6x - x^2y + 8y^2$
14. $f(x, y) = 4x^3y^{-2}$
15. $z = x\sqrt{y}$
16. $z = 2y^2\sqrt{x}$
17. $z = e^{xy}$
18. $z = e^{x/y}$
19. $z = x^2e^{2y}$
20. $z = 7ye^{y/x}$
21. $z = \ln\dfrac{x}{y}$
22. $z = \ln\sqrt{xy}$
23. $z = \ln(x^2 + y^2)$
24. $z = \ln\dfrac{x + y}{x - y}$
25. $z = \dfrac{x^2}{2y} + \dfrac{3y^2}{x}$
26. $z = \dfrac{xy}{x^2 + y^2}$
27. $h(x, y) = e^{-(x^2+y^2)}$
28. $g(x, y) = \ln\sqrt{x^2 + y^2}$
29. $f(x, y) = \sqrt{x^2 + y^2}$
30. $f(x, y) = \sqrt{2x + y^3}$
31. $z = \cos xy$
32. $z = \sin(x + 2y)$
33. $z = \tan(2x - y)$
34. $z = \sin 5x \cos 5y$
35. $z = e^y \sin 8xy$
36. $z = \cos(x^2 + y^2)$
37. $z = \sinh(2x + 3y)$
38. $z = \cosh xy^2$
39. $f(x, y) = \displaystyle\int_x^y (t^2 - 1)\,dt$
40. $f(x, y) = \displaystyle\int_x^y (2t + 1)\,dt + \int_y^x (2t - 1)\,dt$

Finding Partial Derivatives **In Exercises 41–44, use the limit definition of partial derivatives to find $f_x(x, y)$ and $f_y(x, y)$.**

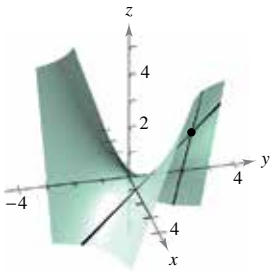
41. $f(x, y) = 3x + 2y$
42. $f(x, y) = x^2 - 2xy + y^2$
43. $f(x, y) = \sqrt{x + y}$
44. $f(x, y) = \dfrac{1}{x + y}$

Finding and Evaluating Partial Derivatives **In Exercises 45–52, find f_x and f_y, and evaluate each at the given point.**

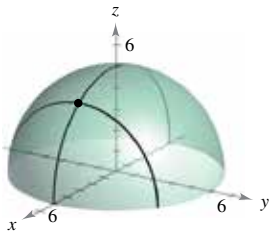
45. $f(x, y) = e^x y^2$, $(\ln 3, 2)$
46. $f(x, y) = x^3 \ln 5y$, $(1, 1)$
47. $f(x, y) = \cos(2x - y)$, $\left(\dfrac{\pi}{4}, \dfrac{\pi}{3}\right)$
48. $f(x, y) = \sin xy$, $\left(2, \dfrac{\pi}{4}\right)$
49. $f(x, y) = \arctan\dfrac{y}{x}$, $(2, -2)$
50. $f(x, y) = \arccos xy$, $(1, 1)$
51. $f(x, y) = \dfrac{xy}{x - y}$, $(2, -2)$
52. $f(x, y) = \dfrac{2xy}{\sqrt{4x^2 + 5y^2}}$, $(1, 1)$

Finding the Slopes of a Surface **In Exercises 53–56, find the slopes of the surface in the x- and y-directions at the given point.**

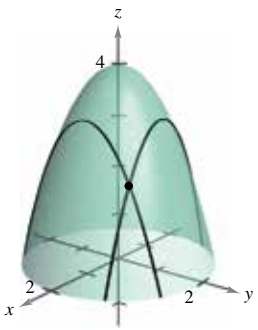
53. $z = xy$
$(1, 2, 2)$



54. $z = \sqrt{25 - x^2 - y^2}$
$(3, 0, 4)$



55. $g(x, y) = 4 - x^2 - y^2$
$(1, 1, 2)$



56. $h(x, y) = x^2 - y^2$
$(-2, 1, 3)$

Finding Partial Derivatives **In Exercises 57–62, find the first partial derivatives with respect to x, y, and z.**

57. $H(x, y, z) = \sin(x + 2y + 3z)$

58. $f(x, y, z) = 3x^2y - 5xyz + 10yz^2$

59. $w = \sqrt{x^2 + y^2 + z^2}$

60. $w = \dfrac{7xz}{x + y}$

61. $F(x, y, z) = \ln\sqrt{x^2 + y^2 + z^2}$

62. $G(x, y, z) = \dfrac{1}{\sqrt{1 - x^2 - y^2 - z^2}}$

Finding and Evaluating Partial Derivatives **In Exercises 63–68, find f_x, f_y, and f_z, and evaluate each at the given point.**

63. $f(x, y, z) = x^3yz^2,\ (1, 1, 1)$

64. $f(x, y, z) = x^2y^3 + 2xyz - 3yz,\ (-2, 1, 2)$

65. $f(x, y, z) = \dfrac{\ln x}{yz},\ (1, -1, -1)$

66. $f(x, y, z) = \dfrac{xy}{x + y + z},\ (3, 1, -1)$

67. $f(x, y, z) = z\sin(x + 6y),\ \left(0, \dfrac{\pi}{2}, -4\right)$

68. $f(x, y, z) = \sqrt{3x^2 + y^2 - 2z^2},\ (1, -2, 1)$

Using First Partial Derivatives **In Exercises 69–76, find all values of x and y such that $f_x(x, y) = 0$ and $f_y(x, y) = 0$ simultaneously.**

69. $f(x, y) = x^2 + xy + y^2 - 2x + 2y$

70. $f(x, y) = x^2 - xy + y^2 - 5x + y$

71. $f(x, y) = x^2 + 4xy + y^2 - 4x + 16y + 3$

72. $f(x, y) = x^2 - xy + y^2$

73. $f(x, y) = \dfrac{1}{x} + \dfrac{1}{y} + xy$

74. $f(x, y) = 3x^3 - 12xy + y^3$

75. $f(x, y) = e^{x^2 + xy + y^2}$

76. $f(x, y) = \ln(x^2 + y^2 + 1)$

Finding Second Partial Derivatives **In Exercises 77–86, find the four second partial derivatives. Observe that the second mixed partials are equal.**

77. $z = 3xy^2$

78. $z = x^2 + 3y^2$

79. $z = x^4 - 2xy + 3y^3$

80. $z = x^4 - 3x^2y^2 + y^4$

81. $z = \sqrt{x^2 + y^2}$

82. $z = \ln(x - y)$

83. $z = e^x \tan y$

84. $z = 2xe^y - 3ye^{-x}$

85. $z = \cos xy$

86. $z = \arctan\dfrac{y}{x}$

Finding Partial Derivatives Using Technology **In Exercises 87–90, use a graphing utility to find the first and second partial derivatives of the function. Determine whether there exist values of x and y such that $f_x(x, y) = 0$ and $f_y(x, y) = 0$ simultaneously.**

87. $f(x, y) = x\sec y$

88. $f(x, y) = \sqrt{25 - x^2 - y^2}$

89. $f(x, y) = \ln\dfrac{x}{x^2 + y^2}$

90. $f(x, y) = \dfrac{xy}{x - y}$

Finding Higher-Order Partial Derivatives **In Exercises 91–94, show that the mixed partial derivatives f_{xyy}, f_{yxy}, and f_{yyx} are equal.**

91. $f(x, y, z) = xyz$

92. $f(x, y, z) = x^2 - 3xy + 4yz + z^3$

93. $f(x, y, z) = e^{-x}\sin yz$

94. $f(x, y, z) = \dfrac{2z}{x + y}$

Laplace's Equation **In Exercises 95–98, show that the function satisfies Laplace's equation $\partial^2z/\partial x^2 + \partial^2z/\partial y^2 = 0$.**

95. $z = 5xy$

96. $z = \frac{1}{2}(e^y - e^{-y})\sin x$

97. $z = e^x\sin y$

98. $z = \arctan\dfrac{y}{x}$

Wave Equation **In Exercises 99–102, show that the function satisfies the wave equation $\partial^2z/\partial t^2 = c^2(\partial^2z/\partial x^2)$.**

99. $z = \sin(x - ct)$

100. $z = \cos(4x + 4ct)$

101. $z = \ln(x + ct)$

102. $z = \sin\omega ct\sin\omega x$

Heat Equation **In Exercises 103 and 104, show that the function satisfies the heat equation $\partial z/\partial t = c^2(\partial^2z/\partial x^2)$.**

103. $z = e^{-t}\cos\dfrac{x}{c}$

104. $z = e^{-t}\sin\dfrac{x}{c}$

Cauchy-Riemann Equations **In Exercises 105 and 106, show that the functions u and v satisfy the Cauchy-Riemann equations**

$$\frac{\partial u}{\partial x} = \frac{\partial v}{\partial y} \quad \text{and} \quad \frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}.$$

105. $u = x^2 - y^2,\ v = 2xy$

106. $u = e^x\cos y,\ v = e^x\sin y$

Using First Partial Derivatives **In Exercises 107 and 108, determine whether there exists a function $f(x, y)$ with the given partial derivatives. Explain your reasoning. If such a function exists, give an example.**

107. $f_x(x, y) = -3\sin(3x - 2y),\ f_y(x, y) = 2\sin(3x - 2y)$

108. $f_x(x, y) = 2x + y,\ f_y(x, y) = x - 4y$

Exploring Concepts

109. Consider $z = f(x, y)$ such that $z_x = z_y$. Does $z = c(x + y)$? Explain.

110. Given $z = f(x)g(y)$, find $z_x + z_y$.

111. Sketch the graph of a function $z = f(x, y)$ whose derivative f_x is always negative and whose derivative f_y is always positive.

112. The price P (in dollars) of a used car is a function of its initial cost C (in dollars) and its age A (in years). What are the units of $\partial P/\partial A$? Is $\partial P/\partial A$ positive or negative? Explain.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

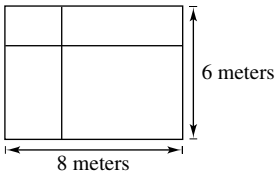
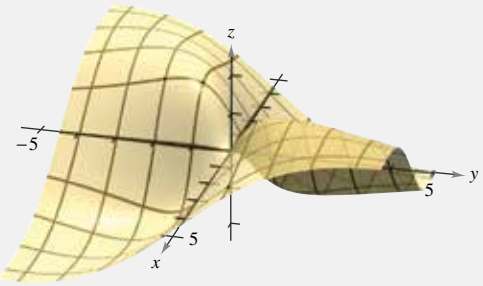
113. Area A rectangle is 8 meters long and 6 meters wide (see figure). A horizontal line and a vertical line are drawn, creating four smaller rectangles.



Let S be the sum of the squares of the areas of the four smaller rectangles. Find the maximum and minimum values of S.

114. HOW DO YOU SEE IT? Use the graph of the surface to determine the sign of each partial derivative. Explain your reasoning.



(a) $f_x(4, 1)$ (b) $f_y(4, 1)$
(c) $f_x(-1, -2)$ (d) $f_y(-1, -2)$

115. Area The area of a triangle is represented by $A = \frac{1}{2}ab \sin\theta$, where a and b are two of the side lengths and θ is the angle between a and b.

(a) Find the rate of change of A with respect to b for $a = 4$, $b = 1$, and $\theta = \pi/4$.

(b) Find the rate of change of A with respect to θ for $a = 2$, $b = 5$, and $\theta = \pi/3$.

116. Volume The volume of a right circular cone of radius r and height h is represented by $V = \frac{1}{3}\pi r^2 h$.

(a) Find the rate of change of V with respect to r for $r = 2$ and $h = 2$.

(b) Find the rate of change of V with respect to h for $r = 2$ and $h = 2$.

117. Marginal Revenue A pharmaceutical corporation has two plants that produce the same over-the-counter medicine. If x_1 and x_2 are the numbers of units produced at plant 1 and plant 2, respectively, then the total revenue for the product is given by

$$R = 200x_1 + 200x_2 - 4x_1^2 - 8x_1x_2 - 4x_2^2.$$

When $x_1 = 4$ and $x_2 = 12$, find (a) the marginal revenue for plant 1, $\partial R/\partial x_1$, and (b) the marginal revenue for plant 2, $\partial R/\partial x_2$.

118. Marginal Costs

A company manufactures two types of wood-burning stoves: a freestanding model and a fireplace-insert model. The cost function for producing x freestanding and y fireplace-insert stoves is

$$C = 32\sqrt{xy} + 175x + 205y + 1050.$$

(a) Find the marginal costs ($\partial C/\partial x$ and $\partial C/\partial y$) when $x = 80$ and $y = 20$.

(b) When additional production is required, which model of stove results in the cost increasing at a higher rate? How can this be determined from the cost model?

119. Psychology Early in the twentieth century, an intelligence test called the *Stanford-Binet Test* (more commonly known as the IQ test) was developed. In this test, an individual's mental age M is divided by the individual's chronological age C and then the quotient is multiplied by 100. The result is the individual's IQ.

$$IQ(M, C) = \frac{M}{C} \times 100$$

Find the partial derivatives of IQ with respect to M and with respect to C. Evaluate the partial derivatives at the point $(12, 10)$ and interpret the result. *(Source: Adapted from Bernstein/Clark-Stewart/Roy/Wickens, Psychology, Fourth Edition)*

120. Marginal Productivity Consider the Cobb-Douglas production function $f(x, y) = 200x^{0.7}y^{0.3}$. When $x = 1000$ and $y = 500$, find (a) the marginal productivity of labor, $\partial f/\partial x$, and (b) the marginal productivity of capital, $\partial f/\partial y$.

121. Think About It Let N be the number of applicants to a university, p the charge for food and housing at the university, and t the tuition. Suppose that N is a function of p and t such that $\partial N/\partial p < 0$ and $\partial N/\partial t < 0$. What information is gained by noticing that both partials are negative?

122. Investment The value of an investment of \$1000 earning 6% compounded annually is

$$V(I, R) = 1000\left[\frac{1 + 0.06(1 - R)}{1 + I}\right]^{10}$$

where I is the annual rate of inflation and R is the tax rate for the person making the investment. Calculate $V_I(0.03, 0.28)$ and $V_R(0.03, 0.28)$. Determine whether the tax rate or the rate of inflation is the greater "negative" factor in the growth of the investment.

123. Temperature Distribution The temperature at any point (x, y) on a steel plate is $T = 500 - 0.6x^2 - 1.5y^2$, where x and y are measured in meters. At the point $(2, 3)$, find the rates of change of the temperature with respect to the distances moved along the plate in the directions of the x- and y-axes.

124. Apparent Temperature A measure of how hot weather feels to an average person is the Apparent Temperature Index. A model for this index is

$$A = 0.885t - 22.4h + 1.20th - 0.544$$

where A is the apparent temperature in degrees Celsius, t is the air temperature, and h is the relative humidity in decimal form. *(Source: The UMAP Journal)*

(a) Find $\frac{\partial A}{\partial t}$ and $\frac{\partial A}{\partial h}$ when $t = 30°$ and $h = 0.80$.

(b) Which has a greater effect on A, air temperature or humidity? Explain.

125. Ideal Gas Law The Ideal Gas Law states that

$$PV = nRT$$

where P is pressure, V is volume, n is the number of moles of gas, R is a fixed constant (the gas constant), and T is absolute temperature. Show that

$$\frac{\partial T}{\partial P} \cdot \frac{\partial P}{\partial V} \cdot \frac{\partial V}{\partial T} = -1.$$

126. Marginal Utility The utility function $U = f(x, y)$ is a measure of the utility (or satisfaction) derived by a person from the consumption of two products x and y. The utility function for two products is

$$U = -5x^2 + xy - 3y^2.$$

(a) Determine the marginal utility of product x.

(b) Determine the marginal utility of product y.

(c) When $x = 2$ and $y = 3$, should a person consume one more unit of product x or one more unit of product y? Explain your reasoning.

(d) Use a graphing utility to graph the function. Interpret the marginal utilities of products x and y graphically.

127. Modeling Data Personal consumption expenditures (in billions of dollars) for several types of recreation from 2012 through 2017 are shown in the table, where x is the expenditures on amusement parks and campgrounds, y is the expenditures on live entertainment (excluding sports), and z is the expenditures on spectator sports. *(Source: U.S. Bureau of Economic Analysis)*

Year	2012	2013	2014	2015	2016	2017
x	44.3	46.8	49.8	54.2	57.9	61.9
y	24.9	24.8	26.5	28.9	30.7	32.6
z	20.9	22.1	23.2	23.1	24.2	26.1

A model for the data is given by

$$z = 0.54x - 0.6y + 11.98.$$

(a) Find $\frac{\partial z}{\partial x}$ and $\frac{\partial z}{\partial y}$.

(b) Interpret the partial derivatives in the context of the problem.

128. Modeling Data The table shows the national health expenditures (in billions of dollars) for the Department of Veterans Affairs x, workers' compensation y, and Medicaid z from 2014 through 2019. *(Source: Centers for Medicare and Medicaid Services)*

Year	2014	2015	2016	2017	2018	2019
x	57.9	64.7	67.4	72.1	76.2	82.3
y	47.5	48.4	48.8	47.9	48.5	48.5
z	498.2	542.7	564.8	578.2	596.0	613.5

A model for the data is given by

$$z = -0.111x^2 + 20.256x + 14.003y^2 - 1343.977y + 31{,}942.$$

(a) Find $\frac{\partial^2 z}{\partial x^2}$ and $\frac{\partial^2 z}{\partial y^2}$.

(b) Determine the concavity of traces parallel to the xz-plane. Interpret the result in the context of the problem.

(c) Determine the concavity of traces parallel to the yz-plane. Interpret the result in the context of the problem.

129. Using a Function Consider the function defined by

$$f(x, y) = \begin{cases} \dfrac{xy(x^2 - y^2)}{x^2 + y^2}, & (x, y) \neq (0, 0) \\ 0, & (x, y) = (0, 0) \end{cases}.$$

(a) Find $f_x(x, y)$ and $f_y(x, y)$ for $(x, y) \neq (0, 0)$.

(b) Use the definition of partial derivatives to find $f_x(0, 0)$ and $f_y(0, 0)$.

$$\left[\textit{Hint: } f_x(0, 0) = \lim_{\Delta x \to 0} \frac{f(\Delta x, 0) - f(0, 0)}{\Delta x} \right]$$

(c) Use the definition of partial derivatives to find $f_{xy}(0, 0)$ and $f_{yx}(0, 0)$.

(d) Using Theorem 13.3 and the result of part (c), what can be said about f_{xy} or f_{yx}?

130. Using a Function Consider the function

$$f(x, y) = (x^3 + y^3)^{1/3}.$$

(a) Find $f_x(0, 0)$ and $f_y(0, 0)$.

(b) Determine the points (if any) at which $f_x(x, y)$ or $f_y(x, y)$ fails to exist.

131. Using a Function Consider the function

$$f(x, y) = (x^2 + y^2)^{2/3}.$$

Show that

$$f_x(x, y) = \begin{cases} \dfrac{4x}{3(x^2 + y^2)^{1/3}}, & (x, y) \neq (0, 0) \\ 0, & (x, y) = (0, 0) \end{cases}.$$

13.4 Differentials

GO DIGITAL

- Apply the concepts of increments and differentials.
- Extend the concept of differentiability to a function of two variables.
- Use a differential as an approximation.

Increments and Differentials

In this section, the concepts of increments and differentials are generalized to functions of two or more variables. Recall from Section 3.9 that for $y = f(x)$, the differential of y was defined as

$$dy = f'(x)\,dx.$$

Similar terminology is used for a function of two variables, $z = f(x, y)$. That is, Δx and Δy are the **increments of x and y,** and the **increment of z** is

$$\Delta z = f(x + \Delta x, y + \Delta y) - f(x, y).$$ Increment of z

Definition of Total Differential

If $z = f(x, y)$ and Δx and Δy are increments of x and y, then the **differentials** of the independent variables x and y are

$$dx = \Delta x \quad \text{and} \quad dy = \Delta y$$

and the **total differential** of the dependent variable z is

$$dz = \frac{\partial z}{\partial x}\,dx + \frac{\partial z}{\partial y}\,dy = f_x(x, y)\,dx + f_y(x, y)\,dy.$$

This definition can be extended to a function of three or more variables. For instance, if $w = f(x, y, z, u)$, then $dx = \Delta x$, $dy = \Delta y$, $dz = \Delta z$, $du = \Delta u$, and the total differential of w is

$$dw = \frac{\partial w}{\partial x}\,dx + \frac{\partial w}{\partial y}\,dy + \frac{\partial w}{\partial z}\,dz + \frac{\partial w}{\partial u}\,du.$$

EXAMPLE 1 Finding the Total Differential

Find the total differential for each function.

a. $z = 2x \sin y - 3x^2y^2$ **b.** $w = x^2 + y^2 + z^2$

Solution

a. The total differential dz for $z = 2x \sin y - 3x^2y^2$ is

$$dz = \frac{\partial z}{\partial x}\,dx + \frac{\partial z}{\partial y}\,dy$$ Total differential dz

$$= (2 \sin y - 6xy^2)\,dx + (2x \cos y - 6x^2y)\,dy.$$

b. The total differential dw for $w = x^2 + y^2 + z^2$ is

$$dw = \frac{\partial w}{\partial x}\,dx + \frac{\partial w}{\partial y}\,dy + \frac{\partial w}{\partial z}\,dz$$ Total differential dw

$$= 2x\,dx + 2y\,dy + 2z\,dz.$$

GO DIGITAL

Differentiability

In Section 3.9, you learned that for a *differentiable* function given by $y = f(x)$, you can use the differential $dy = f'(x)\,dx$ as an approximation (for small Δx) of the value $\Delta y = f(x + \Delta x) - f(x)$. When a similar approximation is possible for a function of two variables, the function is said to be **differentiable.** This is stated explicitly in the next definition.

Definition of Differentiability

A function f given by $z = f(x, y)$ is **differentiable** at (x_0, y_0) if Δz can be written in the form

$$\Delta z = f_x(x_0, y_0)\,\Delta x + f_y(x_0, y_0)\,\Delta y + \varepsilon_1 \Delta x + \varepsilon_2 \Delta y$$

where both ε_1 and $\varepsilon_2 \to 0$ as

$$(\Delta x, \Delta y) \to (0, 0).$$

The function f is **differentiable in a region R** if it is differentiable at each point in R.

EXAMPLE 2 Showing That a Function Is Differentiable

Show that the function

$$f(x, y) = x^2 + 3y$$

is differentiable at every point in the plane.

Solution Letting $z = f(x, y)$, the increment of z at an arbitrary point (x, y) in the plane is

$$\begin{aligned}
\Delta z &= f(x + \Delta x, y + \Delta y) - f(x, y) && \text{Increment of } z \\
&= (x + \Delta x)^2 + 3(y + \Delta y) - (x^2 + 3y) \\
&= x^2 + 2x\Delta x + (\Delta x)^2 + 3y + 3\Delta y - x^2 - 3y \\
&= 2x\Delta x + (\Delta x)^2 + 3\Delta y \\
&= 2x(\Delta x) + 3(\Delta y) + \Delta x(\Delta x) + 0(\Delta y) \\
&= f_x(x, y)\Delta x + f_y(x, y)\Delta y + \varepsilon_1 \Delta x + \varepsilon_2 \Delta y
\end{aligned}$$

where $\varepsilon_1 = \Delta x$ and $\varepsilon_2 = 0$. Because $\varepsilon_1 \to 0$ and $\varepsilon_2 \to 0$ as $(\Delta x, \Delta y) \to (0, 0)$, it follows that f is differentiable at every point in the plane. The graph of f is shown in Figure 13.34. ■

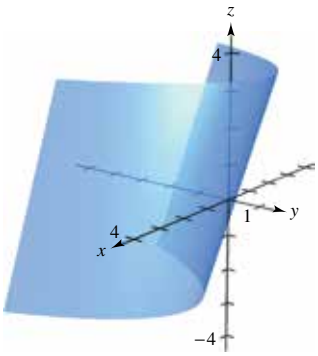

Figure 13.34

Be sure you understand that the term "differentiable" is used differently for functions of two variables than for functions of one variable. A function of one variable is differentiable at a point when its derivative exists at the point. For a function of two variables, however, the existence of the partial derivatives f_x and f_y does not guarantee that the function is differentiable (see Example 5). The next theorem gives a *sufficient* condition for differentiability of a function of two variables.

THEOREM 13.4 Sufficient Condition for Differentiability

If f is a function of x and y, where f_x and f_y are continuous in an open region R, then f is differentiable on R. A proof of this theorem is given in Appendix A.

The exact change in z is Δz. This change can be approximated by the differential dz.

Figure 13.35

Approximation by Differentials

Theorem 13.4 tells you that you can choose $(x + \Delta x, y + \Delta y)$ close enough to (x, y) to make $\varepsilon_1\Delta x$ and $\varepsilon_2\Delta y$ insignificant. In other words, for small Δx and Δy, you can use the approximation

$$\Delta z \approx dz.$$ Approximate change in z

This approximation is illustrated graphically in Figure 13.35. Recall that the partial derivatives $\partial z/\partial x$ and $\partial z/\partial y$ can be interpreted as the slopes of the surface in the x- and y-directions. This means that

$$dz = \frac{\partial z}{\partial x}\Delta x + \frac{\partial z}{\partial y}\Delta y$$

represents the change in height of a plane that is tangent to the surface at the point $(x, y, f(x, y))$. Because a plane in space is represented by a linear equation in the variables x, y, and z, the approximation of Δz by dz is called a **linear approximation.** You will learn more about this geometric interpretation in Section 13.7.

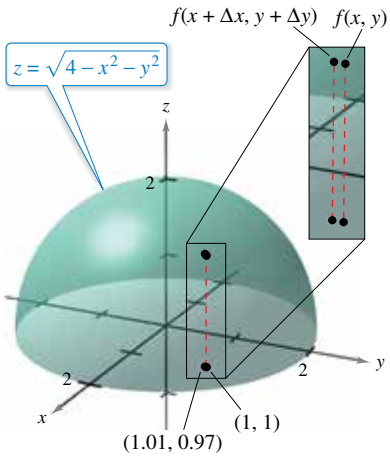
EXAMPLE 3 Using a Differential as an Approximation

See LarsonCalculus.com for an interactive version of this type of example.

Use the differential dz to approximate the change in

$$z = \sqrt{4 - x^2 - y^2}$$

as (x, y) moves from the point $(1, 1)$ to the point $(1.01, 0.97)$. Compare this approximation with the exact change in z.



As (x, y) moves from the point $(1, 1)$ to the point $(1.01, 0.97)$, the value of $f(x, y)$ changes by about 0.0137.

Figure 13.36

Solution Letting $(x, y) = (1, 1)$ and $(x + \Delta x, y + \Delta y) = (1.01, 0.97)$ produces

$$dx = \Delta x = 0.01 \quad \text{and} \quad dy = \Delta y = -0.03.$$

So, the change in z can be approximated by

$$\Delta z \approx dz = \frac{\partial z}{\partial x}dx + \frac{\partial z}{\partial y}dy = \frac{-x}{\sqrt{4 - x^2 - y^2}}\Delta x + \frac{-y}{\sqrt{4 - x^2 - y^2}}\Delta y.$$

When $x = 1$ and $y = 1$, you have

$$\Delta z \approx -\frac{1}{\sqrt{2}}(0.01) - \frac{1}{\sqrt{2}}(-0.03) = \frac{0.02}{\sqrt{2}} = \sqrt{2}(0.01) \approx 0.0141.$$

In Figure 13.36, notice that the exact change corresponds to the difference in the heights of two points on the surface of a hemisphere. This difference is given by

$$\begin{aligned}\Delta z &= f(1.01, 0.97) - f(1, 1)\\ &= \sqrt{4 - (1.01)^2 - (0.97)^2} - \sqrt{4 - 1^2 - 1^2}\\ &\approx 0.0137.\end{aligned}$$

■

A function of three variables $w = f(x, y, z)$ is **differentiable** at (x, y, z) provided that $\Delta w = f(x + \Delta x, y + \Delta y, z + \Delta z) - f(x, y, z)$ can be written in the form

$$\Delta w = f_x\Delta x + f_y\Delta y + f_z\Delta z + \varepsilon_1\Delta x + \varepsilon_2\Delta y + \varepsilon_3\Delta z$$

where ε_1, ε_2, and $\varepsilon_3 \to 0$ as $(\Delta x, \Delta y, \Delta z) \to (0, 0, 0)$. With this definition of differentiability, Theorem 13.4 has the following extension for functions of three variables: If f is a function of x, y, and z, where f_x, f_y, and f_z are continuous in an open region R, then f is differentiable on R.

In Section 3.9, you used differentials to approximate the propagated error introduced by an error in measurement. This application of differentials is further illustrated in Example 4.

Volume = xyz

Figure 13.37

EXAMPLE 4 Error Analysis

The possible error involved in measuring each dimension of a rectangular box is ± 0.1 millimeter. The dimensions of the box are $x = 50$ centimeters, $y = 20$ centimeters, and $z = 15$ centimeters, as shown in Figure 13.37. Use dV to estimate the propagated error and the relative error in the calculated volume of the box.

Solution The volume of the box is $V = xyz$, so

$$\begin{aligned} dV &= \frac{\partial V}{\partial x}\,dx + \frac{\partial V}{\partial y}\,dy + \frac{\partial V}{\partial z}\,dz \\ &= yz\,dx + xz\,dy + xy\,dz. \end{aligned}$$

Using 0.1 millimeter = 0.01 centimeter, you have

$$dx = dy = dz = \pm 0.01$$

and the propagated error is approximately

$$\begin{aligned} dV &= (20)(15)(\pm 0.01) + (50)(15)(\pm 0.01) + (50)(20)(\pm 0.01) \\ &= 300(\pm 0.01) + 750(\pm 0.01) + 1000(\pm 0.01) \\ &= 2050(\pm 0.01) \\ &= \pm 20.5 \text{ cubic centimeters.} \end{aligned}$$

Because the measured volume is

$$V = (50)(20)(15) = 15{,}000 \text{ cubic centimeters}$$

the relative error, $\Delta V/V$, is approximately

$$\frac{\Delta V}{V} \approx \frac{dV}{V} = \frac{\pm 20.5}{15{,}000} \approx \pm 0.0014$$

which is a percent error of about 0.14%. ■

As is true for a function of a single variable, when a function in two or more variables is differentiable at a point, it is also continuous there.

THEOREM 13.5 Differentiability Implies Continuity

If a function of x and y is differentiable at (x_0, y_0), then it is continuous at (x_0, y_0).

Proof Let f be differentiable at (x_0, y_0), where $z = f(x, y)$. Then

$$\Delta z = [f_x(x_0, y_0) + \varepsilon_1]\,\Delta x + [f_y(x_0, y_0) + \varepsilon_2]\,\Delta y$$

where both ε_1 and $\varepsilon_2 \to 0$ as $(\Delta x, \Delta y) \to (0, 0)$. However, by definition, you know that Δz is

$$\Delta z = f(x_0 + \Delta x, y_0 + \Delta y) - f(x_0, y_0).$$

Letting $x = x_0 + \Delta x$ and $y = y_0 + \Delta y$ produces

$$\begin{aligned} f(x, y) - f(x_0, y_0) &= [f_x(x_0, y_0) + \varepsilon_1]\,\Delta x + [f_y(x_0, y_0) + \varepsilon_2]\,\Delta y \\ &= [f_x(x_0, y_0) + \varepsilon_1](x - x_0) + [f_y(x_0, y_0) + \varepsilon_2](y - y_0). \end{aligned}$$

Taking the limit as $(x, y) \to (x_0, y_0)$, you have

$$\lim_{(x, y) \to (x_0, y_0)} f(x, y) = f(x_0, y_0)$$

which means that f is continuous at (x_0, y_0). ■

GO DIGITAL

Remember that the existence of f_x and f_y is not sufficient to guarantee differentiability, as illustrated in the next example.

EXAMPLE 5 A Function That Is Not Differentiable

For the function

$$f(x, y) = \begin{cases} \dfrac{-3xy}{x^2 + y^2}, & (x, y) \neq (0, 0) \\ 0, & (x, y) = (0, 0) \end{cases}$$

show that $f_x(0, 0)$ and $f_y(0, 0)$ both exist but that f is not differentiable at $(0, 0)$.

Solution You can show that f is not differentiable at $(0, 0)$ by showing that it is not continuous at this point. To show that f is not continuous at $(0, 0)$, check the values of $f(x, y)$ along two different approaches to $(0, 0)$, as shown in Figure 13.38. Along the line $y = x$, the limit is

$$\lim_{(x, x) \to (0, 0)} f(x, y) = \lim_{(x, x) \to (0, 0)} \frac{-3x^2}{2x^2} = -\frac{3}{2}$$

whereas along $y = -x$, you have

$$\lim_{(x, -x) \to (0, 0)} f(x, y) = \lim_{(x, -x) \to (0, 0)} \frac{3x^2}{2x^2} = \frac{3}{2}.$$

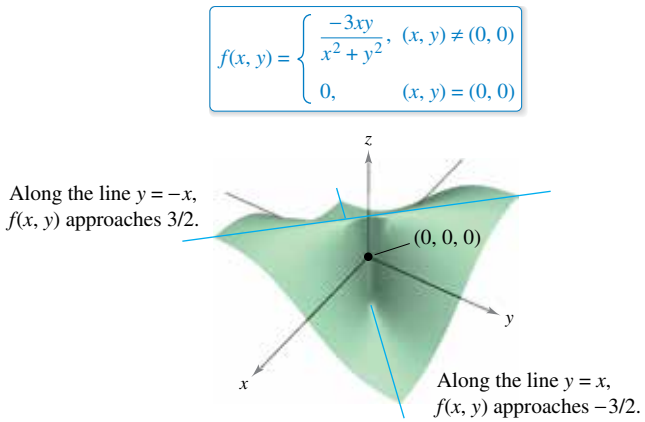
So, the limit of $f(x, y)$ as $(x, y) \to (0, 0)$ does not exist, and you can conclude that f is not continuous at $(0, 0)$. Therefore, by Theorem 13.5, you know that f is not differentiable at $(0, 0)$. On the other hand, by the definition of the partial derivatives f_x and f_y, you have

$$f_x(0, 0) = \lim_{\Delta x \to 0} \frac{f(\Delta x, 0) - f(0, 0)}{\Delta x} = \lim_{\Delta x \to 0} \frac{0 - 0}{\Delta x} = 0$$

and

$$f_y(0, 0) = \lim_{\Delta y \to 0} \frac{f(0, \Delta y) - f(0, 0)}{\Delta y} = \lim_{\Delta y \to 0} \frac{0 - 0}{\Delta y} = 0.$$

So, the partial derivatives at $(0, 0)$ exist.



$f(x, y) = \begin{cases} \frac{-3xy}{x^2 + y^2}, & (x, y) \neq (0, 0) \\ 0, & (x, y) = (0, 0) \end{cases}$
Along the line $y = -x$, $f(x, y)$ approaches 3/2.
z
(0, 0, 0)
y
x
Along the line $y = x$, $f(x, y)$ approaches $-3/2$.

GO DIGITAL

Concept Check

1. Describe the change in accuracy of dz as an approximation of Δz as Δx and Δy increase.
2. Explain what is meant by a linear approximation of $z = f(x, y)$ at the point $P(x_0, y_0)$.

Finding a Total Differential **In Exercises 3–8, find the total differential.**

3. $z = 5x^3y^2$
4. $z = 2x^3y - 8xy^4$
5. $z = \frac{1}{2}\left(e^{x^2+y^2} - e^{-x^2-y^2}\right)$
6. $z = e^{-x}\tan y$
7. $w = x^2yz^2 + \sin yz$
8. $w = (x + y)/(z - 3y)$

Using a Differential as an Approximation **In Exercises 9–14, (a) find $f(2, 1)$ and $f(2.1, 1.05)$ and calculate Δz, and (b) use the total differential dz to approximate Δz.**

9. $f(x, y) = 2x - 3y$
10. $f(x, y) = x^2 + y^2$
11. $f(x, y) = 16 - x^2 - y^2$
12. $f(x, y) = y/x$
13. $f(x, y) = ye^x$
14. $f(x, y) = x\cos y$

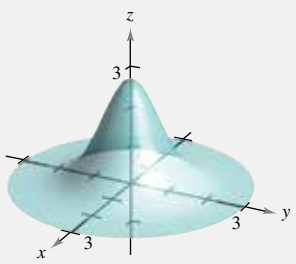
Approximating an Expression **In Exercises 15–18, find $z = f(x, y)$ and use the total differential to approximate the quantity.**

15. $(2.01)^2(9.02) - 2^2 \cdot 9$
16. $\dfrac{1 - (3.05)^2}{(5.95)^2} - \dfrac{1 - 3^2}{6^2}$
17. $\sin[(1.05)^2 + (0.95)^2] - \sin(1^2 + 1^2)$
18. $\sqrt{(4.03)^2 + (3.1)^2} - \sqrt{4^2 + 3^2}$

Exploring Concepts

19. Determine whether $f(x, y)$ is continuous in an open region R when f_x and f_y are each continuous in R. Explain your reasoning.

20. **HOW DO YOU SEE IT?** Which point has a greater differential, (2, 2) or $\left(\frac{1}{2}, \frac{1}{2}\right)$? Explain. (Assume that dx and dy are the same for both points.)



21. **Area** The area of the shaded rectangle in the figure is $A = lh$. The possible errors in the length and height are Δl and Δh, respectively. Find dA and identify the regions in the figure whose areas are given by the terms of dA. What region represents the difference between ΔA and dA?

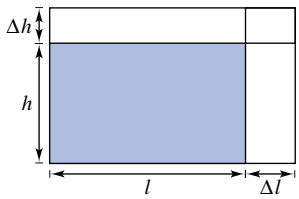


Figure for 21

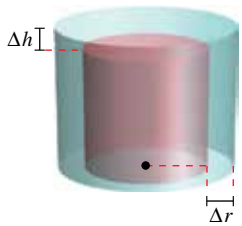

Figure for 22

22. **Volume** The volume of the red right circular cylinder in the figure is $V = \pi r^2 h$. The possible errors in the radius and the height are Δr and Δh, respectively. Find dV and identify the solids in the figure whose volumes are given by the terms of dV. What solid represents the difference between ΔV and dV?
23. **Volume** The possible error involved in measuring each dimension of a rectangular box is ± 0.02 inch. The dimensions of the box are 8 inches by 5 inches by 12 inches. Approximate the propagated error and the relative error in the calculated volume of the box.
24. **Volume** The possible error involved in measuring each dimension of a right circular cylinder is ± 0.05 centimeter. The radius is 3 centimeters and the height is 10 centimeters. Approximate the propagated error and the relative error in the calculated volume of the cylinder.
25. **Numerical Analysis** A right circular cone of height $h = 8$ meters and radius $r = 4$ meters is constructed, and in the process, errors Δr and Δh are made in the radius and height, respectively. Let V be the volume of the cone. Complete the table to show the relationship between ΔV and dV for the indicated errors.

Δr	Δh	dV or dS	ΔV or ΔS	$\Delta V - dV$ or $\Delta S - dS$
0.1	0.1			
0.1	−0.1			
0.001	0.002			
−0.0001	0.0002			

Table for Exercises 25 and 26

26. **Numerical Analysis** A right circular cone of height $h = 16$ meters and radius $r = 6$ meters is constructed, and in the process, errors of Δr and Δh are made in the radius and height, respectively. Let S be the lateral surface area of the cone. Complete the table above to show the relationship between ΔS and dS for the indicated errors.

27. Wind Chill

The formula for wind chill C (in degrees Fahrenheit) is given by

$$C = 35.74 + 0.6215T - 35.75v^{0.16} + 0.4275Tv^{0.16}$$

where v is the wind speed in miles per hour and T is the temperature in degrees Fahrenheit. The wind speed is 23 ± 3 miles per hour and the temperature is $8° \pm 1°$. Use dC to estimate the maximum possible propagated error and relative error in calculating the wind chill. *(Source: National Oceanic and Atmospheric Administration)*

28. Resistance The total resistance R (in ohms) of two resistors connected in parallel is given by

$$\frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2}.$$

Approximate the change in R as R_1 is increased from 10 ohms to 10.5 ohms and R_2 is decreased from 15 ohms to 13 ohms.

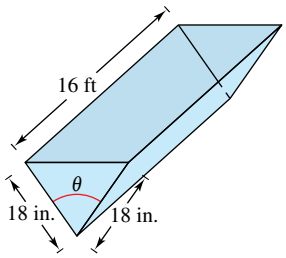
29. Power Electrical power P is given by

$$P = \frac{E^2}{R}$$

where E is voltage and R is resistance. Approximate the maximum percent error in calculating power when 120 volts is applied to a 2000-ohm resistor and the possible percent errors in measuring E and R are 3% and 4%, respectively.

30. Acceleration The centripetal acceleration of a particle moving in a circle is $a = v^2/r$, where v is the velocity and r is the radius of the circle. Approximate the maximum percent error in measuring the acceleration due to errors of 3% in v and 2% in r.

31. Volume A trough is 16 feet long (see figure). Its cross sections are isosceles triangles with each of the two equal sides measuring 18 inches. The angle between the two equal sides is θ.

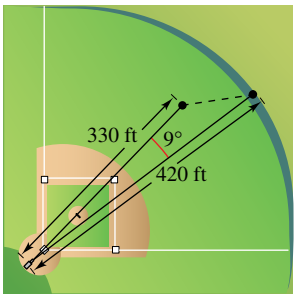


Not drawn to scale

(a) Write the volume of the trough as a function of θ and determine the value of θ such that the volume is a maximum.

(b) The maximum error in the linear measurements is one-half inch, and the maximum error in the angle measure is 2°. Approximate the change in the maximum volume.

32. Sports A baseball player in center field is playing approximately 330 feet from a television camera that is behind home plate. A batter hits a fly ball that goes to the wall 420 feet from the camera (see figure).



(a) The camera turns 9° to follow the play. Approximate the number of feet that the center fielder has to run to make the catch.

(b) The position of the center fielder could be in error by as much as 6 feet, and the maximum error in measuring the rotation of the camera is 1°. Approximate the maximum possible error in the result of part (a).

33. Inductance The inductance L (in microhenrys) of a straight nonmagnetic wire in free space is

$$L = 0.00021\left(\ln\frac{2h}{r} - 0.75\right)$$

where h is the length of the wire in millimeters and r is the radius of a circular cross section. Approximate L when $r = 2 \pm \frac{1}{16}$ millimeters and $h = 100 \pm \frac{1}{100}$ millimeters.

34. Pendulum The period T of a pendulum of length L is $T = \left(2\pi\sqrt{L}\right)/\sqrt{g}$, where g is the acceleration due to gravity. A pendulum is moved from the Canal Zone, where $g = 32.09$ feet per second per second, to Greenland, where $g = 32.23$ feet per second per second. Because of the change in temperature, the length of the pendulum changes from 2.5 feet to 2.48 feet. Approximate the change in the period of the pendulum.

Differentiability **In Exercises 35–38, show that the function is differentiable by finding values of ε_1 and ε_2 as designated in the definition of differentiability, and verify that both ε_1 and ε_2 approach 0 as $(\Delta x, \Delta y) \to (0, 0)$.**

35. $f(x, y) = x^2 - 2x + y$

36. $f(x, y) = x^2 + y^2$

37. $f(x, y) = x^2y$

38. $f(x, y) = 5x - 10y + y^3$

Differentiability **In Exercises 39–41, use the function to show that $f_x(0, 0)$ and $f_y(0, 0)$ both exist but that f is not differentiable at $(0, 0)$.**

39. $$f(x, y) = \begin{cases} \dfrac{3x^2y}{x^4 + y^2}, & (x, y) \neq (0, 0) \\ 0, & (x, y) = (0, 0) \end{cases}$$

40. $$f(x, y) = \begin{cases} \dfrac{5x^2y}{x^3 + y^3}, & (x, y) \neq (0, 0) \\ 0, & (x, y) = (0, 0) \end{cases}$$

41. $$f(x, y) = \begin{cases} 1, & x = 0 \text{ or } y = 0 \\ 0, & \text{elsewhere} \end{cases}$$

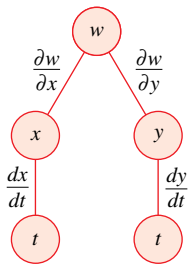
13.5 Chain Rules for Functions of Several Variables

GO DIGITAL

- **Use the Chain Rules for functions of several variables.**
- **Find partial derivatives implicitly.**



Chain Rule: one independent variable w is a function of x and y, which are each functions of t. This diagram represents the derivative of w with respect to t.

Figure 13.39

Chain Rules for Functions of Several Variables

Your work with differentials in the preceding section provides the basis for the extension of the Chain Rule to functions of two variables. There are two cases. The first case involves w as a function of x and y, where x and y are functions of a single independent variable t, as shown in Theorem 13.6.

THEOREM 13.6 Chain Rule: One Independent Variable

Let $w = f(x, y)$, where f is a differentiable function of x and y. If $x = g(t)$ and $y = h(t)$, where g and h are differentiable functions of t, then w is a differentiable function of t, and

$$\frac{dw}{dt} = \frac{\partial w}{\partial x}\frac{dx}{dt} + \frac{\partial w}{\partial y}\frac{dy}{dt}.$$

The Chain Rule is shown schematically in Figure 13.39.
A proof of this theorem is given in Appendix A.

EXAMPLE 1 Chain Rule: One Independent Variable

Let $w = x^2y - y^2$, where $x = \sin t$ and $y = e^t$. Find dw/dt when $t = 0$.

Solution By the Chain Rule for one independent variable, you have

$$\begin{aligned}
\frac{dw}{dt} &= \frac{\partial w}{\partial x}\frac{dx}{dt} + \frac{\partial w}{\partial y}\frac{dy}{dt} && \text{Apply Theorem 13.6.}\\
&= 2xy(\cos t) + (x^2 - 2y)e^t && \text{Find derivatives.}\\
&= 2(\sin t)(e^t)(\cos t) + (\sin^2 t - 2e^t)e^t && \text{Substitute } x = \sin t \text{ and } y = e^t.\\
&= 2e^t \sin t \cos t + e^t \sin^2 t - 2e^{2t}. && \text{Simplify.}
\end{aligned}$$

When $t = 0$, it follows that

$$\frac{dw}{dt} = -2. \qquad \text{Evaluate } \frac{dw}{dt} \text{ when } t = 0.$$

The Chain Rules presented in this section provide alternative techniques for solving many problems in single-variable calculus. For instance, in Example 1, you could have used single-variable techniques to find dw/dt by first writing w as a function of t,

$$\begin{aligned}
w &= x^2y - y^2 && w \text{ as a function of } x \text{ and } y\\
&= (\sin t)^2(e^t) - (e^t)^2 && \text{Substitute } x = \sin t \text{ and } y = e^t.\\
&= e^t \sin^2 t - e^{2t} && w \text{ as a function of } t
\end{aligned}$$

and then differentiating as usual. As shown below, the result is the same as the one in Example 1.

$$\begin{aligned}
\frac{dw}{dt} &= e^t(2)(\sin t)(\cos t) + (\sin^2 t)(e^t) - e^{2t}(2)\\
&= 2e^t \sin t \cos t + e^t \sin^2 t - 2e^{2t}
\end{aligned}$$

GO DIGITAL

The Chain Rule in Theorem 13.6 can be extended to any number of variables. For example, if each x_i is a differentiable function of a single variable t, then for

$$w = f(x_1, x_2, \ldots, x_n)$$

you have

$$\frac{dw}{dt} = \frac{\partial w}{\partial x_1}\frac{dx_1}{dt} + \frac{\partial w}{\partial x_2}\frac{dx_2}{dt} + \cdots + \frac{\partial w}{\partial x_n}\frac{dx_n}{dt}.$$

EXAMPLE 2 An Application of a Chain Rule to Related Rates

Two objects are traveling in elliptical paths given by the following parametric equations.

$x_1 = 4\cos t$ and $y_1 = 2\sin t$ First object

$x_2 = 2\sin 2t$ and $y_2 = 3\cos 2t$ Second object

At what rate is the distance between the two objects changing when $t = \pi$?

Solution From Figure 13.40, you can determine that the distance s between the two objects is given by

$$s = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

and that when $t = \pi$, you have $x_1 = -4$, $y_1 = 0$, $x_2 = 0$, $y_2 = 3$, and

$$s = \sqrt{(0 + 4)^2 + (3 + 0)^2} = 5.$$

When $t = \pi$, the partial derivatives of s are as follows.

$$\frac{\partial s}{\partial x_1} = \frac{-(x_2 - x_1)}{\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}} = -\frac{1}{5}(0 + 4) = -\frac{4}{5}$$

$$\frac{\partial s}{\partial y_1} = \frac{-(y_2 - y_1)}{\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}} = -\frac{1}{5}(3 - 0) = -\frac{3}{5}$$

$$\frac{\partial s}{\partial x_2} = \frac{(x_2 - x_1)}{\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}} = \frac{1}{5}(0 + 4) = \frac{4}{5}$$

$$\frac{\partial s}{\partial y_2} = \frac{(y_2 - y_1)}{\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}} = \frac{1}{5}(3 - 0) = \frac{3}{5}$$

When $t = \pi$, the derivatives of x_1, y_1, x_2, and y_2 are

$$\frac{dx_1}{dt} = -4\sin t = 0$$

$$\frac{dy_1}{dt} = 2\cos t = -2$$

$$\frac{dx_2}{dt} = 4\cos 2t = 4$$

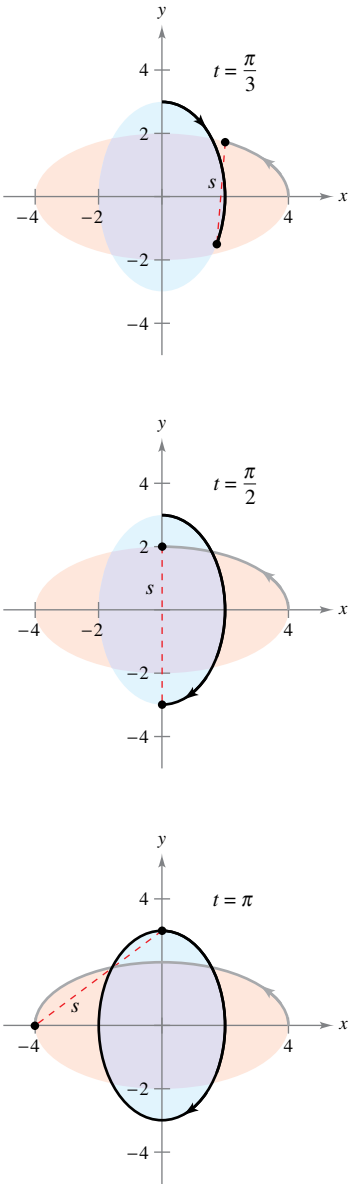
$$\frac{dy_2}{dt} = -6\sin 2t = 0.$$

So, using the appropriate Chain Rule, you know that the distance is changing at a rate of

$$\frac{ds}{dt} = \frac{\partial s}{\partial x_1}\frac{dx_1}{dt} + \frac{\partial s}{\partial y_1}\frac{dy_1}{dt} + \frac{\partial s}{\partial x_2}\frac{dx_2}{dt} + \frac{\partial s}{\partial y_2}\frac{dy_2}{dt}$$

$$= \left(-\frac{4}{5}\right)(0) + \left(-\frac{3}{5}\right)(-2) + \left(\frac{4}{5}\right)(4) + \left(\frac{3}{5}\right)(0)$$

$$= \frac{22}{5}.$$



Paths of two objects traveling in elliptical orbits

In Example 2, note that s is the function of four *intermediate* variables, x_1, y_1, x_2, and y_2, each of which is a function of a single variable t. Another type of composite function is one in which the intermediate variables are themselves functions of more than one variable. For instance, for $w = f(x, y)$, where $x = g(s, t)$ and $y = h(s, t)$, it follows that w is a function of s and t, and you can consider the partial derivatives of w with respect to s and t. One way to find these partial derivatives is to write w as a function of s and t explicitly by substituting the equations $x = g(s, t)$ and $y = h(s, t)$ into the equation $w = f(x, y)$. Then you can find the partial derivatives in the usual way, as demonstrated in the next example.

EXAMPLE 3 Finding Partial Derivatives by Substitution

Find $\partial w/\partial s$ and $\partial w/\partial t$ for $w = 2xy$, where $x = s^2 + t^2$ and $y = s/t$.

Solution Begin by substituting $x = s^2 + t^2$ and $y = s/t$ into the equation $w = 2xy$ to obtain

$$w = 2xy = 2(s^2 + t^2)\left(\frac{s}{t}\right) = 2\left(\frac{s^3}{t} + st\right).$$

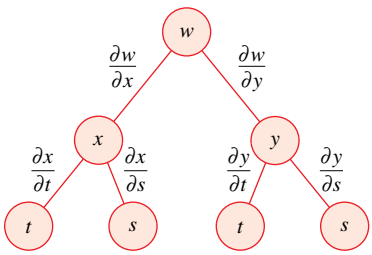
Then, to find $\partial w/\partial s$, hold t constant and differentiate with respect to s.

$$\frac{\partial w}{\partial s} = 2\left(\frac{3s^2}{t} + t\right) \qquad t \text{ is held constant.}$$
$$= \frac{6s^2 + 2t^2}{t}$$

Similarly, to find $\partial w/\partial t$, hold s constant and differentiate with respect to t to obtain

$$\frac{\partial w}{\partial t} = 2\left(-\frac{s^3}{t^2} + s\right) \qquad s \text{ is held constant.}$$
$$= 2\left(\frac{-s^3 + st^2}{t^2}\right)$$
$$= \frac{2st^2 - 2s^3}{t^2}.$$

Theorem 13.7 gives an alternative method for finding the partial derivatives in Example 3 without explicitly writing w as a function of s and t.



Chain Rule: two independent variables
Figure 13.41

THEOREM 13.7 Chain Rule: Two Independent Variables

Let $w = f(x, y)$, where f is a differentiable function of x and y. If $x = g(s, t)$ and $y = h(s, t)$ such that the first partials $\partial x/\partial s$, $\partial x/\partial t$, $\partial y/\partial s$, and $\partial y/\partial t$ all exist, then $\partial w/\partial s$ and $\partial w/\partial t$ exist and are given by

$$\frac{\partial w}{\partial s} = \frac{\partial w}{\partial x}\frac{\partial x}{\partial s} + \frac{\partial w}{\partial y}\frac{\partial y}{\partial s}$$

and

$$\frac{\partial w}{\partial t} = \frac{\partial w}{\partial x}\frac{\partial x}{\partial t} + \frac{\partial w}{\partial y}\frac{\partial y}{\partial t}.$$

The Chain Rule is shown schematically in Figure 13.41.

Proof To obtain $\partial w/\partial s$, hold t constant and apply Theorem 13.6 to obtain the desired result. Similarly, for $\partial w/\partial t$, hold s constant and apply Theorem 13.6.

EXAMPLE 4 The Chain Rule with Two Independent Variables

See LarsonCalculus.com for an interactive version of this type of example.

Use the Chain Rule to find $\partial w/\partial s$ and $\partial w/\partial t$ for

$$w = 2xy$$

where $x = s^2 + t^2$ and $y = s/t$.

Solution Note that these same partials were found in Example 3. This time, using Theorem 13.7, you can hold t constant and differentiate with respect to s to obtain

$$\begin{aligned}
\frac{\partial w}{\partial s} &= \frac{\partial w}{\partial x}\frac{\partial x}{\partial s} + \frac{\partial w}{\partial y}\frac{\partial y}{\partial s} \\
&= 2y(2s) + 2x\left(\frac{1}{t}\right) && t \text{ is held constant.} \\
&= 2\left(\frac{s}{t}\right)(2s) + 2(s^2 + t^2)\left(\frac{1}{t}\right) && \text{Substitute } \frac{s}{t} \text{ for } y \text{ and } s^2 + t^2 \text{ for } x. \\
&= \frac{4s^2}{t} + \frac{2s^2 + 2t^2}{t} \\
&= \frac{6s^2 + 2t^2}{t}.
\end{aligned}$$

Similarly, holding s constant gives

$$\begin{aligned}
\frac{\partial w}{\partial t} &= \frac{\partial w}{\partial x}\frac{\partial x}{\partial t} + \frac{\partial w}{\partial y}\frac{\partial y}{\partial t} \\
&= 2y(2t) + 2x\left(\frac{-s}{t^2}\right) && s \text{ is held constant.} \\
&= 2\left(\frac{s}{t}\right)(2t) + 2(s^2 + t^2)\left(\frac{-s}{t^2}\right) && \text{Substitute } \frac{s}{t} \text{ for } y \text{ and } s^2 + t^2 \text{ for } x. \\
&= 4s - \frac{2s^3 + 2st^2}{t^2} \\
&= \frac{4st^2 - 2s^3 - 2st^2}{t^2} \\
&= \frac{2st^2 - 2s^3}{t^2}.
\end{aligned}$$

■

The Chain Rule in Theorem 13.7 can also be extended to any number of variables. For example, if w is a differentiable function of the n variables

$$x_1, x_2, \ldots, x_n$$

where each x_i is a differentiable function of the m variables $t_1, t_2, \ldots, t_m$, then for

$$w = f(x_1, x_2, \ldots, x_n)$$

you obtain the following.

$$\begin{aligned}
\frac{\partial w}{\partial t_1} &= \frac{\partial w}{\partial x_1}\frac{\partial x_1}{\partial t_1} + \frac{\partial w}{\partial x_2}\frac{\partial x_2}{\partial t_1} + \cdots + \frac{\partial w}{\partial x_n}\frac{\partial x_n}{\partial t_1} \\
\frac{\partial w}{\partial t_2} &= \frac{\partial w}{\partial x_1}\frac{\partial x_1}{\partial t_2} + \frac{\partial w}{\partial x_2}\frac{\partial x_2}{\partial t_2} + \cdots + \frac{\partial w}{\partial x_n}\frac{\partial x_n}{\partial t_2} \\
&\vdots \\
\frac{\partial w}{\partial t_m} &= \frac{\partial w}{\partial x_1}\frac{\partial x_1}{\partial t_m} + \frac{\partial w}{\partial x_2}\frac{\partial x_2}{\partial t_m} + \cdots + \frac{\partial w}{\partial x_n}\frac{\partial x_n}{\partial t_m}
\end{aligned}$$

EXAMPLE 5 **The Chain Rule for a Function of Three Variables**

Find $\partial w/\partial s$ and $\partial w/\partial t$ when $s = 1$ and $t = 2\pi$ for

$$w = xy + yz + xz$$

where $x = s\cos t$, $y = s\sin t$, and $z = t$.

Solution By extending the result of Theorem 13.7, you have

$$\begin{aligned}\frac{\partial w}{\partial s} &= \frac{\partial w}{\partial x}\frac{\partial x}{\partial s} + \frac{\partial w}{\partial y}\frac{\partial y}{\partial s} + \frac{\partial w}{\partial z}\frac{\partial z}{\partial s} \\ &= (y + z)(\cos t) + (x + z)(\sin t) + (y + x)(0) \\ &= (y + z)(\cos t) + (x + z)(\sin t).\end{aligned}$$

When $s = 1$ and $t = 2\pi$, you have $x = 1$, $y = 0$, and $z = 2\pi$. So,

$$\frac{\partial w}{\partial s} = (0 + 2\pi)(1) + (1 + 2\pi)(0) = 2\pi.$$

Furthermore,

$$\begin{aligned}\frac{\partial w}{\partial t} &= \frac{\partial w}{\partial x}\frac{\partial x}{\partial t} + \frac{\partial w}{\partial y}\frac{\partial y}{\partial t} + \frac{\partial w}{\partial z}\frac{\partial z}{\partial t} \\ &= (y + z)(-s\sin t) + (x + z)(s\cos t) + (y + x)(1)\end{aligned}$$

and for $s = 1$ and $t = 2\pi$, it follows that

$$\begin{aligned}\frac{\partial w}{\partial t} &= (0 + 2\pi)(0) + (1 + 2\pi)(1) + (0 + 1)(1) \\ &= 2 + 2\pi.\end{aligned}$$

Implicit Partial Differentiation

This section concludes with an application of the Chain Rule to determine the derivative of a function defined *implicitly*. Let x and y be related by the equation $F(x, y) = 0$, where $y = f(x)$ is a differentiable function of x. To find dy/dx, you could use the techniques discussed in Section 2.5. The Chain Rule, however, provides a convenient alternative. Consider the function

$$w = F(x, y) = F(x, f(x)).$$

You can apply Theorem 13.6 to obtain

$$\frac{dw}{dx} = F_x(x, y)\frac{dx}{dx} + F_y(x, y)\frac{dy}{dx}.$$

Because $w = F(x, y) = 0$ for all x in the domain of f, you know that

$$\frac{dw}{dx} = 0$$

and you have

$$F_x(x, y)\frac{dx}{dx} + F_y(x, y)\frac{dy}{dx} = 0.$$

Now, if $F_y(x, y) \neq 0$, you can use the fact that $dx/dx = 1$ to conclude that

$$\frac{dy}{dx} = -\frac{F_x(x, y)}{F_y(x, y)}.$$

A similar procedure can be used to find the partial derivatives of functions of several variables that are defined implicitly.

THEOREM 13.8 Chain Rule: Implicit Differentiation

If the equation $F(x, y) = 0$ defines y implicitly as a differentiable function of x, then

$$\frac{dy}{dx} = -\frac{F_x(x, y)}{F_y(x, y)}, \quad F_y(x, y) \neq 0.$$

If the equation $F(x, y, z) = 0$ defines z implicitly as a differentiable function of x and y, then

$$\frac{\partial z}{\partial x} = -\frac{F_x(x, y, z)}{F_z(x, y, z)} \quad \text{and} \quad \frac{\partial z}{\partial y} = -\frac{F_y(x, y, z)}{F_z(x, y, z)}, \quad F_z(x, y, z) \neq 0.$$

This theorem can be extended to differentiable functions defined implicitly with any number of variables.

EXAMPLE 6 Finding a Derivative Implicitly

Find dy/dx for

$$y^3 + y^2 - 5y - x^2 + 4 = 0.$$

Solution Begin by letting

$$F(x, y) = y^3 + y^2 - 5y - x^2 + 4.$$

Then

$$F_x(x, y) = -2x \quad \text{and} \quad F_y(x, y) = 3y^2 + 2y - 5.$$

Using Theorem 13.8, you have

$$\frac{dy}{dx} = -\frac{F_x(x, y)}{F_y(x, y)} = \frac{-(-2x)}{3y^2 + 2y - 5} = \frac{2x}{3y^2 + 2y - 5}.$$

REMARK Compare the solution to Example 6 with the solution to Example 2 in Section 2.5.

EXAMPLE 7 Finding Partial Derivatives Implicitly

Find $\partial z/\partial x$ and $\partial z/\partial y$ for

$$3x^2z - x^2y^2 + 2z^3 + 3yz - 5 = 0.$$

Solution Begin by letting

$$F(x, y, z) = 3x^2z - x^2y^2 + 2z^3 + 3yz - 5.$$

Then

$$F_x(x, y, z) = 6xz - 2xy^2$$
$$F_y(x, y, z) = -2x^2y + 3z$$

and

$$F_z(x, y, z) = 3x^2 + 6z^2 + 3y.$$

Using Theorem 13.8, you have

$$\frac{\partial z}{\partial x} = -\frac{F_x(x, y, z)}{F_z(x, y, z)} = \frac{2xy^2 - 6xz}{3x^2 + 6z^2 + 3y}$$

and

$$\frac{\partial z}{\partial y} = -\frac{F_y(x, y, z)}{F_z(x, y, z)} = \frac{2x^2y - 3z}{3x^2 + 6z^2 + 3y}.$$

Concept Check

1. Consider $w = f(x, y)$, where $x = g(s, t)$ and $y = h(s, t)$. Describe two ways of finding the partial derivatives $\partial w/\partial s$ and $\partial w/\partial t$.
2. Explain why using the Chain Rule to determine the derivative of the equation

   $F(x, y) = 0$

   is implicitly easier than using the method you learned in Section 2.5.

Using the Chain Rule **In Exercises 3–6, find dw/dt using the appropriate Chain Rule. Evaluate dw/dt at the given value of t.**

	Function	Value
3.	$w = x^2 + 5y$ $x = 2t,\ y = t$	$t = 2$
4.	$w = \sqrt{x^2 + y^2}$ $x = \cos t,\ y = e^t$	$t = 0$
5.	$w = x \sin y$ $x = e^t,\ y = \pi - t$	$t = 0$
6.	$w = \ln \frac{y}{x}$ $x = \cos t,\ y = \sin t$	$t = \frac{\pi}{4}$

Using Different Methods **In Exercises 7–12, find dw/dt (a) by using the appropriate Chain Rule and (b) by converting w to a function of t before differentiating.**

7. $w = x - \frac{1}{y}, \quad x = e^{2t}, \quad y = t^3$
8. $w = \cos(x - y), \quad x = t^2, \quad y = 1$
9. $w = x^2 + y^2 + z^2, \quad x = \cos t, \quad y = \sin t, \quad z = e^t$
10. $w = xy \cos z, \quad x = t, \quad y = t^2, \quad z = \arccos t$
11. $w = xy + xz + yz, \quad x = t - 1, \quad y = t^2 - 1, \quad z = t$
12. $w = xy^2 + x^2z + yz^2, \quad x = t^2, \quad y = 2t, \quad z = 2$

Projectile Motion **In Exercises 13 and 14, the parametric equations for the paths of two objects are given. At what rate is the distance between the two objects changing at the given value of t?**

13. $x_1 = 10 \cos 2t, \quad y_1 = 6 \sin 2t$ First object
    $x_2 = 7 \cos t, \quad y_2 = 4 \sin t$ Second object
    $t = \pi/2$
14. $x_1 = 48\sqrt{2}t, \quad y_1 = 48\sqrt{2}t - 16t^2$ First object
    $x_2 = 48\sqrt{3}t, \quad y_2 = 48t - 16t^2$ Second object
    $t = 1$

Finding Partial Derivatives **In Exercises 15–18, find $\partial w/\partial s$ and $\partial w/\partial t$ using the appropriate Chain Rule. Evaluate each partial derivative at the given values of s and t.**

	Function	Values
15.	$w = x^2 + y^2$ $x = s + t, \quad y = s - t$	$s = 1, \quad t = 3$
16.	$w = y^3 - 3x^2y$ $x = e^s, \quad y = e^t$	$s = -1, \quad t = 2$
17.	$w = \sin(2x + 3y)$ $x = s + t, \quad y = s - t$	$s = 0, \quad t = \frac{\pi}{2}$
18.	$w = x^2 - y^2$ $x = s \cos t, \quad y = s \sin t$	$s = 3, \quad t = \frac{\pi}{4}$

Using Different Methods **In Exercises 19–22, find $\partial w/\partial s$ and $\partial w/\partial t$ (a) by using the appropriate Chain Rule and (b) by converting w to a function of s and t before differentiating.**

19. $w = xyz, \quad x = s + t, \quad y = s - t, \quad z = st^2$
20. $w = x^2 + y^2 + z^2, \quad x = t \sin s, \quad y = t \cos s, \quad z = st^2$
21. $w = ze^{xy}, \quad x = s - t, \quad y = s + t, \quad z = st$
22. $w = x \cos yz, \quad x = s^2, \quad y = t^2, \quad z = s - 2t$

Finding a Derivative Implicitly **In Exercises 23–26, differentiate implicitly to find dy/dx.**

23. $x^2 - xy + y^2 - x + y = 0$
24. $\sec xy + \tan xy + 5 = 0$
25. $\ln\sqrt{x^2 + y^2} + x + y = 4$
26. $\frac{x}{x^2 + y^2} - y^2 = 6$

Finding Partial Derivatives Implicitly **In Exercises 27–34, differentiate implicitly to find the first partial derivatives of z.**

27. $x^2 + y^2 + z^2 = 1$
28. $xz + yz + xy = 0$
29. $x^2 + 2yz + z^2 = 1$
30. $x + \sin(y + z) = 0$
31. $\tan(x + y) + \cos z = 2$
32. $z = e^x \sin(y + z)$
33. $e^{xz} + xy = 0$
34. $x \ln y + y^2z + z^2 = 8$

Finding Partial Derivatives Implicitly **In Exercises 35–38, differentiate implicitly to find the first partial derivatives of w.**

35. $7xy + yz^2 - 4wz + w^2z + w^2x - 6 = 0$
36. $x^2 + y^2 + z^2 - 5yw + 10w^2 = 2$
37. $\cos xy + \sin yz + wz = 20$
38. $w - \sqrt{x - y} - \sqrt{y - z} = 0$

Homogeneous Functions **A function f is *homogeneous of degree n* when $f(tx, ty) = t^n f(x, y)$. In Exercises 39–42, (a) show that the function is homogeneous and determine n, and (b) show that $xf_x(x, y) + yf_y(x, y) = nf(x, y)$.**

39. $f(x, y) = 2x^2 - 5xy$

40. $f(x, y) = x^3 - 3xy^2 + y^3$

41. $f(x, y) = e^{x/y}$

42. $f(x, y) = x \cos \dfrac{x + y}{y}$

43. Using a Table of Values Let $w = f(x, y)$, $x = g(t)$, and $y = h(t)$, where f, g, and h are differentiable. Use the appropriate Chain Rule and the table of values to find dw/dt when $t = 2$.

$g(2)$	$h(2)$	$g'(2)$	$h'(2)$	$f_x(4, 3)$	$f_y(4, 3)$
4	3	-1	6	-5	7

44. Using a Table of Values Let $w = f(x, y)$, $x = g(s, t)$, and $y = h(s, t)$, where f, g, and h are differentiable. Use the appropriate Chain Rule and the table of values to find $w_s(1, 2)$.

$g(1, 2)$	$h(1, 2)$	$g_s(1, 2)$	$h_s(1, 2)$	$f_x(4, 3)$	$f_y(4, 3)$
4	3	-3	5	-5	7

Exploring Concepts

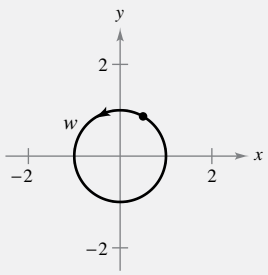
45. Show that $\dfrac{\partial w}{\partial u} + \dfrac{\partial w}{\partial v} = 0$ for $w = f(x, y)$, $x = u - v$, and $y = v - u$.

46. Demonstrate the result of Exercise 45 for

$w = (x - y) \sin(y - x)$.

47. Let $F(u, v)$ be a function of two variables. Find a formula for $f'(x)$ when (a) $f(x) = F(4x, 4)$ and (b) $f(x) = F(-2x, x^2)$.

48. HOW DO YOU SEE IT? The path of an object represented by $w = f(x, y)$ is shown, where x and y are functions of t. The point on the graph represents the position of the object.



Determine whether each of the following is positive, negative, or zero.

(a) $\dfrac{dx}{dt}$ (b) $\dfrac{dy}{dt}$

49. Volume and Surface Area The radius of a right circular cylinder is increasing at a rate of 6 inches per minute, and the height is decreasing at a rate of 4 inches per minute. What are the rates of change of the volume and surface area when the radius is 12 inches and the height is 36 inches?

50. Ideal Gas Law The Ideal Gas Law is

$PV = mRT$

where P is the pressure, V is the volume, m is the constant mass, R is a constant, T is the temperature, and P and V are functions of time. Find dT/dt, the rate at which the temperature changes with respect to time.

51. Moment of Inertia An annular cylinder has an inside radius of r_1 and an outside radius of r_2 (see figure). Its moment of inertia is

$I = \frac{1}{2}m(r_1^2 + r_2^2)$

where m is the mass. The two radii are increasing at a rate of 2 centimeters per second. Find the rate at which I is changing at the instant the radii are 6 centimeters and 8 centimeters. (Assume mass is a constant.)

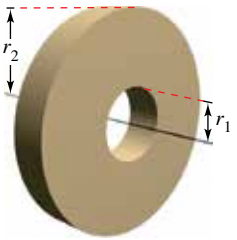


Figure for 51

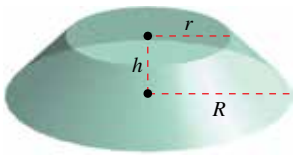

Figure for 52

52. Volume and Surface Area The two radii of the frustum of a right circular cone are increasing at a rate of 4 centimeters per minute, and the height is increasing at a rate of 12 centimeters per minute (see figure). Find the rates at which the volume and surface area are changing when the two radii are 15 centimeters and 25 centimeters and the height is 10 centimeters.

53. Cauchy-Riemann Equations Given the functions $u(x, y)$ and $v(x, y)$, verify that the **Cauchy-Riemann equations**

$$\frac{\partial u}{\partial x} = \frac{\partial v}{\partial y} \quad \text{and} \quad \frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}$$

can be written in polar coordinate form as

$$\frac{\partial u}{\partial r} = \frac{1}{r} \cdot \frac{\partial v}{\partial \theta} \quad \text{and} \quad \frac{\partial v}{\partial r} = -\frac{1}{r} \cdot \frac{\partial u}{\partial \theta}.$$

54. Cauchy-Riemann Equations Demonstrate the result of Exercise 53 for the functions

$u = \ln \sqrt{x^2 + y^2}$ and $v = \arctan \dfrac{y}{x}$.

55. Homogeneous Function Show that if $f(x, y)$ is homogeneous of degree n, then

$xf_x(x, y) + yf_y(x, y) = nf(x, y)$.

[*Hint:* Let $g(t) = f(tx, ty) = t^n f(x, y)$. Find $g'(t)$ and then let $t = 1$.]

13.6 Directional Derivatives and Gradients

GO DIGITAL

- Find and use directional derivatives of a function of two variables.
- Find the gradient of a function of two variables.
- Use the gradient of a function of two variables in applications.
- Find directional derivatives and gradients of functions of three variables.

Directional Derivative

You are on the hillside represented by $z = f(x, y)$ in Figure 13.42 and want to determine the hill's incline toward the z-axis. You already know how to determine the slopes in two different directions—the slope in the y-direction is given by the partial derivative $f_y(x, y)$, and the slope in the x-direction is given by the partial derivative $f_x(x, y)$. In this section, you will see that these two partial derivatives can be used to find the slope in *any* direction.

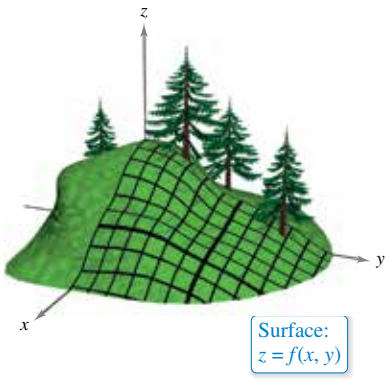

Figure 13.42

To determine the slope at a point on a surface, you will define a new type of derivative called a **directional derivative.** Begin by letting $z = f(x, y)$ be a *surface* and $P(x_0, y_0)$ be a *point* in the domain of f, as shown in Figure 13.43. The "direction" of the directional derivative is given by a unit vector

$$\mathbf{u} = \cos\theta\mathbf{i} + \sin\theta\mathbf{j}$$

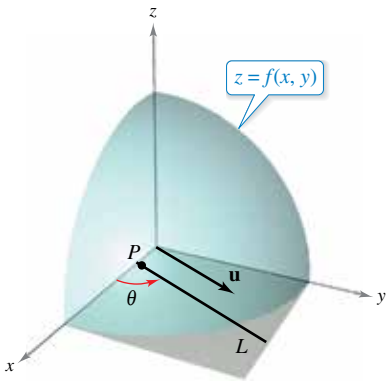

Figure 13.43

where θ is the angle the vector makes with the positive x-axis. To find the desired slope, reduce the problem to two dimensions by intersecting the surface with a vertical plane passing through the point P and parallel to $\mathbf{u}$, as shown in Figure 13.44. This vertical plane intersects the surface to form a curve C. The slope of the surface at $(x_0, y_0, f(x_0, y_0))$ in the direction of $\mathbf{u}$ is defined as the slope of the curve C at that point.

Informally, you can write the slope of the curve C as a limit that looks much like those used in single-variable calculus. The vertical plane used to form C intersects the xy-plane in a line L, represented by the parametric equations

$$x = x_0 + t\cos\theta$$

and

$$y = y_0 + t\sin\theta$$

so that for any value of t, the point $Q(x, y)$ lies on the line L. For each of the points P and Q, there is a corresponding point on the surface.

$(x_0, y_0, f(x_0, y_0))$ Point above P

$(x, y, f(x, y))$ Point above Q

Moreover, because the distance between P and Q is

$$\sqrt{(x - x_0)^2 + (y - y_0)^2} = \sqrt{(t\cos\theta)^2 + (t\sin\theta)^2} = |t|$$

you can write the slope of the secant line through $(x_0, y_0, f(x_0, y_0))$ and $(x, y, f(x, y))$ as

$$\frac{f(x, y) - f(x_0, y_0)}{t} = \frac{f(x_0 + t\cos\theta, y_0 + t\sin\theta) - f(x_0, y_0)}{t}.$$

Finally, by letting t approach 0, you arrive at the definition on the next page.

REMARK Be sure you understand that the directional derivative represents the *rate of change of a function* in the direction of the unit vector $\mathbf{u} = \cos\theta\mathbf{i} + \sin\theta\mathbf{j}$. Geometrically, you can interpret the directional derivative as giving the *slope of a surface* in the direction of $\mathbf{u}$ at a point on the surface. (See Figure 13.46.)

Definition of Directional Derivative

Let f be a function of two variables x and y and let $\mathbf{u} = \cos\theta\mathbf{i} + \sin\theta\mathbf{j}$ be a unit vector. Then the **directional derivative of f in the direction of $\mathbf{u}$,** denoted by $D_{\mathbf{u}}f$, is

$$D_{\mathbf{u}}f(x, y) = \lim_{t\to 0}\frac{f(x + t\cos\theta, y + t\sin\theta) - f(x, y)}{t}$$

provided this limit exists.

Calculating directional derivatives by this definition is similar to finding the derivative of a function of one variable by the limit process (see Section 2.1). A simpler formula for finding directional derivatives involves the partial derivatives f_x and f_y.

GO DIGITAL

THEOREM 13.9 Directional Derivative

If f is a differentiable function of x and y, then the directional derivative of f in the direction of the unit vector $\mathbf{u} = \cos\theta\mathbf{i} + \sin\theta\mathbf{j}$ is

$$D_{\mathbf{u}}f(x, y) = f_x(x, y)\cos\theta + f_y(x, y)\sin\theta.$$

Proof For a fixed point (x_0, y_0), let

$$x = x_0 + t\cos\theta \quad \text{and} \quad y = y_0 + t\sin\theta.$$

Then, let $g(t) = f(x, y)$. Because f is differentiable, you can apply the Chain Rule given in Theorem 13.6 to obtain

$$\begin{aligned} g'(t) &= f_x(x, y)x'(t) + f_y(x, y)y'(t) \qquad \text{Apply Chain Rule (Theorem 13.6).} \\ &= f_x(x, y)\cos\theta + f_y(x, y)\sin\theta. \end{aligned}$$

If $t = 0$, then $x = x_0$ and $y = y_0$, so

$$g'(0) = f_x(x_0, y_0)\cos\theta + f_y(x_0, y_0)\sin\theta.$$

By the definition of $g'(t)$, it is also true that

$$\begin{aligned} g'(0) &= \lim_{t\to 0}\frac{g(t) - g(0)}{t} \\ &= \lim_{t\to 0}\frac{f(x_0 + t\cos\theta, y_0 + t\sin\theta) - f(x_0, y_0)}{t}. \end{aligned}$$

Consequently, $D_{\mathbf{u}}f(x_0, y_0) = f_x(x_0, y_0)\cos\theta + f_y(x_0, y_0)\sin\theta$. ∎

There are infinitely many directional derivatives of a surface at a given point—one for each direction specified by $\mathbf{u}$, as shown in Figure 13.45. Two of these are the partial derivatives f_x and f_y.

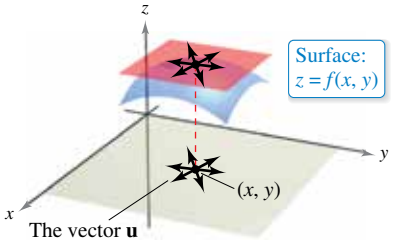

Figure 13.45

1. Direction of positive x-axis $(\theta = 0)$: $\mathbf{u} = \cos 0\mathbf{i} + \sin 0\mathbf{j} = \mathbf{i}$

$$D_{\mathbf{i}}f(x, y) = f_x(x, y)\cos 0 + f_y(x, y)\sin 0 = f_x(x, y)$$

2. Direction of positive y-axis $\left(\theta = \frac{\pi}{2}\right)$: $\mathbf{u} = \cos\frac{\pi}{2}\mathbf{i} + \sin\frac{\pi}{2}\mathbf{j} = \mathbf{j}$

$$D_{\mathbf{j}}f(x, y) = f_x(x, y)\cos\frac{\pi}{2} + f_y(x, y)\sin\frac{\pi}{2} = f_y(x, y)$$

GO DIGITAL

EXAMPLE 1 Finding a Directional Derivative

Find the directional derivative of

$$f(x, y) = 4 - x^2 - \frac{1}{4}y^2 \qquad \text{Surface}$$

at $(1, 2)$ in the direction of

$$\mathbf{u} = \left(\cos\frac{\pi}{3}\right)\mathbf{i} + \left(\sin\frac{\pi}{3}\right)\mathbf{j}. \qquad \text{Direction}$$

Solution Because $f_x(x, y) = -2x$ and $f_y(x, y) = -y/2$ are continuous, f is differentiable, and you can apply Theorem 13.9.

$$D_{\mathbf{u}}f(x, y) = f_x(x, y)\cos\theta + f_y(x, y)\sin\theta = (-2x)\cos\theta + \left(-\frac{y}{2}\right)\sin\theta$$

Evaluating at $\theta = \pi/3$, $x = 1$, and $y = 2$ produces

$$\begin{aligned} D_{\mathbf{u}}f(1, 2) &= (-2)\left(\frac{1}{2}\right) + (-1)\left(\frac{\sqrt{3}}{2}\right) \\ &= -1 - \frac{\sqrt{3}}{2} \\ &\approx -1.866. \end{aligned}$$ See Figure 13.46.

Note in Figure 13.46 that you can interpret the directional derivative as giving the slope of the surface at the point $(1, 2, 2)$ in the direction of the unit vector $\mathbf{u}$.

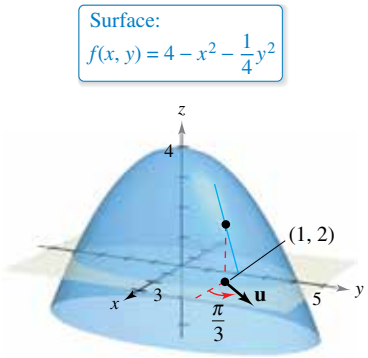

Figure 13.46

You have been specifying direction by a unit vector $\mathbf{u}$. When the direction is given by a vector whose length is not 1, you must normalize the vector before applying the formula in Theorem 13.9.

EXAMPLE 2 Finding a Directional Derivative

See LarsonCalculus.com for an interactive version of this type of example.

Find the directional derivative of

$$f(x, y) = x^2 \sin 2y \qquad \text{Surface}$$

at $(1, \pi/2)$ in the direction of

$$\mathbf{v} = 3\mathbf{i} - 4\mathbf{j}. \qquad \text{Direction}$$

Solution Because $f_x(x, y) = 2x \sin 2y$ and $f_y(x, y) = 2x^2 \cos 2y$ are continuous, f is differentiable, and you can apply Theorem 13.9. Begin by finding a unit vector in the direction of $\mathbf{v}$.

$$\mathbf{u} = \frac{\mathbf{v}}{\|\mathbf{v}\|} = \frac{3}{5}\mathbf{i} - \frac{4}{5}\mathbf{j} = \cos\theta\mathbf{i} + \sin\theta\mathbf{j}$$

Using this unit vector, you have

$$D_{\mathbf{u}}f(x, y) = (2x \sin 2y)(\cos\theta) = (2x^2 \cos 2y)(\sin\theta)$$

$$\begin{aligned} D_{\mathbf{u}}f\left(1, \frac{\pi}{2}\right) &= (2\sin\pi)\left(\frac{3}{5}\right) + (2\cos\pi)\left(-\frac{4}{5}\right) \\ &= (0)\left(\frac{3}{5}\right) + (-2)\left(-\frac{4}{5}\right) \\ &= \frac{8}{5}. \end{aligned}$$ See Figure 13.47.

The gradient of f is a vector in the xy-plane.

Figure 13.48

The Gradient of a Function of Two Variables

The **gradient** of a function of two variables is a vector-valued function of two variables. This function has many important uses, some of which are described later in this section.

Definition of Gradient of a Function of Two Variables

Let $z = f(x, y)$ be a function of x and y such that f_x and f_y exist. Then the **gradient of f,** denoted by $\nabla f(x, y)$, is the vector

$$\nabla f(x, y) = f_x(x, y)\mathbf{i} + f_y(x, y)\mathbf{j}.$$

(The symbol ∇f is read as "del f.") Another notation for the gradient is given by **grad** $f(x, y)$. In Figure 13.48, note that for each (x, y), the gradient $\nabla f(x, y)$ is a vector in the plane (not a vector in space).

Notice that no value is assigned to the symbol ∇ by itself. It is an operator in the same sense that d/dx is an operator. When ∇ operates on $f(x, y)$, it produces the vector $\nabla f(x, y)$.

EXAMPLE 3 Finding the Gradient of a Function

Find the gradient of

$$f(x, y) = y \ln x + xy^2$$

at the point $(1, 2)$.

Solution Using

$$f_x(x, y) = \frac{y}{x} + y^2 \quad \text{and} \quad f_y(x, y) = \ln x + 2xy$$

you have

$$\begin{aligned}\nabla f(x, y) &= f_x(x, y)\mathbf{i} + f_y(x, y)\mathbf{j} \\ &= \left(\frac{y}{x} + y^2\right)\mathbf{i} + (\ln x + 2xy)\mathbf{j}.\end{aligned}$$

At the point $(1, 2)$, the gradient is

$$\begin{aligned}\nabla f(1, 2) &= \left(\frac{2}{1} + 2^2\right)\mathbf{i} + [\ln 1 + 2(1)(2)]\mathbf{j} \\ &= 6\mathbf{i} + 4\mathbf{j}.\end{aligned}$$

■

Because the gradient of f is a vector, you can write the directional derivative of f in the direction of $\mathbf{u}$ as

$$D_{\mathbf{u}}f(x, y) = [f_x(x, y)\mathbf{i} + f_y(x, y)\mathbf{j}] \cdot (\cos\theta\mathbf{i} + \sin\theta\mathbf{j}).$$

In other words, the directional derivative is the dot product of the gradient and the direction vector. This useful result is summarized in the next theorem.

THEOREM 13.10 Alternative Form of the Directional Derivative

If f is a differentiable function of x and y, then the directional derivative of f in the direction of the unit vector $\mathbf{u}$ is

$$D_{\mathbf{u}}f(x, y) = \nabla f(x, y) \cdot \mathbf{u}.$$

GO DIGITAL

EXAMPLE 4 Using $\nabla f(x, y)$ to Find a Directional Derivative

Find the directional derivative of $f(x, y) = 3x^2 - 2y^2$ at $\left(-\frac{3}{4}, 0\right)$ in the direction from $P\left(-\frac{3}{4}, 0\right)$ to $Q(0, 1)$.

Solution Because the partials of f are continuous, f is differentiable and you can apply Theorem 13.10. A vector in the specified direction is

$$\overrightarrow{PQ} = \left(0 + \frac{3}{4}\right)\mathbf{i} + (1 - 0)\mathbf{j} = \frac{3}{4}\mathbf{i} + \mathbf{j}$$

and a unit vector in this direction is

$$\mathbf{u} = \frac{\overrightarrow{PQ}}{\|\overrightarrow{PQ}\|} = \frac{3}{5}\mathbf{i} + \frac{4}{5}\mathbf{j}.$$ Unit vector in direction of $\overrightarrow{PQ}$

Because $\nabla f(x, y) = f_x(x, y)\mathbf{i} + f_y(x, y)\mathbf{j} = 6x\mathbf{i} - 4y\mathbf{j}$, the gradient at $\left(-\frac{3}{4}, 0\right)$ is

$$\nabla f\left(-\frac{3}{4}, 0\right) = -\frac{9}{2}\mathbf{i} + 0\mathbf{j}.$$ Gradient at $\left(-\frac{3}{4}, 0\right)$

Consequently, at $\left(-\frac{3}{4}, 0\right)$, the directional derivative is

$$\begin{aligned} D_{\mathbf{u}} f\left(-\frac{3}{4}, 0\right) &= \nabla f\left(-\frac{3}{4}, 0\right) \cdot \mathbf{u} \\ &= \left(-\frac{9}{2}\mathbf{i} + 0\mathbf{j}\right) \cdot \left(\frac{3}{5}\mathbf{i} + \frac{4}{5}\mathbf{j}\right) \\ &= -\frac{27}{10}. \end{aligned}$$ Directional derivative at $\left(-\frac{3}{4}, 0\right)$

See Figure 13.49.

Applications of the Gradient

You have already seen that there are many directional derivatives at the point (x, y) on a surface. In many applications, you may want to know in which direction to move so that $f(x, y)$ increases most rapidly. This direction is called the direction of steepest ascent, and it is given by the gradient, as stated in the next theorem.

THEOREM 13.11 Properties of the Gradient

Let f be differentiable at the point (x, y).

1. If $\nabla f(x, y) = \mathbf{0}$, then $D_{\mathbf{u}} f(x, y) = 0$ for all $\mathbf{u}$.
2. The direction of *maximum* increase of f is given by $\nabla f(x, y)$. The maximum value of $D_{\mathbf{u}} f(x, y)$ is
$$\|\nabla f(x, y)\|. \qquad \text{Maximum value of } D_{\mathbf{u}} f(x, y)$$
3. The direction of *minimum* increase of f is given by $-\nabla f(x, y)$. The minimum value of $D_{\mathbf{u}} f(x, y)$ is
$$-\|\nabla f(x, y)\|. \qquad \text{Minimum value of } D_{\mathbf{u}} f(x, y)$$

REMARK Property 2 of Theorem 13.11 says that at the point (x, y), f increases most rapidly in the direction of the gradient, $\nabla f(x, y)$.

Proof If $\nabla f(x, y) = \mathbf{0}$, then for any direction (any $\mathbf{u}$), you have

$$\begin{aligned} D_{\mathbf{u}} f(x, y) &= \nabla f(x, y) \cdot \mathbf{u} \\ &= (0\mathbf{i} + 0\mathbf{j}) \cdot (\cos\theta\mathbf{i} + \sin\theta\mathbf{j}) \\ &= 0. \end{aligned}$$

If $\nabla f(x, y) \neq \mathbf{0}$, then let ϕ be the angle between $\nabla f(x, y)$ and a unit vector $\mathbf{u}$. Using the dot product, you can apply Theorem 11.5 to conclude that

$$\begin{aligned} D_{\mathbf{u}} f(x, y) &= \nabla f(x, y) \cdot \mathbf{u} \\ &= \|\nabla f(x, y)\| \, \|\mathbf{u}\| \cos\phi \\ &= \|\nabla f(x, y)\| \cos\phi \end{aligned}$$

and it follows that the maximum value of $D_{\mathbf{u}} f(x, y)$ will occur when

$$\cos\phi = 1.$$

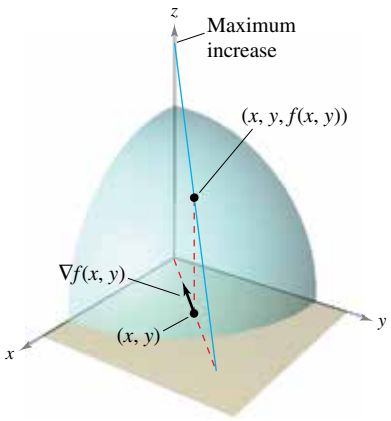
So, $\phi = 0$, and the maximum value of the directional derivative occurs when $\mathbf{u}$ has the same direction as $\nabla f(x, y)$. Moreover, this largest value of $D_{\mathbf{u}} f(x, y)$ is precisely

$$\|\nabla f(x, y)\| \cos\phi = \|\nabla f(x, y)\|.$$

Similarly, the minimum value of $D_{\mathbf{u}} f(x, y)$ can be obtained by letting

$$\phi = \pi$$

so that $\mathbf{u}$ points in the direction opposite that of $\nabla f(x, y)$, as shown in Figure 13.50.



The gradient of f is a vector in the xy-plane that points in the direction of maximum increase on the surface given by $z = f(x, y)$.
Figure 13.50

To visualize one of the properties of the gradient, imagine a skier coming down a mountainside. If $f(x, y)$ denotes the altitude of the skier, then $-\nabla f(x, y)$ indicates the *compass direction* the skier should take to ski the path of steepest descent. (Remember that the gradient indicates direction in the xy-plane and does not itself point up or down the mountainside.)

As another illustration of the gradient, consider the temperature $T(x, y)$ at any point (x, y) on a flat metal plate. In this case, $\nabla T(x, y)$ gives the direction of greatest temperature increase at the point (x, y), as illustrated in the next example.

The direction of most rapid increase in temperature at $(2, -3)$ is given by $-16\mathbf{i} + 6\mathbf{j}$.

Figure 13.51

EXAMPLE 5 Finding the Direction of Maximum Increase

The temperature in degrees Celsius on the surface of a metal plate is

$$T(x, y) = 20 - 4x^2 - y^2$$

where x and y are measured in centimeters. In what direction from $(2, -3)$ does the temperature increase most rapidly? What is this rate of increase?

Solution The gradient is

$$\nabla T(x, y) = T_x(x, y)\mathbf{i} + T_y(x, y)\mathbf{j} = -8x\mathbf{i} - 2y\mathbf{j}.$$

It follows that the direction of maximum increase is given by

$$\nabla T(2, -3) = -16\mathbf{i} + 6\mathbf{j}$$

as shown in Figure 13.51, and the rate of increase is

$$\|\nabla T(2, -3)\| = \sqrt{256 + 36} = \sqrt{292} \approx 17.09° \text{ per centimeter.}$$

The solution presented in Example 5 can be misleading. Although the gradient points in the direction of maximum temperature increase, it does not necessarily point toward the hottest spot on the plate. In other words, the gradient provides a local solution to finding an increase relative to the temperature at the point $(2, -3)$. *Once you leave that position, the direction of maximum increase may change.*

EXAMPLE 6 Finding the Path of a Heat-Seeking Particle

A heat-seeking particle is located at the point $(2, -3)$ on a metal plate whose temperature at (x, y) is

$$T(x, y) = 20 - 4x^2 - y^2.$$

Find the path of the particle as it continuously moves in the direction of maximum temperature increase.

Solution Let the path be represented by the position vector

$$\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}.$$

A tangent vector at each point $(x(t), y(t))$ is given by

$$\mathbf{r}'(t) = \frac{dx}{dt}\mathbf{i} + \frac{dy}{dt}\mathbf{j}.$$

Because the particle seeks maximum temperature increase, the directions of $\mathbf{r}'(t)$ and $\nabla T(x, y) = -8x\mathbf{i} - 2y\mathbf{j}$ are the same at each point on the path. So,

$$-8x = k\frac{dx}{dt} \quad \text{and} \quad -2y = k\frac{dy}{dt}$$

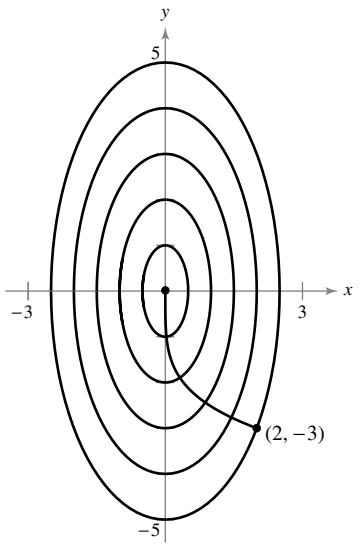
where k depends on t. By solving each equation for dt/k and equating the results, you obtain

$$\frac{dx}{-8x} = \frac{dy}{-2y}.$$

The solution of this differential equation is $x = Cy^4$. Because the particle starts at the point $(2, -3)$, you can determine that $C = 2/81$. So, the path of the heat-seeking particle is

$$x = \frac{2}{81}y^4.$$

The path is shown in Figure 13.52.



Path followed by a heat-seeking particle

GO DIGITAL

In Figure 13.52, the path of the particle (determined by the gradient at each point) appears to be orthogonal to each of the level curves. This becomes clear when you consider that the temperature $T(x, y)$ is constant along a given level curve. So, at any point (x, y) on the curve, the rate of change of T in the direction of a unit tangent vector $\mathbf{u}$ is 0, and you can write

$$\nabla f(x, y) \cdot \mathbf{u} = D_{\mathbf{u}}T(x, y) = 0.$$ $\mathbf{u}$ is a unit tangent vector.

Because the dot product of $\nabla f(x, y)$ and $\mathbf{u}$ is 0, you can conclude that they must be orthogonal. This result is stated in the next theorem.

THEOREM 13.12 Gradient Is Normal to Level Curves

If f is differentiable at (x_0, y_0) and $\nabla f(x_0, y_0) \neq \mathbf{0}$, then $\nabla f(x_0, y_0)$ is normal to the level curve through (x_0, y_0).

EXAMPLE 7 Finding a Normal Vector to a Level Curve

Sketch the level curve corresponding to $c = 0$ for the function given by

$$f(x, y) = y - \sin x$$

and find a normal vector at several points on the curve.

Solution The level curve for $c = 0$ is given by

$$0 = y - \sin x \quad \Rightarrow \quad y = \sin x$$

as shown in Figure 13.53(a). Because the gradient of f at (x, y) is

$$\begin{aligned}\nabla f(x, y) &= f_x(x, y)\mathbf{i} + f_y(x, y)\mathbf{j} \\ &= -\cos x\mathbf{i} + \mathbf{j}\end{aligned}$$

you can use Theorem 13.12 to conclude that $\nabla f(x, y)$ is normal to the level curve at the point (x, y). Some gradients are

$$\nabla f(-\pi, 0) = \mathbf{i} + \mathbf{j}$$

$$\nabla f\left(-\frac{2\pi}{3}, -\frac{\sqrt{3}}{2}\right) = \frac{1}{2}\mathbf{i} + \mathbf{j}$$

$$\nabla f\left(-\frac{\pi}{2}, -1\right) = \mathbf{j}$$

$$\nabla f\left(-\frac{\pi}{3}, -\frac{\sqrt{3}}{2}\right) = -\frac{1}{2}\mathbf{i} + \mathbf{j}$$

$$\nabla f(0, 0) = -\mathbf{i} + \mathbf{j}$$

$$\nabla f\left(\frac{\pi}{3}, \frac{\sqrt{3}}{2}\right) = -\frac{1}{2}\mathbf{i} + \mathbf{j}$$

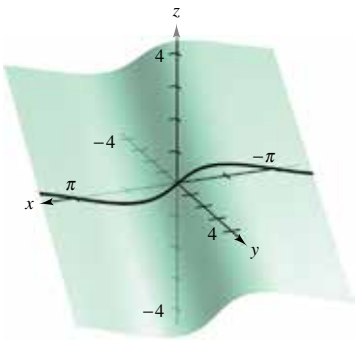
$$\nabla f\left(\frac{\pi}{2}, 1\right) = \mathbf{j}$$

$$\nabla f\left(\frac{2\pi}{3}, \frac{\sqrt{3}}{2}\right) = \frac{1}{2}\mathbf{i} + \mathbf{j}$$

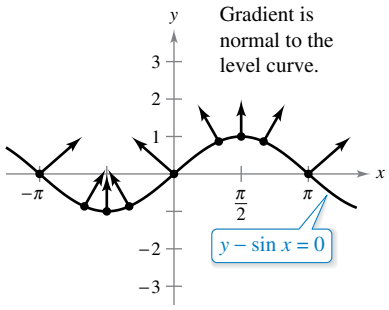
and

$$\nabla f(\pi, 0) = \mathbf{i} + \mathbf{j}.$$

These gradients and the level curve $y = \sin x$ are shown in Figure 13.53(b). ■



(a) The surface is given by $f(x, y) = y - \sin x$.



(b) The level curve is given by $f(x, y) = 0$.

Functions of Three Variables

The definitions of the directional derivative and the gradient can be extended naturally to functions of three or more variables. As often happens, some of the geometric interpretation is lost in the generalization from functions of two variables to those of three variables. For example, you cannot interpret the directional derivative of a function of three variables as representing slope.

The definitions and properties of the directional derivative and the gradient of a function of three variables are listed below.

Directional Derivative and Gradient for Three Variables

Let f be a function of x, y, and z with continuous first partial derivatives. The **directional derivative of f** in the direction of a unit vector

$$\mathbf{u} = a\mathbf{i} + b\mathbf{j} + c\mathbf{k}$$

is given by

$$D_{\mathbf{u}}f(x, y, z) = af_x(x, y, z) + bf_y(x, y, z) + cf_z(x, y, z).$$

The **gradient of f** is defined as

$$\nabla f(x, y, z) = f_x(x, y, z)\mathbf{i} + f_y(x, y, z)\mathbf{j} + f_z(x, y, z)\mathbf{k}.$$

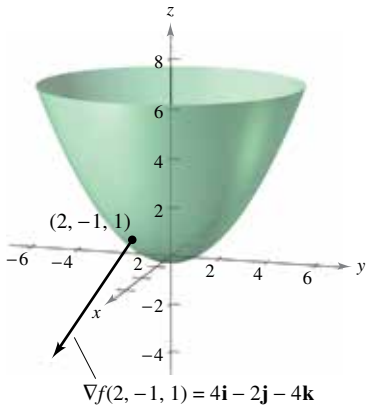
Properties of the gradient are as follows.

1. $D_{\mathbf{u}}f(x, y, z) = \nabla f(x, y, z) \cdot \mathbf{u}$
2. If $\nabla f(x, y, z) = \mathbf{0}$, then $D_{\mathbf{u}}f(x, y, z) = 0$ for all $\mathbf{u}$.
3. The direction of *maximum* increase of f is given by $\nabla f(x, y, z)$. The maximum value of $D_{\mathbf{u}}f(x, y, z)$ is
$$\|\nabla f(x, y, z)\|. \qquad \text{Maximum value of } D_{\mathbf{u}}f(x, y, z)$$
4. The direction of *minimum* increase of f is given by $-\nabla f(x, y, z)$. The minimum value of $D_{\mathbf{u}}f(x, y, z)$ is
$$-\|\nabla f(x, y, z)\|. \qquad \text{Minimum value of } D_{\mathbf{u}}f(x, y, z)$$

You can generalize Theorem 13.12 to functions of three variables. Under suitable hypotheses,

$$\nabla f(x_0, y_0, z_0)$$

is normal to the level surface through (x_0, y_0, z_0).



Level surface and gradient at $(2, -1, 1)$ for $f(x, y, z) = x^2 + y^2 - 4z$

Figure 13.54

EXAMPLE 8 Finding the Gradient of a Function

Find $\nabla f(x, y, z)$ for the function

$$f(x, y, z) = x^2 + y^2 - 4z$$

and find the direction of maximum increase of f at the point $(2, -1, 1)$.

Solution The gradient is

$$\begin{aligned}\nabla f(x, y, z) &= f_x(x, y, z)\mathbf{i} + f_y(x, y, z)\mathbf{j} + f_z(x, y, z)\mathbf{k} \\ &= 2x\mathbf{i} + 2y\mathbf{j} - 4\mathbf{k}.\end{aligned}$$

So, it follows that the direction of maximum increase at $(2, -1, 1)$ is

$$\nabla f(2, -1, 1) = 4\mathbf{i} - 2\mathbf{j} - 4\mathbf{k}. \qquad \text{See Figure 13.54.}$$

Concept Check

1. For a function $f(x, y)$, when does the directional derivative at the point (x_0, y_0) equal the partial derivative with respect to x at the point (x_0, y_0)? Explain what this means graphically.
2. What is the meaning of the gradient of a function f at a point (x, y)?

Finding a Directional Derivative **In Exercises 3–6, use Theorem 13.9 to find the directional derivative of the function at P in the direction of the unit vector $\mathbf{u} = \cos\theta\mathbf{i} + \sin\theta\mathbf{j}$.**

3. $f(x, y) = x^2 + y^2, \quad P(1, -2), \quad \theta = \frac{\pi}{4}$
4. $f(x, y) = \frac{y}{x + y}, \quad P(3, 0), \quad \theta = -\frac{\pi}{6}$
5. $f(x, y) = \sin(2x + y), \quad P(0, \pi), \quad \theta = -\frac{5\pi}{6}$
6. $g(x, y) = xe^y, \quad P(0, 2), \quad \theta = \frac{2\pi}{3}$

Finding a Directional Derivative **In Exercises 7–10, use Theorem 13.9 to find the directional derivative of the function at P in the direction of $\mathbf{v}$.**

7. $f(x, y) = 3x - 4xy + 9y, \quad P(1, 2), \quad \mathbf{v} = \frac{3}{5}\mathbf{i} + \frac{4}{5}\mathbf{j}$
8. $f(x, y) = x^3 - y^3, \quad P(4, 3), \quad \mathbf{v} = \frac{\sqrt{2}}{2}(\mathbf{i} + \mathbf{j})$
9. $g(x, y) = \sqrt{x^2 + y^2}, \quad P(3, 4), \quad \mathbf{v} = 3\mathbf{i} - 4\mathbf{j}$
10. $h(x, y) = e^{-(x^2+y^2)}, \quad P(0, 0), \quad \mathbf{v} = \mathbf{i} + \mathbf{j}$

Finding a Directional Derivative **In Exercises 11–14, use Theorem 13.9 to find the directional derivative of the function at P in the direction of $\overrightarrow{PQ}$.**

11. $f(x, y) = x^2 + 3y^2, \quad P(1, 1), \quad Q(4, 5)$
12. $f(x, y) = \cos(x + y), \quad P(0, \pi), \quad Q\left(\frac{\pi}{2}, 0\right)$
13. $f(x, y) = e^y \sin x, \quad P(0, 0), \quad Q(2, 1)$
14. $f(x, y) = \sin 2x \cos y, \quad P(\pi, 0), \quad Q\left(\frac{\pi}{2}, \pi\right)$

Finding the Gradient of a Function **In Exercises 15–20, find the gradient of the function at the given point.**

15. $f(x, y) = 3x + 5y^2 + 1, \quad (2, 1)$
16. $g(x, y) = 2xe^{y/x}, \quad (2, 0)$
17. $z = \frac{\ln(x^2 - y)}{x} - 4, \quad (2, 3)$
18. $z = \cos(x^2 + y^2), \quad (3, -4)$
19. $w = 6xy - y^2 + 2xyz^3, \quad (-1, 5, -1)$
20. $w = x\tan(y + z), \quad (4, 3, -1)$

Finding a Directional Derivative **In Exercises 21–24, use the gradient to find the directional derivative of the function at P in the direction of $\mathbf{v}$.**

21. $f(x, y) = xy, \quad P(0, -2), \quad \mathbf{v} = \frac{1}{2}(\mathbf{i} + \sqrt{3}\mathbf{j})$
22. $h(x, y) = e^{-3x}\sin y, \quad P\left(1, \frac{\pi}{2}\right), \quad \mathbf{v} = -\mathbf{i}$
23. $f(x, y, z) = x^2 + y^2 + z^2, \quad P(1, 1, 1), \quad \mathbf{v} = \frac{\sqrt{3}}{3}(\mathbf{i} - \mathbf{j} + \mathbf{k})$
24. $f(x, y, z) = xy + yz + xz, \quad P(1, 2, -1), \quad \mathbf{v} = 2\mathbf{i} + \mathbf{j} - \mathbf{k}$

Finding a Directional Derivative **In Exercises 25–28, use the gradient to find the directional derivative of the function at P in the direction of $\overrightarrow{PQ}$.**

25. $g(x, y) = x^2 + y^2 + 1, \quad P(1, 2), \quad Q(2, 3)$
26. $f(x, y) = 3x^2 - y^2 + 4, \quad P(-1, 4), \quad Q(3, 6)$
27. $g(x, y, z) = xye^z, \quad P(2, 4, 0), \quad Q(0, 0, 0)$
28. $h(x, y, z) = \ln(x + y + z), \quad P(1, 0, 0), \quad Q(4, 3, 1)$

Using Properties of the Gradient **In Exercises 29–38, find the gradient of the function and the maximum value of the directional derivative at the given point.**

29. $f(x, y) = y^2 - x\sqrt{y}, \quad (0, 3)$
30. $f(x, y) = \frac{x + y}{y + 1}, \quad (0, 1)$
31. $h(x, y) = x\tan y, \quad \left(2, \frac{\pi}{4}\right)$
32. $h(x, y) = y\cos(x - y), \quad \left(0, \frac{\pi}{3}\right)$
33. $f(x, y) = \sin x^2y^3, \quad \left(\frac{1}{\pi}, \pi\right)$
34. $g(x, y) = \ln\sqrt[3]{x^2 + y^2}, \quad (1, 2)$
35. $f(x, y, z) = \sqrt{x^2 + y^2 + z^2}, \quad (1, 4, 2)$
36. $w = \frac{1}{\sqrt{1 - x^2 - y^2 - z^2}}, \quad (0, 0, 0)$
37. $w = xy^2z^2, \quad (2, 1, 1)$
38. $f(x, y, z) = xe^{yz}, \quad (2, 0, -4)$

Finding a Normal Vector to a Level Curve **In Exercises 39–42, find a normal vector to the level curve $f(x, y) = c$ at P.**

39. $f(x, y) = 6 - 2x - 3y$
$c = 6, \quad P(0, 0)$

40. $f(x, y) = x^2 + y^2$
$c = 25, \quad P(3, 4)$

41. $f(x, y) = xy$
$c = -3, \quad P(-1, 3)$

42. $f(x, y) = \frac{x}{x^2 + y^2}$
$c = \frac{1}{2}, \quad P(1, 1)$

Using a Function **In Exercises 43–46, (a) find the gradient of the function at P, (b) find a unit normal vector to the level curve $f(x, y) = c$ at P, (c) find the tangent line to the level curve $f(x, y) = c$ at P, and (d) sketch the level curve, the unit normal vector, and the tangent line in the xy-plane.**

43. $f(x, y) = 4x^2 - y$, $c = 6$, $P(2, 10)$

44. $f(x, y) = x - y^2$, $c = 3$, $P(4, -1)$

45. $f(x, y) = 3x^2 - 2y^2$, $c = 1$, $P(1, 1)$

46. $f(x, y) = 9x^2 + 4y^2$, $c = 40$, $P(2, -1)$

47. Using a Function Consider the function

$$f(x, y) = 3 - \frac{x}{3} - \frac{y}{2}.$$

(a) Sketch the graph of f in the first octant and plot the point $(3, 2, 1)$ on the surface.

(b) Find $D_{\mathbf{u}}f(3, 2)$, where $\mathbf{u} = \cos\theta\mathbf{i} + \sin\theta\mathbf{j}$, using each given value of θ.

(i) $\theta = \frac{\pi}{4}$ (ii) $\theta = \frac{2\pi}{3}$ (iii) $\theta = \frac{4\pi}{3}$ (iv) $\theta = -\frac{\pi}{6}$

(c) Find $D_{\mathbf{u}}f(3, 2)$, where $\mathbf{u} = \frac{\mathbf{v}}{\|\mathbf{v}\|}$, using each given vector $\mathbf{v}$.

(i) $\mathbf{v} = \mathbf{i} + \mathbf{j}$

(ii) $\mathbf{v} = -3\mathbf{i} - 4\mathbf{j}$

(iii) $\mathbf{v}$ is the vector from $(1, 2)$ to $(-2, 6)$.

(iv) $\mathbf{v}$ is the vector from $(3, 2)$ to $(4, 5)$.

(d) Find $\nabla f(x, y)$.

(e) Find the maximum value of the directional derivative at $(3, 2)$.

(f) Find a unit vector $\mathbf{u}$ orthogonal to $\nabla f(3, 2)$ and calculate $D_{\mathbf{u}}f(3, 2)$. Discuss the geometric meaning of the result.

48. Using a Function Consider the function

$$f(x, y) = 9 - x^2 - y^2.$$

(a) Sketch the graph of f in the first octant and plot the point $(1, 2, 4)$ on the surface.

(b) Find $D_{\mathbf{u}}f(1, 2)$, where $\mathbf{u} = \cos\theta\mathbf{i} + \sin\theta\mathbf{j}$, using each given value of θ.

(i) $\theta = -\frac{\pi}{4}$ (ii) $\theta = \frac{\pi}{3}$ (iii) $\theta = \frac{3\pi}{4}$ (iv) $\theta = -\frac{\pi}{2}$

(c) Find $D_{\mathbf{u}}f(1, 2)$, where $\mathbf{u} = \frac{\mathbf{v}}{\|\mathbf{v}\|}$, using each given vector $\mathbf{v}$.

(i) $\mathbf{v} = 3\mathbf{i} + \mathbf{j}$

(ii) $\mathbf{v} = -8\mathbf{i} - 6\mathbf{j}$

(iii) $\mathbf{v}$ is the vector from $(-1, -1)$ to $(3, 5)$.

(iv) $\mathbf{v}$ is the vector from $(-2, 0)$ to $(1, 3)$.

(d) Find $\nabla f(1, 2)$.

(e) Find the maximum value of the directional derivative at $(1, 2)$.

(f) Find a unit vector $\mathbf{u}$ orthogonal to $\nabla f(1, 2)$ and calculate $D_{\mathbf{u}}f(1, 2)$. Discuss the geometric meaning of the result.

49. Investigation Consider the function

$$f(x, y) = x^2 - y^2$$

at the point $(4, -3, 7)$.

(a) Use a graphing utility to graph the surface represented by the function.

(b) Determine the directional derivative $D_{\mathbf{u}}f(4, -3)$ as a function of θ, where

$$\mathbf{u} = \cos\theta\mathbf{i} + \sin\theta\mathbf{j}.$$

Use a graphing utility to graph the function on the interval $[0, 2\pi)$.

(c) Approximate the zeros of the function in part (b) and interpret each in the context of the problem.

(d) Approximate the critical numbers of the function in part (b) and interpret each in the context of the problem.

(e) Find $\|\nabla f(4, -3)\|$ and explain its relationship to your answers in part (d).

(f) Use a graphing utility to graph the level curve of the function f at the level $c = 7$. On this curve, graph the vector in the direction of $\nabla f(4, -3)$ and state its relationship to the level curve.

50. Investigation Consider the function

$$f(x, y) = \frac{8y}{1 + x^2 + y^2}.$$

(a) Analytically verify that the level curve of $f(x, y)$ at the level $c = 2$ is a circle.

(b) At the point $(\sqrt{3}, 2)$ on the level curve for which $c = 2$, sketch the vector showing the direction of the greatest rate of increase of the function. To print a graph of the level curve, go to *MathGraphs.com.*

(c) At the point $(\sqrt{3}, 2)$ on the level curve for which $c = 2$, sketch a vector such that the directional derivative is 0.

(d) Use a graphing utility to graph the surface to verify your answers in parts (a)–(c).

Exploring Concepts

51. Consider $\mathbf{v} = 3\mathbf{u}$. Determine whether the directional derivative of a differentiable function $f(x, y)$ in the direction of $\mathbf{v}$ at the point (x_0, y_0) is three times the directional derivative of f in the direction of $\mathbf{u}$ at the point (x_0, y_0). Explain.

52. Sketch the graph of a surface and select a point P on the surface. Sketch a vector in the xy-plane giving the direction of steepest ascent on the surface at P.

53. Topography The surface of a mountain is modeled by the equation

$$h(x, y) = 5000 - 0.001x^2 - 0.004y^2.$$

A mountain climber is at the point $(500, 300, 4390)$. In what direction should the climber move to ascend at the greatest rate?

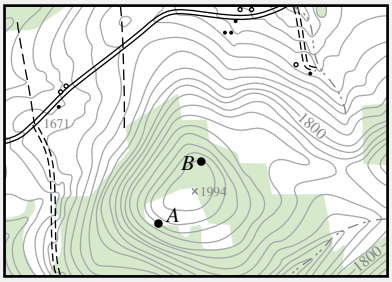
54. HOW DO YOU SEE IT? The figure shows a topographic map carried by a group of hikers. Sketch the paths of steepest descent when the hikers start at point A and when they start at point B. (To print an enlarged copy of the graph, go to *MathGraphs.com*.)



55. Temperature The temperature at the point (x, y) on a metal plate is

$$T(x, y) = \frac{x}{x^2 + y^2}.$$

Find the direction of greatest increase in heat from the point $(3, 4)$.

56. Temperature The temperature at the point (x, y) on a metal plate is $T(x, y) = 400e^{-(x^2+y)/2}$, $x \geq 0$, $y \geq 0$.

(a) Use a graphing utility to graph the temperature distribution function.

(b) Find the directions of no change in heat on the plate from the point $(3, 5)$.

(c) Find the direction of greatest increase in heat from the point $(3, 5)$.

Finding the Direction of Maximum Increase **In Exercises 57 and 58, the temperature in degrees Celsius on the surface of a metal plate is given by $T(x, y)$, where x and y are measured in centimeters. Find the direction from point P where the temperature increases most rapidly and this rate of increase.**

57. $T(x, y) = 80 - 3x^2 - y^2$, $P(-1, 5)$

58. $T(x, y) = 50 - x^2 - 4y^2$, $P(2, -1)$

Finding the Path of a Heat-Seeking Particle **In Exercises 59 and 60, find the path of a heat-seeking particle placed at point P on a metal plate whose temperature at (x, y) is $T(x, y)$.**

59. $T(x, y) = 400 - 2x^2 - y^2$, $P(10, 10)$

60. $T(x, y) = 100 - x^2 - 2y^2$, $P(4, 3)$

True or False? **In Exercises 61–64, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

61. If $f(x, y) = \sqrt{1 - x^2 - y^2}$, then $D_{\mathbf{u}} f(0, 0) = 0$ for any unit vector $\mathbf{u}$.

62. If $f(x, y) = x + y$, then $-1 \leq D_{\mathbf{u}} f(x, y) \leq 1$.

63. If $D_{\mathbf{u}} f(x, y)$ exists, then $D_{\mathbf{u}} f(x, y) = -D_{\mathbf{u}} f(x, y)$.

64. If $D_{\mathbf{u}} f(x_0, y_0) = c$ for any unit vector $\mathbf{u}$, then $c = 0$.

65. Finding a Function Find a function f such that

$$\nabla f = e^x \cos y\mathbf{i} - e^x \sin y\mathbf{j} + z\mathbf{k}.$$

66. Ocean Floor

A team of oceanographers is mapping the ocean floor to assist in the recovery of a sunken ship. Using sonar, they develop the model

$$D = 250 + 30x^2 + 50 \sin \frac{\pi y}{2}, \quad 0 \leq x \leq 2, \quad 0 \leq y \leq 2$$

where D is the depth in meters, and x and y are the distances in kilometers.

(a) Use a graphing utility to graph D.

(b) Because the graph in part (a) is showing depth, it is not a map of the ocean floor. How could the model be changed so that the graph of the ocean floor could be obtained?

(c) What is the depth of the ship if it is located at the coordinates $x = 1$ and $y = 0.5$?

(d) Determine the steepness of the ocean floor in the positive x-direction from the position of the ship.

(e) Determine the steepness of the ocean floor in the positive y-direction from the position of the ship.

(f) Determine the direction of the greatest rate of change of depth from the position of the ship.

67. Using a Function Consider the function

$$f(x, y) = \sqrt[3]{xy}.$$

(a) Show that f is continuous at the origin.

(b) Show that f_x and f_y exist at the origin but that the directional derivatives at the origin in all other directions do not exist.

(c) Use a graphing utility to graph f near the origin to verify your answers in parts (a) and (b). Explain.

68. Directional Derivative Consider the function

$$f(x, y) = \begin{cases} \dfrac{4xy}{x^2 + y^2}, & (x, y) \neq (0, 0) \\ 0, & (x, y) \neq (0, 0) \end{cases}$$

and the unit vector

$$\mathbf{u} = \frac{1}{\sqrt{2}}(\mathbf{i} + \mathbf{j}).$$

Does the directional derivative of f at $P(0, 0)$ in the direction of $\mathbf{u}$ exist? If $f(0, 0)$ were defined as 2 instead of 0, would the directional derivative exist? Explain.

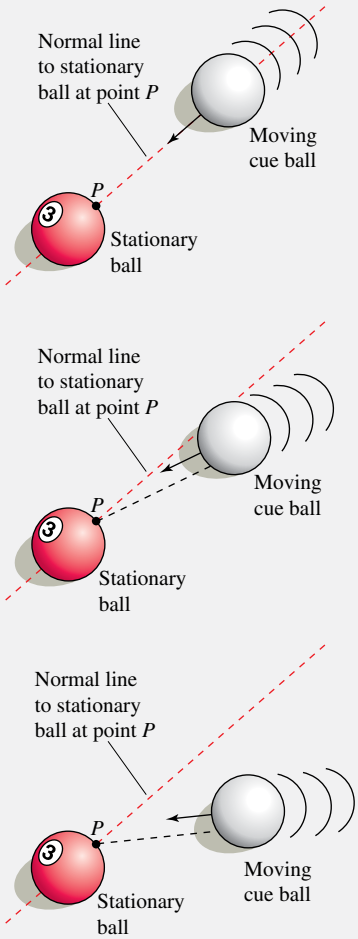
13.7 Tangent Planes and Normal Lines

GO DIGITAL

- **Find equations of tangent planes and normal lines to surfaces.**
- **Find the angle of inclination of a plane in space.**
- **Compare the gradients $\nabla f(x, y)$ and $\nabla F(x, y, z)$.**

Exploration

Billiard Balls and Normal Lines In each of the three figures below, the cue ball is about to strike a stationary ball at point P. Explain how you can use the normal line to the stationary ball at point P to describe the resulting motion of each of the two balls. Assuming that each cue ball has the same speed, which stationary ball will acquire the greatest speed? Which will acquire the least? Explain your reasoning.



Tangent Plane and Normal Line to a Surface

So far, you have represented surfaces in space primarily by equations of the form

$$z = f(x, y).$$ Equation of a surface S

In the development to follow, however, it is convenient to use the more general representation $F(x, y, z) = 0$. For a surface S given by $z = f(x, y)$, you can convert to the general form by defining F as

$$F(x, y, z) = f(x, y) - z.$$

Because $f(x, y) - z = 0$, you can consider S to be the level surface of F given by

$$F(x, y, z) = 0.$$ Alternative equation of surface S

EXAMPLE 1 Writing an Equation of a Surface

For the function

$$F(x, y\, z) = x^2 + y^2 + z^2 - 4$$

describe the level surface given by

$$F(x, y, z) = 0.$$

Solution The level surface given by $F(x, y, z) = 0$ can be written as

$$x^2 + y^2 + z^2 = 4$$

which is a sphere of radius 2 whose center is at the origin. ■

You have seen many examples of the usefulness of normal lines in applications involving curves. Normal lines are equally important in analyzing surfaces and solids. For example, consider the collision of two billiard balls. When a stationary ball is struck at a point P on its surface, it moves along the **line of impact** determined by P and the center of the ball. The impact can occur in *two* ways. When the cue ball is moving along the line of impact, it stops dead and imparts all of its momentum to the stationary ball, as shown in Figure 13.55.

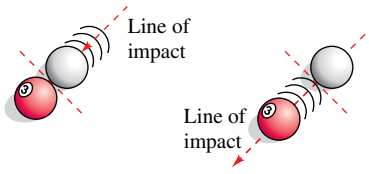


Figure 13.55

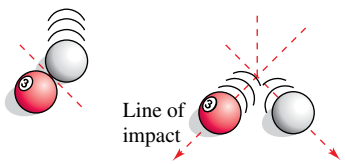

Figure 13.56

When the cue ball is not moving along the line of impact, it is deflected to one side or the other and retains part of its momentum. The part of the momentum that is transferred to the stationary ball occurs along the line of impact, *regardless* of the direction of the cue ball, as shown in Figure 13.56. This line of impact is called the **normal line** to the surface of the ball at the point P.

GO DIGITAL

In the process of finding a normal line to a surface, you are also able to solve the problem of finding a **tangent plane** to the surface. Let S be a surface given by

$$F(x, y, z) = 0$$

and let $P(x_0, y_0, z_0)$ be a point on S. Let C be a curve on S through P that is defined by the vector-valued function

$$\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}.$$

Then, for all t,

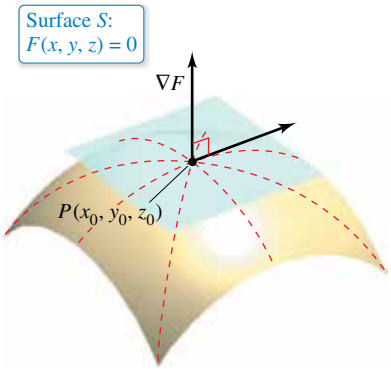
$$F(x(t), y(t), z(t)) = 0.$$

If F is differentiable and $x'(t)$, $y'(t)$, and $z'(t)$ all exist, then it follows from the Chain Rule that

$$\begin{aligned} 0 &= F'(t) \\ &= F_x(x, y, z)x'(t) + F_y(x, y, z)y'(t) + F_z(x, y, z)z'(t). \end{aligned}$$

At (x_0, y_0, z_0), the equivalent vector form is

$$0 = \underbrace{\nabla F(x_0, y_0, z_0)}_{\text{Gradient}} \cdot \underbrace{\mathbf{r}'(t_0)}_{\text{Tangent vector}}.$$



Tangent plane to surface S at P
Figure 13.57

This result means that the gradient at P is orthogonal to the tangent vector of every curve on S through P. So, all tangent lines on S lie in a plane that is normal to $\nabla F(x_0, y_0, z_0)$ and contains P, as shown in Figure 13.57.

REMARK In the remainder of this section, assume $\nabla F(x_0, y_0, z_0)$ to be nonzero unless stated otherwise.

Definitions of Tangent Plane and Normal Line

Let F be differentiable at the point $P(x_0, y_0, z_0)$ on the surface S given by $F(x, y, z) = 0$ such that

$$\nabla F(x_0, y_0, z_0) \neq \mathbf{0}.$$

1. The plane through P that is normal to $\nabla F(x_0, y_0, z_0)$ is called the **tangent plane to S at P.**
2. The line through P having the direction of $\nabla F(x_0, y_0, z_0)$ is called the **normal line to S at P.**

To find an equation for the tangent plane to S at (x_0, y_0, z_0), let (x, y, z) be an arbitrary point in the tangent plane. Then the vector

$$\mathbf{v} = (x - x_0)\mathbf{i} + (y - y_0)\mathbf{j} + (z - z_0)\mathbf{k}$$

lies in the tangent plane. Because $\nabla F(x_0, y_0, z_0)$ is normal to the tangent plane at (x_0, y_0, z_0), it must be orthogonal to every vector in the tangent plane, and you have

$$\nabla F(x_0, y_0, z_0) \cdot \mathbf{v} = 0$$

which leads to the next theorem.

THEOREM 13.13 Equation of Tangent Plane

If F is differentiable at (x_0, y_0, z_0), then an equation of the tangent plane to the surface given by $F(x, y, z) = 0$ at (x_0, y_0, z_0) is

$$F_x(x_0, y_0, z_0)(x - x_0) + F_y(x_0, y_0, z_0)(y - y_0) + F_z(x_0, y_0, z_0)(z - z_0) = 0.$$

GO DIGITAL

EXAMPLE 2 **Finding an Equation of a Tangent Plane**

Find an equation of the tangent plane to the hyperboloid

$$z^2 - 2x^2 - 2y^2 = 12$$

at the point $(1, -1, 4)$.

Solution Begin by writing the equation of the surface as

$$z^2 - 2x^2 - 2y^2 - 12 = 0.$$

Then, considering

$$F(x, y, z) = z^2 - 2x^2 - 2y^2 - 12$$

you have

$$F_x(x, y, z) = -4x, \quad F_y(x, y, z) = -4y, \quad \text{and} \quad F_z(x, y, z) = 2z.$$

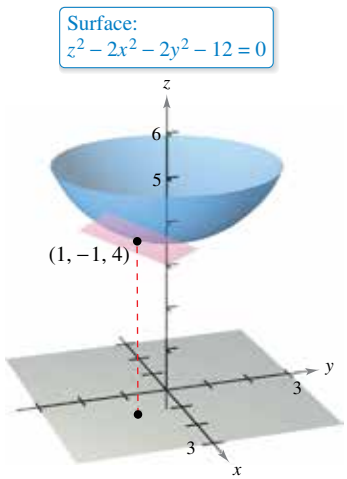
At the point $(1, -1, 4)$, the partial derivatives are

$$F_x(1, -1, 4) = -4, \quad F_y(1, -1, 4) = 4, \quad \text{and} \quad F_z(1, -1, 4) = 8.$$

So, an equation of the tangent plane at $(1, -1, 4)$ is

$$\begin{aligned} -4(x - 1) + 4(y + 1) + 8(z - 4) &= 0 \\ -4x + 4 + 4y + 4 + 8z - 32 &= 0 \\ -4x + 4y + 8z - 24 &= 0 \\ x - y - 2z + 6 &= 0. \end{aligned}$$

Figure 13.58 shows a portion of the hyperboloid and the tangent plane.



Tangent plane to surface

Figure 13.58

To find an equation of the tangent plane at a point on a surface given by $z = f(x, y)$, you can define the function F by

$$F(x, y, z) = f(x, y) - z.$$

Then S is given by the level surface $F(x, y, z) = 0$, and by Theorem 13.13, an equation of the tangent plane to S at the point (x_0, y_0, z_0) is

$$f_x(x_0, y_0)(x - x_0) + f_y(x_0, y_0)(y - y_0) - (z - z_0) = 0.$$

EXAMPLE 3 Finding an Equation of the Tangent Plane

Find an equation of the tangent plane to the paraboloid

$$z = 1 - \frac{1}{10}(x^2 + 4y^2)$$

at the point $\left(1, 1, \frac{1}{2}\right)$.

Solution From $z = f(x, y) = 1 - \frac{1}{10}(x^2 + 4y^2)$, you obtain

$$f_x(x, y) = -\frac{x}{5} \quad \Rightarrow \quad f_x(1, 1) = -\frac{1}{5}$$

and

$$f_y(x, y) = -\frac{4y}{5} \quad \Rightarrow \quad f_y(1, 1) = -\frac{4}{5}.$$

So, an equation of the tangent plane at $\left(1, 1, \frac{1}{2}\right)$ is

$$f_x(1, 1)(x - 1) + f_y(1, 1)(y - 1) - \left(z - \frac{1}{2}\right) = 0$$

$$-\frac{1}{5}(x - 1) - \frac{4}{5}(y - 1) - \left(z - \frac{1}{2}\right) = 0$$

$$-\frac{1}{5}x - \frac{4}{5}y - z + \frac{3}{2} = 0.$$

This tangent plane is shown in Figure 13.59.

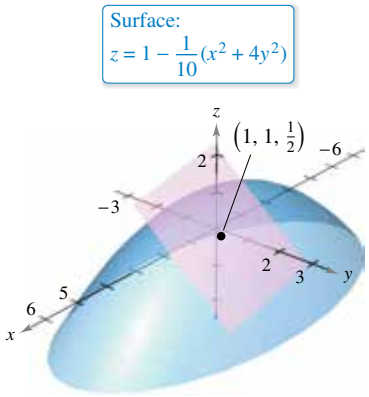

Figure 13.59

The gradient $\nabla F(x, y, z)$ provides a convenient way to find equations of normal lines, as shown in Example 4.

EXAMPLE 4 Finding an Equation of a Normal Line to a Surface

See LarsonCalculus.com for an interactive version of this type of example.

Find a set of symmetric equations for the normal line to the surface

$$xyz = 12$$

at the point $(2, -2, -3)$.

Solution Begin by letting

$$F(x, y, z) = xyz - 12.$$

Then, the gradient is given by

$$\nabla F(x, y, z) = F_x(x, y, z)\mathbf{i} + F_y(x, y, z)\mathbf{j} + F_z(x, y, z)\mathbf{k}$$
$$= yz\mathbf{i} + xz\mathbf{j} + xy\mathbf{k}$$

and at the point $(2, -2, -3)$, you have

$$\nabla F(2, -2, -3) = (-2)(-3)\mathbf{i} + (2)(-3)\mathbf{j} + (2)(-2)\mathbf{k}$$
$$= 6\mathbf{i} - 6\mathbf{j} - 4\mathbf{k}.$$

The normal line at $(2, -2, -3)$ has direction numbers 6, -6, and -4, and the corresponding set of symmetric equations is

$$\frac{x - 2}{6} = \frac{y + 2}{-6} = \frac{z + 3}{-4}.$$

See Figure 13.60.

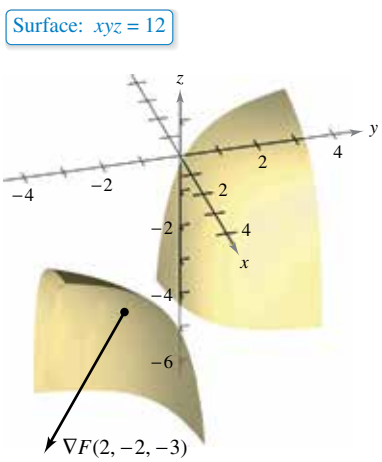

Figure 13.60

GO DIGITAL

Knowing that the gradient $\nabla F(x, y, z)$ is normal to the surface given by $F(x, y, z) = 0$ allows you to solve a variety of problems dealing with surfaces and curves in space.

EXAMPLE 5 Finding the Equation of a Tangent Line to a Curve

Find a set of parametric equations for the tangent line to the curve of intersection of the ellipsoid

$$x^2 + 2y^2 + 2z^2 = 20 \qquad \text{Ellipsoid}$$

and the paraboloid

$$x^2 + y^2 + z = 4 \qquad \text{Paraboloid}$$

at the point $(0, 1, 3)$, as shown in Figure 13.61.

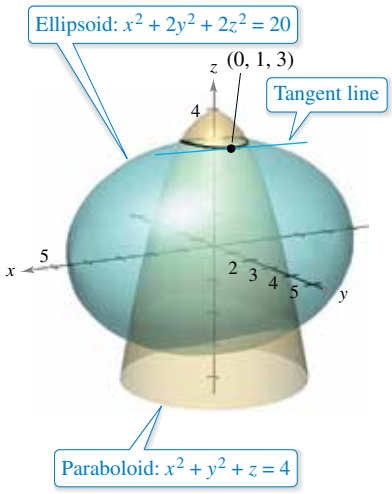

Figure 13.61

Solution Begin by finding the gradients to both surfaces at the point $(0, 1, 3)$.

Ellipsoid	**Paraboloid**
$F(x, y, z) = x^2 + 2y^2 + 2z^2 - 20$	$G(x, y, z) = x^2 + y^2 + z - 4$
$\nabla F(x, y, z) = 2x\mathbf{i} + 4y\mathbf{j} + 4z\mathbf{k}$	$\nabla G(x, y, z) = 2x\mathbf{i} + 2y\mathbf{j} + \mathbf{k}$
$\nabla F(0, 1, 3) = 4\mathbf{j} + 12\mathbf{k}$	$\nabla G(0, 1, 3) = 2\mathbf{j} + \mathbf{k}$

The cross product of these two gradients is a vector that is tangent to both surfaces at the point $(0, 1, 3)$.

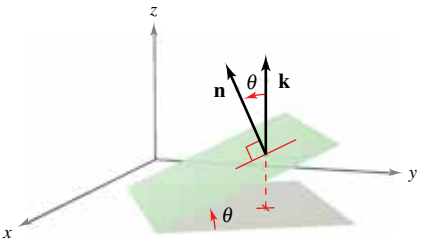
$$\nabla F(0, 1, 3) \times \nabla G(0, 1, 3) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & 4 & 12 \\ 0 & 2 & 1 \end{vmatrix} = -20\mathbf{i}$$

So, the tangent line to the curve of intersection of the two surfaces at the point $(0, 1, 3)$ is a line that is parallel to the x-axis and passes through the point $(0, 1, 3)$. Because $-20\mathbf{i} = -20(\mathbf{i} + 0\mathbf{j} + 0\mathbf{k})$, the direction numbers are 1, 0, and 0. So a set of parametric equations for the tangent line passing through the point $(0, 1, 3)$ is $x = t$, $y = 1$, and $z = 3$. ■

The Angle of Inclination of a Plane

Another use of the gradient $\nabla F(x, y, z)$ is to determine the angle of inclination of the tangent plane to a surface. The **angle of inclination** of a plane is defined as the angle θ $(0 \le \theta \le \pi/2)$ between the given plane and the xy-plane, as shown in Figure 13.62. (The angle of inclination of a horizontal plane is defined as zero.) Because the vector $\mathbf{k}$ is normal to the xy-plane, you can use the formula for the cosine of the angle between two planes (given in Section 11.5) to conclude that the angle of inclination of a plane with normal vector $\mathbf{n}$ is

$$\cos\theta = \frac{|\mathbf{n} \cdot \mathbf{k}|}{\|\mathbf{n}\|\,\|\mathbf{k}\|} = \frac{|\mathbf{n} \cdot \mathbf{k}|}{\|\mathbf{n}\|}. \qquad \text{Angle of inclination of a plane}$$



The angle of inclination

EXAMPLE 6 Finding the Angle of Inclination of a Tangent Plane

Find the angle of inclination of the tangent plane to the ellipsoid

$$\frac{x^2}{12} + \frac{y^2}{12} + \frac{z^2}{3} = 1$$

at the point $(2, 2, 1)$.

Solution Begin by letting

$$F(x, y, z) = \frac{x^2}{12} + \frac{y^2}{12} + \frac{z^2}{3} - 1.$$

Then, the gradient of F at the point $(2, 2, 1)$ is

$$\nabla F(x, y, z) = \frac{x}{6}\mathbf{i} + \frac{y}{6}\mathbf{j} + \frac{2z}{3}\mathbf{k}$$

$$\nabla F(2, 2, 1) = \frac{1}{3}\mathbf{i} + \frac{1}{3}\mathbf{j} + \frac{2}{3}\mathbf{k}.$$

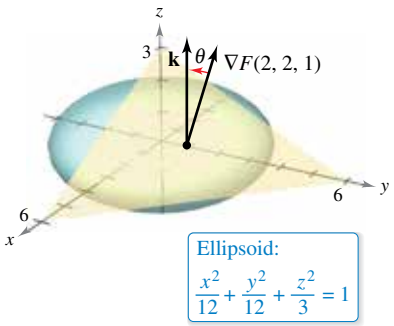

Figure 13.63

Because $\nabla F(2, 2, 1)$ is normal to the tangent plane and $\mathbf{k}$ is normal to the xy-plane, it follows that the angle of inclination of the tangent plane is

$$\cos\theta = \frac{|\nabla F(2, 2, 1) \cdot \mathbf{k}|}{\|\nabla F(2, 2, 1)\|} = \frac{2/3}{\sqrt{(1/3)^2 + (1/3)^2 + (2/3)^2}} = \sqrt{\frac{2}{3}}$$

which implies that

$$\theta = \arccos\sqrt{\frac{2}{3}} \approx 35.3°$$

as shown in Figure 13.63. ■

A special case of the procedure shown in Example 6 is worth noting. The angle of inclination θ of the tangent plane to the surface $z = f(x, y)$ at (x_0, y_0, z_0) is

$$\cos\theta = \frac{1}{\sqrt{[f_x(x_0, y_0)]^2 + [f_y(x_0, y_0)]^2 + 1}}.$$

Alternative formula for angle of inclination (See Exercise 65.)

A Comparison of the Gradients $\nabla f(x, y)$ and $\nabla F(x, y, z)$

This section concludes with a comparison of the gradients $\nabla f(x, y)$ and $\nabla F(x, y, z)$. In the preceding section, you learned that the gradient of a function f of two variables is normal to the level curves of f. Specifically, Theorem 13.12 states that if f is differentiable at (x_0, y_0) and $\nabla f(x_0, y_0) \neq \mathbf{0}$, then $\nabla f(x_0, y_0)$ is normal to the level curve through (x_0, y_0). Having developed normal lines to surfaces, you can now extend this result to a function of three variables. The proof of Theorem 13.14 is left as an exercise (see Exercise 66).

THEOREM 13.14 Gradient Is Normal to Level Surfaces

If F is differentiable at (x_0, y_0, z_0) and

$$\nabla F(x_0, y_0, z_0) \neq \mathbf{0}$$

then $\nabla F(x_0, y_0, z_0)$ is normal to the level surface through (x_0, y_0, z_0).

When working with the gradients $\nabla f(x, y)$ and $\nabla F(x, y, z)$, be sure you remember that $\nabla f(x, y)$ is a vector in the xy-plane and $\nabla F(x, y, z)$ is a vector in space.

13.7 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Consider a point (x_0, y_0, z_0) on a surface given by $F(x, y, z) = 0$. What is the relationship between $\nabla F(x_0, y_0, z_0)$ and any tangent vector $\mathbf{v}$ at (x_0, y_0, z_0)? How do you represent this relationship mathematically?
2. Consider a point (x_0, y_0, z_0) on a surface given by $F(x, y, z) = 0$. What is the relationship between $\nabla F(x_0, y_0, z_0)$ and the normal line through (x_0, y_0, z_0)?

Describing a Surface **In Exercises 3–6, describe the level surface $F(x, y, z) = 0$.**

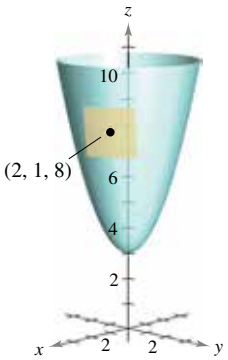
3. $F(x, y, z) = 3x - 5y + 3z - 15$
4. $F(x, y, z) = 36 - x^2 - y^2 - z^2$
5. $F(x, y, z) = 4x^2 + 9y^2 - 4z^2$
6. $F(x, y, z) = 16x^2 - 9y^2 + 36z$

Finding a Unit Normal Vector **In Exercises 7 and 8, find a unit normal vector to the surface at the given point. [*Hint:* Normalize the gradient vector $\nabla F(x, y, z)$.]**

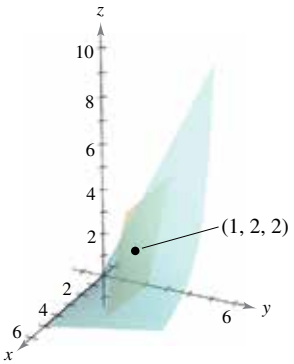
Surface	Point
7. $3x + 4y + 12z = 0$	$(0, 0, 0)$
8. $x^2y^3 - y^2z + 2xz^3 = 4$	$(-1, 1, -1)$

Finding an Equation of a Tangent Plane **In Exercises 9–18, find an equation of the tangent plane to the surface at the given point.**

9. $z = x^2 + y^2 + 3$, $(2, 1, 8)$



10. $f(x, y) = \frac{y}{x}$, $(1, 2, 2)$



11. $z = \sqrt{x^2 + y^2}$, $(3, 4, 5)$
12. $g(x, y) = \arctan\frac{y}{x}$, $(1, 0, 0)$
13. $g(x, y) = x^2 + y^2$, $(1, -1, 2)$
14. $f(x, y) = x^2 - 2xy + y^2$, $(1, 2, 1)$
15. $h(x, y) = \ln\sqrt{x^2 + y^2}$, $(3, 4, \ln 5)$
16. $f(x, y) = \sin x \cos y$, $\left(\frac{\pi}{3}, \frac{\pi}{6}, \frac{3}{4}\right)$
17. $x^2 + y^2 - 5z^2 = 15$, $(-4, -2, 1)$
18. $x^2 + 2z^2 = y^2$, $(1, 3, -2)$

Finding an Equation of a Tangent Plane and a Normal Line **In Exercises 19–28, (a) find an equation of the tangent plane to the surface at the given point and (b) find a set of symmetric equations for the normal line to the surface at the given point.**

19. $x + y + z = 9$, $(3, 3, 3)$
20. $x^2 + y^2 + z^2 = 9$, $(1, 2, 2)$
21. $x^2 + 2y^2 + z^2 = 7$, $(1, -1, 2)$
22. $z = 16 - x^2 - y^2$, $(2, 2, 8)$
23. $z = x^2 - y^2$, $(3, 2, 5)$
24. $xy - z = 0$, $(-2, -3, 6)$
25. $xyz = 10$, $(1, 2, 5)$
26. $6xy = z$, $(-1, 1, -6)$
27. $z = ye^{2xy}$, $(0, 2, 2)$
28. $y \ln xz^2 = 2$, $(e, 2, 1)$

Finding the Equation of a Tangent Line to a Curve **In Exercises 29–34, find a set of parametric equations for the tangent line to the curve of intersection of the surfaces at the given point.**

29. $x^2 + y^2 = 2$, $z = x$, $(1, 1, 1)$
30. $z = x^2 + y^2$, $z = 4 - y$, $(2, -1, 5)$
31. $x^2 + z^2 = 25$, $y^2 + z^2 = 25$, $(3, 3, 4)$
32. $z = \sqrt{x^2 + y^2}$, $5x - 2y + 3z = 22$, $(3, 4, 5)$
33. $x^2 + y^2 + z^2 = 14$, $x - y - z = 0$, $(3, 1, 2)$
34. $z = x^2 + y^2$, $x + y + 6z = 33$, $(1, 2, 5)$

Finding the Angle of Inclination of a Tangent Plane **In Exercises 35–38, find the angle of inclination of the tangent plane to the surface at the given point.**

35. $3x^2 + 2y^2 - z = 15$, $(2, 2, 5)$
36. $2xy - z^3 = 0$, $(2, 2, 2)$
37. $x^2 - y^2 + z = 0$, $(1, 2, 3)$
38. $x^2 + y^2 = 5$, $(2, 1, 3)$

Horizontal Tangent Plane **In Exercises 39–44, find the point(s) on the surface at which the tangent plane is horizontal.**

39. $z = 3 - x^2 - y^2 + 6y$
40. $z = 3x^2 + 2y^2 - 3x + 4y - 5$
41. $z = x^2 - xy + y^2 - 2x - 2y$
42. $z = 4x^2 + 4xy - 2y^2 + 8x - 5y - 4$
43. $z = 5xy$
44. $z = xy + \frac{1}{x} + \frac{1}{y}$

Tangent Surfaces **In Exercises 45 and 46, show that the surfaces are tangent to each other at the given point by showing that the surfaces have the same tangent plane at this point.**

45. $x^2 + 2y^2 + 3z^2 = 3$, $x^2 + y^2 + z^2 + 6x - 10y + 14 = 0$, $(-1, 1, 0)$

46. $x^2 + y^2 + z^2 - 8x - 12y + 4z + 42 = 0$, $x^2 + y^2 + 2z = 7$, $(2, 3, -3)$

Perpendicular Tangent Planes **In Exercises 47 and 48, (a) show that the surfaces intersect at the given point and (b) show that the surfaces have perpendicular tangent planes at this point.**

47. $z = 2xy^2$, $8x^2 - 5y^2 - 8z = -13$, $(1, 1, 2)$

48. $x^2 + y^2 + z^2 + 2x - 4y - 4z - 12 = 0$, $4x^2 + y^2 + 16z^2 = 24$, $(1, -2, 1)$

Exploring Concepts

49. The tangent plane to the surface represented by $F(x, y, z) = 0$ at a point P is also tangent to the surface represented by $G(x, y, z) = 0$ at P. Is $\nabla F(x, y, z) = \nabla G(x, y, z)$ at P? Explain.

50. For some surfaces, the normal lines at any point pass through the same geometric object. What is the common geometric object for a sphere? What is the common geometric object for a right circular cylinder? Explain.

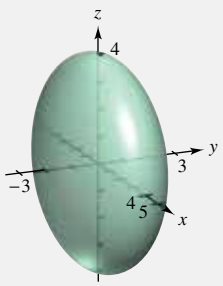
51. Using an Ellipsoid Find a point on the ellipsoid $3x^2 + y^2 + 3z^2 = 1$ where the tangent line is parallel to the plane $-12x + 2y + 6z = 0$.

52. Using a Hyperboloid Find a point on the hyperboloid $x^2 + 4y^2 - z^2 = 1$ where the tangent plane is parallel to the plane $x + 4y - z = 0$.

53. Using an Ellipsoid Find a point on the ellipsoid $x^2 + 4y^2 + z^2 = 9$ where the tangent plane is perpendicular to the line with parametric equations

$x = 2 - 4t$, $y = 1 + 8t$, and $z = 3 - 2t$.

54. HOW DO YOU SEE IT? The graph shows the ellipsoid $x^2 + 4y^2 + z^2 = 16$. Use the graph to determine the equation of the tangent plane at each of the given points.



(a) $(4, 0, 0)$ (b) $(0, -2, 0)$ (c) $(0, 0, -4)$

55. Investigation Consider the function

$$f(x, y) = \frac{4xy}{(x^2 + 1)(y^2 + 1)}$$

on the intervals $-2 \le x \le 2$ and $0 \le y \le 3$.

(a) Find a set of parametric equations of the normal line and an equation of the tangent plane to the surface at the point $(1, 1, 1)$.

(b) Repeat part (a) for the point $\left(-1, 2, -\frac{4}{5}\right)$.

(c) Use a graphing utility to graph the surface, the normal lines, and the tangent planes found in parts (a) and (b).

56. Investigation Consider the function

$$f(x, y) = \frac{\sin y}{x}$$

on the intervals $-3 \le x \le 3$ and $0 \le y \le 2\pi$.

(a) Find a set of parametric equations of the normal line and an equation of the tangent plane to the surface at the point

$$\left(2, \frac{\pi}{2}, \frac{1}{2}\right).$$

(b) Repeat part (a) for the point $\left(-\frac{2}{3}, \frac{3\pi}{2}, \frac{3}{2}\right)$.

(c) Use a graphing utility to graph the surface, the normal lines, and the tangent planes found in parts (a) and (b).

57. Using Functions Consider the functions

$$f(x, y) = 6 - x^2 - \frac{y^2}{4} \quad \text{and} \quad g(x, y) = 2x + y.$$

(a) Find a set of parametric equations of the tangent line to the curve of intersection of the surfaces at the point $(1, 2, 4)$ and find the angle between the gradients of f and g.

(b) Use a graphing utility to graph the surfaces and the tangent line found in part (a).

58. Using Functions Consider the functions

$$f(x, y) = \sqrt{16 - x^2 - y^2 + 2x - 4y}$$

and

$$g(x, y) = \frac{\sqrt{2}}{2}\sqrt{1 - 3x^2 + y^2 + 6x + 4y}.$$

(a) Use a graphing utility to graph the first-octant portion of the surfaces represented by f and g.

(b) Find one first-octant point on the curve of intersection and show that the surfaces are orthogonal at this point.

(c) These surfaces are orthogonal along the curve of intersection. Does part (b) prove this fact? Explain.

Writing a Tangent Plane **In Exercises 59 and 60, show that the tangent plane to the quadric surface at the point (x_0, y_0, z_0) can be written in the given form.**

59. Ellipsoid: $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$

Tangent plane: $\frac{x_0 x}{a^2} + \frac{y_0 y}{b^2} + \frac{z_0 z}{c^2} = 1$

60. Hyperboloid: $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$

Tangent plane: $\frac{x_0 x}{a^2} + \frac{y_0 y}{b^2} - \frac{z_0 z}{c^2} = 1$

61. Tangent Planes of a Cone Show that any tangent plane to the cone

$$z^2 = a^2x^2 + b^2y^2$$

passes through the origin.

62. Tangent Planes Let f be a differentiable function and consider the surface

$$z = xf\left(\frac{y}{x}\right).$$

Show that the tangent plane at any point $P(x_0, y_0, z_0)$ on the surface passes through the origin.

63. Approximation Consider the following approximations for a function $f(x, y)$ centered at $(0, 0)$.

Linear Approximation:

$$P_1(x, y) = f(0, 0) + f_x(0, 0)x + f_y(0, 0)y$$

Quadratic Approximation:

$$P_2(x, y) = f(0, 0) + f_x(0, 0)x + f_y(0, 0)y + \tfrac{1}{2}f_{xx}(0, 0)x^2 + f_{xy}(0, 0)xy + \tfrac{1}{2}f_{yy}(0, 0)y^2$$

[Note that the linear approximation is the tangent plane to the surface at $(0, 0, f(0, 0))$.]

(a) Find the linear approximation of $f(x, y) = e^{x-y}$ centered at $(0, 0)$.

(b) Find the quadratic approximation of $f(x, y) = e^{x-y}$ centered at $(0, 0)$.

(c) When $x = 0$ in the quadratic approximation, you obtain the second-degree Taylor polynomial for what function? Answer the same question for $y = 0$.

(d) Complete the table.

x	y	$f(x, y)$	$P_1(x, y)$	$P_2(x, y)$
0	0			
0	0.1			
0.2	0.1			
0.2	0.5			
1	0.5			

(e) Use a graphing utility to graph the surfaces $z = f(x, y)$, $z = P_1(x, y)$, and $z = P_2(x, y)$.

64. Approximation Repeat Exercise 63 for the function $f(x, y) = \cos(x + y)$.

65. Proof Prove that the angle of inclination θ of the tangent plane to the surface $z = f(x, y)$ at the point (x_0, y_0, z_0) is given by

$$\cos\theta = \frac{1}{\sqrt{[f_x(x_0, y_0)]^2 + [f_y(x_0, y_0)]^2 + 1}}.$$

66. Proof Prove Theorem 13.14.

SECTION PROJECT

Wildflowers

The diversity of wildflowers in a meadow can be measured by counting the numbers of daisies, buttercups, shooting stars, and so on. When there are n types of wildflowers, each with a proportion p_i of the total population, it follows that

$$p_1 + p_2 + \cdots + p_n = 1.$$

The measure of diversity of the population is defined as

$$H = -\sum_{i=1}^{n} p_i \log_2 p_i.$$

In this definition, it is understood that $p_i \log_2 p_i = 0$ when $p_i = 0$. The tables show proportions of wildflowers in a meadow in May, June, August, and September.

May

Flower type	1	2	3	4
Proportion	$\frac{5}{16}$	$\frac{5}{16}$	$\frac{5}{16}$	$\frac{1}{16}$

June

Flower type	1	2	3	4
Proportion	$\frac{1}{4}$	$\frac{1}{4}$	$\frac{1}{4}$	$\frac{1}{4}$

August

Flower type	1	2	3	4
Proportion	$\frac{1}{4}$	0	$\frac{1}{4}$	$\frac{1}{2}$

September

Flower type	1	2	3	4
Proportion	0	0	0	1

(a) Determine the wildflower diversity for each month. How would you interpret September's diversity? Which month had the greatest diversity?

(b) When the meadow contains 10 types of wildflowers in roughly equal proportions, is the diversity of the population greater than or less than the diversity of a similar distribution of 4 types of flowers? What type of distribution (of 10 types of wildflowers) would produce maximum diversity?

(c) Let H_n represent the maximum diversity of n types of wildflowers. Does H_n approach a limit as n approaches ∞?

FOR FURTHER INFORMATION Biologists use the concept of diversity to measure the proportions of different types of organisms within an environment. For more information on this technique, see the article "Information Theory and Biological Diversity" by Steven Kolmes and Kevin Mitchell in the *UMAP Modules.*

13.8 Extrema of Functions of Two Variables

GO DIGITAL

- **Find absolute extrema and relative extrema of a function of two variables.**
- **Use the Second Partials Test to find relative extrema of a function of two variables.**

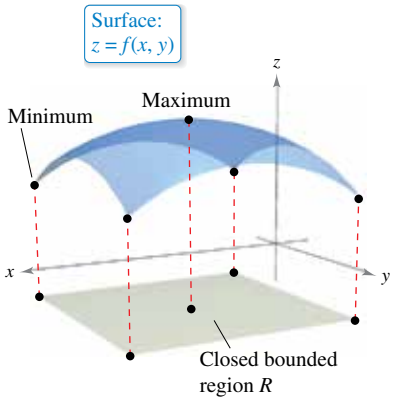
Absolute Extrema and Relative Extrema

In Chapter 3, you studied techniques for finding the extreme values of a function of a single variable. In this section, you will extend these techniques to functions of two variables. For example, in Theorem 13.15 below, the Extreme Value Theorem for a function of a single variable is extended to a function of two variables.

Consider the continuous function f of two variables, defined on a closed bounded region R in the xy-plane. The values $f(a, b)$ and $f(c, d)$ such that

$$f(a, b) \leq f(x, y) \leq f(c, d) \qquad (a, b) \text{ and } (c, d) \text{ are in } R.$$

for all (x, y) in R are called the **minimum** and **maximum** of f in the region R, as shown in Figure 13.64. Recall from Section 13.2 that a region in the plane is *closed* when it contains all of its boundary points. The Extreme Value Theorem deals with a region in the plane that is both closed and *bounded.* A region in the plane is **bounded** when it is a subregion of a closed disk in the plane.



R contains point(s) at which $f(x, y)$ is a minimum and point(s) at which $f(x, y)$ is a maximum.

Figure 13.64

THEOREM 13.15 Extreme Value Theorem

Let f be a continuous function of two variables x and y defined on a closed bounded region R in the xy-plane.

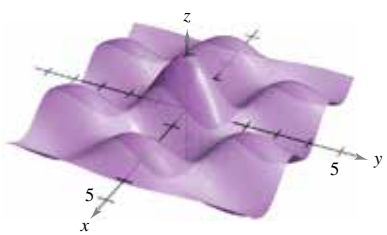
1. There is at least one point in R at which f takes on a minimum value.
2. There is at least one point in R at which f takes on a maximum value.

A minimum is also called an **absolute minimum** and a maximum is also called an **absolute maximum.** As in single-variable calculus, there is a distinction made between absolute extrema and **relative extrema.**

Definition of Relative Extrema

Let f be a function defined on a region R containing (x_0, y_0).

1. The function f has a **relative minimum** at (x_0, y_0) if
$$f(x, y) \geq f(x_0, y_0)$$
for all (x, y) in an *open* disk containing (x_0, y_0).
2. The function f has a **relative maximum** at (x_0, y_0) if
$$f(x, y) \leq f(x_0, y_0)$$
for all (x, y) in an *open* disk containing (x_0, y_0).



Relative extrema

Figure 13.65

To say that f has a relative maximum at (x_0, y_0) means that the point (x_0, y_0, z_0) is at least as high as all nearby points on the graph of

$$z = f(x, y).$$

Similarly, f has a relative minimum at (x_0, y_0) when (x_0, y_0, z_0) is at least as low as all nearby points on the graph. (See Figure 13.65.)

KARL WEIERSTRASS (1815–1897)

Although the Extreme Value Theorem had been used by earlier mathematicians, the first to provide a rigorous proof was the German mathematician Karl Weierstrass. Weierstrass also provided rigorous justifications for many other mathematical results already in common use. We are indebted to him for much of the logical foundation on which modern calculus is built. *See LarsonCalculus.com to read more of this biography.*

To locate relative extrema of f, you can investigate the points at which the gradient of f is $\mathbf{0}$ or the points at which one of the partial derivatives does not exist. Such points are called **critical points** of f.

Definition of Critical Point

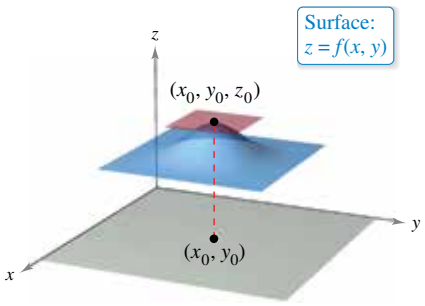
Let f be defined on an open region R containing (x_0, y_0). The point (x_0, y_0) is a **critical point** of f if one of the following is true.

1. $f_x(x_0, y_0) = 0$ and $f_y(x_0, y_0) = 0$
2. $f_x(x_0, y_0)$ or $f_y(x_0, y_0)$ does not exist.

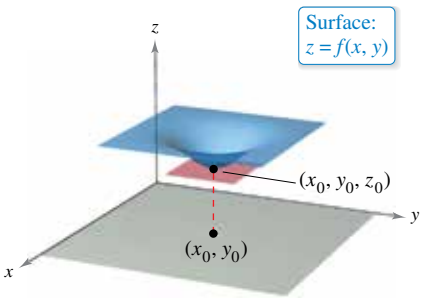
Recall from Theorem 13.11 that if f is differentiable and

$$\nabla f(x_0, y_0) = f_x(x_0, y_0)\mathbf{i} + f_y(x_0, y_0)\mathbf{j} = 0\mathbf{i} + 0\mathbf{j}$$

then every directional derivative at (x_0, y_0) must be 0. This implies that the function has a horizontal tangent plane at the point (x_0, y_0), as shown in Figure 13.66. It appears that such a point is a likely location of a relative extremum. This is confirmed by Theorem 13.16.



Relative maximum



Relative minimum

Figure 13.66

THEOREM 13.16 Relative Extrema Occur Only at Critical Points

If f has a relative extremum at (x_0, y_0) on an open region R, then (x_0, y_0) is a critical point of f.

Exploration

Use a graphing utility to graph $z = x^3 - 3xy + y^3$ using the bounds $0 \le x \le 3$, $0 \le y \le 3$, and $-3 \le z \le 3$. This view makes it appear as though the surface has an absolute minimum. Does the surface have an absolute minimum? Why or why not?

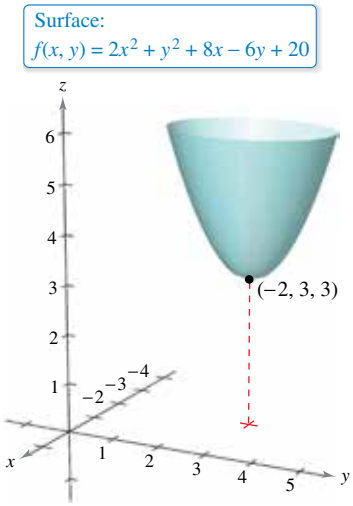
GO DIGITAL



The function $z = f(x, y)$ has a relative minimum at $(-2, 3)$.

Figure 13.67

EXAMPLE 1 Finding a Relative Extremum

See LarsonCalculus.com for an interactive version of this type of example.

Determine the relative extrema of

$$f(x, y) = 2x^2 + y^2 + 8x - 6y + 20.$$

Solution Begin by finding the critical points of f. Because

$$f_x(x, y) = 4x + 8 \qquad \text{Partial with respect to } x$$

and

$$f_y(x, y) = 2y - 6 \qquad \text{Partial with respect to } y$$

are defined for all x and y, the only critical points are those for which both first partial derivatives are 0. To locate these points, set $f_x(x, y)$ and $f_y(x, y)$ equal to 0, and solve the equations

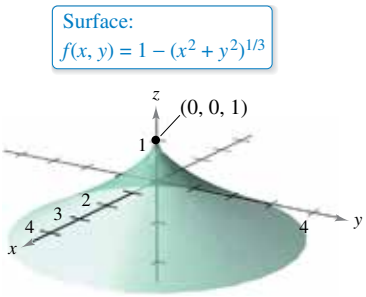
$$4x + 8 = 0 \quad \text{and} \quad 2y - 6 = 0$$

to obtain the critical point $(-2, 3)$. By completing the square for f, you can see that for all $(x, y) \neq (-2, 3)$

$$f(x, y) = 2(x + 2)^2 + (y - 3)^2 + 3 > 3.$$

So, a relative *minimum* of f occurs at $(-2, 3)$. The value of the relative minimum is $f(-2, 3) = 3$, as shown in Figure 13.67. ■

Example 1 shows a relative minimum occurring at one type of critical point—the type for which both $f_x(x, y)$ and $f_y(x, y)$ are 0. The next example concerns a relative maximum that occurs at the other type of critical point—the type for which either $f_x(x, y)$ or $f_y(x, y)$ does not exist.



$f_x(x, y)$ and $f_y(x, y)$ are undefined at $(0, 0)$.

Figure 13.68

EXAMPLE 2 Finding a Relative Extremum

Determine the relative extrema of

$$f(x, y) = 1 - (x^2 + y^2)^{1/3}.$$

Solution Because

$$f_x(x, y) = -\frac{2x}{3(x^2 + y^2)^{2/3}} \qquad \text{Partial with respect to } x$$

and

$$f_y(x, y) = -\frac{2y}{3(x^2 + y^2)^{2/3}} \qquad \text{Partial with respect to } y$$

it follows that both partial derivatives exist for all points in the xy-plane except for $(0, 0)$. Moreover, because the partial derivatives cannot both be 0 unless both x and y are 0, you can conclude that $(0, 0)$ is the only critical point. In Figure 13.68, note that $f(0, 0)$ is 1. For all other (x, y), it is clear that

$$f(x, y) = 1 - (x^2 + y^2)^{1/3} < 1.$$

So, f has a relative *maximum* at $(0, 0)$. ■

In Example 2, $f_x(x, y) = 0$ for every point on the y-axis other than $(0, 0)$. However, because $f_y(x, y)$ is nonzero, these are not critical points. Remember that *one* of the partials must not exist or *both* must be 0 to yield a critical point.

The Second Partials Test

Theorem 13.16 tells you that to find relative extrema, you need only examine values of $f(x, y)$ at critical points. However, as is true for a function of one variable, the critical points of a function of two variables do not always yield relative maxima or minima. Some critical points yield **saddle points,** which are neither relative maxima nor relative minima.

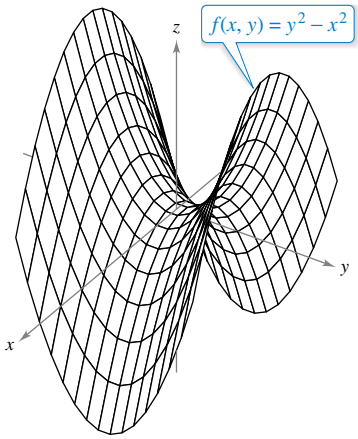
As an example of a critical point that does not yield a relative extremum, consider the hyperbolic paraboloid

$$f(x, y) = y^2 - x^2$$

as shown in Figure 13.69. At the point $(0, 0)$, both partial derivatives

$$f_x(x, y) = -2x \quad \text{and} \quad f_y(x, y) = 2y$$

are 0. The function f does not, however, have a relative extremum at this point because in any open disk centered at $(0, 0)$, the function takes on both negative values (along the x-axis) *and* positive values (along the y-axis), So, the point $(0, 0, 0)$ is a saddle point of the surface. (The term "saddle point" comes from the fact that surfaces such as the one shown in Figure 13.69 resemble saddles.)



Saddle point at $(0, 0, 0)$:
$f_x(0, 0) = f_y(0, 0) = 0$
Figure 13.69

For the functions in Examples 1 and 2, it was relatively easy to determine the relative extrema, because each function was either given, or could be written, in completed square form. For more complicated functions, algebraic arguments are less convenient and it is better to rely on the analytic means presented in the following Second Partials Test. This is the two-variable counterpart of the Second Derivative Test for functions of one variable. The proof of this theorem is best left to a course in advanced calculus.

THEOREM 13.17 Second Partials Test

Let f have continuous second partial derivatives on an open region containing a point (a, b) for which

$$f_x(a, b) = 0 \quad \text{and} \quad f_y(a, b) = 0.$$

To test for relative extrema of f, consider the quantity

$$d = f_{xx}(a, b)f_{yy}(a, b) - [f_{xy}(a, b)]^2.$$

1. If $d > 0$ and $f_{xx}(a, b) > 0$, then f has a **relative minimum** at (a, b).
2. If $d > 0$ and $f_{xx}(a, b) < 0$, then f has a **relative maximum** at (a, b).
3. If $d < 0$, then $(a, b, f(a, b))$ is a **saddle point.**
4. The test is inconclusive if $d = 0$.

REMARK If $d > 0$, then $f_{xx}(a, b)$ and $f_{yy}(a, b)$ must have the same sign. This means that $f_{xx}(a, b)$ can be replaced by $f_{yy}(a, b)$ in the first two parts of the test.

A convenient device for remembering the formula for d in the Second Partials Test is given by the 2×2 determinant

$$d = \begin{vmatrix} f_{xx}(a, b) & f_{xy}(a, b) \\ f_{yx}(a, b) & f_{yy}(a, b) \end{vmatrix}$$

where $f_{xy}(a, b) = f_{yx}(a, b)$ by Theorem 13.3.

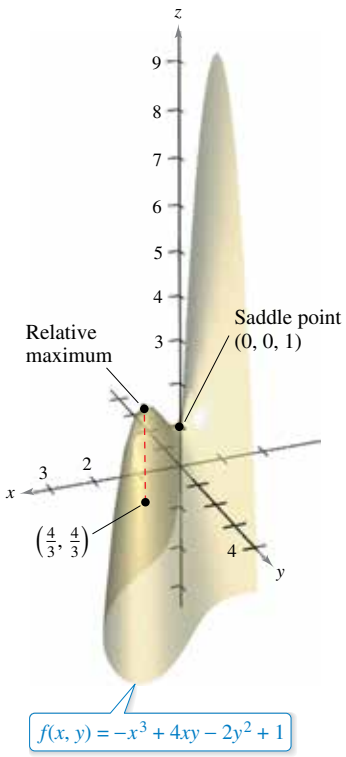

Figure 13.70

EXAMPLE 3 Using the Second Partials Test

Find the relative extrema of $f(x, y) = -x^3 + 4xy - 2y^2 + 1$.

Solution Begin by finding the critical points of f. Because

$$f_x(x, y) = -3x^2 + 4y \quad \text{and} \quad f_y(x, y) = 4x - 4y$$

exist for all x and y, the only critical points are those for which both first partial derivatives are 0. To locate these points, set $f_x(x, y)$ and $f_y(x, y)$ equal to 0 to obtain

$$-3x^2 + 4y = 0 \quad \text{and} \quad 4x - 4y = 0.$$

From the second equation, you know that $x = y$. Substituting for x in the first equation and solving for y yields two solutions.

$$-3y^2 + 4y = 0 \quad \Rightarrow \quad y(-3y + 4) = 0 \quad \Rightarrow \quad y = 0 \quad \text{and} \quad y = \frac{4}{3}$$

So, with $x = y$, the critical points are $(0, 0)$ and $\left(\frac{4}{3}, \frac{4}{3}\right)$. The second partials are

$$f_{xx}(x, y) = -6x, \quad f_{yy}(x, y) = -4, \quad \text{and} \quad f_{xy}(x, y) = 4.$$

For the critical point $(0, 0)$, it follows that

$$d = f_{xx}(0, 0)f_{yy}(0, 0) - [f_{xy}(0, 0)]^2 = 0 - 16 < 0$$

and, by the Second Partials Test, you can conclude that $(0, 0, 1)$ is a saddle point of f. Furthermore, for the critical point $\left(\frac{4}{3}, \frac{4}{3}\right)$,

$$d = f_{xx}\left(\frac{4}{3}, \frac{4}{3}\right)f_{yy}\left(\frac{4}{3}, \frac{4}{3}\right) - \left[f_{xy}\left(\frac{4}{3}, \frac{4}{3}\right)\right]^2 = -8(-4) - 16 = 16 > 0$$

and because $f_{xx}\left(\frac{4}{3}, \frac{4}{3}\right) = -8 < 0$, you can conclude that f has a relative maximum at $\left(\frac{4}{3}, \frac{4}{3}\right)$, as shown in Figure 13.70. ■

The Second Partials Test can fail to find relative extrema in two ways. If either of the first partial derivatives does not exist, you cannot use the test. Also, if

$$d = f_{xx}(a, b)f_{yy}(a, b) - [f_{xy}(a, b)]^2 = 0$$

the test fails. In such cases, you can try a sketch or some other approach, as demonstrated in the next example.

EXAMPLE 4 Failure of the Second Partials Test

Find the relative extrema of $f(x, y) = x^2y^2$.

Solution Because $f_x(x, y) = 2xy^2$ and $f_y(x, y) = 2x^2y$, you know that both partial derivatives are 0 when $x = 0$ or $y = 0$. That is, every point along the x- or y-axis is a critical point. Moreover, because

$$f_{xx}(x, y) = 2y^2, \quad f_{yy}(x, y) = 2x^2, \quad \text{and} \quad f_{xy}(x, y) = 4xy$$

you know that

$$\begin{aligned} d &= f_{xx}(x, y)f_{yy}(x, y) - [f_{xy}(x, y)]^2 \\ &= 4x^2y^2 - 16x^2y^2 \\ &= -12x^2y^2 \end{aligned}$$

which is 0 when either $x = 0$ or $y = 0$. So, the Second Partials Test fails. However, because $f(x, y) = 0$ for every point along the x- or y-axis and $f(x, y) = x^2y^2 > 0$ for all other points, you can conclude that each of these critical points yields an absolute minimum, as shown in Figure 13.71. ■

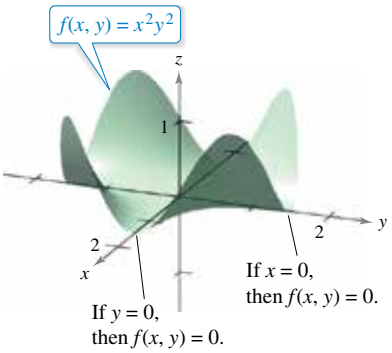

Figure 13.71

Absolute extrema of a function can occur in two ways. First, some relative extrema also happen to be absolute extrema. For instance, in Example 1, $f(-2, 3)$ is an absolute minimum of the function. (On the other hand, the relative maximum found in Example 3 is not an absolute maximum of the function.) Second, absolute extrema can occur at a boundary point of the domain. This is illustrated in Example 5.

EXAMPLE 5 Finding Absolute Extrema

Find the absolute extrema of the function

$$f(x, y) = \sin xy$$

on the closed region given by

$$0 \le x \le \pi \quad \text{and} \quad 0 \le y \le 1.$$

Solution From the partial derivatives

$$f_x(x, y) = y \cos xy \quad \text{and} \quad f_y(x, y) = x \cos xy$$

you can determine that each point lying on the hyperbola $xy = \pi/2$ is a critical point. These points each yield the value

$$f(x, y) = \sin \frac{\pi}{2} = 1$$

which you know is the absolute maximum, as shown in Figure 13.72. The only other critical point of f *lying in the given region* is $(0, 0)$. It yields an absolute minimum of 0, because

$$0 \le xy \le \pi$$

implies that

$$0 \le \sin xy \le 1.$$

To locate other absolute extrema, you should consider the four boundaries of the region formed by taking traces with the vertical planes $x = 0$, $x = \pi$, $y = 0$, and $y = 1$. In doing this, you will find that $\sin xy = 0$ at all points on the x-axis, at all points on the y-axis, and at the point $(\pi, 1)$. Each of these points yields an absolute minimum for the surface, as shown in Figure 13.72.

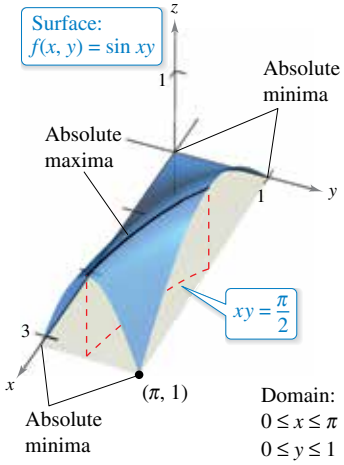

Figure 13.72

The concepts of relative extrema and critical points can be extended to functions of three or more variables. When all first partial derivatives of

$$w = f(x_1, x_2, x_3, \ldots, x_n)$$

exist, it can be shown that a relative maximum or minimum can occur at $(x_1, x_2, x_3, \ldots, x_n)$ only when every first partial derivative is 0 at that point. This means that the critical points are obtained by solving the following system of equations.

$$\begin{aligned} f_{x_1}(x_1, x_2, x_3, \ldots, x_n) &= 0 \\ f_{x_2}(x_1, x_2, x_3, \ldots, x_n) &= 0 \\ &\vdots \\ f_{x_n}(x_1, x_2, x_3, \ldots, x_n) &= 0 \end{aligned}$$

The extension of Theorem 13.17 to three or more variables is also possible, although you will not study such an extension in this text.

13.8 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

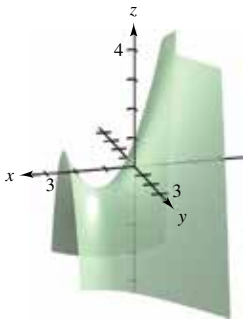
1. For a function of two variables, describe (a) relative minimum, (b) relative maximum, (c) critical point, and (d) saddle point.
2. Under what condition does the Second Partials Test fail? Explain why the test fails under this condition.

Finding Relative Extrema **In Exercises 3–8, identify any extrema of the function by recognizing its given form or its form after completing the square. Verify your results by using the partial derivatives to locate any critical points and test for relative extrema.**

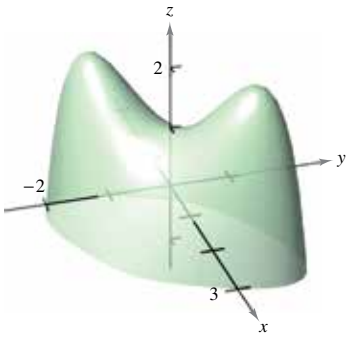
3. $g(x, y) = (x - 1)^2 + (y - 3)^2$
4. $g(x, y) = 5 - (x - 6)^2 - (y + 2)^2$
5. $f(x, y) = \sqrt{x^2 + y^2 + 1}$
6. $f(x, y) = \sqrt{49 - (x - 2)^2 - y^2}$
7. $f(x, y) = x^2 + y^2 + 2x - 6y + 6$
8. $f(x, y) = -x^2 - y^2 + 10x + 12y - 64$

Using the Second Partials Test **In Exercises 9–24, find all relative extrema and saddle points of the function. Use the Second Partials Test where applicable.**

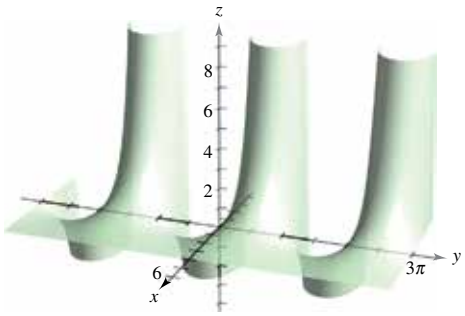
9. $f(x, y) = x^2 + y^2 + 8x - 12y - 3$
10. $g(x, y) = x^2 - y^2 - x - y$
11. $f(x, y) = -2x^4y^4$
12. $f(x, y) = \frac{1}{2}xy$
13. $f(x, y) = -3x^2 - 2y^2 + 3x - 4y + 5$
14. $h(x, y) = x^2 - 3xy - y^2$
15. $f(x, y) = 7x^2 + 2y^2 - 7x + 16y - 13$
16. $f(x, y) = x^5 + y^5$
17. $z = x^2 + xy + \frac{1}{2}y^2 - 2x + y$
18. $z = -5x^2 + 4xy - y^2 + 16x + 10$
19. $f(x, y) = -4(x^2 + y^2 + 81)^{1/4}$
20. $h(x, y) = (x^2 + y^2)^{1/3} + 2$
21. $f(x, y) = x^2 - xy - y^2 - 3x - y$



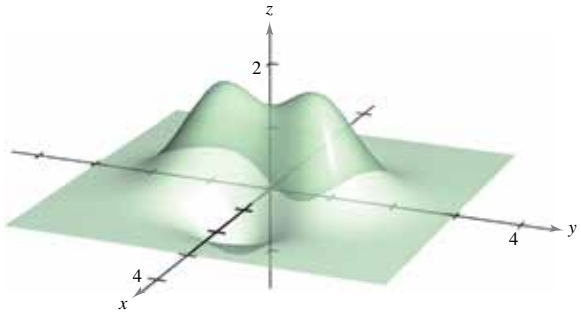
22. $f(x, y) = 2xy - \frac{1}{2}(x^4 + y^4) + 1$



23. $z = e^{-x} \sin y$



24. $z = \left(\frac{1}{2} - x^2 + y^2\right)e^{1-x^2-y^2}$



Finding Relative Extrema and Saddle Points Using Technology **In Exercises 25–28, use a graphing utility to graph the surface and locate any relative extrema and saddle points.**

25. $z = \dfrac{-4x}{x^2 + y^2 + 1}$
26. $z = \cos x + \sin y, \quad -\pi/2 < x < \pi/2, \quad -\pi < y < \pi$
27. $z = (x^2 + 4y^2)e^{1-x^2-y^2}$
28. $z = e^{xy}$

Finding Relative Extrema **In Exercises 29 and 30, examine the function for extrema without using the derivative tests, and use a graphing utility to graph the surface and verify your answers. (*Hint:* By observation, determine whether it is possible for z to be negative. When is z equal to 0?)**

29. $z = \dfrac{(x - y)^4}{x^2 + y^2}$
30. $z = \dfrac{(x^2 - y^2)^2}{x^2 + y^2}$

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Think About It **In Exercises 31–34, determine whether there is a relative maximum, a relative minimum, a saddle point, or insufficient information to determine the nature of the function $f(x, y)$ at the critical point (x_0, y_0).**

31. $f_{xx}(x_0, y_0) = 9, \quad f_{yy}(x_0, y_0) = 4, \quad f_{xy}(x_0, y_0) = 6$

32. $f_{xx}(x_0, y_0) = -3, \quad f_{yy}(x_0, y_0) = -8, \quad f_{xy}(x_0, y_0) = 2$

33. $f_{xx}(x_0, y_0) = -9, \quad f_{yy}(x_0, y_0) = 6, \quad f_{xy}(x_0, y_0) = 10$

34. $f_{xx}(x_0, y_0) = 25, \quad f_{yy}(x_0, y_0) = 8, \quad f_{xy}(x_0, y_0) = 10$

Finding Relative Extrema and Saddle Points **In Exercises 35–38, (a) find the critical points, (b) test for relative extrema, (c) list the critical points for which the Second Partials Test fails, and (d) use a graphing utility to graph the function, labeling any extrema and saddle points.**

35. $f(x, y) = x^3 + y^3$

36. $f(x, y) = x^3 + y^3 - 6x^2 + 9x^2 + 12x + 27y + 19$

37. $f(x, y) = (x - 1)^2(y + 4)^2$

38. $f(x, y) = x^{2/3} + y^{2/3}$

Finding Absolute Extrema **In Exercises 39–46, find the absolute extrema of the function over the region R. (In each case, R contains the boundaries.) Use a graphing utility to confirm your results.**

39. $f(x, y) = x^2 - 4xy + 5$

$R = \{(x, y): 1 \le x \le 4, 0 \le y \le 2\}$

40. $f(x, y) = x^2 + xy$

$R = \{(x, y): |x| \le 2, |y| \le 1\}$

41. $f(x, y) = 12 - 3x - 2y$

R: The triangular region in the xy-plane with vertices $(2, 0)$, $(0, 1)$, and $(1, 2)$

42. $f(x, y) = (2x - y)^2$

R: The triangular region in the xy-plane with vertices $(2, 0)$, $(0, 1)$, and $(1, 2)$

43. $f(x, y) = 3x^2 + 2y^2 - 4y$

R: The region in the xy-plane bounded by the graphs of $y = x^2$ and $y = 4$

44. $f(x, y) = 2x - 2xy + y^2$

R: The region in the xy-plane bounded by the graphs of $y = x^2$ and $y = 1$

45. $f(x, y) = x^2 + 2xy + y^2$

$R = \{(x, y): |x| \le 2, |y| \le 1\}$

46. $f(x, y) = \dfrac{4xy}{(x^2 + 1)(y^2 + 1)}$

$R = \{(x, y): 0 \le x \le 1, 0 \le y \le 1\}$

Examining a Function **In Exercises 47 and 48, find the critical points of the function and, from the form of the function, determine whether a relative maximum or a relative minimum occurs at each point.**

47. $f(x, y, z) = x^2 + (y - 3)^2 + (z + 1)^2$

48. $f(x, y, z) = 9 - [x(y - 1)(z + 2)]^2$

Exploring Concepts

49. A function f has continuous second partial derivatives on an open region containing the critical point $(3, 7)$. The function has a minimum at $(3, 7)$, and $d > 0$ for the Second Partials Test. Determine the interval for $f_{xy}(3, 7)$ when $f_{xx}(3, 7) = 2$ and $f_{yy}(3, 7) = 8$.

50. A function f has continuous second partial derivatives on an open region containing the critical point (a, b). What is implied when $f_{xx}(a, b)$ and $f_{yy}(a, b)$ have opposite signs? Explain.

In Exercises 51 and 52, sketch the graph of an arbitrary function f satisfying the given conditions. State whether the function has any extrema or saddle points. (There are many correct answers.)

51. All of the first and second partial derivatives of f are 0.

52. $f_x(x, y) > 0$ and $f_y(x, y) < 0$ for all (x, y).

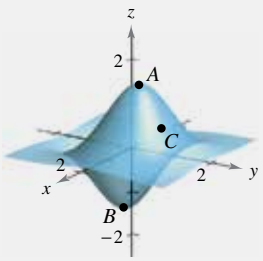
53. Comparing Functions Consider the functions

$f(x, y) = x^2 - y^2$ and $g(x, y) = x^2 + y^2$.

(a) Show that both functions have a critical point at $(0, 0)$.

(b) Explain how f and g behave differently at this critical point.

54. HOW DO YOU SEE IT? Determine whether each labeled point is an absolute maximum, an absolute minimum, or neither.



True or False? **In Exercises 55–58, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

55. If f has a relative maximum at (x_0, y_0, z_0), then

$f_x(x_0, y_0) = f_y(x_0, y_0) = 0.$

56. If

$f_x(x_0, y_0) = f_y(x_0, y_0) = 0$

then f has a relative extremum at (x_0, y_0, z_0).

57. Between any two relative minima of f, there must be at least one relative maximum of f.

58. If f is continuous for all x and y and has two relative minima, then f must have at least one relative maximum.

13.9 Applications of Extrema

GO DIGITAL

- Solve optimization problems involving functions of several variables.
- Use the method of least squares.

Applied Optimization Problems

In this section, you will study a few of the many applications of extrema of functions of two (or more) variables.

EXAMPLE 1 Finding Maximum Volume

See LarsonCalculus.com for an interactive version of this type of example.

A rectangular box is resting on the xy-plane with one vertex at the origin. The opposite vertex lies in the plane $6x + 4y + 3z = 24$, as shown in Figure 13.73. Find the maximum volume of the box.

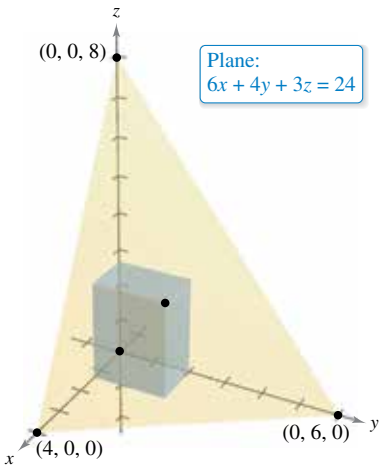

Figure 13.73

Solution Let x, y, and z represent the length, width, and height of the box. Because one vertex of the box lies in the plane $6x + 4y + 3z = 24$, you know that $z = \frac{1}{3}(24 - 6x - 4y)$. So, you can write the volume xyz of the box as a function of two variables.

$$V(x, y) = (x)(y)\left[\frac{1}{3}(24 - 6x - 4y)\right] = \frac{1}{3}(24xy - 6x^2y - 4xy^2)$$

Next, find the first partial derivatives of V.

$$V_x(x, y) = \frac{1}{3}(24y - 12xy - 4y^2) = \frac{y}{3}(24 - 12x - 4y)$$

and

$$V_y(x, y) = \frac{1}{3}(24x - 6x^2 - 8xy) = \frac{x}{3}(24 - 6x - 8y)$$

Note that the first partial derivatives are defined for all x and y. So, by setting $V_x(x, y)$ and $V_y(x, y)$ equal to 0 and solving the equations $\frac{1}{3}y(24 - 12x - 4y) = 0$ and $\frac{1}{3}x(24 - 6x - 8y) = 0$, you obtain the critical points $(0, 0)$, $(4, 0)$, $(0, 6)$, and $\left(\frac{4}{3}, 2\right)$. At $(0, 0)$, $(4, 0)$, and $(0, 6)$, the volume is 0, so these points do not yield a maximum volume. At the point $\left(\frac{4}{3}, 2\right)$, you can apply the Second Partials Test.

$$V_{xx}(x, y) = -4y, \quad V_{yy}(x, y) = \frac{-8x}{3}, \quad V_{xy}(x, y) = \frac{1}{3}(24 - 12x - 8y)$$

Because

$$V_{xx}\left(\frac{4}{3}, 2\right)V_{yy}\left(\frac{4}{3}, 2\right) - \left[V_{xy}\left(\frac{4}{3}, 2\right)\right]^2 = (-8)\left(-\frac{32}{9}\right) - \left(-\frac{8}{3}\right)^2 = \frac{64}{3} > 0$$

and

$$V_{xx}\left(\frac{4}{3}, 2\right) = -8 < 0$$

you can conclude from the Second Partials Test that the maximum volume is

$$V\left(\frac{4}{3}, 2\right) = \frac{1}{3}\left[24\left(\frac{4}{3}\right)(2) - 6\left(\frac{4}{3}\right)^2(2) - 4\left(\frac{4}{3}\right)(2^2)\right] = \frac{64}{9} \text{ cubic units.}$$

Note that the volume is 0 at the boundary points of the triangular domain of V. ■

REMARK In many applied problems, the domain of the function to be optimized is a closed bounded region. To find minimum or maximum points, you must not only test critical points, but also consider the values of the function at points on the boundary.

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Applications of extrema in economics and business often involve more than one independent variable. For instance, a company may produce several models of one type of product. The price per unit and profit per unit are usually different for each model. Moreover, the demand for each model is often a function of the prices of the other models (as well as its own price). The next example illustrates an application involving two products.

EXAMPLE 2 Finding the Maximum Profit

A manufacturer determines that the profit P (in dollars) obtained by producing and selling x units of Product 1 and y units of Product 2 is approximated by the model

$$P(x, y) = 8x + 10y - (0.001)(x^2 + xy + y^2) - 10{,}000.$$

Find the production level that produces a maximum profit. What is the maximum profit?

Solution The first partial derivatives of the profit function are

$$P_x(x, y) = 8 - (0.001)(2x + y)$$

and

$$P_y(x, y) = 10 - (0.001)(x + 2y).$$

By setting these partial derivatives equal to 0, you obtain the following system of equations.

$$\begin{aligned} 8 - (0.001)(2x + y) &= 0 \\ 10 - (0.001)(x + 2y) &= 0 \end{aligned}$$

After simplifying, this system of linear equations can be written as

$$\begin{aligned} 2x + y &= 8000 \\ x + 2y &= 10{,}000. \end{aligned}$$

Solving this system produces $x = 2000$ and $y = 4000$. The second partial derivatives of P are

$$\begin{aligned} P_{xx}(2000, 4000) &= -0.002 \\ P_{yy}(2000, 4000) &= -0.002 \end{aligned}$$

and

$$P_{xy}(2000, 4000) = -0.001.$$

Because $P_{xx} < 0$ and

$$P_{xx}(2000, 4000)P_{yy}(2000, 4000) - [P_{xy}(2000, 4000)]^2 = (-0.002)^2 - (-0.001)^2$$

is greater than 0, you can conclude that the production level of $x = 2000$ units and $y = 4000$ units yields a *maximum* profit. The maximum profit is

$$\begin{aligned} &P(2000, 4000) \\ &\quad = 8(2000) + 10(4000) - (0.001)[2000^2 + 2000(4000) + 4000^2] - 10{,}000 \\ &\quad = \$18{,}000. \end{aligned}$$

In Example 2, it was assumed that the manufacturing plant is able to produce the required number of units to yield a maximum profit. In actual practice, the production would be bounded by physical constraints. You will study such constrained optimization problems in the next section.

The Method of Least Squares

Many of the examples in this text have involved **mathematical models.** For instance, Example 2 involves a quadratic model for profit. There are several ways to develop such models; one is called the **method of least squares.**

In constructing a model to represent a particular phenomenon, the goals are simplicity and accuracy. Of course, these goals often conflict. For instance, a simple linear model for the points in Figure 13.74 is

$$y = 1.9x - 5.$$ Linear model

Figure 13.75, however, shows that by choosing the slightly more complicated quadratic model

$$y = 0.20x^2 - 0.7x + 1$$ Quadratic model

you can achieve greater accuracy.

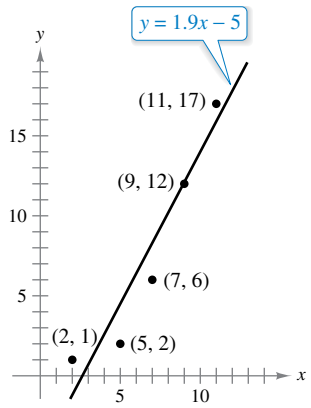

Figure 13.74

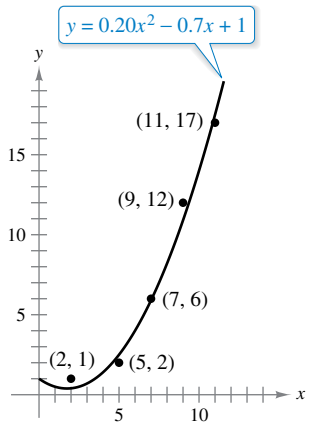

Figure 13.75

As a measure of how well the model $y = f(x)$ fits the collection of points

$$\{(x_1, y_1), (x_2, y_2), (x_3, y_3), \ldots, (x_n, y_n)\}$$

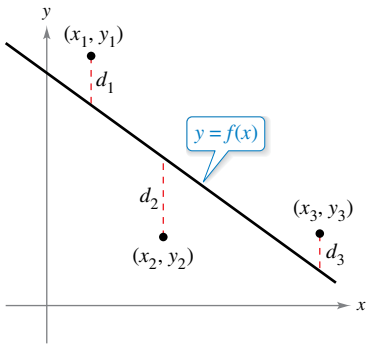
add the squares of the differences between the actual y-values and the values given by the model to obtain the **sum of the squared errors**

$$S = \sum_{i=1}^{n} [f(x_i) - y_i]^2.$$ Sum of the squared errors

Graphically, S can be interpreted as the sum of the squares of the vertical distances between the graph of f and the given points in the plane, as shown in Figure 13.76. If the model is a perfect fit, then $S = 0$. However, when a perfect fit is not feasible, you can use a model that minimizes S. For instance, the sum of the squared errors for the linear model in Figure 13.74 is

$$S = 17.6.$$

Statisticians call the *linear model* that minimizes S the **least squares regression line.** The proof that this line actually minimizes S involves the minimizing of a function of two variables.



Sum of the squared errors:
$S = d_1^2 + d_2^2 + d_3^2$

Figure 13.76

REMARK A method for finding the least squares regression quadratic for a collection of data is described in Exercise 31.

ADRIEN-MARIE LEGENDRE (1752–1833)

The method of least squares was introduced by the French mathematician Adrien-Marie Legendre. Legendre is best known for his work in geometry. In fact, his text *Elements of Geometry* was so popular in the United States that it continued to be used for 33 editions, spanning a period of more than 100 years. *See LarsonCalculus.com to read more of this biography.*

THEOREM 13.18 Least Squares Regression Line

The **least squares regression line** for the points

$$\{(x_1, y_1), (x_2, y_2), \ldots, (x_n, y_n)\}$$

is given by $f(x) = ax + b$, where

$$a = \frac{n\sum_{i=1}^{n} x_i y_i - \sum_{i=1}^{n} x_i \sum_{i=1}^{n} y_i}{n\sum_{i=1}^{n} x_i^2 - \left(\sum_{i=1}^{n} x_i\right)^2} \quad \text{and} \quad b = \frac{1}{n}\left(\sum_{i=1}^{n} y_i - a\sum_{i=1}^{n} x_i\right).$$

Proof Let $S(a, b)$ represent the sum of the squared errors for the model

$$f(x) = ax + b$$

and the given set of points. That is,

$$\begin{aligned} S(a, b) &= \sum_{i=1}^{n} [f(x_i) - y_i]^2 \\ &= \sum_{i=1}^{n} (ax_i + b - y_i)^2 \end{aligned}$$

where the points (x_i, y_i) represent constants. Because S is a function of a and b, you can use the methods discussed in the preceding section to find the minimum value of S. Specifically, the first partial derivatives of S are

$$\begin{aligned} S_a(a, b) &= \sum_{i=1}^{n} 2x_i(ax_i + b - y_i) \\ &= 2a\sum_{i=1}^{n} x_i^2 + 2b\sum_{i=1}^{n} x_i - 2\sum_{i=1}^{n} x_i y_i \end{aligned}$$

and

$$\begin{aligned} S_b(a, b) &= \sum_{i=1}^{n} 2(ax_i + b - y_i) \\ &= 2a\sum_{i=1}^{n} x_i + 2nb - 2\sum_{i=1}^{n} y_i. \end{aligned}$$

By setting these two partial derivatives equal to 0, you obtain the values of a and b that are listed in the theorem. It is left to you to apply the Second Partials Test (see Exercise 41) to verify that these values of a and b yield a minimum. ■

If the x-values are symmetrically spaced about the y-axis, then $\Sigma x_i = 0$ and the formulas for a and b simplify to

$$a = \frac{\sum_{i=1}^{n} x_i y_i}{\sum_{i=1}^{n} x_i^2}$$

and

$$b = \frac{1}{n}\sum_{i=1}^{n} y_i.$$

This simplification is often possible with a translation of the x-values. For instance, given that the x-values in a data set are 9, 10, 11, 12, and 13, you could let 0 represent 11. So, after the translation, the values are -2, -1, 0, 1, and 2.

EXAMPLE 3 Finding the Least Squares Regression Line

Find the least squares regression line for the points

$$(-3, 0), \quad (-1, 1), \quad (0, 2), \quad \text{and} \quad (2, 3).$$

Solution The table shows the calculations involved in finding the least squares regression line using $n = 4$.

x	y	xy	x^2
-3	0	0	9
-1	1	-1	1
0	2	0	0
2	3	6	4
$\sum_{i=1}^{n} x_i = -2$	$\sum_{i=1}^{n} y_i = 6$	$\sum_{i=1}^{n} x_i y_i = 5$	$\sum_{i=1}^{n} x_i^2 = 14$

Applying Theorem 13.18 produces

$$\begin{aligned} a &= \frac{n\sum_{i=1}^{n} x_i y_i - \sum_{i=1}^{n} x_i \sum_{i=1}^{n} y_i}{n\sum_{i=1}^{n} x_i^2 - \left(\sum_{i=1}^{n} x_i\right)^2} \\ &= \frac{4(5) - (-2)(6)}{4(14) - (-2)^2} \\ &= \frac{8}{13} \end{aligned}$$

and

$$\begin{aligned} b &= \frac{1}{n}\left(\sum_{i=1}^{n} y_i - a\sum_{i=1}^{n} x_i\right) \\ &= \frac{1}{4}\left[6 - \frac{8}{13}(-2)\right] \\ &= \frac{47}{26}. \end{aligned}$$

TECHNOLOGY

Many calculators have "built-in" least squares regression programs. If your calculator has such a program, use it to duplicate the results of Example 3.

The least squares regression line is

$$f(x) = \frac{8}{13}x + \frac{47}{26}$$

as shown in Figure 13.77.

13.9 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. State the problem-solving strategy for applied minimum and maximum problems.
2. Describe the method of least squares for finding mathematical models.

Finding Minimum Distance **In Exercises 3 and 4, find the minimum distance from the point to the plane $x - y + z = 3$. (*Hint:* To simplify the computations, minimize the square of the distance.)**

3. $(1, -3, 2)$
4. $(4, 0, 6)$

Finding Minimum Distance **In Exercises 5 and 6, find the minimum distance from the point to the surface $z = \sqrt{1 - 2x - 2y}$. (*Hint:* To simplify the computations, minimize the square of the distance.)**

5. $(-2, -2, 0)$
6. $(-4, 1, 0)$

Finding Positive Numbers **In Exercises 7–10, find three positive integers x, y, and z that satisfy the given conditions.**

7. The product is 27, and the sum is a minimum.
8. The sum is 32, and $P = xy^2z$ is a maximum.
9. The sum is 30, and the sum of the squares is a minimum.
10. The product is 1, and the sum of the squares is a minimum.

11. **Cost** A home improvement contractor is painting the walls and ceiling of a rectangular room. The volume of the room is 668.25 cubic feet. The cost of wall paint is \$0.06 per square foot and the cost of ceiling paint is \$0.11 per square foot. Find the room dimensions that result in a minimum cost for the paint. What is the minimum cost for the paint?
12. **Maximum Volume** The material for constructing the base of an open box costs 1.5 times as much per unit area as the material for constructing the sides. For a fixed amount of money C, find the dimensions of the box of largest volume that can be made.
13. **Volume and Surface Area** Show that a rectangular box of given volume and minimum surface area is a cube.
14. **Maximum Volume** Show that the rectangular box of maximum volume inscribed in a sphere of radius r is a cube.
15. **Maximum Revenue** A company manufactures running shoes and basketball shoes. The total revenue (in thousands of dollars) from x_1 units of running shoes and x_2 units of basketball shoes is

$$R = -5x_1^2 - 8x_2^2 - 2x_1x_2 + 42x_1 + 102x_2$$

where x_1 and x_2 are in thousands of units. Find x_1 and x_2 so as to maximize the revenue.

16. **Maximum Profit** A corporation manufactures candles at two locations. The cost of producing x_1 units at location 1 is $C_1 = 0.02x_1^2 + 4x_1 + 500$ and the cost of producing x_2 units at location 2 is $C_2 = 0.05x_2^2 + 4x_2 + 275$. The candles sell for \$15 per unit. Find the quantity that should be produced at each location to maximize the profit $P = 15(x_1 + x_2) - C_1 - C_2$.
17. **Hardy-Weinberg Law** Common blood types are determined genetically by three alleles A, B, and O. (An allele is any of a group of possible mutational forms of a gene.) A person whose blood type is AA, BB, or OO is homozygous. A person whose blood type is AB, AO, or BO is heterozygous. The Hardy-Weinberg Law states that the proportion P of heterozygous individuals in any given population is

$$P(p, q, r) = 2pq + 2pr + 2qr$$

where p represents the percent of allele A in the population, q represents the percent of allele B in the population, and r represents the percent of allele O in the population. Use the fact that

$$p + q + r = 1$$

to show that the maximum proportion of heterozygous individuals in any population is $\frac{2}{3}$.

18. **Shannon Diversity Index** One way to measure species diversity is to use the Shannon diversity index H. If a habitat consists of three species, A, B, and C, then its Shannon diversity index is

$$H = -x \ln x - y \ln y - z \ln z$$

where x is the percent of species A in the habitat, y is the percent of species B in the habitat, and z is the percent of species C in the habitat. Use the fact that

$$x + y + z = 1$$

to show that the maximum value of H occurs when $x = y = z = \frac{1}{3}$. What is the maximum value of H?

19. **Minimum Cost** A water line is to be built from point P to point S and must pass through regions where construction costs differ (see figure). The cost per kilometer (in dollars) is $3k$ from P to Q, $2k$ from Q to R, and k from R to S. Find x and y such that the total cost C will be minimized.

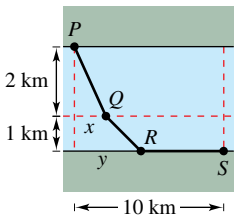

Figure for 19

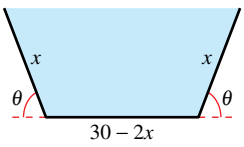

Figure for 20

20. **Area** A trough with trapezoidal cross sections is formed by turning up the edges of a 30-inch-wide sheet of aluminum (see figure). Find the cross section of maximum area.

Finding the Least Squares Regression Line **In Exercises 25–28, find the least squares regression line for the points. Use the regression capabilities of a graphing utility to verify your results. Use the graphing utility to plot the points and graph the regression line.**

25. $(0, 0),\ (1, 1),\ (3, 6),\ (4, 8),\ (5, 9)$

26. $(0, 4),\ (4, 1),\ (7, -3)$

27. $(0, 6),\ (4, 3),\ (5, 0),\ (8, -4),\ (10, -5)$

28. $(6, 4),\ (1, 2),\ (3, 3),\ (8, 6),\ (11, 8),\ (13, 8)$

29. Modeling Data The table shows the gross tax collections (in billions of dollars) by the Internal Revenue Service for internal revenue x and income taxes y for selected years. *(Source: U.S. Internal Revenue Service)*

Year	1985	1990	1995	2000
Internal Revenue, x	743	1056	1376	2097
Income Taxes, y	474	650	850	1373

Year	2005	2010	2015	2020
Internal Revenue, x	2269	2345	3303	3493
Income Taxes, y	1415	1454	2183	2135

(a) Use the regression capabilities of a graphing utility to find the least squares regression line for the data.

(b) Use the model to estimate the income taxes collected when the internal revenue collected is \$1300 billion.

(c) In 1980, the internal revenue collected was \$519 billion and the income taxes collected was \$360 billion. Describe how including this information would affect the model.

30. Modeling Data The ages x (in years) and systolic blood pressures y (in mmHg) of seven men are shown in the table.

Age, x	16	25	39	45	49	64	70
Systolic Blood Pressure, y	109	122	150	165	159	183	199

(a) Use the regression capabilities of a graphing utility to find the least squares regression line for the data.

(b) Use a graphing utility to plot the data and graph the model.

(c) Use the model to approximate the change in systolic blood pressure for each one-year increase in age.

(d) A 30-year-old man has a systolic blood pressure of 180 mmHg. Describe how including this information would affect the model.

Exploring Concepts

31. Find a system of equations whose solution yields the coefficients a, b, and c for the least squares regression quadratic

$$y = ax^2 + bx + c$$

for the points $(x_1, y_1), (x_2, y_2), \ldots, (x_n, y_n)$ by minimizing the sum

$$S(a, b, c) = \sum_{i=1}^{n} (y_i - ax_i^2 - bx_i - c)^2.$$

32. HOW DO YOU SEE IT? Match the regression equation with the appropriate graph. Explain your reasoning. (Note that the x- and y-axes are broken.)

(a) $y = 0.22x - 7.5$

(b) $y = -0.35x + 11.5$

(c) $y = 0.09x + 19.8$

(d) $y = -1.29x + 89.8$

Finding the Least Squares Regression Quadratic **In Exercises 33–36, use the result of Exercise 31 to find the least squares regression quadratic for the points. Use the regression capabilities of a graphing utility to verify your results. Use the graphing utility to plot the points and graph the least squares regression quadratic.**

33. $(-2, 0),\ (-1, 0),\ (0, 1),\ (1, 2),\ (2, 5)$

34. $(-4, 5),\ (-2, 6),\ (2, 6),\ (4, 2)$

35. $(0, 0),\ (2, 2),\ (3, 6),\ (4, 12)$

36. $(0, 10),\ (1, 9),\ (2, 6),\ (3, 0)$

37. Modeling Data After a new turbocharger for an automobile engine was developed, the following experimental data were obtained for speed y in miles per hour at two-second time intervals x.

Time, x	0	2	4	6	8	10
Speed, y	0	15	30	50	65	70

(a) Use the result of Exercise 31 to find the least squares regression quadratic for the data.

(b) Use a graphing utility to plot the points and graph the model.

38. Modeling Data The table shows the total numbers of veterans y (in millions) with a service-connected disability for 2015 through 2019. Let $x = 5$ represent the year 2015. *(Source: U.S. Department of Veterans Affairs)*

Year, x	2015	2016	2017	2018	2019
Veterans, y	4.2	4.4	4.6	4.7	4.9

(a) Use the regression capabilities of a graphing utility to find the least squares regression line for the data.

(b) Use the regression capabilities of a graphing utility to find the least squares regression quadratic for the data.

(c) Use a graphing utility to plot the data and graph the models.

(d) Use both models to forecast the total number of veterans with a service-connected disability for the year 2030. How do the two models differ as you extrapolate into the future?

39. Modeling Data A meteorologist measures the atmospheric pressure P (in kilograms per square meter) at altitude h (in kilometers). The data are shown below.

Altitude, h	0	5	10	15	20
Pressure, P	10,332	5583	2376	1240	517

(a) Use the regression capabilities of a graphing utility to find the least squares regression line for the points $(h, \ln P)$.

(b) The result in part (a) is an equation of the form $\ln P = ah + b$. Write this logarithmic form in exponential form.

(c) Use a graphing utility to plot the original data, and graph the exponential model in part (b).

40. Modeling Data The endpoints of the interval over which distinct vision is possible are called the *near point* and *far point* of the eye. With increasing age, these points normally change. The table shows the approximate near points y (in inches) for various ages x (in years). *(Source: Ophthalmology & Physiological Optics)*

Age, x	16	32	44	50	60
Near Point, y	3.0	4.7	9.8	19.7	39.4

(a) Find a rational model for the data by taking the reciprocals of the near points to generate the points $(x, 1/y)$. Use the regression capabilities of a graphing utility to find the least squares regression line for the revised data. The resulting line has the form $1/y = ax + b$. Solve for y.

(b) Use a graphing utility to plot the data and graph the model.

(c) Do you think the model can be used to predict the near point for a person who is 70 years old? Explain.

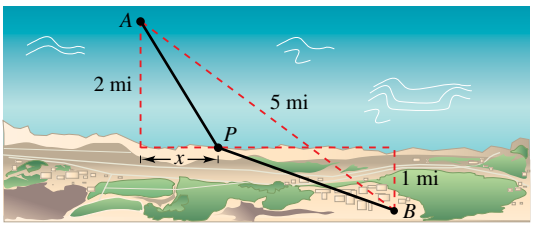
41. Using the Second Partials Test Use the Second Partials Test to verify that the formulas for a and b given in Theorem 13.18 yield a minimum.

$$\left[\textit{Hint: } \text{Use the fact that } n\sum_{i=1}^{n} x_i^2 \geq \left(\sum_{i=1}^{n} x_i\right)^2.\right]$$

SECTION PROJECT

Building a Pipeline

An oil company wishes to construct a pipeline from its offshore facility A to its refinery B. The offshore facility is 2 miles from shore, and the refinery is 1 mile inland. Furthermore, A and B are 5 miles apart, as shown in the figure.



The cost of building the pipeline is \$3 million per mile in the water and \$4 million per mile on land. So, the cost of the pipeline depends on the location of point P, where it meets the shore. What would be the most economical route of the pipeline?

Imagine that you are to write a report to the oil company about this problem. Let x be the distance shown in the figure. Determine the cost of building the pipeline from A to P and the cost of building it from P to B. Analyze some sample pipeline routes and their corresponding costs. For instance, what is the cost of the most direct route? Then use calculus to determine the route of the pipeline that minimizes the cost. Explain all steps of your development and include any relevant graphs.

13.10 Lagrange Multipliers

GO DIGITAL

- **Describe the Method of Lagrange Multipliers.**
- **Use Lagrange multipliers to solve constrained optimization problems.**
- **Use the Method of Lagrange Multipliers with two constraints.**

LAGRANGE MULTIPLIERS

The Method of Lagrange Multipliers is named after the French mathematician Joseph-Louis Lagrange. Lagrange first introduced the method in his famous paper on mechanics, written when he was just 19 years old.

Lagrange Multipliers

Many optimization problems have restrictions, or **constraints,** on the values that can be used to produce the optimal solution. Such constraints tend to complicate optimization problems because the optimal solution can occur at a boundary point of the domain. In this section, you will study an ingenious technique for solving such problems. It is called the **Method of Lagrange Multipliers.**

To see how this technique works, consider the problem of finding the rectangle of maximum area that can be inscribed in the ellipse

$$\frac{x^2}{3^2} + \frac{y^2}{4^2} = 1.$$

Let (x, y) be the vertex of the rectangle in the first quadrant, as shown in Figure 13.78. Because the rectangle has sides of lengths $2x$ and $2y$, its area is given by

$$f(x, y) = 4xy. \qquad \text{Objective function}$$

You want to find x and y such that $f(x, y)$ is a maximum. Your choice of (x, y) is restricted to first-quadrant points that lie on the ellipse

$$\frac{x^2}{3^2} + \frac{y^2}{4^2} = 1. \qquad \text{Constraint}$$

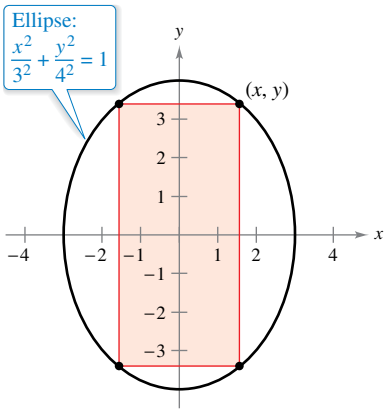
Now, consider the constraint equation to be a fixed level curve of

$$g(x, y) = \frac{x^2}{3^2} + \frac{y^2}{4^2}.$$

The level curves of f represent a family of hyperbolas

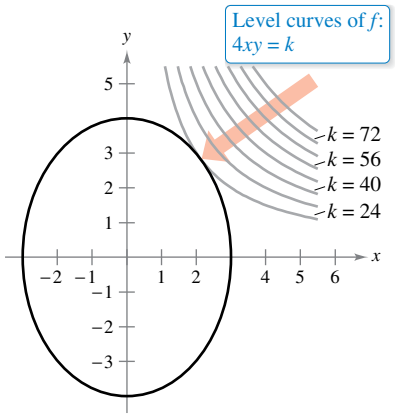
$$f(x, y) = 4xy = k.$$

In this family, the level curves that meet the constraint correspond to the hyperbolas that intersect the ellipse. Moreover, to maximize $f(x, y)$, you want to find the hyperbola that just barely satisfies the constraint. The level curve that does this is the one that is *tangent* to the ellipse, as shown in Figure 13.79.



Objective function: $f(x, y) = 4xy$

Figure 13.78



Constraint: $g(x, y) = \frac{x^2}{3^2} + \frac{y^2}{4^2} = 1$

Figure 13.79

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

To find the appropriate hyperbola, use the fact that two curves are tangent at a point if and only if their gradients are parallel. This means that $\nabla f(x, y)$ must be a scalar multiple of $\nabla g(x, y)$ at the point of tangency. In the context of constrained optimization problems, this scalar is denoted by λ (the lowercase Greek letter lambda).

$$\nabla f(x, y) = \lambda \nabla g(x, y)$$

The scalar λ is called a **Lagrange multiplier.** Theorem 13.19 gives the necessary conditions for the existence of such multipliers.

THEOREM 13.19 Lagrange's Theorem

Let f and g have continuous first partial derivatives such that f has an extremum at a point (x_0, y_0) on the smooth constraint curve $g(x, y) = c$. If $\nabla g(x_0, y_0) \neq \mathbf{0}$, then there is a real number λ such that

$$\nabla f(x_0, y_0) = \lambda \nabla g(x_0, y_0).$$

REMARK Using a similar argument with level surfaces and Theorem 13.14, it can be shown that Lagrange's Theorem is also true for functions of three variables.

Proof To begin, represent the smooth curve given by $g(x, y) = c$ by the vector-valued function

$$\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}, \quad \mathbf{r}'(t) \neq \mathbf{0}$$

where x' and y' are continuous on an open interval I. Define the function h as $h(t) = f(x(t), y(t))$. Then, because $f(x_0, y_0)$ is an extreme value of f, you know that

$$h(t_0) = f(x(t_0), y(t_0)) = f(x_0, y_0)$$

is an extreme value of h. This implies that $h'(t_0) = 0$, and, by the Chain Rule,

$$\begin{aligned} h'(t_0) &= f_x(x_0, y_0)x'(t_0) + f_y(x_0, y_0)y'(t_0) \\ &= \nabla f(x_0, y_0) \cdot \mathbf{r}'(t_0) \\ &= 0. \end{aligned}$$

So, $\nabla f(x_0, y_0)$ is orthogonal to $\mathbf{r}'(t_0)$. Moreover, by Theorem 13.12, $\nabla g(x_0, y_0)$ is also orthogonal to $\mathbf{r}'(t_0)$. Consequently, the gradients $\nabla f(x_0, y_0)$ and $\nabla g(x_0, y_0)$ are parallel, and there must exist a scalar λ such that

$$\nabla f(x_0, y_0) = \lambda \nabla g(x_0, y_0).$$

The Method of Lagrange Multipliers uses Theorem 13.19 to find the extreme values of a function f subject to a constraint.

REMARK As you will see in Examples 1 and 2, the Method of Lagrange Multipliers requires solving systems of nonlinear equations. This often can require some tricky algebraic manipulation.

Method of Lagrange Multipliers

Let f and g satisfy the hypothesis of Lagrange's Theorem, and let f have a minimum or maximum subject to the constraint $g(x, y) = c$. To find the minimum or maximum of f, use these steps.

1. Simultaneously solve the equations $\nabla f(x, y) = \lambda \nabla g(x, y)$ and $g(x, y) = c$ by solving the following system of equations.

$$\begin{aligned} f_x(x, y) &= \lambda g_x(x, y) \\ f_y(x, y) &= \lambda g_y(x, y) \\ g(x, y) &= c \end{aligned}$$

2. Evaluate f at each solution point obtained in the first step. The greatest value yields the maximum of f subject to the constraint $g(x, y) = c$, and the least value yields the minimum of f subject to the constraint $g(x, y) = c$.

Constrained Optimization Problems

In the problem at the beginning of this section, you wanted to maximize the area of a rectangle that is inscribed in an ellipse. Example 1 shows how to use Lagrange multipliers to solve this problem.

EXAMPLE 1 **Using a Lagrange Multiplier with One Constraint**

Find the maximum value of $f(x, y) = 4xy$, where $x > 0$ and $y > 0$, subject to the constraint $(x^2/3^2) + (y^2/4^2) = 1$.

Solution To begin, let

$$g(x, y) = \frac{x^2}{3^2} + \frac{y^2}{4^2} = 1.$$

By equating $\nabla f(x, y) = 4y\mathbf{i} + 4x\mathbf{j}$ and $\lambda \nabla g(x, y) = (2\lambda x/9)\mathbf{i} + (\lambda y/8)\mathbf{j}$, you obtain the following system of equations.

$$4y = \frac{2}{9}\lambda x \qquad f_x(x, y) = \lambda g_x(x, y)$$

$$4x = \frac{1}{8}\lambda y \qquad f_y(x, y) = \lambda g_y(x, y)$$

$$\frac{x^2}{3^2} + \frac{y^2}{4^2} = 1 \qquad \text{Constraint}$$

From the first equation, you obtain $\lambda = 18y/x$, and substitution into the second equation produces

$$4x = \frac{1}{8}\left(\frac{18y}{x}\right)y \quad \Rightarrow \quad x^2 = \frac{9}{16}y^2.$$

Substituting this value for x^2 into the third equation produces

$$\frac{1}{9}\left(\frac{9}{16}y^2\right) + \frac{1}{16}y^2 = 1 \quad \Rightarrow \quad y^2 = 8 \quad \Rightarrow \quad y = \pm 2\sqrt{2}.$$

Because $y > 0$, choose the positive value and find that

$$x^2 = \frac{9}{16}y^2$$

$$= \frac{9}{16}(8)$$

$$= \frac{9}{2}$$

$$x = \pm\frac{3}{\sqrt{2}}.$$

Because $x > 0$, choose the positive value. So, the maximum value of f is

$$f\left(\frac{3}{\sqrt{2}}, 2\sqrt{2}\right) = 4\left(\frac{3}{\sqrt{2}}\right)\left(2\sqrt{2}\right) = 24.$$

REMARK Note in Example 1 that writing the constraint as

$$\frac{x^2}{3^2} + \frac{y^2}{4^2} = 1$$

or

$$\frac{x^2}{3^2} + \frac{y^2}{4^2} - 1 = 0$$

does not affect the solution—the constant is eliminated when you form ∇g.

Example 1 can also be solved using the techniques you learned in Chapter 3. To see how, try to find the maximum value of $A = 4xy$ given that $(x^2/3^2) + (y^2/4^2) = 1$. To begin, solve the second equation for y to obtain $y = \frac{4}{3}\sqrt{9 - x^2}$. Then substitute into the first equation to obtain $A = 4x\left(\frac{4}{3}\sqrt{9 - x^2}\right)$. Finally, use the techniques of Chapter 3 to maximize A.

FOR FURTHER INFORMATION
For more information on the use of Lagrange multipliers in economics, see the article "Lagrange Multiplier Problems in Economics" by John V. Baxley and John C. Moorhouse in *The American Mathematical Monthly*. To view this article, go to *MathArticles.com*.

EXAMPLE 2 A Business Application

The Cobb-Douglas production function (see Section 13.1) for a manufacturer is given by

$$f(x, y) = 100x^{3/4}y^{1/4}$$ Objective function

where x represents the units of labor (at \$150 per unit) and y represents the units of capital (at \$250 per unit). The total cost of labor and capital is limited to \$50,000. Find the maximum production level for this manufacturer.

Solution The gradient of f is

$$\nabla f(x, y) = 75x^{-1/4}y^{1/4}\mathbf{i} + 25x^{3/4}y^{-3/4}\mathbf{j}.$$

The limit on the cost of labor and capital produces the constraint

$$g(x, y) = 150x + 250y = 50{,}000.$$ Constraint

So, $\lambda\nabla g(x, y) = 150\lambda\mathbf{i} + 250\lambda\mathbf{j}$. This gives rise to the following system of equations.

$$\begin{aligned} 75x^{-1/4}y^{1/4} &= 150\lambda && f_x(x, y) = \lambda g_x(x, y) \\ 25x^{3/4}y^{-3/4} &= 250\lambda && f_y(x, y) = \lambda g_y(x, y) \\ 150x + 250y &= 50{,}000 && \text{Constraint} \end{aligned}$$

By solving for λ in the first equation

$$\lambda = \frac{75x^{-1/4}y^{1/4}}{150} = \frac{x^{-1/4}y^{1/4}}{2}$$

and substituting into the second equation, you obtain

$$\begin{aligned} 25x^{3/4}y^{-3/4} &= 250\left(\frac{x^{-1/4}y^{1/4}}{2}\right) \\ 25x &= 125y && \text{Multiply by } x^{1/4}y^{3/4}. \\ x &= 5y. \end{aligned}$$

By substituting this value for x in the third equation, you have

$$\begin{aligned} 150(5y) + 250y &= 50{,}000 \\ 1000y &= 50{,}000 \\ y &= 50 \text{ units of capital.} \end{aligned}$$

This means that the value of x is

$$\begin{aligned} x &= 5(50) \\ &= 250 \text{ units of labor.} \end{aligned}$$

So, the maximum production level is

$$\begin{aligned} f(250, 50) &= 100(250)^{3/4}(50)^{1/4} \\ &\approx 16{,}719 \text{ units of product.} \end{aligned}$$

Economists call the Lagrange multiplier obtained in a production function the **marginal productivity of money.** For instance, in Example 2, the marginal productivity of money at $x = 250$ and $y = 50$ is

$$\lambda = \frac{x^{-1/4}y^{1/4}}{2} = \frac{(250)^{-1/4}(50)^{1/4}}{2} \approx 0.334.$$

This means that for each additional dollar spent on production, approximately 0.334 additional unit of the product can be produced.

EXAMPLE 3 Lagrange Multipliers and Three Variables

See LarsonCalculus.com for an interactive version of this type of example.

Find the minimum value of

$$f(x, y, z) = 2x^2 + y^2 + 3z^2$$ Objective function

subject to the constraint $2x - 3y - 4z = 49$.

Solution Let $g(x, y, z) = 2x - 3y - 4z = 49$. Then, because

$$\nabla f(x, y, z) = 4x\mathbf{i} + 2y\mathbf{j} + 6z\mathbf{k}$$

and

$$\lambda \nabla g(x, y, z) = 2\lambda\mathbf{i} - 3\lambda\mathbf{j} - 4\lambda\mathbf{k}$$

you obtain the following system of equations.

$$\begin{aligned} 4x &= 2\lambda && f_x(x, y, z) = \lambda g_x(x, y, z) \\ 2y &= -3\lambda && f_y(x, y, z) = \lambda g_y(x, y, z) \\ 6z &= -4\lambda && f_z(x, y, z) = \lambda g_z(x, y, z) \\ 2x - 3y - 4z &= 49 && \text{Constraint} \end{aligned}$$

The solution of this system is $x = 3$, $y = -9$, and $z = -4$. So, the optimum value of f is

$$\begin{aligned} f(3, -9, -4) &= 2(3)^2 + (-9)^2 + 3(-4)^2 \\ &= 147. \end{aligned}$$

From the original function and constraint, it is clear that $f(x, y, z)$ has no maximum. So, the optimum value of f determined above is a minimum. ■

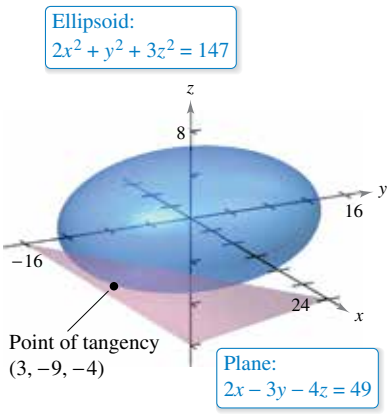

Figure 13.80

A graphical interpretation of constrained optimization problems in two variables was given at the beginning of this section. In three variables, the interpretation is similar, except that level surfaces are used instead of level curves. For instance, in Example 3, the level surfaces of f are ellipsoids centered at the origin, and the constraint

$$2x - 3y - 4z = 49$$

is a plane. The minimum value of f is represented by the ellipsoid that is tangent to the constraint plane, as shown in Figure 13.80.

EXAMPLE 4 Optimization Inside a Region

Find the extreme values of

$$f(x, y) = x^2 + 2y^2 - 2x + 3$$ Objective function

subject to the constraint $x^2 + y^2 \leq 10$.

Solution To solve this problem, you can break the constraint into two cases.

a. For points *on the circle* $x^2 + y^2 = 10$, you can use Lagrange multipliers to find that the maximum value of $f(x, y)$ is 24—this value occurs at $(-1, 3)$ and at $(-1, -3)$. In a similar way, you can determine that the minimum value of $f(x, y)$ is approximately 6.675—this value occurs at $\left(\sqrt{10}, 0\right)$.

b. For points *inside the circle,* you can use the techniques discussed in Section 13.8 to conclude that the function has a relative minimum of 2 at the point $(1, 0)$.

By combining these two results, you can conclude that f has a maximum of 24 at $(-1, \pm 3)$ and a minimum of 2 at $(1, 0)$, as shown in Figure 13.81. ■

The Method of Lagrange Multipliers with Two Constraints

For optimization problems involving *two* constraint functions g and h, you can introduce a second Lagrange multiplier, μ (the lowercase Greek letter mu), and then solve the equation

$$\nabla f = \lambda \nabla g + \mu \nabla h$$

where the gradients are not parallel, as illustrated in Example 5.

EXAMPLE 5 Optimization with Two Constraints

Let $T(x, y, z) = 20 + 2x + 2y + z^2$ represent the temperature at each point on the sphere

$$x^2 + y^2 + z^2 = 11.$$

Find the extreme temperatures on the curve formed by the intersection of the plane $x + y + z = 3$ and the sphere.

Solution The two constraints are

$$g(x, y, z) = x^2 + y^2 + z^2 = 11 \quad \text{and} \quad h(x, y, z) = x + y + z = 3.$$

Using

$$\nabla T(x, y, z) = 2\mathbf{i} + 2\mathbf{j} + 2z\mathbf{k}$$
$$\lambda \nabla g(x, y, z) = 2\lambda x\mathbf{i} + 2\lambda y\mathbf{j} + 2\lambda z\mathbf{k}$$

and

$$\mu \nabla h(x, y, z) = \mu\mathbf{i} + \mu\mathbf{j} + \mu\mathbf{k}$$

you can write the following system of equations.

$$\begin{aligned} 2 &= 2\lambda x + \mu && T_x(x, y, z) = \lambda g_x(x, y, z) + \mu h_x(x, y, z) \\ 2 &= 2\lambda y + \mu && T_y(x, y, z) = \lambda g_y(x, y, z) + \mu h_y(x, y, z) \\ 2z &= 2\lambda z + \mu && T_z(x, y, z) = \lambda g_z(x, y, z) + \mu h_z(x, y, z) \\ x^2 + y^2 + z^2 &= 11 && \text{Constraint 1} \\ x + y + z &= 3 && \text{Constraint 2} \end{aligned}$$

By subtracting the second equation from the first, you obtain the following system.

$$\begin{aligned} \lambda(x - y) &= 0 \\ 2z(1 - \lambda) - \mu &= 0 \\ x^2 + y^2 + z^2 &= 11 \\ x + y + z &= 3 \end{aligned}$$

From the first equation, you can conclude that $\lambda = 0$ or $x = y$. For $\lambda = 0$, you can show that the critical points are $(3, -1, 1)$ and $(-1, 3, 1)$. (Try doing this—it takes a little work.) For $\lambda \neq 0$, then $x = y$ and you can show that the critical points occur when $x = y = \left(3 \pm 2\sqrt{3}\right)/3$ and $z = \left(3 \mp 4\sqrt{3}\right)/3$. Finally, to find the optimal solutions, compare the temperatures at the four critical points.

$$T(3, -1, 1) = T(-1, 3, 1) = 25$$
$$T\left(\frac{3 - 2\sqrt{3}}{3}, \frac{3 - 2\sqrt{3}}{3}, \frac{3 + 4\sqrt{3}}{3}\right) = \frac{91}{3} \approx 30.33$$
$$T\left(\frac{3 + 2\sqrt{3}}{3}, \frac{3 + 2\sqrt{3}}{3}, \frac{3 - 4\sqrt{3}}{3}\right) = \frac{91}{3} \approx 30.33$$

So, $T = 25$ is the minimum temperature and $T = \frac{91}{3}$ is the maximum temperature on the curve. ■

REMARK The systems of equations that arise when the Method of Lagrange Multipliers is used are not, in general, linear systems, and finding the solutions often requires ingenuity.

Concept Check

1. Explain what is meant by constrained optimization problems.
2. Describe the Method of Lagrange Multipliers for solving constrained optimization problems.

Using Lagrange Multipliers **In Exercises 3–10, use Lagrange multipliers to find the indicated extrema, assuming that x and y are positive.**

3. Maximize $f(x, y) = xy$
   Constraint: $x + y = 10$
4. Minimize $f(x, y) = 2x + y$
   Constraint: $xy = 32$
5. Minimize $f(x, y) = x^2 + y^2$
   Constraint: $x + 2y - 5 = 0$
6. Maximize $f(x, y) = x^2 - y^2$
   Constraint: $2y - x^2 = 0$
7. Maximize $f(x, y) = 2x + 2xy + y$
   Constraint: $2x + y = 100$
8. Minimize $f(x, y) = 3x + y + 10$
   Constraint: $x^2y = 6$
9. Maximize $f(x, y) = \sqrt{6 - x^2 - y^2}$
   Constraint: $x + y - 2 = 0$
10. Minimize $f(x, y) = \sqrt{x^2 + y^2}$
    Constraint: $2x + 4y - 15 = 0$

Using Lagrange Multipliers **In Exercises 11–14, use Lagrange multipliers to find the indicated extrema, assuming that x, y, and z are positive.**

11. Minimize $f(x, y, z) = x^2 + y^2 + z^2$
    Constraint: $x + y + z - 9 = 0$
12. Maximize $f(x, y, z) = xyz$
    Constraint: $x + y + z - 3 = 0$
13. Minimize $f(x, y, z) = x^2 + y^2 + z^2$
    Constraint: $x + y + z = 1$
14. Maximize $f(x, y, z) = x + y + z$
    Constraint: $x^2 + y^2 + z^2 = 1$

Using Lagrange Multipliers **In Exercises 15 and 16, use Lagrange multipliers to find any extrema of the function subject to the constraint $x^2 + y^2 \leq 1$.**

15. $f(x, y) = x^2 + 3xy + y^2$
16. $f(x, y) = e^{-xy/4}$

Using Lagrange Multipliers **In Exercises 17 and 18, use Lagrange multipliers to find the indicated extrema of f subject to two constraints, assuming that x, y, and z are nonnegative.**

17. Maximize $f(x, y, z) = xyz$
    Constraints: $x + y + z = 32, \quad x - y + z = 0$
18. Minimize $f(x, y, z) = x^2 + y^2 + z^2$
    Constraints: $x + 2z = 6, \quad x + y = 12$

Finding Minimum Distance **In Exercises 19–28, use Lagrange multipliers to find the minimum distance from the curve or surface to the indicated point. (*Hint:* To simplify the computations, minimize the square of the distance.)**

Curve	Point
19. Line: $x + y = 1$	$(0, 0)$
20. Line: $2x + 3y = -1$	$(0, 0)$
21. Line: $x - y = 4$	$(0, 2)$
22. Line: $x + 4y = 3$	$(1, 0)$
23. Parabola: $y = x^2$	$(0, 3)$
24. Parabola: $y = x^2$	$(-3, 0)$
25. Circle: $x^2 + (y - 1)^2 = 9$	$(4, 4)$
26. Circle: $(x - 4)^2 + y^2 = 4$	$(0, 10)$
Surface	**Point**
27. Plane: $x + y + z = 1$	$(2, 1, 1)$
28. Cone: $z = \sqrt{x^2 + y^2}$	$(4, 0, 0)$

Intersection of Surfaces **In Exercises 29 and 30, use Lagrange multipliers to find the highest point on the curve of intersection of the surfaces.**

29. Cone: $x^2 + y^2 - z^2 = 0$
    Plane: $x + 2z = 4$
30. Sphere: $x^2 + y^2 + z^2 = 36$
    Plane: $2x + y - z = 2$

Using Lagrange Multipliers **In Exercises 31–38, use Lagrange multipliers to solve the indicated exercise in Section 13.9.**

31. Exercise 3
32. Exercise 4
33. Exercise 7
34. Exercise 8
35. Exercise 11
36. Exercise 12
37. Exercise 17
38. Exercise 18

39. **Maximum Volume** Use Lagrange multipliers to find the dimensions of a rectangular box of maximum volume that can be inscribed (with edges parallel to the coordinate axes) in the ellipsoid

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1.$$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

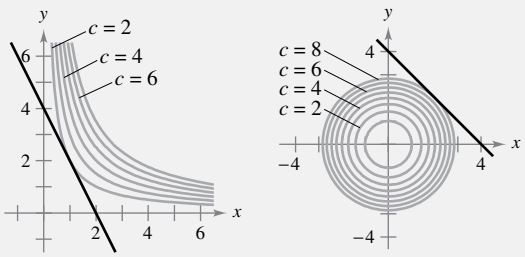
40. HOW DO YOU SEE IT? The graphs show the constraint and several level curves of the objective function. Use the graph to approximate the indicated extrema.

(a) Maximize $z = xy$ Constraint: $2x + y = 4$

(b) Minimize $z = x^2 + y^2$ Constraint: $x + y - 4 = 0$



Exploring Concepts

41. Explain why you cannot use Lagrange multipliers to find the minimum of the function $f(x, y) = x$ subject to the constraint $y^2 + x^4 - x^3 = 0$.

42. Draw the level curves for $f(x, y) = x^2 + y^2 = c$ for $c = 1, 2, 3$, and 4, and sketch the constraint $x + y = 2$. Explain analytically how you know that the extremum of $f(x, y) = x^2 + y^2$ at $(1, 1)$ is a minimum instead of a maximum.

43. Minimum Cost A cargo container (in the shape of a rectangular solid) must have a volume of 480 cubic feet. The bottom will cost \$5 per square foot to construct, and the sides and the top will cost \$3 per square foot to construct. Use Lagrange multipliers to find the dimensions of the container of this size that has minimum cost.

44. Geometric and Arithmetic Means

(a) Use Lagrange multipliers to prove that the product of three positive numbers x, y, and z, whose sum has the constant value S, is a maximum when the three numbers are equal. Use this result to prove that

$$\sqrt[3]{xyz} \le \frac{x + y + z}{3}.$$

(b) Generalize the result of part (a) to prove that the product $x_1x_2x_3 \cdots x_n$ is a maximum when

$$x_1 = x_2 = x_3 = \cdots = x_n, \sum_{i=1}^{n} x_i = S, \text{ and all } x_i \ge 0.$$

Then prove that

$$\sqrt[n]{x_1x_2x_3 \cdots x_n} \le \frac{x_1 + x_2 + x_3 + \cdots + x_n}{n}.$$

This shows that the geometric mean is never greater than the arithmetic mean.

45. Minimum Surface Area Use Lagrange multipliers to find the dimensions of a right circular cylinder with volume V_0 and minimum surface area.

46. Temperature Let $T(x, y, z) = 100 + x^2 + y^2$ represent the temperature at each point on the sphere

$$x^2 + y^2 + z^2 = 50.$$

Use Lagrange multipliers to find the maximum temperature on the curve formed by the intersection of the sphere and the plane $x - z = 0$.

47. Refraction of Light When light waves traveling in a transparent medium strike the surface of a second transparent medium, they tend to "bend" to follow the path of minimum time. This tendency is called *refraction* and is described by **Snell's Law of Refraction,**

$$\frac{\sin\theta_1}{v_1} = \frac{\sin\theta_2}{v_2}$$

where θ_1 and θ_2 are the magnitudes of the angles shown in the figure, and v_1 and v_2 are the velocities of light in the two media. Use Lagrange multipliers to derive this law using $x + y = a$.

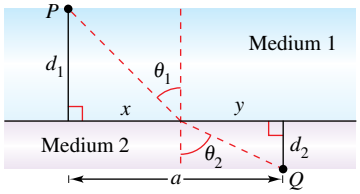


Figure for 47

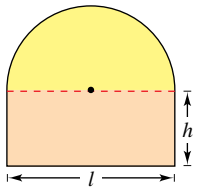

Figure for 48

48. Area and Perimeter A semicircle is on top of a rectangle (see figure). When the area is fixed and the perimeter is a minimum, or when the perimeter is fixed and the area is a maximum, use Lagrange multipliers to verify that the length of the rectangle is twice its height.

Production Level **In Exercises 49 and 50, use Lagrange multipliers to find the maximum production level when the total cost of labor (at \$112 per unit) and capital (at \$60 per unit) is limited to \$250,000, where P is the production function, x is the number of units of labor, and y is the number of units of capital.**

49. $P(x, y) = 100x^{0.25}y^{0.75}$

50. $P(x, y) = 100x^{0.4}y^{0.6}$

Cost **In Exercises 51 and 52, use Lagrange multipliers to find the minimum cost of producing 50,000 units of a product, where P is the production function, x is the number of units of labor (at \$72 per unit), and y is the number of units of capital (at \$80 per unit).**

51. $P(x, y) = 100x^{0.25}y^{0.75}$ **52.** $P(x, y) = 100x^{0.6}y^{0.4}$

PUTNAM EXAM CHALLENGE

53. A can buoy is to be made of three pieces, namely, a cylinder and two equal cones, the altitude of each cone being equal to the altitude of the cylinder. For a given area of surface, what shape will have the greatest volume?

Exploring Concepts

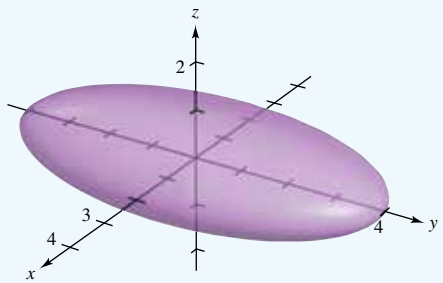
In this chapter, you expanded your knowledge of calculus from functions of one variable to functions of two or more variables. Many of the formulas and techniques in this chapter are extensions of those used in earlier chapters of the text. Several examples are listed below.

Single variable	**Two variable**
Limit of $y = f(x)$	*Limit of* $z = f(x, y)$
$\lim_{x \to c} f(x) = L$	$\lim_{(x, y) \to (x_0, y_0)} f(x, y) = L$
Derivative of $y = f(x)$	*Partial Derivative of* $z = f(x, y)$
$\frac{dy}{dx} = \lim_{\Delta x \to 0} \frac{f(x + \Delta x) - f(x)}{\Delta x}$	$\frac{\partial z}{\partial x} = \lim_{\Delta x \to 0} \frac{f(x + \Delta x, y) - f(x, y)}{\Delta x}$

1. In your own words, describe how to sketch the graph of a function of two variables.

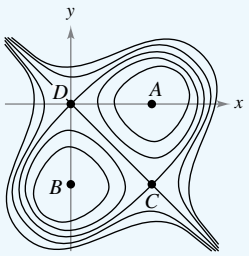
2. How can you visualize a function of three variables?

3. Use the graph to determine whether z is a function of x and y. Explain.



4. Sketch a graph of a function $z = f(x, y)$ whose derivative f_x is always negative and whose derivative f_y is always negative.

5. The figure shows the level curves for an unknown function $f(x, y)$. What, if any, information can be determined about f at the points A, B, C, and D? Explain your reasoning.



6. Consider the functions $f(x, y) = x^2 - y^2$ and $g(x, y) = x^2 + y^2$.

(a) Show that both functions have a critical point at $(0, 0)$.

(b) Explain how f and g behave differently at this critical point.

Evaluating a Function **In Exercises 7 and 8, evaluate the function at the given values of the independent variables. Simplify the results.**

7. $f(x, y) = x^2y - 3$

(a) $f(0, 4)$ (b) $f(2, -1)$ (c) $f(-3, 2)$ (d) $f(x, 7)$

8. $f(x, y) = 6 - 4x - 2y^2$

(a) $f(0, 2)$ (b) $f(5, 0)$ (c) $f(-1, -2)$ (d) $f(-3, y)$

Finding the Domain and Range of a Function **In Exercises 9 and 10, find the domain and range of the function.**

9. $f(x, y) = \frac{\sqrt{x}}{y}$

10. $f(x, y) = \sqrt{36 - x^2 - y^2}$

Sketching a Surface **In Exercises 11 and 12, describe and sketch the surface given by the function.**

11. $f(x, y) = -2$

12. $g(x, y) = x$

Sketching a Contour Map **In Exercises 13 and 14, describe the level curves of the function. Sketch a contour map of the surface using level curves for the given c-values.**

13. $z = 3 - 2x + y, \quad c = 0, 2, 4, 6, 8$

14. $z = 2x^2 + y^2, \quad c = 1, 2, 3, 4, 5$

15. Conjecture Consider the function $f(x, y) = x^2 + y^2$.

(a) Sketch the graph of the surface given by f.

(b) Make a conjecture about the relationship between the graphs of f and $g(x, y) = f(x, y) + 2$. Explain your reasoning.

(c) Make a conjecture about the relationship between the graphs of f and $g(x, y) = f(x, y - 2)$. Explain your reasoning.

(d) On the surface in part (a), sketch the graphs of $z = f(1, y)$ and $z = f(x, 1)$.

16. Cobb-Douglas Production Function A manufacturer estimates that its production can be modeled by

$$f(x, y) = 100x^{0.8}y^{0.2}$$

where x is the number of units of labor and y is the number of units of capital.

(a) Find the production level when $x = 100$ and $y = 200$.

(b) Find the production level when $x = 500$ and $y = 1500$.

Sketching a Level Surface **In Exercises 17 and 18, describe and sketch the graph of the level surface $f(x, y, z) = c$ at the given value of c.**

17. $f(x, y, z) = x^2 - y + z^2, \quad c = 2$

18. $f(x, y, z) = 4x^2 - y^2 + 4z^2, \quad c = 0$

Limit and Continuity **In Exercises 19–24, find the limit (if it exists) and discuss the continuity of the function.**

19. $\lim_{(x, y)\to(1, 1)} \dfrac{xy}{x^2 + y^2}$

20. $\lim_{(x, y)\to(1, 1)} \dfrac{xy}{x^2 - y^2}$

21. $\lim_{(x, y)\to(0, 0)} \dfrac{y + xe^{-y^2}}{1 + x^2}$

22. $\lim_{(x, y)\to(0, 0)} \dfrac{x^2y}{x^4 + y^2}$

23. $\lim_{(x, y, z)\to(-3, 1, 2)} \dfrac{\ln z}{xy - z}$

24. $\lim_{(x, y, z)\to(1, 3, \pi)} \sin\dfrac{xz}{2y}$

Finding Partial Derivatives **In Exercises 25–32, find all first partial derivatives.**

25. $f(x, y) = 5x^3 + 7y - 3$

26. $f(x, y) = 4x^2 - 2xy + y^2$

27. $f(x, y) = e^x \cos y$

28. $f(x, y) = \dfrac{xy}{x + y}$

29. $f(x, y) = y^3e^{y/x}$

30. $z = \ln(x^2 + y^2 + 1)$

31. $f(x, y, z) = 2xz^2 + 6xyz$

32. $w = \sqrt{x^2 - y^2 - z^2}$

Finding and Evaluating Partial Derivatives **In Exercises 33–36, find all first partial derivatives, and evaluate each at the given point.**

33. $f(x, y) = x^2 - y, \quad (0, 2)$

34. $f(x, y) = xe^{2y}, \quad (-1, 1)$

35. $f(x, y, z) = xy \cos xz, \quad (2, 3, -\pi/3)$

36. $f(x, y, z) = \sqrt{x^2 + y - z^2}, \quad (-3, -3, 1)$

Finding Second Partial Derivatives **In Exercises 37–40, find the four second partial derivatives. Observe that the second mixed partials are equal.**

37. $f(x, y) = 3x^2 - xy + 2y^3$

38. $h(x, y) = \dfrac{x}{x + y}$

39. $h(x, y) = x \sin y + y \cos x$

40. $g(x, y) = \cos(x - 2y)$

41. Finding the Slopes of a Surface Find the slopes of the surface

$$z = x^2 \ln(y + 1)$$

in the x- and y-directions at the point $(2, 0, 0)$.

42. Marginal Revenue A company has two plants that produce the same lawn mower. If x_1 and x_2 are the numbers of units produced at plant 1 and plant 2, respectively, then the total revenue for the product is given by

$$R = 300x_1 + 300x_2 - 5x_1^2 - 10x_1x_2 - 5x_2^2.$$

When $x_1 = 5$ and $x_2 = 8$, find (a) the marginal revenue for plant 1, $\partial R/\partial x_1$, and (b) the marginal revenue for plant 2, $\partial R/\partial x_2$.

Finding a Total Differential **In Exercises 43–46, find the total differential.**

43. $z = x \sin xy$

44. $z = 5x^4y^3$

45. $w = 3xy^2 - 2x^3yz^2$

46. $w = \dfrac{3x + 4y}{y + 3z}$

Using a Differential as an Approximation **In Exercises 47 and 48, (a) find $f(2, 1)$ and $f(2.1, 1.05)$ and calculate Δz, and (b) use the total differential dz to approximate Δz.**

47. $f(x, y) = 4x + 2y$

48. $f(x, y) = 36 - x^2 - y^2$

49. Volume The possible error involved in measuring each dimension of a right circular cone is $\pm\frac{1}{8}$ inch. The radius is 2 inches and the height is 5 inches. Approximate the propagated error and the relative error in the calculated volume of the cone.

50. Lateral Surface Area Approximate the propagated error and the relative error in the calculated lateral surface area of the cone in Exercise 49. (The lateral surface area is given by $A = \pi r\sqrt{r^2 + h^2}$.)

Differentiability **In Exercises 51 and 52, show that the function is differentiable by finding values of ε_1 and ε_2 as designated in the definition of differentiability, and verify that both ε_1 and ε_2 approach 0 as $(\Delta x, \Delta y) \to (0, 0)$.**

51. $f(x, y) = 6x - y^2$

52. $f(x, y) = xy^2$

Using Different Methods **In Exercises 53–56, find dw/dt (a) by using the appropriate Chain Rule and (b) by converting w to a function of t before differentiating.**

53. $w = \ln(x^2 + y), \quad x = 2t, \quad y = 4 - t$

54. $w = y^2 - x, \quad x = \cos t, \quad y = \sin t$

55. $w = x^2z + y + z, \quad x = e^t, \quad y = t, \quad z = t^2$

56. $w = \sin x + y^2z + 2z, \quad x = \arcsin(t - 1), \quad y = t^3, \quad z = 3$

Using Different Methods **In Exercises 57 and 58, find $\partial w/\partial r$ and $\partial w/\partial t$ (a) by using the appropriate Chain Rule and (b) by converting w to a function of r and t before differentiating.**

57. $w = \dfrac{xy}{z}, \quad x = 2r + t, \quad y = rt, \quad z = 2r - t$

58. $w = x^2 + y^2 + z^2, \quad x = r \cos t, \quad y = r \sin t, \quad z = t$

Finding a Derivative Implicitly **In Exercises 59 and 60, differentiate implicitly to find dy/dx.**

59. $x^3 - xy + 5y = 0$

60. $\dfrac{xy^2}{x + y} = 3$

Finding Partial Derivatives Implicitly **In Exercises 61 and 62, differentiate implicitly to find the first partial derivatives of z.**

61. $x^2 + xy + y^2 + yz + z^2 = 0$

62. $xz^2 - y \sin z = 0$

Finding a Directional Derivative **In Exercises 63 and 64, use Theorem 13.9 to find the directional derivative of the function at P in the direction of $\mathbf{v}$.**

63. $f(x, y) = x^2y, \quad P(-5, 5), \quad \mathbf{v} = 3\mathbf{i} - 4\mathbf{j}$

64. $f(x, y) = \frac{1}{4}y^2 - x^2, \quad P(1, 4), \quad \mathbf{v} = 2\mathbf{i} + \mathbf{j}$

Finding a Directional Derivative **In Exercises 65 and 66, use the gradient to find the directional derivative of the function at P in the direction of $\mathbf{v}$.**

65. $w = y^2 + xz, \quad P(1, 2, 2), \quad \mathbf{v} = 2\mathbf{i} - \mathbf{j} + 2\mathbf{k}$

66. $w = 5x^2 + 2xy - 3y^2z, \quad P(1, 0, 1), \quad \mathbf{v} = \mathbf{i} + \mathbf{j} - \mathbf{k}$

Using Properties of the Gradient **In Exercises 67–72, find the gradient of the function and the maximum value of the directional derivative at the given point.**

67. $z = x^2y, \quad (2, 1)$

68. $z = e^{-x} \cos y, \quad \left(0, \frac{\pi}{4}\right)$

69. $z = \frac{y}{x^2 + y^2}, \quad (1, 1)$

70. $z = \frac{x^2}{x - y}, \quad (2, 1)$

71. $w = x^4y - y^2z^2, \quad \left(-1, \frac{1}{2}, 2\right)$

72. $w = e^{\sqrt{x+y+z^2}}, \quad (5, 0, 2)$

Using a Function **In Exercises 73 and 74, (a) find the gradient of the function at P, (b) find a unit normal vector to the level curve $f(x, y) = c$ at P, (c) find the tangent line to the level curve $f(x, y) = c$ at P, and (d) sketch the level curve, the unit normal vector, and the tangent line in the xy-plane.**

73. $f(x, y) = 9x^2 - 4y^2$

$c = 65, \quad P(3, 2)$

74. $f(x, y) = 4y \sin x - y$

$c = 3, \quad P\left(\frac{\pi}{2}, 1\right)$

Finding an Equation of a Tangent Plane **In Exercises 75–78, find an equation of the tangent plane to the surface at the given point.**

75. $z = x^2 + y^2 + 2, \quad (1, 3, 12)$

76. $9x^2 + y^2 + 4z^2 = 25, \quad (0, -3, 2)$

77. $z = -9 + 4x - 6y - x^2 - y^2, \quad (2, -3, 4)$

78. $f(x, y) = \sqrt{25 - y^2}, \quad (2, 3, 4)$

Finding an Equation of a Tangent Plane and a Normal Line **In Exercises 79 and 80, (a) find an equation of the tangent plane to the surface at the given point and (b) find a set of symmetric equations for the normal line to the surface at the given point.**

79. $f(x, y) = x^2y, \quad (2, 1, 4)$

80. $z = \sqrt{9 - x^2 - y^2}, \quad (1, 2, 2)$

Finding the Angle of Inclination of a Tangent Plane **In Exercises 81 and 82, find the angle of inclination of the tangent plane to the surface at the given point.**

81. $x^2 + y^2 + z^2 = 14, \quad (2, 1, 3)$

82. $xy + yz^2 = 32, \quad (-4, 1, 6)$

Horizontal Tangent Plane **In Exercises 83 and 84, find the point(s) on the surface at which the tangent plane is horizontal.**

83. $z = 9 - 2x^2 + y^3$

84. $z = 2xy + 3x + 5y$

Using the Second Partials Test **In Exercises 85–90, find all relative extrema and saddle points of the function. Use the Second Partials Test where applicable.**

85. $f(x, y) = -x^2 - 4y^2 + 8x - 8y - 11$

86. $f(x, y) = x^2 - y^2 - 16x - 16y$

87. $f(x, y) = 2x^2 + 6xy + 9y^2 + 8x + 14$

88. $f(x, y) = x^6y^6$

89. $f(x, y) = xy + \frac{1}{x} + \frac{1}{y}$

90. $f(x, y) = -8x^2 + 4xy - y^2 + 12x + 7$

91. Finding Minimum Distance Find the minimum distance from the point $(2, 1, 4)$ to the surface $x + y + z = 4$. (*Hint:* To simplify the computations, minimize the square of the distance.)

92. Finding Positive Numbers Find three positive integers, x, y, and z, such that the product is 64 and the sum is a minimum.

93. Maximum Revenue A company manufactures two types of bicycles, a racing bicycle and a mountain bicycle. The total revenue (in thousands of dollars) from x_1 units of racing bicycles and x_2 units of mountain bicycles is

$$R = -6x_1^2 - 10x_2^2 - 2x_1x_2 + 32x_1 + 84x_2$$

where x_1 and x_2 are in thousands of units. Find x_1 and x_2 so as to maximize the revenue.

94. Maximum Profit A corporation manufactures digital cameras at two locations. The cost of producing x_1 units at location 1 is $C_1 = 0.05x_1^2 + 15x_1 + 5400$ and the cost of producing x_2 units at location 2 is $C_2 = 0.03x_2^2 + 15x_2 + 6100$. The digital cameras sell for \$180 per unit. Find the quantity that should be produced at each location to maximize the profit $P = 180(x_1 + x_2) - C_1 - C_2$.

Finding the Least Squares Regression Line **In Exercises 95 and 96, find the least squares regression line for the points. Use the regression capabilities of a graphing utility to verify your results. Use the graphing utility to plot the points and graph the regression line.**

95. $(0, 4), (1, 5), (3, 6), (6, 8), (8, 10)$

96. $(0, 10), (2, 8), (4, 7), (7, 5), (9, 3), (12, 0)$

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. WCN 02-200-322

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

97. Modeling Data An agronomist used four test plots to determine the relationship between the wheat yield y (in bushels per acre) and the amount of fertilizer x (in pounds per acre). The results are shown in the table. Use a graphing utility to find the least squares regression line for the data. Use the model to approximate the wheat yield for a fertilizer application of 175 pounds per acre.

Fertilizer, x	100	150	200	250
Yield, y	35	44	50	56

98. Modeling Data The table shows the yield y (in milligrams) of a chemical reaction after t minutes.

Minutes, t	1	2	3	4
Yield, y	1.2	7.1	9.9	13.1

Minutes, t	5	6	7	8
Yield, y	15.5	16.0	17.9	18.0

(a) Use a graphing utility to find the least squares regression line for the data. Then use the graphing utility to plot the data and graph the model.

(b) Use a graphing utility to plot the points $(\ln t, y)$. Do these points appear to follow a linear pattern more closely than the plot of the given data in part (a)?

(c) Use a graphing utility to find the least squares regression line for the points $(\ln t, y)$ and obtain the logarithmic model $y = a + b \ln t$. Then, plot the original data and graph the linear and logarithmic models. Which is a better model? Explain.

Using Lagrange Multipliers **In Exercises 99–104, use Lagrange multipliers to find the indicated extrema, assuming that x and y are positive.**

99. Minimize $f(x, y) = x^2 + y^2$

Constraint: $x + y - 8 = 0$

100. Maximize $f(x, y) = xy$

Constraint: $x + 3y - 6 = 0$

101. Maximize $f(x, y) = 2x + 3xy + y$

Constraint: $x + 2y = 29$

102. Minimize $f(x, y) = x^2 - y^2$

Constraint: $x - 2y + 6 = 0$

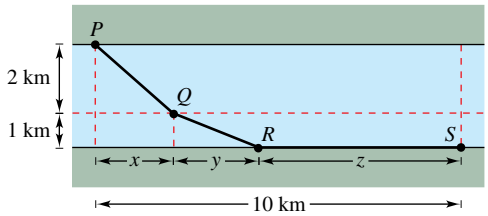
103. Maximize $f(x, y) = 2xy$

Constraint: $2x + y = 12$

104. Minimize $f(x, y) = 3x^2 - y^2$

Constraint: $2x - 2y + 5 = 0$

105. Minimum Cost A water line is to be built from point P to point S and must pass through regions where construction costs differ (see figure). The cost per kilometer (in dollars) is $3k$ from P to Q, $2k$ from Q to R, and k from R to S. For simplicity, let $k = 1$. Use Lagrange multipliers to find x, y, and z such that the total cost C will be minimized.



Building on Concepts

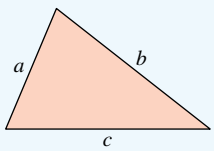
106. Heron's Formula states that the area of a triangle with sides of lengths a, b, and c is given by

$$A = \sqrt{s(s-a)(s-b)(s-c)}$$

where

$$s = \frac{a+b+c}{2}$$

as shown in the figure.



(a) Use Heron's Formula to find the area of the triangle with vertices $(0, 0)$, $(3, 4)$, and $(6, 0)$.

(b) Show that among all triangles having a fixed perimeter, the triangle with the largest area is an equilateral triangle.

(c) Show that among all triangles having a fixed area, the triangle with the smallest perimeter is an equilateral triangle.

107. The Ideal Gas Law states that $PV = nRT$, where P is pressure, V is volume, n is the number of moles of gas, R is a fixed constant (the gas constant), and T is temperature (in kelvins). The **van der Waals equation**

$$\left(P + \frac{an^2}{V^2}\right)(V - nb) = nRT$$

is a modification of the Ideal Gas Law. Here, b is the volume per mole that is occupied by the gas molecules, and a is a constant that represents the interaction of the gas molecules. Find $\partial P/\partial V$ and $\partial T/\partial P$.

108. Show that

$$u(x, t) = \frac{1}{2}\left[f(x - ct) + f(x + ct)\right]$$

is a solution of the one-dimensional wave equation

$$\frac{\partial^2 u}{\partial t^2} = c^2 \frac{\partial^2 u}{\partial x^2}.$$

(This equation describes the small transverse vibration of an elastic string such as those on certain musical instruments.)

P.S. Problem Solving

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

1. Tangent Plane Let $P(x_0, y_0, z_0)$ be a point in the first octant on the surface $xyz = 1$, as shown in the figure.

(a) Find the equation of the tangent plane to the surface at the point P.

(b) Show that the volume of the tetrahedron formed by the three coordinate planes and the tangent plane is constant, independent of the point of tangency (see figure).

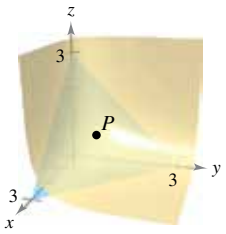

Figure for 1

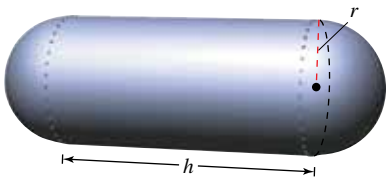

Figure for 2

2. Minimizing Material An industrial container is in the shape of a cylinder with hemispherical ends, as shown in the figure. The container must hold 1000 liters of fluid. Determine the radius r and length h that minimize the amount of material used in the construction of the tank.

3. Finding Maximum and Minimum Values

(a) Let $f(x, y) = x - y$ and $g(x, y) = x^2 + y^2 = 4$. Graph various level curves of f and the constraint g in the xy-plane. Use the graph to determine the maximum value of f subject to the constraint $g = 4$. Then verify your answer using Lagrange multipliers.

(b) Let $f(x, y) = x - y$ and $g(x, y) = x^2 + y^2 = 0$. Find the maximum and minimum values of f subject to the constraint $g = 0$. Does the Method of Lagrange Multipliers work in this case? Explain.

4. Using Functions Use a graphing utility to graph the functions $f(x) = \sqrt[3]{x^3 - 1}$ and $g(x) = x$ in the same viewing window.

(a) Show that

$$\lim_{x\to\infty}[f(x) - g(x)] = 0 \quad \text{and} \quad \lim_{x\to-\infty}[f(x) - g(x)] = 0.$$

(b) Find the point on the graph of f that is farthest from the graph of g.

5. Cobb-Douglas Production Function Consider the Cobb-Douglas production function

$$f(x, y) = Cx^a y^{1-a}, \quad 0 < a < 1.$$

(a) Show that f satisfies the equation $x\dfrac{\partial f}{\partial x} + y\dfrac{\partial f}{\partial y} = f$.

(b) Show that $f(tx, ty) = tf(x, y)$.

6. Laplace's Equation Rewrite Laplace's equation

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} = 0$$

in cylindrical coordinates.

7. Finding Extrema and Saddle Points Consider the function

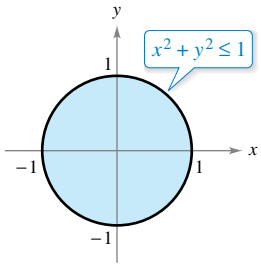
$$f(x, y) = (\alpha x^2 + \beta y^2)e^{-(x^2+y^2)}, \quad 0 < |\alpha| < \beta.$$

(a) Use a graphing utility to graph the function for $\alpha = 1$ and $\beta = 2$, and identify any extrema or saddle points.

(b) Use a graphing utility to graph the function for $\alpha = -1$ and $\beta = 2$, and identify any extrema or saddle points.

(c) Generalize the results in parts (a) and (b) for the function f.

8. Temperature Consider a circular plate of radius 1 given by $x^2 + y^2 \le 1$, as shown in the figure. The temperature at any point $P(x, y)$ on the plate is $T(x, y) = 2x^2 + y^2 - y + 10$.



(a) Sketch the isotherm $T(x, y) = 10$. To print an enlarged copy of the graph, go to *MathGraphs.com.*

(b) Find the hottest and coldest points on the plate.

9. Wave Equation Show that

$$u(x, t) = \frac{1}{2}[\sin(x - t) + \sin(x + t)]$$

is a solution of the one-dimensional wave equation

$$\frac{\partial^2 u}{\partial t^2} = \frac{\partial^2 u}{\partial x^2}.$$

10. Tangent Planes Let f be a differentiable function of one variable. Show that all tangent planes to the surface $z = yf(x/y)$ intersect in a common point.

11. Verifying Equations Consider the function $w = f(x, y)$, where $x = r\cos\theta$ and $y = r\sin\theta$. Verify each of the following.

(a) $$\frac{\partial w}{\partial x} = \frac{\partial w}{\partial r}\cos\theta - \frac{\partial w}{\partial \theta}\frac{\sin\theta}{r}$$

$$\frac{\partial w}{\partial y} = \frac{\partial w}{\partial r}\sin\theta + \frac{\partial w}{\partial \theta}\frac{\cos\theta}{r}$$

(b) $$\left(\frac{\partial w}{\partial x}\right)^2 + \left(\frac{\partial w}{\partial y}\right)^2 = \left(\frac{\partial w}{\partial r}\right)^2 + \left(\frac{1}{r^2}\right)\left(\frac{\partial w}{\partial \theta}\right)^2$$

12. Using a Function Demonstrate the result of Exercise 11(b) for

$$w = \arctan\frac{y}{x}.$$

13. Proof Prove that if f is a differentiable function such that $\nabla f(x_0, y_0) = \mathbf{0}$, then the tangent plane at (x_0, y_0) is horizontal.

14.1 Iterated Integrals and Area in the Plane

GO DIGITAL

- **Evaluate an iterated integral.**
- **Use an iterated integral to find the area of a plane region.**

Big Ideas of Calculus

Just as you extended the concepts of limits and derivatives to functions of several variables, you can extend *single* integration

$$\int_a^b f(x)\,dx$$

to *multiple* integration. In multiple integration, the integrand is a function of several variables, such as

$$\int_a^b \int_{g_1(x)}^{g_2(x)} f(x, y)\,dy\,dx.$$

With multiple integration, you can analyze more general regions to find their volumes, masses, and centroids. You can also find the center of mass and moments of inertia of a solid with a variable density.

Iterated Integrals

In Chapters 14 and 15, you will study several applications of integration involving functions of several variables. Chapter 14 is like Chapter 7 in that it surveys the use of integration to find plane areas, volumes, surface areas, moments, and centers of mass.

In Chapter 13, you differentiated functions of several variables with respect to one variable while holding the other variables constant. You can *integrate* functions of several variables by a similar procedure. For example, consider the partial derivative $f_x(x, y) = 2xy$. By considering y constant, you can integrate with respect to x to obtain

$$\begin{aligned} f(x, y) &= \int f_x(x, y)\,dx && \text{Integrate with respect to } x. \\ &= \int 2xy\,dx && \text{Hold } y \text{ constant.} \\ &= y \int 2x\,dx && \text{Factor out constant } y. \\ &= y(x^2) + C(y) && \text{Antiderivative of } 2x \text{ is } x^2. \\ &= x^2y + C(y). && C(y) \text{ is a function of } y. \end{aligned}$$

The "constant" of integration, $C(y)$, is a function of y. In other words, by integrating with respect to x, you are able to recover $f(x, y)$ only partially. The total recovery of a function of x and y from its partial derivatives is a topic you will study in Chapter 15. For now, you will focus on extending definite integrals to functions of several variables. For instance, by considering y constant, you can apply the Fundamental Theorem of Calculus to evaluate

$$\int_1^{2y} 2xy\,dx = x^2y\Big]_1^{2y} = (2y)^2y - (1)^2y = 4y^3 - y.$$

x is the variable of integration, and y is fixed. — Replace x by the limits of integration. — The result is a function of y.

Similarly, you can integrate with respect to y by holding x fixed. Both procedures are summarized as follows.

$$\int_{h_1(y)}^{h_2(y)} f_x(x, y)\,dx = f(x, y)\Big]_{h_1(y)}^{h_2(y)} = f(h_2(y), y) - f(h_1(y), y) \qquad \text{With respect to } x$$

$$\int_{g_1(x)}^{g_2(x)} f_y(x, y)\,dy = f(x, y)\Big]_{g_1(x)}^{g_2(x)} = f(x, g_2(x)) - f(x, g_1(x)) \qquad \text{With respect to } y$$

Note that the variable of integration cannot appear in either limit of integration. For instance, it makes no sense to write

$$\int_0^x y\,dx.$$

GO DIGITAL

EXAMPLE 1 Integrating with Respect to *y*

Evaluate $\int_1^x (2xy + 3y^2)\,dy$.

Solution Considering x to be constant and integrating with respect to y, you have

$$\int_1^x (2xy + 3y^2)\,dy = \Big[xy^2 + y^3\Big]_1^x \qquad \text{Integrate with respect to } y.$$
$$= (2x^3) - (x + 1)$$
$$= 2x^3 - x - 1.$$

REMARK Remember that you can check an antiderivative using differentiation. For instance, in Example 1, you can verify that

$$xy^2 + y^3$$

is the correct antiderivative by finding

$$\frac{\partial}{\partial y}[xy^2 + y^3].$$

Notice in Example 1 that the integral defines a function of x and can *itself* be integrated, as shown in the next example.

EXAMPLE 2 The Integral of an Integral

Evaluate $\int_1^2 \left[\int_1^x (2xy + 3y^2)\,dy\right] dx$.

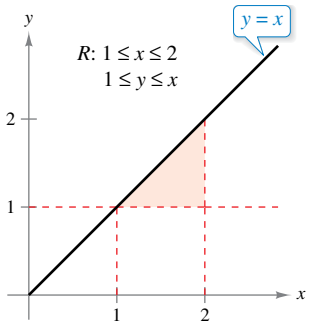
Solution Using the result of Example 1, you have

$$\int_1^2 \left[\int_1^x (2xy + 3y^2)\,dy\right] dx = \int_1^2 (2x^3 - x - 1)\,dx$$
$$= \left[\frac{x^4}{2} - \frac{x^2}{2} - x\right]_1^2 \qquad \text{Integrate with respect to } x.$$
$$= 4 - (-1)$$
$$= 5.$$

The integral in Example 2 is an **iterated integral.** The brackets used in Example 2 are normally not written. Instead, iterated integrals are usually written simply as

$$\int_a^b \int_{g_1(x)}^{g_2(x)} f(x, y)\,dy\,dx \quad \text{and} \quad \int_c^d \int_{h_1(y)}^{h_2(y)} f(x, y)\,dx\,dy.$$

The **inside limits of integration** can be variable with respect to the outer variable of integration. However, the **outside limits of integration** *must be* constant with respect to both variables of integration. After performing the inside integration, you obtain a "standard" definite integral, and the second integration produces a real number. The limits of integration for an iterated integral identify two sets of boundary intervals for the variables. For instance, in Example 2, the outside limits indicate that x lies in the interval $1 \le x \le 2$, and the inside limits indicate that y lies in the interval $1 \le y \le x$. Together, these two intervals determine the **region of integration** R of the iterated integral, as shown in Figure 14.1.



The region of integration for $\int_1^2 \int_1^x f(x, y)\,dy\,dx$

Figure 14.1

Because an iterated integral is just a special type of definite integral—one in which the integrand is also an integral—you can use the properties of definite integrals to evaluate iterated integrals.

Vertically simple region
Figure 14.2

Area of a Plane Region

In the remainder of this section, you will revisit the problem of finding the area of a plane region. Consider the plane region R bounded by $a \le x \le b$ and $g_1(x) \le y \le g_2(x)$, as shown in Figure 14.2. The area of R is

$$\int_a^b [g_2(x) - g_1(x)]\,dx. \qquad \text{Area of } R$$

Using the Fundamental Theorem of Calculus, you can rewrite the integrand $g_2(x) - g_1(x)$ as a definite integral. Specifically, consider x to be fixed and let y vary from $g_1(x)$ to $g_2(x)$, and you can write

$$\int_{g_1(x)}^{g_2(x)} dy = y\Big]_{g_1(x)}^{g_2(x)} = g_2(x) - g_1(x).$$

Combining these two integrals, you can write the area of the region R as an iterated integral

$$\int_a^b \int_{g_1(x)}^{g_2(x)} dy\,dx = \int_a^b y\Big]_{g_1(x)}^{g_2(x)} dx$$

$$= \int_a^b [g_2(x) - g_1(x)]\,dx. \qquad \text{Area of } R$$

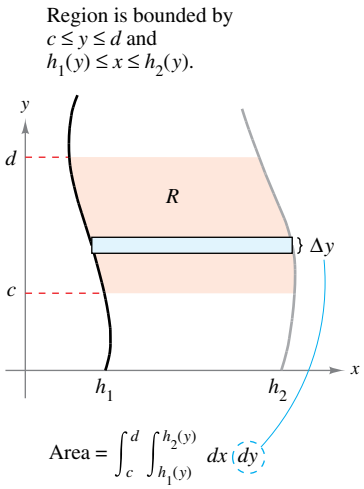
GO DIGITAL

Placing a representative rectangle in the region R helps determine both the order and the limits of integration. A vertical rectangle implies the order $dy\,dx$, with the inside limits of integration corresponding to the upper and lower bounds of the rectangle, as shown in Figure 14.2. This type of region is **vertically simple,** because the outside limits of integration represent the vertical lines

$$x = a \quad \text{and} \quad x = b.$$

Similarly, a horizontal rectangle implies the order $dx\,dy$, with the inside limits of integration determined by the left and right bounds of the rectangle, as shown in Figure 14.3. This type of region is **horizontally simple,** because the outside limits of integration represent the horizontal lines

$$y = c \quad \text{and} \quad y = d.$$



Horizontally simple region
Figure 14.3

The iterated integrals used for these two types of simple regions are summarized as follows.

REMARK Be sure you understand that the orders of integration of these two integrals are different—the order $dy\,dx$ corresponds to a vertically simple region (see Figure 14.2), and the order $dx\,dy$ corresponds to a horizontally simple region (see Figure 14.3).

Area of a Region in the Plane

1. If R is defined by $a \le x \le b$ and $g_1(x) \le y \le g_2(x)$, where g_1 and g_2 are continuous on $[a, b]$, then the area of R is

$$A = \int_a^b \int_{g_1(x)}^{g_2(x)} dy\,dx. \qquad \text{Figure 14.2 (vertically simple)}$$

2. If R is defined by $c \le y \le d$ and $h_1(y) \le x \le h_2(y)$, where h_1 and h_2 are continuous on $[c, d]$, then the area of R is

$$A = \int_c^d \int_{h_1(y)}^{h_2(y)} dx\,dy. \qquad \text{Figure 14.3 (horizontally simple)}$$

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

If all four limits of integration happen to be constants, then the region of integration is rectangular, as shown in Example 3.

EXAMPLE 3 The Area of a Rectangular Region

Use an iterated integral to represent the area of the rectangle shown in Figure 14.4.

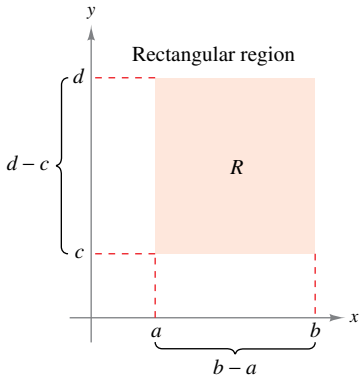

Figure 14.4

Solution The region shown in Figure 14.4 is both vertically simple and horizontally simple, so you can use either order of integration. By choosing the order $dy\,dx$, you obtain the following.

$$\int_a^b \int_c^d dy\,dx = \int_a^b y\Big]_c^d dx \qquad \text{Integrate with respect to } y.$$

$$= \int_a^b (d - c)\,dx$$

$$= \Big[(d - c)x\Big]_a^b \qquad \text{Integrate with respect to } x.$$

$$= (d - c)(b - a)$$

Notice that this answer is consistent with what you know from geometry.

EXAMPLE 4 Finding Area by an Iterated Integral

Use an iterated integral to find the area of the region bounded by the graphs of

$$f(x) = \sin x \qquad \text{Sine curve forms upper boundary.}$$

and

$$g(x) = \cos x \qquad \text{Cosine curve forms lower boundary.}$$

between $x = \pi/4$ and $x = 5\pi/4$.

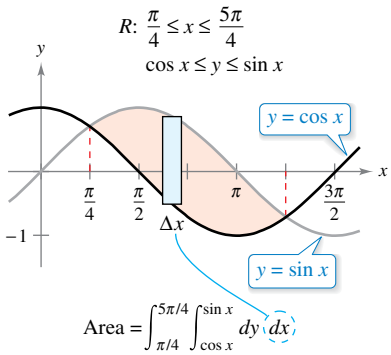

Figure 14.5

Solution Because f and g are given as functions of x, a vertical representative rectangle is convenient, and you can choose $dy\,dx$ as the order of integration, as shown in Figure 14.5. The outside limits of integration are

$$\frac{\pi}{4} \le x \le \frac{5\pi}{4}.$$

Moreover, because the rectangle is bounded above by $f(x) = \sin x$ and below by $g(x) = \cos x$, you have

$$\text{Area of } R = \int_{\pi/4}^{5\pi/4} \int_{\cos x}^{\sin x} dy\,dx$$

$$= \int_{\pi/4}^{5\pi/4} y\Big]_{\cos x}^{\sin x} dx \qquad \text{Integrate with respect to } y.$$

$$= \int_{\pi/4}^{5\pi/4} (\sin x - \cos x)\,dx$$

$$= \Big[-\cos x - \sin x\Big]_{\pi/4}^{5\pi/4} \qquad \text{Integrate with respect to } x.$$

$$= 2\sqrt{2}.$$

The region of integration of an iterated integral need not have any straight lines as boundaries. For instance, the region of integration shown in Figure 14.5 is *vertically simple* even though it has no vertical lines as left and right boundaries. The quality that makes the region vertically simple is that it is bounded above and below by the graphs of *functions of x*.

GO DIGITAL

One order of integration will often produce a simpler integration problem than the other order. For instance, rework Example 4 with the order $dx\,dy$. You may be surprised to find that the task is formidable. However, if you succeed, you will discover that the answer is the same. In other words, the order of integration affects the ease of integration but not the value of the integral.

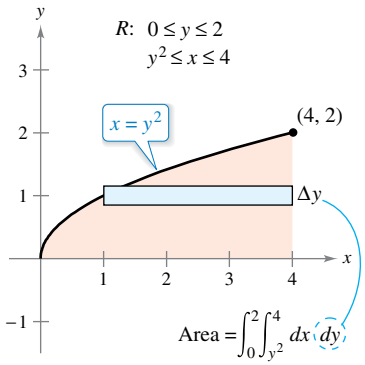
EXAMPLE 5 Comparing Different Orders of Integration

See LarsonCalculus.com for an interactive version of this type of example.

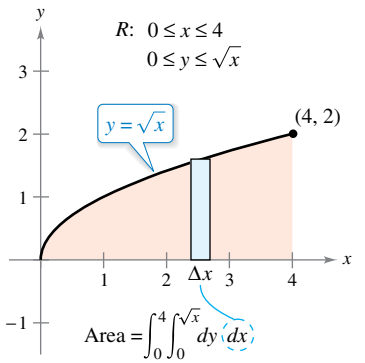
Sketch the region whose area is represented by the integral

$$\int_0^2 \int_{y^2}^4 dx\,dy.$$

Then find another iterated integral using the order $dy\,dx$ to represent the same area and show that both integrals yield the same value.



(a)



(b)

Figure 14.6

Solution From the given limits of integration, you know that

$$y^2 \le x \le 4 \qquad \text{Inner limits of integration}$$

which means that the region R is bounded on the left by the parabola $x = y^2$ and on the right by the line $x = 4$. Furthermore, because

$$0 \le y \le 2 \qquad \text{Outer limits of integration}$$

you know that R is bounded below by the x-axis, as shown in Figure 14.6(a). The value of this integral is

$$\begin{aligned}\int_0^2 \int_{y^2}^4 dx\,dy &= \int_0^2 x\Big]_{y^2}^4 dy && \text{Integrate with respect to } x.\\ &= \int_0^2 (4 - y^2)\,dy\\ &= \left[4y - \frac{y^3}{3}\right]_0^2 && \text{Integrate with respect to } y.\\ &= \frac{16}{3}.\end{aligned}$$

To change the order of integration to $dy\,dx$, place a vertical rectangle in the region, as shown in Figure 14.6(b). From this, you can determine that the constant bounds $0 \le x \le 4$ serve as the outer limits of integration. By solving for y in the equation $x = y^2$, you can conclude that the inner bounds are $0 \le y \le \sqrt{x}$. So, the area of the region can also be represented by

$$\int_0^4 \int_0^{\sqrt{x}} dy\,dx.$$

As shown below, evaluating this integral yields the same value as the original integral.

$$\begin{aligned}\int_0^4 \int_0^{\sqrt{x}} dy\,dx &= \int_0^4 y\Big]_0^{\sqrt{x}} dx && \text{Integrate with respect to } y.\\ &= \int_0^4 \sqrt{x}\,dx\\ &= \frac{2}{3}x^{3/2}\Big]_0^4 && \text{Integrate with respect to } x.\\ &= \frac{16}{3}\end{aligned}$$

GO DIGITAL

Sometimes it is not possible to calculate the area of a region with a single iterated integral. In these cases, divide the region into subregions such that the area of each subregion can be calculated by an iterated integral. The total area is then the sum of the iterated integrals.

EXAMPLE 6 An Area Represented by Two Iterated Integrals

Find the area of the region R that lies below the parabola

$$y = 4x - x^2$$ Parabola forms upper boundary.

above the x-axis, and above the line

$$y = -3x + 6.$$ Line and x-axis form lower boundary.

Solution Begin by dividing R into the two subregions R_1 and R_2 shown in Figure 14.7.

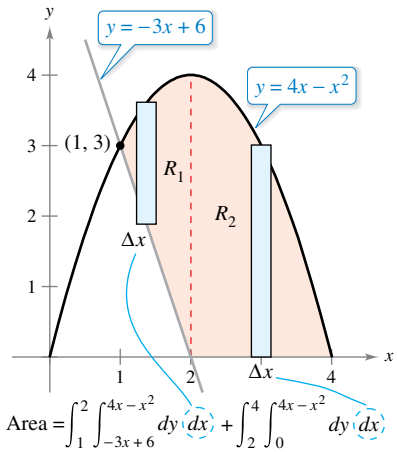

Figure 14.7

REMARK In Examples 3 through 6, be sure you see the benefit of sketching the region of integration. You should develop the habit of making sketches to help you determine the limits of integration for all iterated integrals in this chapter.

In both regions, it is convenient to use vertical rectangles, and you have

$$\begin{aligned}
\text{Area} &= \int_1^2 \int_{-3x+6}^{4x-x^2} dy\, dx + \int_2^4 \int_0^{4x-x^2} dy\, dx \\
&= \int_1^2 (4x - x^2 + 3x - 6)\, dx + \int_2^4 (4x - x^2)\, dx \\
&= \left[\frac{7x^2}{2} - \frac{x^3}{3} - 6x\right]_1^2 + \left[2x^2 - \frac{x^3}{3}\right]_2^4 \\
&= \left(14 - \frac{8}{3} - 12 - \frac{7}{2} + \frac{1}{3} + 6\right) + \left(32 - \frac{64}{3} - 8 + \frac{8}{3}\right) \\
&= \frac{15}{2}.
\end{aligned}$$

The area of the region is $15/2$ square units. Try checking this using the procedure for finding the area between two curves, as presented in Section 7.1. ■

At this point, you may be wondering why you would need iterated integrals. After all, you already know how to use conventional integration to find the area of a region in the plane. (For instance, compare the solution to Example 4 in this section with that given in Example 3 in Section 7.1.) The need for iterated integrals will become clear in the next section. In this section, primary attention is given to procedures for finding the limits of integration of the region of an iterated integral, and the following exercise set is designed to develop skill in this important procedure.

14.1 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Explain what is meant by an iterated integral. How is it evaluated?
2. Sketch the region of integration for the iterated integral $\int_1^2 \int_0^{2-x} f(x, y)\, dy\, dx$.

Evaluating an Integral In Exercises 3–10, evaluate the integral.

3. $\int_0^x (2x - y)\, dy$
4. $\int_x^{x^2} \frac{y}{x}\, dy$
5. $\int_0^{\sqrt{4-x^2}} x^2 y\, dy$
6. $\int_{x^3}^{\sqrt{x}} (x^2 + 3y^2)\, dy$
7. $\int_{e^y}^{y} \frac{y \ln x}{x}\, dx, \quad y > 0$
8. $\int_{-\sqrt{1-y^2}}^{\sqrt{1-y^2}} (x^2 + y^2)\, dx$
9. $\int_0^{x^3} ye^{-y/x}\, dy$
10. $\int_y^{\pi/2} \sin^3 x \cos y\, dx$

Evaluating an Iterated Integral In Exercises 11–28, evaluate the iterated integral.

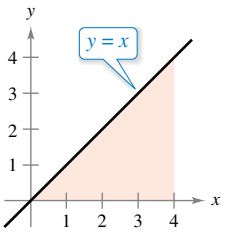
11. $\int_0^1 \int_0^2 (x + y)\, dy\, dx$
12. $\int_{-1}^1 \int_{-2}^2 (x^2 - y^2)\, dy\, dx$
13. $\int_0^{\pi/4} \int_0^1 y \cos x\, dy\, dx$
14. $\int_0^{\ln 4} \int_0^{\ln 3} e^{x+y}\, dy\, dx$
15. $\int_0^2 \int_0^{6x^2} x^3\, dy\, dx$
16. $\int_0^1 \int_0^y (6x + 5y^3)\, dx\, dy$
17. $\int_0^{\pi/2} \int_0^{\cos x} (1 + \sin x)\, dy\, dx$
18. $\int_1^4 \int_1^{\sqrt{x}} 2ye^{-x}\, dy\, dx$
19. $\int_0^1 \int_0^x \sqrt{1 - x^2}\, dy\, dx$
20. $\int_{-4}^4 \int_0^{x^2} \sqrt{64 - x^3}\, dy\, dx$
21. $\int_0^1 \int_0^{\sqrt{1-y^2}} (x + y)\, dx\, dy$
22. $\int_0^2 \int_{3y^2-6y}^{2y-y^2} 3y\, dx\, dy$
23. $\int_0^2 \int_0^{\sqrt{4-y^2}} \frac{2}{\sqrt{4 - y^2}}\, dx\, dy$
24. $\int_1^3 \int_0^y \frac{4}{x^2 + y^2}\, dx\, dy$
25. $\int_0^{\pi/2} \int_0^{2\cos\theta} r\, dr\, d\theta$
26. $\int_0^{\pi/4} \int_{\sqrt{3}}^{\sqrt{3}\cos\theta} r\, dr\, d\theta$
27. $\int_0^{\pi/2} \int_0^{\sin\theta} \theta r\, dr\, d\theta$
28. $\int_0^{\pi/4} \int_0^{\cos\theta} 3r^2 \sin\theta\, dr\, d\theta$

Evaluating an Improper Iterated Integral In Exercises 29–32, evaluate the improper iterated integral.

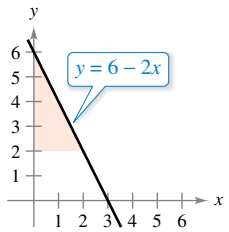
29. $\int_1^{\infty} \int_0^{1/x} y\, dy\, dx$
30. $\int_0^3 \int_0^{\infty} \frac{x^2}{1 + y^2}\, dy\, dx$
31. $\int_1^{\infty} \int_1^{\infty} \frac{1}{xy}\, dx\, dy$
32. $\int_0^{\infty} \int_0^{\infty} xye^{-(x^2+y^2)} dx\, dy$

Finding the Area of a Region In Exercises 33–36, use an iterated integral to find the area of the region.

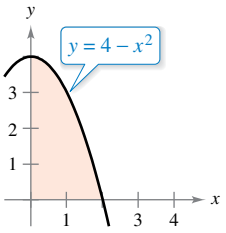
33.



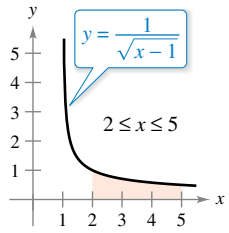
34.



35.



36.



Finding the Area of a Region In Exercises 37–42, use an iterated integral to find the area of the region bounded by the graphs of the equations.

37. $y = 9 - x^2, \quad y = 0$
38. $2x - 3y = 0, \quad x + y = 5, \quad y = 0$
39. $\sqrt{x} + \sqrt{y} = 2, \quad x = 0, \quad y = 0$
40. $y = x^{3/2}, \quad y = 2x$
41. $y = 4 - x^2, \quad y = x + 2$
42. $y = x, \quad y = 2x, \quad x = 2$

Changing the Order of Integration In Exercises 43–50, sketch the region R of integration and change the order of integration.

43. $\int_0^4 \int_0^y f(x, y)\, dx\, dy$
44. $\int_0^4 \int_{\sqrt{y}}^2 f(x, y)\, dx\, dy$
45. $\int_{-2}^2 \int_0^{\sqrt{4-x^2}} f(x, y)\, dy\, dx$
46. $\int_0^2 \int_0^{4-x^2} f(x, y)\, dy\, dx$
47. $\int_1^{10} \int_0^{\ln y} f(x, y)\, dx\, dy$
48. $\int_{-1}^2 \int_0^{e^{-x}} f(x, y)\, dy\, dx$
49. $\int_{-1}^1 \int_{x^2}^1 f(x, y)\, dy\, dx$
50. $\int_{-\pi/2}^{\pi/2} \int_0^{\cos x} f(x, y)\, dy\, dx$

Changing the Order of Integration **In Exercises 51–60, sketch the region R whose area is given by the iterated integral. Then change the order of integration and show that both orders yield the same area.**

51. $\int_0^1 \int_0^2 dy\,dx$

52. $\int_1^2 \int_2^4 dx\,dy$

53. $\int_0^1 \int_{2y}^2 dx\,dy$

54. $\int_0^9 \int_{\sqrt{x}}^3 dy\,dx$

55. $\int_0^1 \int_{-\sqrt{1-y^2}}^{\sqrt{1-y^2}} dx\,dy$

56. $\int_{-2}^2 \int_{-\sqrt{4-x^2}}^{\sqrt{4-x^2}} dy\,dx$

57. $\int_0^2 \int_0^x dy\,dx + \int_2^4 \int_0^{4-x} dy\,dx$

58. $\int_0^4 \int_0^{x/2} dy\,dx + \int_4^6 \int_0^{6-x} dy\,dx$

59. $\int_0^1 \int_{y^2}^{\sqrt[3]{y}} dx\,dy$

60. $\int_{-2}^2 \int_0^{4-y^2} dx\,dy$

Changing the Order of Integration **In Exercises 61–66, sketch the region of integration. Then evaluate the iterated integral. (*Hint:* Note that it is necessary to change the order of integration.)**

61. $\int_0^2 \int_x^2 x\sqrt{1+y^3}\,dy\,dx$

62. $\int_0^4 \int_{\sqrt{x}}^2 \frac{3}{2+y^3}\,dy\,dx$

63. $\int_0^1 \int_{2x}^2 4e^{y^2}\,dy\,dx$

64. $\int_0^2 \int_x^2 e^{-y^2}\,dy\,dx$

65. $\int_0^1 \int_y^1 \sin x^2\,dx\,dy$

66. $\int_0^2 \int_{y^2}^4 \sqrt{x}\sin x\,dx\,dy$

Exploring Concepts

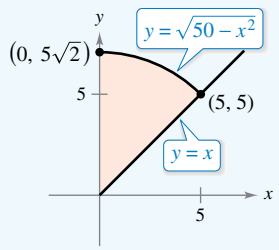
67. Write an iterated integral that represents the area of a circle of radius 5 centered at the origin. Verify that your integral produces the correct area.

68. Express the area of the region bounded by $x = \sqrt{4-4y^2}$, $y = 1$, and $x = 2$ in at least two different ways, one of which is an iterated integral. Do not find the area of the region.

69. Determine whether each expression represents the area of the shaded region (see figure).

(a) $\int_0^5 \int_y^{\sqrt{50-y^2}} dy\,dx$ (b) $\int_0^5 \int_x^{\sqrt{50-x^2}} dy\,dx$

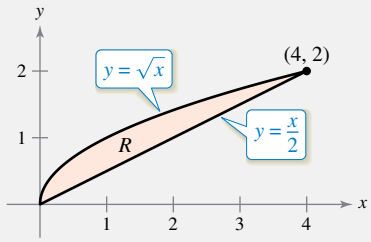
(c) $\int_0^5 \int_0^y dx\,dy + \int_5^{5\sqrt{2}} \int_0^{\sqrt{50-y^2}} dx\,dy$



70. HOW DO YOU SEE IT? Use each order of integration to write an iterated integral that represents the area of the region R (see figure).

(a) Area $= \iint dy\,dx$

(b) Area $= \iint dy\,dx$



Evaluating an Iterated Integral **In Exercises 71–78, use a graphing utility to evaluate the iterated integral.**

71. $\int_0^2 \int_{x^2}^{2x} (x^3 + 3y^2)\,dy\,dx$

72. $\int_0^a \int_0^{a-x} (x^2 + y^2)\,dy\,dx$

73. $\int_0^1 \int_y^{2y} \sin(x+y)\,dx\,dy$

74. $\int_0^2 \int_0^{4-x^2} e^{xy}\,dy\,dx$

75. $\int_0^4 \int_0^y \frac{2}{(x+1)(y+1)}\,dx\,dy$

76. $\int_0^2 \int_x^2 \sqrt{16 - x^3 - y^3}\,dy\,dx$

77. $\int_0^{2\pi} \int_0^{1+\cos\theta} 6r^2\cos\theta\,dr\,d\theta$

78. $\int_0^{\pi/2} \int_0^{1+\sin\theta} 15\theta r\,dr\,d\theta$

Comparing Different Orders of Integration **In Exercises 79 and 80, (a) sketch the region of integration, (b) change the order of integration, and (c) use a graphing utility to show that both orders yield the same value.**

79. $\int_0^2 \int_{y^3}^{4\sqrt{2y}} (x^2y - xy^2)\,dx\,dy$

80. $\int_0^2 \int_{\sqrt{4-x^2}}^{4-(x^2/4)} \frac{xy}{x^2+y^2+1}\,dy\,dx$

True or False? **In Exercises 81 and 82, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

81. $\int_a^b \int_c^d f(x,y)\,dy\,dx = \int_c^d \int_a^b f(x,y)\,dx\,dy$

82. $\int_0^1 \int_0^x f(x,y)\,dy\,dx = \int_0^1 \int_0^y f(x,y)\,dx\,dy$

14.2 Double Integrals and Volume

GO DIGITAL

- **Use a double integral to represent the volume of a solid region and use properties of double integrals.**
- **Evaluate a double integral as an iterated integral.**
- **Find the average value of a function over a region.**

Double Integrals and Volume of a Solid Region

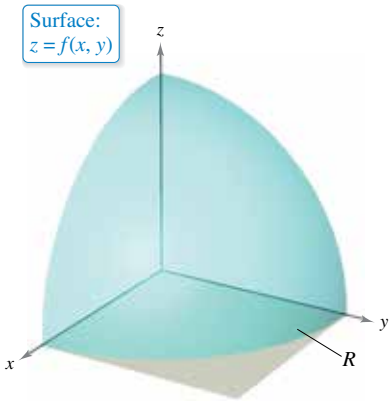

Figure 14.8

You already know that a definite integral over an *interval* uses a limit process to assign measures to quantities such as area, volume, arc length, and mass. In this section, you will use a similar process to define the **double integral** of a function of two variables over a *region in the plane*.

Consider a continuous function f such that $f(x, y) \geq 0$ for all (x, y) in a region R in the xy-plane. The goal is to find the volume of the solid region lying between the surface given by

$z = f(x, y)$ Surface lying above the xy-plane

and the xy-plane, as shown in Figure 14.8. You can begin by superimposing a rectangular grid over the region, as shown in Figure 14.9. The rectangles lying entirely within R form an **inner partition** Δ, whose **norm** $\|\Delta\|$ is defined as the length of the longest diagonal of the n rectangles. Next, choose a point (x_i, y_i) in each rectangle and form the rectangular prism whose height is

$f(x_i, y_i)$ Height of ith prism

as shown in Figure 14.10. Because the area of the ith rectangle is

ΔA_i Area of ith rectangle

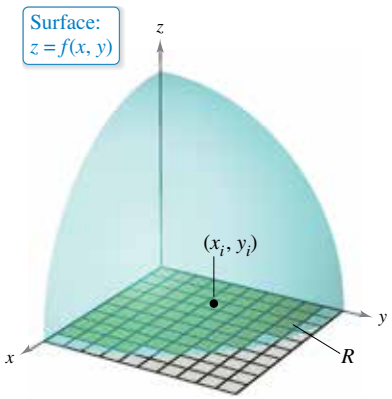
it follows that the volume of the ith prism is

$f(x_i, y_i)\,\Delta A_i$ Volume of ith prism

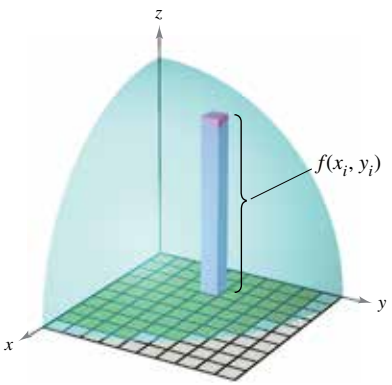
and you can approximate the volume of the solid region by the Riemann sum of the volumes of all n prisms,

$$\sum_{i=1}^{n} f(x_i, y_i)\,\Delta A_i$$ Riemann sum

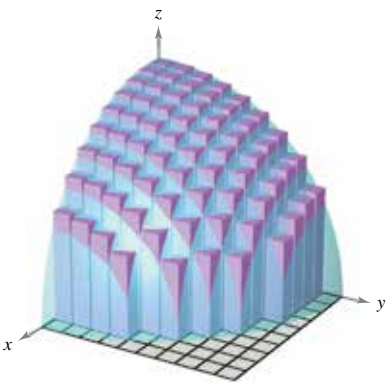
as shown in Figure 14.11. This approximation can be improved by tightening the mesh of the grid to form smaller and smaller rectangles, as shown in Example 1.



The rectangles lying within R form an inner partition of R.
Figure 14.9



Rectangular prism whose base has an area of ΔA_i and whose height is $f(x_i, y_i)$
Figure 14.10



Volume approximated by rectangular prisms

EXAMPLE 1 Approximating the Volume of a Solid

Approximate the volume of the solid lying between the paraboloid

$$f(x, y) = 1 - \frac{1}{2}x^2 - \frac{1}{2}y^2$$

and the square region R given by $0 \le x \le 1, 0 \le y \le 1$. Use a partition made up of squares whose sides have a length of $\frac{1}{4}$.

Solution Begin by forming the specified partition of R. For this partition, it is convenient to choose the centers of the subregions as the points at which to evaluate $f(x, y)$.

$$\begin{array}{cccc} \left(\frac{1}{8}, \frac{1}{8}\right) & \left(\frac{1}{8}, \frac{3}{8}\right) & \left(\frac{1}{8}, \frac{5}{8}\right) & \left(\frac{1}{8}, \frac{7}{8}\right) \\ \left(\frac{3}{8}, \frac{1}{8}\right) & \left(\frac{3}{8}, \frac{3}{8}\right) & \left(\frac{3}{8}, \frac{5}{8}\right) & \left(\frac{3}{8}, \frac{7}{8}\right) \\ \left(\frac{5}{8}, \frac{1}{8}\right) & \left(\frac{5}{8}, \frac{3}{8}\right) & \left(\frac{5}{8}, \frac{5}{8}\right) & \left(\frac{5}{8}, \frac{7}{8}\right) \\ \left(\frac{7}{8}, \frac{1}{8}\right) & \left(\frac{7}{8}, \frac{3}{8}\right) & \left(\frac{7}{8}, \frac{5}{8}\right) & \left(\frac{7}{8}, \frac{7}{8}\right) \end{array}$$

Because the area of each square is $\Delta A_i = \frac{1}{16}$, you can approximate the volume by the sum

$$\sum_{i=1}^{16} f(x_i, y_i)\,\Delta A_i = \sum_{i=1}^{16} \left(1 - \frac{1}{2}x_i^2 - \frac{1}{2}y_i^2\right)\left(\frac{1}{16}\right) \approx 0.672.$$

This approximation is shown graphically in Figure 14.12. The exact volume of the solid is $\frac{2}{3}$ (see Example 2).

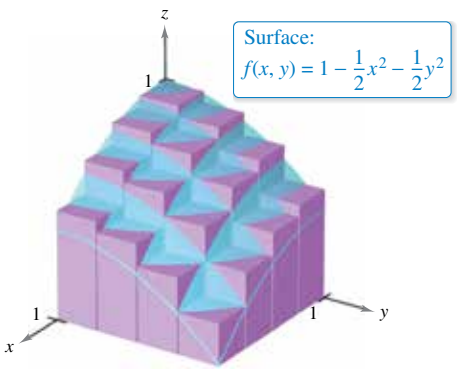

Figure 14.12

REMARK In Example 1, to obtain a better approximation, use a finer partition. For instance, using a partition of squares with sides of length $1/10$, the approximation is 0.668.

In Example 1, note that by using finer partitions, you obtain better approximations of the volume. This observation suggests that you could obtain the exact volume by taking a limit. That is,

$$\text{Volume} = \lim_{\|\Delta\| \to 0} \sum_{i=1}^{n} f(x_i, y_i)\,\Delta A_i.$$

The precise meaning of this limit is that the limit is equal to L if for every $\varepsilon > 0$, there exists a $\delta > 0$ such that

$$\left| L - \sum_{i=1}^{n} f(x_i, y_i)\,\Delta A_i \right| < \varepsilon$$

for all partitions Δ of the plane region R (that satisfy $\|\Delta\| < \delta$) and for all possible choices of x_i and y_i in the ith region.

Using the limit of a Riemann sum to define volume is a special case of using the limit to define a **double integral.** The general case, however, does not require that the function be positive or continuous.

Definition of Double Integral

If f is defined on a closed, bounded region R in the xy-plane, then the **double integral of f over R** is

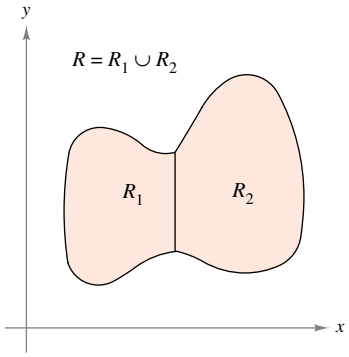
$$\iint_R f(x, y)\, dA = \lim_{\|\Delta\| \to 0} \sum_{i=1}^{n} f(x_i, y_i)\, \Delta A_i$$

provided the limit exists. If the limit exists, then f is **integrable** over R.

Having defined a double integral, you will see that a definite integral is occasionally referred to as a **single integral.**

Sufficient conditions for the double integral of f on the region R to exist are that R can be written as a union of a finite number of nonoverlapping subregions (see Figure 14.13) that are vertically or horizontally simple *and* that f is continuous on the region R. This means that the intersection of two nonoverlapping regions is a set that has an area of 0. In Figure 14.13, the area of the line segment common to R_1 and R_2 is 0.

A double integral can be used to find the volume of a solid region that lies between the xy-plane and the surface given by $z = f(x, y)$.



The two regions R_1 and R_2 are nonoverlapping.
Figure 14.13

Volume of a Solid Region

If f is integrable over a plane region R and $f(x, y) \geq 0$ for all (x, y) in R, then the volume of the solid region that lies above R and below the graph of f is

$$V = \iint_R f(x, y)\, dA.$$

Double integrals share many properties of single integrals.

THEOREM 14.1 Properties of Double Integrals

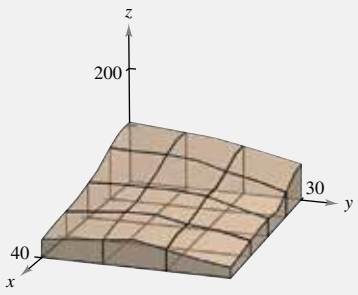
Let f and g be continuous over a closed, bounded plane region R, and let c be a constant.

1. $\displaystyle\iint_R cf(x, y)\, dA = c\iint_R f(x, y)\, dA$
2. $\displaystyle\iint_R [f(x, y) \pm g(x, y)]\, dA = \iint_R f(x, y)\, dA \pm \iint_R g(x, y)\, dA$
3. $\displaystyle\iint_R f(x, y)\, dA \geq 0, \quad \text{if } f(x, y) \geq 0$
4. $\displaystyle\iint_R f(x, y)\, dA \geq \iint_R g(x, y)\, dA, \quad \text{if } f(x, y) \geq g(x, y)$
5. $\displaystyle\iint_R f(x, y)\, dA = \iint_{R_1} f(x, y)\, dA + \iint_{R_2} f(x, y)\, dA$, where R is the union of two nonoverlapping subregions R_1 and R_2.

Exploration

The entries in the table represent the depths (in yards) of earth at the centers of the squares in the figure below.

x \ y	10	20	30
10	100	90	70
20	70	70	40
30	50	50	40
40	40	50	30



Approximate the number of cubic yards of earth in the first octant. (This exploration was submitted by Robert Vojack.)

Triangular cross section

Figure 14.15

Evaluation of Double Integrals

Normally, the first step in evaluating a double integral is to rewrite it as an iterated integral. To show how this is done, a geometric model of a double integral is used as the volume of a solid.

Consider the solid region bounded by the plane $z = f(x, y) = 2 - x - 2y$ and the three coordinate planes, as shown in Figure 14.14. Each vertical cross section taken parallel to the yz-plane is a triangular region whose base has a length of $y = (2 - x)/2$ and whose height is $z = 2 - x$. This implies that for a fixed value of x, the area of the triangular cross section is

$$A(x) = \frac{1}{2}(\text{base})(\text{height}) = \frac{1}{2}\left(\frac{2 - x}{2}\right)(2 - x) = \frac{(2 - x)^2}{4}.$$

By the formula for the volume of a solid with known cross sections (see Section 7.2), the volume of the solid is

$$\begin{aligned}
\text{Volume} &= \int_a^b A(x)\,dx && \text{Formula for volume} \\
&= \int_0^2 \frac{(2 - x)^2}{4}\,dx && \text{Substitute.} \\
&= -\frac{(2 - x)^3}{12}\Big]_0^2 && \text{Integrate with respect to } x. \\
&= \frac{2}{3}. && \text{Volume of solid region (See Figure 14.14.)}
\end{aligned}$$

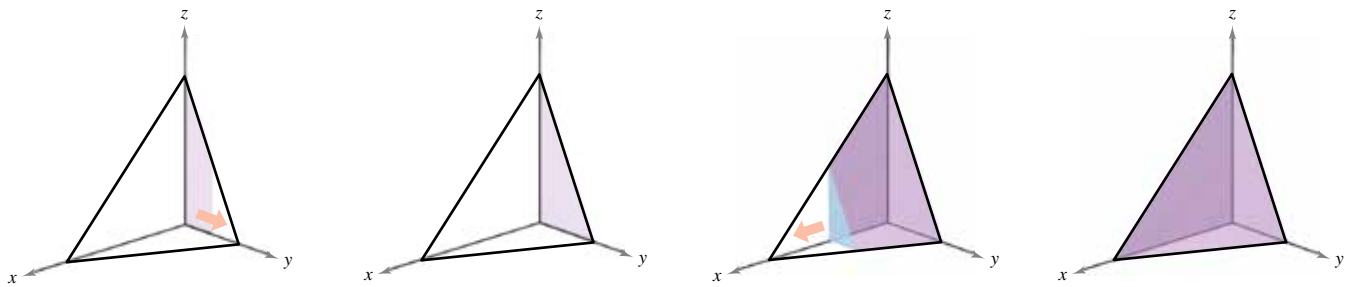
This procedure works no matter how $A(x)$ is obtained. In particular, you can find $A(x)$ by integration, as shown in Figure 14.15. That is, you consider x to be constant and integrate $z = 2 - x - 2y$ from 0 to $(2 - x)/2$ to obtain

$$\begin{aligned}
A(x) &= \int_0^{(2-x)/2} (2 - x - 2y)\,dy && \text{Apply formula for area.} \\
&= \left[(2 - x)y - y^2\right]_0^{(2-x)/2} && \text{Integrate with respect to } y. \\
&= \frac{(2 - x)^2}{4}. && \text{Area of triangular cross section (See Figure 14.15.)}
\end{aligned}$$

Combining these results, you have the *iterated integral*

$$\text{Volume} = \int_R\int f(x, y)\,dA = \int_0^2 \int_0^{(2-x)/2} (2 - x - 2y)\,dy\,dx.$$

To understand this procedure better, it helps to imagine the integration as two sweeping motions. For the inner integration, a vertical line sweeps out the area of a cross section. For the outer integration, the triangular cross section sweeps out the volume, as shown in Figure 14.16.



Integrate with respect to y to obtain the area of the cross section.

Integrate with respect to x to obtain the volume of the solid.

GO DIGITAL

The next theorem was proved by the Italian mathematician Guido Fubini (1879–1943). The theorem states that if R is a vertically or horizontally simple region and f is continuous on R, then the double integral of f on R is equal to an iterated integral.

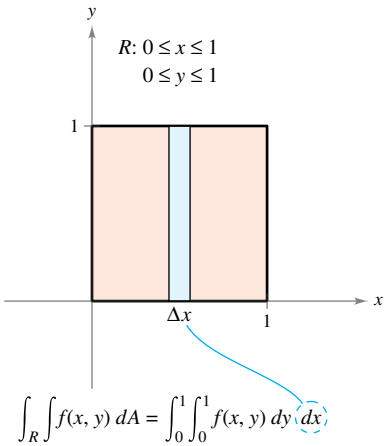
THEOREM 14.2 Fubini's Theorem

Let f be continuous on a plane region R.

1. If R is defined by $a \le x \le b$ and $g_1(x) \le y \le g_2(x)$, where g_1 and g_2 are continuous on $[a, b]$, then
$$\iint_R f(x, y)\, dA = \int_a^b \int_{g_1(x)}^{g_2(x)} f(x, y)\, dy\, dx.$$
2. If R is defined by $c \le y \le d$ and $h_1(y) \le x \le h_2(y)$, where h_1 and h_2 are continuous on $[c, d]$, then
$$\iint_R f(x, y)\, dA = \int_c^d \int_{h_1(y)}^{h_2(y)} f(x, y)\, dx\, dy.$$

EXAMPLE 2 Evaluating a Double Integral as an Iterated Integral

Evaluate
$$\iint_R \left(1 - \frac{1}{2}x^2 - \frac{1}{2}y^2\right) dA$$
where R is the region given by
$$0 \le x \le 1, \quad 0 \le y \le 1.$$



Solution Because the region R is a square, it is both vertically and horizontally simple, and you can use either order of integration. Choose $dy\, dx$ by placing a vertical representative rectangle in the region (see the figure at the right). This produces the following.

$$\begin{aligned}
\iint_R \left(1 - \frac{1}{2}x^2 - \frac{1}{2}y^2\right) dA &= \int_0^1 \int_0^1 \left(1 - \frac{1}{2}x^2 - \frac{1}{2}y^2\right) dy\, dx \\
&= \int_0^1 \left[\left(1 - \frac{1}{2}x^2\right)y - \frac{y^3}{6}\right]_0^1 dx \\
&= \int_0^1 \left(\frac{5}{6} - \frac{1}{2}x^2\right) dx \\
&= \left[\frac{5}{6}x - \frac{x^3}{6}\right]_0^1 \\
&= \frac{2}{3}
\end{aligned}$$

The double integral evaluated in Example 2 represents the volume of the solid region approximated in Example 1. Note that the approximation obtained in Example 1 is quite good $\left(0.672 \text{ vs. } \frac{2}{3}\right)$, even though you used a partition consisting of only 16 squares. The error resulted because the centers of the square subregions were used as the points in the approximation. This is comparable to the Midpoint Rule approximation of a single integral.

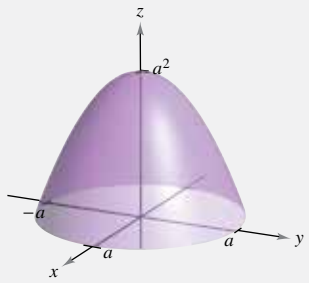
Exploration

Volume of a Paraboloid Sector The solid in Example 3 has an elliptical (not a circular) base. Consider the region bounded by the circular paraboloid

$z = a^2 - x^2 - y^2, \quad a > 0$

and the xy-plane. How many ways of finding the volume of this solid do you now know? For instance, you could use the disk method to find the volume as a solid of revolution. Does each method involve integration?



The difficulty of evaluating a single integral $\int_a^b f(x)\,dx$ usually depends on the function f, not on the interval $[a, b]$. This is a major difference between single and double integrals. In the next example, you will integrate a function similar to the one in Examples 1 and 2. Notice that a change in the region R produces a much more difficult integration problem.

EXAMPLE 3 Finding Volume by a Double Integral

Find the volume of the solid region bounded by the paraboloid $z = 4 - x^2 - 2y^2$ and the xy-plane, as shown in Figure 14.17(a).

Solution By letting $z = 0$, you can see that the base of the region in the xy-plane is the ellipse $x^2 + 2y^2 = 4$, as shown in Figure 14.17(b). This plane region is both vertically and horizontally simple, so the order $dy\,dx$ is appropriate.

Variable bounds for y: $-\sqrt{\dfrac{4 - x^2}{2}} \le y \le \sqrt{\dfrac{4 - x^2}{2}}$

Constant bounds for x: $-2 \le x \le 2$

The volume is

$$V = \int_{-2}^{2}\int_{-\sqrt{(4-x^2)/2}}^{\sqrt{(4-x^2)/2}} (4 - x^2 - 2y^2)\,dy\,dx \qquad \text{See Figure 14.17(b).}$$

$$= \int_{-2}^{2}\left[(4 - x^2)y - \frac{2y^3}{3}\right]_{-\sqrt{(4-x^2)/2}}^{\sqrt{(4-x^2)/2}} dx$$

$$= \frac{4}{3\sqrt{2}}\int_{-2}^{2}(4 - x^2)^{3/2}\,dx$$

$$= \frac{4}{3\sqrt{2}}\int_{-\pi/2}^{\pi/2} 16\cos^4\theta\,d\theta \qquad x = 2\sin\theta$$

$$= \frac{64}{3\sqrt{2}}(2)\int_{0}^{\pi/2}\cos^4\theta\,d\theta$$

$$= \frac{128}{3\sqrt{2}}\left(\frac{3\pi}{16}\right) \qquad \text{Wallis's Formula}$$

$$= 4\sqrt{2}\pi.$$

REMARK In Example 3, note the usefulness of Wallis's Formula to evaluate $\int_0^{\pi/2}\cos^n\theta\,d\theta$. You may want to review this formula in Section 8.3.

In Examples 2 and 3, the problems could be solved with either order of integration because the regions were both vertically and horizontally simple. Moreover, had you used the order $dx\,dy$, you would have obtained integrals of comparable difficulty. There are, however, some occasions when one order of integration is much more convenient than the other. Example 4 shows such a case.

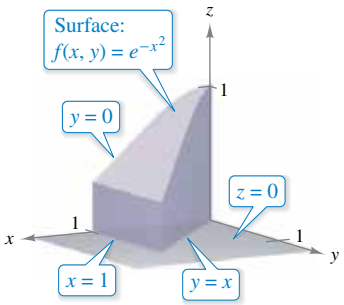
EXAMPLE 4 Comparing Different Orders of Integration

See LarsonCalculus.com for an interactive version of this type of example.

Find the volume of the solid region bounded by the surface

$$f(x, y) = e^{-x^2}$$ Surface

and the planes $z = 0$, $y = 0$, $y = x$, and $x = 1$, as shown in Figure 14.18.



Base is bounded by $y = 0$, $y = x$, and $x = 1$.

Figure 14.18

Solution The base of the solid region in the xy-plane is bounded by the lines $y = 0$, $x = 1$, and $y = x$. The two possible orders of integration are shown in Figure 14.19.

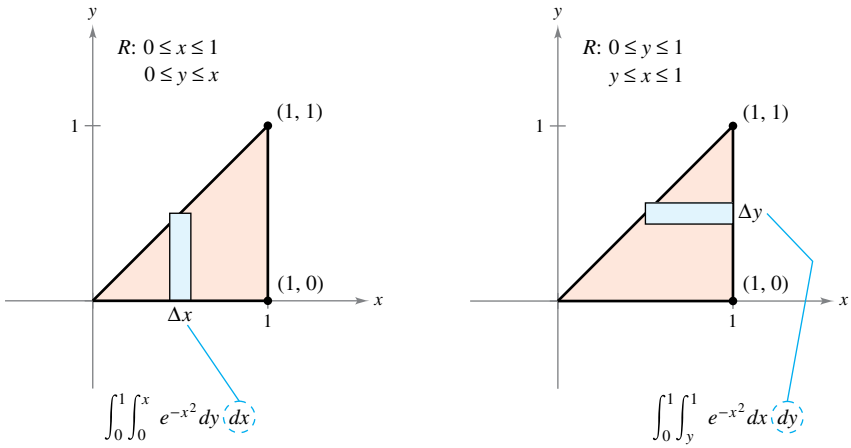


Figure 14.19

By setting up the corresponding iterated integrals, you can determine that the order $dx\,dy$ requires the antiderivative

$$\int e^{-x^2}\,dx$$

which is not an elementary function. On the other hand, the order $dy\,dx$ produces

$$\begin{aligned}
\int_0^1 \int_0^x e^{-x^2}\,dy\,dx &= \int_0^1 e^{-x^2} y \Big]_0^x\,dx && \text{Integrate with respect to } y. \\
&= \int_0^1 x e^{-x^2}\,dx \\
&= -\frac{1}{2} e^{-x^2} \Big]_0^1 && \text{Integrate with respect to } x. \\
&= -\frac{1}{2}\left(\frac{1}{e} - 1\right) \\
&= \frac{e - 1}{2e} && \text{Volume of solid region (See Figure 14.18.)} \\
&\approx 0.316.
\end{aligned}$$

TECHNOLOGY Use a graphing utility to evaluate the iterated integral in Example 4.

EXAMPLE 5 Volume of a Region Bounded by Two Surfaces

Find the volume of the solid region bounded above by the paraboloid

$$z = 1 - x^2 - y^2$$ Paraboloid

and below by the plane

$$z = 1 - y$$ Plane

as shown in Figure 14.20.

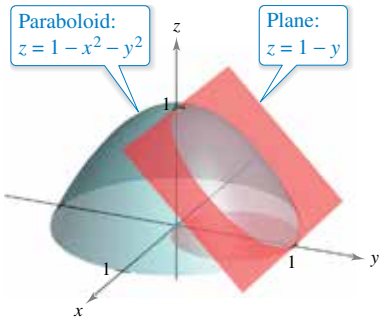

Figure 14.20

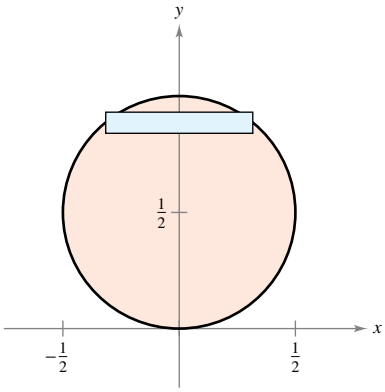

R: $0 \le y \le 1$
$-\sqrt{y - y^2} \le x \le \sqrt{y - y^2}$

Figure 14.21

Solution Equating z-values, you can determine that the intersection of the two surfaces occurs on the right circular cylinder given by

$$1 - y = 1 - x^2 - y^2 \quad \Rightarrow \quad x^2 = y - y^2.$$

So, the region R in the xy-plane is a circle, as shown in Figure 14.21. Because the volume of the solid region is the difference between the volume under the paraboloid and the volume under the plane, you have

$$\begin{aligned}
\text{Volume} &= (\text{volume under paraboloid}) - (\text{volume under plane}) \\
&= \int_0^1 \int_{-\sqrt{y-y^2}}^{\sqrt{y-y^2}} (1 - x^2 - y^2)\, dx\, dy - \int_0^1 \int_{-\sqrt{y-y^2}}^{\sqrt{y-y^2}} (1 - y)\, dx\, dy \\
&= \int_0^1 \int_{-\sqrt{y-y^2}}^{\sqrt{y-y^2}} (y - y^2 - x^2)\, dx\, dy \\
&= \int_0^1 \left[(y - y^2)x - \frac{x^3}{3} \right]_{-\sqrt{y-y^2}}^{\sqrt{y-y^2}} dy \\
&= \frac{4}{3} \int_0^1 (y - y^2)^{3/2}\, dy \\
&= \left(\frac{4}{3}\right)\left(\frac{1}{8}\right) \int_0^1 [1 - (2y - 1)^2]^{3/2}\, dy \\
&= \frac{1}{6} \int_{-\pi/2}^{\pi/2} \frac{\cos^4 \theta}{2}\, d\theta \qquad 2y - 1 = \sin\theta \\
&= \frac{1}{6} \int_0^{\pi/2} \cos^4 \theta\, d\theta \\
&= \left(\frac{1}{6}\right)\left(\frac{3\pi}{16}\right) \qquad \text{Wallis's Formula} \\
&= \frac{\pi}{32}.
\end{aligned}$$

Average Value of a Function

Recall from Section 4.4 that for a function f in one variable, the average value of f on the interval $[a, b]$ is

$$\frac{1}{b-a}\int_a^b f(x)\,dx.$$

Given a function f in two variables, you can find the average value of f over the plane region R as shown in the following definition.

Definition of the Average Value of a Function Over a Region

If f is integrable over the plane region R, then the **average value** of f over R is

$$\text{Average value} = \frac{1}{A}\iint_R f(x, y)\,dA$$

where A is the area of R.

EXAMPLE 6 **Finding the Average Value of a Function**

Find the average value of

$$f(x, y) = \frac{1}{2}xy$$

over the plane region R, where R is a rectangle with vertices

$$(0, 0), (4, 0), (4, 3), \quad \text{and} \quad (0, 3).$$

Solution The area of the rectangular region R is

$$A = (4)(3) = 12$$

as shown in Figure 14.22. The bounds for x are

$$0 \le x \le 4$$

and the bounds for y are

$$0 \le y \le 3.$$

So, the average value is

$$\begin{aligned}
\text{Average value} &= \frac{1}{A}\iint_R f(x, y)\,dA \\
&= \frac{1}{12}\int_0^4\int_0^3 \frac{1}{2}xy\,dy\,dx \\
&= \frac{1}{12}\int_0^4 \frac{1}{4}xy^2\Big]_0^3\,dx \\
&= \left(\frac{1}{12}\right)\left(\frac{9}{4}\right)\int_0^4 x\,dx \\
&= \frac{3}{16}\left[\frac{1}{2}x^2\right]_0^4 \\
&= \left(\frac{3}{16}\right)(8) \\
&= \frac{3}{2}.
\end{aligned}$$

Concept Check

1. Describe the process of using an inner partition to approximate the volume of a solid region lying above the xy-plane. How can the approximation be improved?
2. Explain the benefit of Fubini's Theorem when evaluating a double integral.

Approximation **In Exercises 3–6, approximate the integral $\int_R\int f(x,y)\,dA$ by dividing the rectangle R with vertices $(0,0)$, $(4,0)$, $(4,2)$, and $(0,2)$ into eight equal squares and finding the sum $\sum_{i=1}^{8} f(x_i,y_i)\,\Delta A_i$, where (x_i,y_i) is the center of the ith square. Evaluate the iterated integral and compare it with the approximation.**

3. $\int_0^4\int_0^2 (x+y)\,dy\,dx$
4. $\frac{1}{2}\int_0^4\int_0^2 x^2y\,dy\,dx$
5. $\int_0^4\int_0^2 (x^2+y^2)\,dy\,dx$
6. $\int_0^4\int_0^2 \frac{1}{(x+1)(y+1)}\,dy\,dx$

Evaluating a Double Integral **In Exercises 7–12, sketch the region R and evaluate the iterated integral $\int_R\int f(x,y)\,dA$.**

7. $\int_0^2\int_0^1 (1-4x+8y)\,dy\,dx$
8. $\int_0^{\pi}\int_0^{\pi/2} \sin^2 x\cos^2 y\,dy\,dx$
9. $\int_0^6\int_{y/2}^3 (x+y)\,dx\,dy$
10. $\int_0^4\int_{y/2}^{\sqrt{y}} x^2y^2\,dx\,dy$
11. $\int_{-3}^3\int_{-\sqrt{9-x^2}}^{\sqrt{9-x^2}} (x+y)\,dy\,dx$
12. $\int_0^1\int_{y-1}^0 e^{x+y}\,dx\,dy + \int_0^1\int_0^{1-y} e^{x+y}\,dx\,dy$

Evaluating a Double Integral **In Exercises 13–20, set up integrals for both orders of integration. Use the more convenient order to evaluate the integral over the plane region R.**

13. $\int_R\int xy\,dA$

R: rectangle with vertices $(0,0)$, $(0,5)$, $(3,5)$, $(3,0)$

14. $\int_R\int \sin x\sin y\,dA$

R: rectangle with vertices $(-\pi,0)$, $(\pi,0)$, $(\pi,\pi/2)$, $(-\pi,\pi/2)$

15. $\int_R\int \frac{y}{x^2+y^2}\,dA$

R: trapezoid bounded by $y=x$, $y=2x$, $x=1$, $x=2$

16. $\int_R\int xe^y\,dA$

R: triangle bounded by $y=4-x$, $y=0$, $x=0$

17. $\int_R\int -2y\,dA$

R: region bounded by $y=4-x^2$, $y=4-x$

18. $\int_R\int \frac{y}{1+x^2}\,dA$

R: region bounded by $y=0$, $y=\sqrt{x}$, $x=4$

19. $\int_R\int x\,dA$

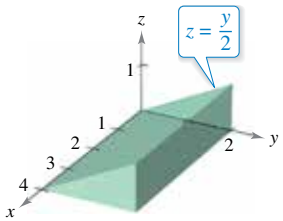
R: sector of a circle in the first quadrant bounded by $y=\sqrt{25-x^2}$, $3x-4y=0$, $y=0$

20. $\int_R\int (x^2+y^2)\,dA$

R: semicircle bounded by $y=\sqrt{4-x^2}$, $y=0$

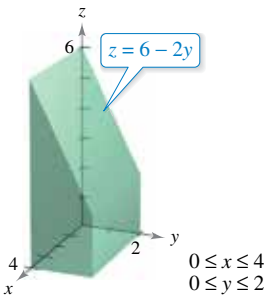
Finding Volume **In Exercises 21–26, use a double integral to find the volume of the indicated solid.**

21.



$0 \le x \le 4$
$0 \le y \le 2$

22.



$0 \le x \le 4$
$0 \le y \le 2$

23.

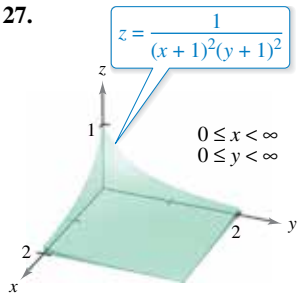
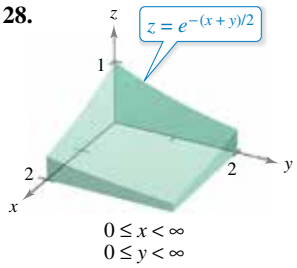
Finding Volume **In Exercises 27 and 28, use an improper double integral to find the volume of the indicated solid.**

27.



28.



Finding Volume **In Exercises 29–34, set up and evaluate a double integral to find the volume of the solid bounded by the graphs of the equations.**

29. $z = xy,\ z = 0,\ y = x^3,\ x = 1,$ first octant

30. $z = 0,\ z = x^2,\ x = 0,\ x = 2,\ y = 0,\ y = 4$

31. $z = x + y,\ x^2 + y^2 = 4,$ first octant

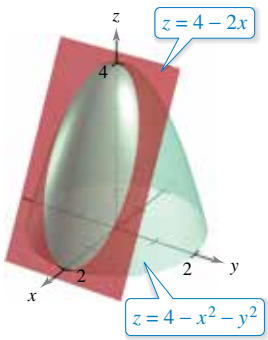
32. $z = \dfrac{1}{1 + y^2},\ x = 0,\ x = 2,\ y \ge 0$

33. $y = 4 - x^2,\ z = 4 - x^2,$ first octant

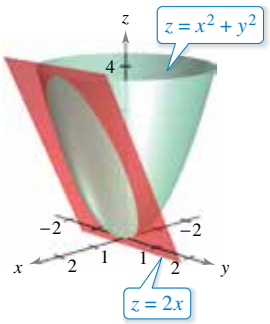
34. $x^2 + z^2 = 1,\ y^2 + z^2 = 1,$ first octant

Volume of a Region Bounded by Two Surfaces **In Exercises 35–40, set up a double integral to find the volume of the solid region bounded by the graphs of the equations. Do not evaluate the integral.**

35.



36.



37. $z = x^2 + y^2,\ x^2 + y^2 = 4,\ z = 0$

38. $z = \sin^2 x,\ z = 0,\ 0 \le x \le \pi,\ 0 \le y \le 5$

39. $z = x^2 + 2y^2,\ z = 4y$

40. $z = x^2 + y^2,\ z = 18 - x^2 - y^2$

Finding Volume Using Technology **In Exercises 41–44, use a graphing utility to find the volume of the solid bounded by the graphs of the equations.**

41. $z = 9 - x^2 - y^2,\ z = 0$

42. $x^2 = 9 - y,\ z^2 = 9 - y,$ first octant

43. $z = \dfrac{2}{1 + x^2 + y^2},\ z = 0,\ y = 0,\ x = 0,\ y = -0.5x + 1$

44. $z = \ln(1 + x + y),\ z = 0,\ y = 0,\ x = 0,\ x = 4 - \sqrt{y}$

Evaluating an Iterated Integral **In Exercises 45–50, sketch the region of integration. Then evaluate the iterated integral, changing the order of integration if necessary.**

45. $\displaystyle\int_0^1 \int_{y/2}^{1/2} e^{-x^2}\,dx\,dy$

46. $\displaystyle\int_0^{\ln 10} \int_{e^x}^{10} \frac{1}{\ln y}\,dy\,dx$

47. $\displaystyle\int_{-2}^{2} \int_{-\sqrt{4-x^2}}^{\sqrt{4-x^2}} \sqrt{4 - y^2}\,dy\,dx$

48. $\displaystyle\int_0^3 \int_{y/3}^{1} \frac{1}{1 + x^4}\,dx\,dy$

49. $\displaystyle\int_0^2 \int_{2x}^{4} \sin y^2\,dy\,dx$

50. $\displaystyle\int_0^2 \int_{x^2/2}^{2} \sqrt{y} \cos y\,dy\,dx$

Average Value **In Exercises 51–56, find the average value of $f(x, y)$ over the plane region R.**

51. $f(x, y) = x$, R: rectangle with vertices $(0, 0), (4, 0), (4, 2), (0, 2)$

52. $f(x, y) = 2xy$, R: rectangle with vertices $(0, 1), (1, 1), (1, 6), (0, 6)$

53. $f(x, y) = x^2 + y^2$

R: square with vertices $(0, 0), (2, 0), (2, 2), (0, 2)$

54. $f(x, y) = \dfrac{1}{x + y}$, R: triangle with vertices $(0, 0), (1, 0), (1, 1)$

55. $f(x, y) = e^{x+y}$, R: triangle with vertices $(0, 0), (0, 1), (1, 1)$

56. $f(x, y) = \sin(x + y)$

R: rectangle with vertices $(0, 0), (\pi, 0), (\pi, \pi), (0, \pi)$

57. Average Production

The Cobb-Douglas production function for an automobile manufacturer is $f(x, y) = 100x^{0.6}y^{0.4}$, where x is the number of units of labor and y is the number of units of capital. Estimate the average production level when the number of units of labor x varies between 200 and 250 and the number of units of capital y varies between 300 and 325.

58. Average Temperature The temperature in degrees Celsius on the surface of a metal plate is

$$T(x, y) = 20 - 4x^2 - y^2$$

where x and y are measured in centimeters. Estimate the average temperature when x varies between 0 and 2 centimeters and y varies between 0 and 4 centimeters.

Exploring Concepts

59. Let R be a region in the xy-plane whose area is B. When $f(x, y) = k$ for every point (x, y) in R, what is the value of $\int_R \int f(x, y)\,dA$? Explain.

60. Let the plane region R be a unit circle and let the maximum value of f on R be 6. Is the greatest possible value of $\int_R \int f(x, y)\,dy\,dx$ equal to 6? Why or why not? If not, what is the greatest possible value?

Probability A *joint density function* of the continuous random variables x and y is a function $f(x, y)$ satisfying the following properties.

(a) $f(x, y) \geq 0$ for all (x, y)

(b) $\int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f(x, y)\, dA = 1$

(c) $P[(x, y) \in R] = \int_R \int f(x, y)\, dA$

In Exercises 61–64, show that the function is a joint density function and find the required probability.

61. $f(x, y) = \begin{cases} \frac{1}{3}, & 0 \leq x \leq 1, 1 \leq y \leq 4 \\ 0, & \text{elsewhere} \end{cases}$

$P(0 \leq x \leq 1, 1 \leq y \leq 3)$

62. $f(x, y) = \begin{cases} \frac{1}{5}xy, & 0 \leq x \leq 2, 0 \leq y \leq \sqrt{5} \\ 0, & \text{elsewhere} \end{cases}$

$P(0 \leq x \leq 1, 0 \leq y \leq 2)$

63. $f(x, y) = \begin{cases} \frac{1}{27}(9 - x - y), & 0 \leq x \leq 3, 3 \leq y \leq 6 \\ 0, & \text{elsewhere} \end{cases}$

$P(0 \leq x \leq 1, 3 \leq y \leq 6)$

64. $f(x, y) = \begin{cases} e^{-x-y}, & x \geq 0, y \geq 0 \\ 0, & \text{elsewhere} \end{cases}$

$P(0 \leq x \leq 1, x \leq y \leq 1)$

65. Proof Let f be a continuous function such that $0 \leq f(x, y) \leq 1$ over a region R of area 1. Prove that $0 \leq \int_R \int f(x, y)\, dA \leq 1$.

66. Finding Volume Find the volume of the solid in the first octant bounded by the coordinate planes and the plane

$$\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$$

where $a > 0$, $b > 0$, and $c > 0$.

67. Approximation The table shows values of a function f over a square region R. Divide the region into 16 equal squares and select (x_i, y_i) to be the point in the ith square closest to the origin. Approximate the value of the integral below. Compare this approximation with that obtained by using the point in the ith square farthest from the origin.

$$\int_0^4 \int_0^4 f(x, y)\, dy\, dx$$

x \ y	0	1	2	3	4
0	32	31	28	23	16
1	31	30	27	22	15
2	28	27	24	19	12
3	23	22	19	14	7
4	16	15	12	7	0

68. HOW DO YOU SEE IT? The figure below shows Erie County, New York. Let $f(x, y)$ represent the total annual snowfall at the point (x, y) in the county, where R is the county. Interpret each of the following.

(a) $\int_R \int f(x, y)\, dA$

(b) $\dfrac{\int_R \int f(x, y)\, dA}{\int_R \int dA}$

True or False? **In Exercises 69 and 70, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

69. The volume of the sphere $x^2 + y^2 + z^2 = 1$ is given by the integral

$$V = 8 \int_0^1 \int_0^1 \sqrt{1 - x^2 - y^2}\, dx\, dy.$$

70. If $f(x, y) \leq g(x, y)$ for all (x, y) in R, and both f and g are continuous over R, then $\int_R \int f(x, y)\, dA \leq \int_R \int g(x, y)\, dA$.

71. Maximizing a Double Integral Determine the region R in the xy-plane that maximizes the value of

$$\int_R \int (9 - x^2 - y^2)\, dA.$$

72. Minimizing a Double Integral Determine the region R in the xy-plane that minimizes the value of

$$\int_R \int (x^2 + y^2 - 4)\, dA.$$

73. Average Value Let

$$f(x) = \int_1^x e^{t^2}\, dt.$$

Find the average value of f on the interval $[0, 1]$.

74. Using Geometry Use a geometric argument to show that

$$\int_0^3 \int_0^{\sqrt{9-y^2}} \sqrt{9 - x^2 - y^2}\, dx\, dy = \frac{9\pi}{2}.$$

PUTNAM EXAM CHALLENGE

75. Evaluate $\int_0^a \int_0^b e^{\max\{b^2x^2,\, a^2y^2\}}\, dy\, dx$, where a and b are positive.

76. Show that if $\lambda > \frac{1}{2}$ there does not exist a real-valued function u such that for all x in the closed interval $0 \leq x \leq 1$, $u(x) = 1 + \lambda \int_x^1 u(y)u(y - x)\, dy$.

14.3 Change of Variables: Polar Coordinates

GO DIGITAL

Write and evaluate double integrals in polar coordinates.

Double Integrals in Polar Coordinates

Some double integrals are *much* easier to evaluate in polar form than in rectangular form. This is especially true for regions such as circles, cardioids, and rose curves, and for integrands that involve $x^2 + y^2$.

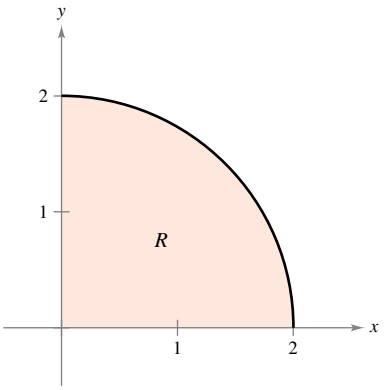
In Section 10.4, you learned that the polar coordinates (r, θ) of a point are related to the rectangular coordinates (x, y) of the point as follows.

$$x = r\cos\theta \quad \text{and} \quad y = r\sin\theta$$

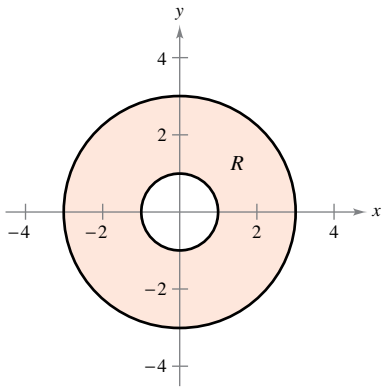
$$r^2 = x^2 + y^2 \quad \text{and} \quad \tan\theta = \frac{y}{x}$$

EXAMPLE 1 **Using Polar Coordinates to Describe a Region**

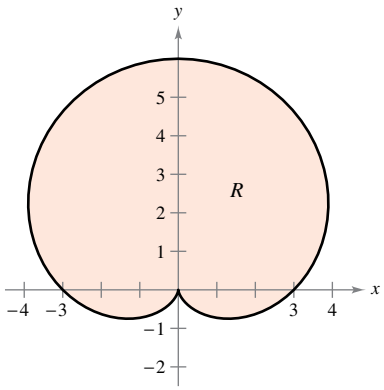
Use polar coordinates to describe each region shown in Figure 14.23.



(a)



(b)



(c)

Figure 14.23

Solution

a. The region R is a quarter circle of radius 2. It can be described in polar coordinates as

$$R = \{(r, \theta):\ 0 \le r \le 2, \quad 0 \le \theta \le \pi/2\}.$$

b. The region R consists of all points between concentric circles of radii 1 and 3. It can be described in polar coordinates as

$$R = \{(r, \theta):\ 1 \le r \le 3, \quad 0 \le \theta \le 2\pi\}.$$

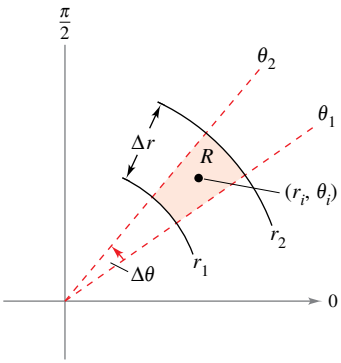
c. The region R is a cardioid with $a = b = 3$. It can be described in polar coordinates as

$$R = \{(r, \theta):\ 0 \le r \le 3 + 3\sin\theta, \quad 0 \le \theta \le 2\pi\}.$$

The regions in Example 1 are special cases of **polar sectors**

$$R = \{(r, \theta):\ r_1 \le r \le r_2, \quad \theta_1 \le \theta \le \theta_2\}$$ Polar sector

as shown in Figure 14.24.



Polar sector

Figure 14.24

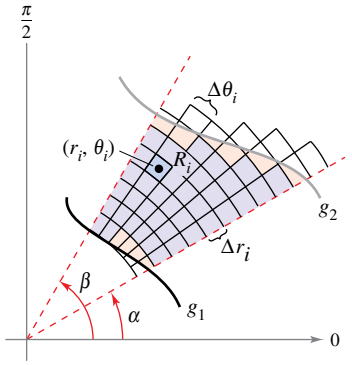
Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.



Polar grid superimposed over region R
Figure 14.25

To define a double integral of a continuous function $z = f(x, y)$ in polar coordinates, consider a region R bounded by the graphs of

$$r = g_1(\theta) \quad \text{and} \quad r = g_2(\theta)$$

and the lines $\theta = \alpha$ and $\theta = \beta$. Instead of partitioning R into small rectangles, use a partition of small polar sectors. On R, superimpose a polar grid made of rays and circular arcs, as shown in Figure 14.25. The polar sectors R_i lying entirely within R form an **inner polar partition** Δ, whose **norm** $\|\Delta\|$ is the length of the longest diagonal of the n polar sectors.

Consider a specific polar sector R_i, as shown in Figure 14.26. It can be shown (see Exercise 68) that the area of R_i is

$$\Delta A_i = r_i \, \Delta r_i \, \Delta\theta_i \qquad \text{Area of } R_i$$

where $\Delta r_i = r_2 - r_1$ and $\Delta\theta_i = \theta_2 - \theta_1$. This implies that the volume of the solid of height $f(r_i \cos\theta_i, r_i \sin\theta_i)$ above R_i is approximately

$$f(r_i \cos\theta_i, r_i \sin\theta_i) r_i \, \Delta r_i \, \Delta\theta_i$$

and you have

$$\iint_R f(x, y)\, dA \approx \sum_{i=1}^{n} f(r_i \cos\theta_i, r_i \sin\theta_i) r_i \, \Delta r_i \, \Delta\theta_i.$$

The sum on the right can be interpreted as a Riemann sum for

$$f(r \cos\theta, r \sin\theta) r.$$

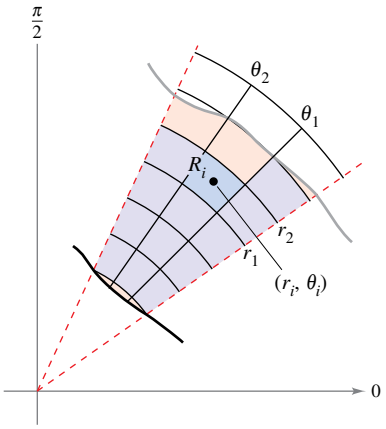
The region R corresponds to a *horizontally simple* region S in the $r\theta$-plane, as shown in Figure 14.27. The polar sectors R_i correspond to rectangles S_i, and the area ΔA_i of S_i is $\Delta r_i \, \Delta\theta_i$. So, the right side of the equation corresponds to the double integral

$$\iint_S f(r \cos\theta, r \sin\theta) r \, dA.$$

From this, you can apply Theorem 14.2 to write

$$\begin{aligned} \iint_R f(x, y)\, dA &= \iint_S f(r \cos\theta, r \sin\theta) r \, dA \\ &= \int_\alpha^\beta \int_{g_1(\theta)}^{g_2(\theta)} f(r \cos\theta, r \sin\theta) r \, dr \, d\theta. \end{aligned}$$

This suggests the theorem on the next page, the proof of which is discussed in Section 14.8.



The polar sector R_i is the set of all points (r, θ) such that $r_1 \le r \le r_2$ and $\theta_1 \le \theta \le \theta_2$.

THEOREM 14.3 Change of Variables to Polar Form

Let R be a plane region consisting of all points $(x, y) = (r\cos\theta, r\sin\theta)$ satisfying the conditions $0 \le g_1(\theta) \le r \le g_2(\theta)$, $\alpha \le \theta \le \beta$, where $0 \le (\beta - \alpha) \le 2\pi$. If g_1 and g_2 are continuous on $[\alpha, \beta]$ and f is continuous on R, then

$$\iint_R f(x, y)\,dA = \int_\alpha^\beta \int_{g_1(\theta)}^{g_2(\theta)} f(r\cos\theta, r\sin\theta) r\,dr\,d\theta.$$

Exploration

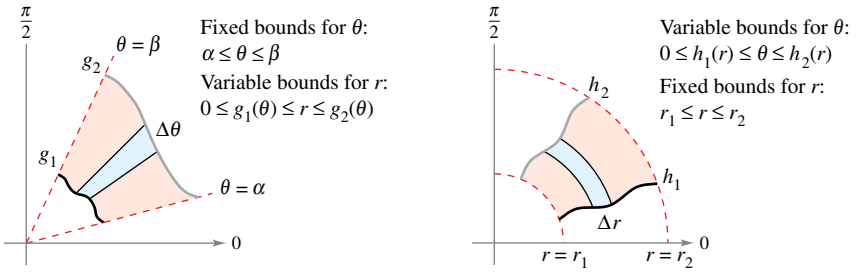
Volume of a Paraboloid Sector In the Exploration on page 983, you were asked to summarize the different ways you know of finding the volume of the solid bounded by the paraboloid

$z = a^2 - x^2 - y^2, a > 0$

and the xy-plane. You now know another way. Use it to find the volume of the solid.

If $z = f(x, y)$ is nonnegative on R, then the integral in Theorem 14.3 can be interpreted as the volume of the solid region between the graph of f and the region R. When using the integral in Theorem 14.3, be certain not to omit the extra factor of r in the integrand.

The region R is restricted to two basic types, ***r*-simple** regions and ***θ*-simple** regions, as shown in Figure 14.28.



r-Simple region θ-Simple region

Figure 14.28

EXAMPLE 2 Evaluating a Double Polar Integral

Let R be the annular region lying between the two circles $x^2 + y^2 = 1$ and $x^2 + y^2 = 5$. Evaluate the integral

$$\iint_R (x^2 + y)\,dA.$$

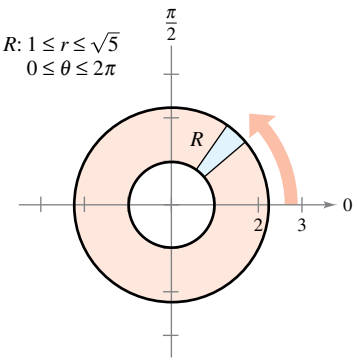


Figure 14.29

Solution The polar boundaries are $1 \le r \le \sqrt{5}$ and $0 \le \theta \le 2\pi$, as shown in Figure 14.29. Furthermore, $x^2 = (r\cos\theta)^2$ and $y = r\sin\theta$. So, you have

$$\begin{aligned}
\iint_R (x^2 + y)\,dA &= \int_0^{2\pi}\int_1^{\sqrt{5}} (r^2\cos^2\theta + r\sin\theta) r\,dr\,d\theta \\
&= \int_0^{2\pi}\int_1^{\sqrt{5}} (r^3\cos^2\theta + r^2\sin\theta)\,dr\,d\theta \\
&= \int_0^{2\pi} \left(\frac{r^4}{4}\cos^2\theta + \frac{r^3}{3}\sin\theta\right)\Big]_1^{\sqrt{5}} d\theta \\
&= \int_0^{2\pi} \left(6\cos^2\theta + \frac{5\sqrt{5} - 1}{3}\sin\theta\right) d\theta \\
&= \int_0^{2\pi} \left(3 + 3\cos 2\theta + \frac{5\sqrt{5} - 1}{3}\sin\theta\right) d\theta \\
&= \left(3\theta + \frac{3\sin 2\theta}{2} - \frac{5\sqrt{5} - 1}{3}\cos\theta\right)\Big]_0^{2\pi} \\
&= 6\pi.
\end{aligned}$$

In Example 2, be sure to notice the factor of r with $dr\,d\theta$ in the integrand. This comes from the formula for the area of a polar sector. In differential notation, you can write

$$dA = r\,dr\,d\theta$$

which indicates that the area of a polar sector increases as you move away from the origin.

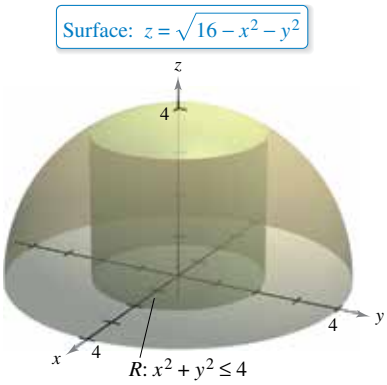

Figure 14.30

EXAMPLE 3 Change of Variables to Polar Coordinates

Use polar coordinates to find the volume of the solid region bounded above by the hemisphere

$$z = \sqrt{16 - x^2 - y^2}$$ Hemisphere forms upper surface.

and below by the circular region R given by

$$x^2 + y^2 \le 4$$ Circular region forms lower surface.

as shown in Figure 14.30.

Solution In Figure 14.30, R has the bounds

$$-\sqrt{4 - y^2} \le x \le \sqrt{4 - y^2}, \quad -2 \le y \le 2$$

and that $0 \le z \le \sqrt{16 - x^2 - y^2}$. In polar coordinates, the bounds are

$$0 \le r \le 2 \quad \text{and} \quad 0 \le \theta \le 2\pi$$

with height $z = \sqrt{16 - x^2 - y^2} = \sqrt{16 - r^2}$. Consequently, the volume V is

$$\begin{aligned}
V &= \int_R\int f(x, y)\,dA && \text{Formula for volume} \\
&= \int_0^{2\pi}\int_0^2 \sqrt{16 - r^2}\,r\,dr\,d\theta && \text{Polar coordinates} \\
&= -\frac{1}{3}\int_0^{2\pi} (16 - r^2)^{3/2}\Big]_0^2\,d\theta && \text{Integrate with respect to } r. \\
&= -\frac{1}{3}\int_0^{2\pi} \left(24\sqrt{3} - 64\right)d\theta \\
&= -\frac{8}{3}\left(3\sqrt{3} - 8\right)\theta\Big]_0^{2\pi} && \text{Integrate with respect to } \theta. \\
&= \frac{16\pi}{3}\left(8 - 3\sqrt{3}\right) \\
&\approx 46.979.
\end{aligned}$$

REMARK To see the benefit of polar coordinates in Example 3, evaluate the corresponding rectangular iterated integral

$$\int_{-2}^{2}\int_{-\sqrt{4-y^2}}^{\sqrt{4-y^2}} \sqrt{16 - x^2 - y^2}\,dx\,dy.$$

TECHNOLOGY Any graphing utility that can evaluate double integrals in rectangular coordinates can also evaluate double integrals in polar coordinates. The reason this is true is that once you have formed the iterated integral, its value is not changed by using different variables. In other words, when you use a graphing utility to evaluate

$$\int_0^{2\pi}\int_0^2 \sqrt{16 - x^2}\,x\,dx\,dy$$

you will obtain the same value as that obtained in Example 3.

Just as with rectangular coordinates, the double integral

$$\int_R\int dA$$

can be used to find the area of a region in the plane.

EXAMPLE 4 Finding Areas of Polar Regions

See LarsonCalculus.com for an interactive version of this type of example.

To use a double integral to find the area enclosed by the graph of $r = 3\cos 3\theta$, let R be one petal of the curve shown in Figure 14.31. This region is r-simple, and the boundaries are $-\pi/6 \le \theta \le \pi/6$ and $0 \le r \le 3\cos 3\theta$. So, the area of one petal is

$$\begin{aligned}
\frac{1}{3}A = \iint_R dA &= \int_{-\pi/6}^{\pi/6}\int_0^{3\cos 3\theta} r\,dr\,d\theta \\
&= \int_{-\pi/6}^{\pi/6} \frac{r^2}{2}\Big]_0^{3\cos 3\theta} d\theta \qquad \text{Integrate with respect to } r. \\
&= \frac{9}{2}\int_{-\pi/6}^{\pi/6} \cos^2 3\theta\,d\theta \\
&= \frac{9}{4}\int_{-\pi/6}^{\pi/6} (1 + \cos 6\theta)\,d\theta \\
&= \frac{9}{4}\left[\theta + \frac{1}{6}\sin 6\theta\right]_{-\pi/6}^{\pi/6} \qquad \text{Integrate with respect to } \theta. \\
&= \frac{3\pi}{4}.
\end{aligned}$$

So, the total area is $A = 9\pi/4$. ■

As illustrated in Example 4, the area of a region in the plane can be represented by

$$A = \int_\alpha^\beta \int_{g_1(\theta)}^{g_2(\theta)} r\,dr\,d\theta.$$

For $g_1(\theta) = 0$, you obtain

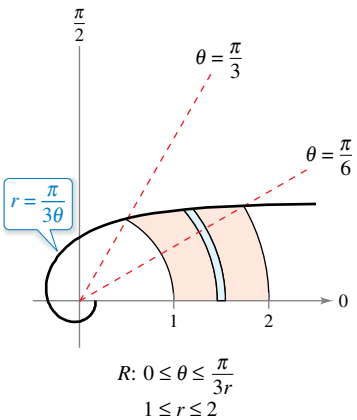
$$A = \int_\alpha^\beta \int_0^{g_2(\theta)} r\,dr\,d\theta = \int_\alpha^\beta \frac{r^2}{2}\Big]_0^{g_2(\theta)} d\theta = \frac{1}{2}\int_\alpha^\beta [g_2(\theta)]^2\,d\theta$$

which agrees with Theorem 10.13.

So far in this section, all of the examples of iterated integrals in polar form have been of the form

$$\int_\alpha^\beta \int_{g_1(\theta)}^{g_2(\theta)} f(r\cos\theta, r\sin\theta) r\,dr\,d\theta$$

in which the order of integration is with respect to r first. Sometimes you can obtain a simpler integration problem by integrating with respect to θ first.



θ-Simple region

Figure 14.32

EXAMPLE 5 Integrating with Respect to θ First

Find the area of the region bounded above by the spiral $r = \pi/(3\theta)$ and below by the polar axis, between $r = 1$ and $r = 2$.

Solution The region is shown in Figure 14.32. The polar boundaries for the region are

$$1 \le r \le 2 \quad \text{and} \quad 0 \le \theta \le \frac{\pi}{3r}.$$

So, the area of the region can be evaluated as follows.

$$A = \int_1^2 \int_0^{\pi/(3r)} r\,d\theta\,dr = \int_1^2 r\theta\Big]_0^{\pi/(3r)} dr = \int_1^2 \frac{\pi}{3}\,dr = \frac{\pi r}{3}\Big]_1^2 = \frac{\pi}{3}$$

14.3 Exercises

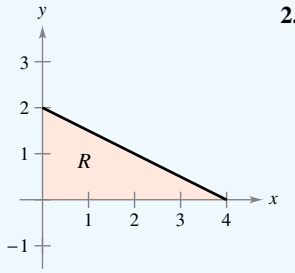
See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

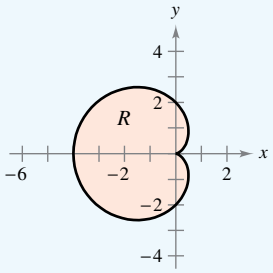
Concept Check

In Exercises 1 and 2, the region R for the integral $\int_R\int f(x, y)\,dA$ is shown. State whether you would use rectangular or polar coordinates to evaluate the integral.

1.



2.



3. Describe r-simple regions and θ-simple regions.

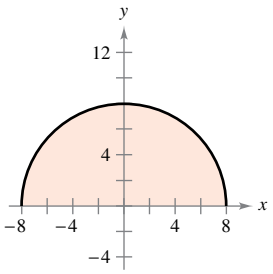
4. Sketch the region of integration represented by the double integral

$$\int_0^{2\pi}\int_3^6 f(r, \theta)r\,dr\,d\theta.$$

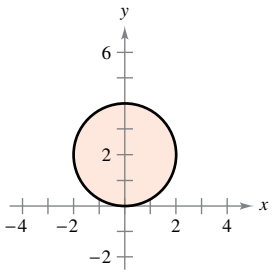
Describing a Region

In Exercises 5–8, use polar coordinates to describe the region shown.

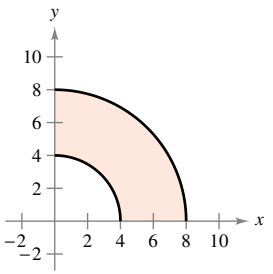
5.



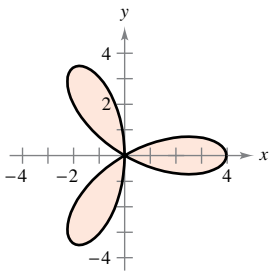
6.



7.



8.



Evaluating a Double Integral

In Exercises 9–16, evaluate the double integral $\int_R\int f(r, \theta)\,dA$ and sketch the region R.

9. $\displaystyle\int_0^{\pi}\int_0^{2\cos\theta} r\,dr\,d\theta$

10. $\displaystyle\int_0^{\pi/2}\int_0^{\sin\theta} r^2\,dr\,d\theta$

11. $\displaystyle\int_0^{2\pi}\int_0^{1} 6r^2\sin\theta\,dr\,d\theta$

12. $\displaystyle\int_0^{\pi/4}\int_0^{4} r^2\sin\theta\cos\theta\,dr\,d\theta$

13. $\displaystyle\int_0^{\pi/2}\int_1^{3} \sqrt{9 - r^2}\,r\,dr\,d\theta$

14. $\displaystyle\int_0^{\pi/2}\int_0^{3} re^{-r^2}\,dr\,d\theta$

15. $\displaystyle\int_0^{\pi/2}\int_0^{1+\sin\theta} \theta r\,dr\,d\theta$

16. $\displaystyle\int_0^{\pi/2}\int_0^{1-\cos\theta} (\sin\theta)r\,dr\,d\theta$

Converting to Polar Coordinates

In Exercises 17–26, evaluate the iterated integral by converting to polar coordinates.

17. $\displaystyle\int_0^{3}\int_0^{\sqrt{9-y^2}} y\,dx\,dy$

18. $\displaystyle\int_0^{2}\int_0^{\sqrt{4-x^2}} x\,dy\,dx$

19. $\displaystyle\int_{-2}^{2}\int_0^{\sqrt{4-x^2}} (x^2 + y^2)\,dy\,dx$

20. $\displaystyle\int_0^{1}\int_{-\sqrt{x-x^2}}^{\sqrt{x-x^2}} (x^2 + y^2)\,dy\,dx$

21. $\displaystyle\int_0^{1}\int_0^{\sqrt{1-x^2}} (x^2 + y^2)^{3/2}\,dy\,dx$

22. $\displaystyle\int_0^{2}\int_y^{\sqrt{8-y^2}} \sqrt{x^2 + y^2}\,dx\,dy$

23. $\displaystyle\int_0^{2}\int_0^{\sqrt{2x-x^2}} xy\,dy\,dx$

24. $\displaystyle\int_0^{4}\int_0^{\sqrt{4y-y^2}} x^2\,dx\,dy$

25. $\displaystyle\int_{-1}^{1}\int_0^{\sqrt{1-x^2}} \cos(x^2 + y^2)\,dy\,dx$

26. $\displaystyle\int_0^{\sqrt{6}}\int_0^{\sqrt{6-x^2}} \sin\sqrt{x^2 + y^2}\,dy\,dx$

Converting to Polar Coordinates

In Exercises 27 and 28, write the sum of the two iterated integrals as a single iterated integral by converting to polar coordinates. Evaluate the resulting iterated integral.

27. $\displaystyle\int_0^{2}\int_0^{x} \sqrt{x^2 + y^2}\,dy\,dx + \int_2^{2\sqrt{2}}\int_0^{\sqrt{8-x^2}} \sqrt{x^2 + y^2}\,dy\,dx$

28. $\displaystyle\int_0^{(5\sqrt{2})/2}\int_0^{x} xy\,dy\,dx + \int_{(5\sqrt{2})/2}^{5}\int_0^{\sqrt{25-x^2}} xy\,dy\,dx$

Converting to Polar Coordinates **In Exercises 29–32, use polar coordinates to set up and evaluate the double integral $\int_R\int f(x, y)\, dA$.**

29. $f(x, y) = x + y$

R: $x^2 + y^2 \le 36,\ x \ge 0,\ y \ge 0$

30. $f(x, y) = e^{-(x^2+y^2)/2}$

R: $x^2 + y^2 \le 25,\ x \ge 0$

31. $f(x, y) = \arctan\dfrac{y}{x}$

R: $x^2 + y^2 \ge 1,\ x^2 + y^2 \le 4,\ 0 \le y \le x$

32. $f(x, y) = 9 - x^2 - y^2$

R: $x^2 + y^2 \le 9,\ x \ge 0,\ y \ge 0$

Volume **In Exercises 33–38, use a double integral in polar coordinates to find the volume of the solid bounded by the graphs of the equations.**

33. $z = xy,\ x^2 + y^2 = 1,$ first octant

34. $z = x^2 + y^2 + 3,\ z = 0,\ x^2 + y^2 = 1$

35. $z = \sqrt{x^2 + y^2},\ z = 0,\ x^2 + y^2 = 25$

36. $z = \ln(x^2 + y^2),\ z = 0,\ x^2 + y^2 \ge 1,\ x^2 + y^2 \le 4$

37. Inside the hemisphere $z = \sqrt{16 - x^2 - y^2}$ and inside the cylinder $x^2 + y^2 - 4x = 0$

38. Inside the hemisphere $z = \sqrt{16 - x^2 - y^2}$ and outside the cylinder $x^2 + y^2 = 1$

39. Volume Use a double integral in polar coordinates to find a such that the volume inside the hemisphere

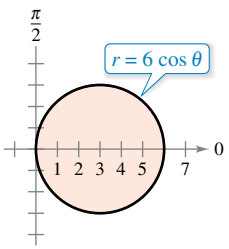
$z = \sqrt{16 - x^2 - y^2}$

and outside the cylinder $x^2 + y^2 = a^2$ is one-half the volume of the hemisphere.

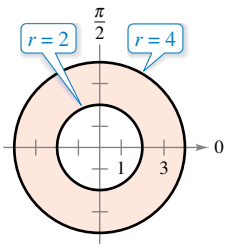
40. Volume Use a double integral in polar coordinates to find the volume of a sphere of radius a.

Area **In Exercises 41–46, use a double integral to find the area of the shaded region.**

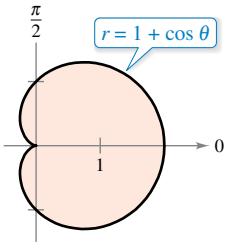
41.



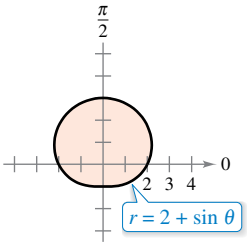
42.



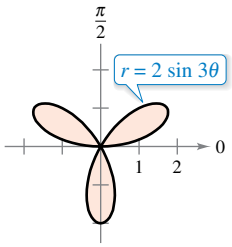
43.



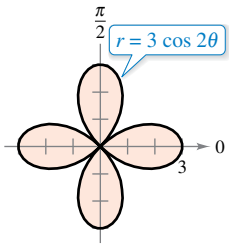
44.



45.



46.



Area **In Exercises 47–52, sketch a graph of the region bounded by the graphs of the equations. Then use a double integral to find the area of the region.**

47. Inside the circle $r = 2\cos\theta$ and outside the circle $r = 1$

48. Inside the cardioid $r = 2 + 2\cos\theta$ and outside the circle $r = 1$

49. Inside the circle $r = 3\cos\theta$ and outside the cardioid $r = 1 + \cos\theta$

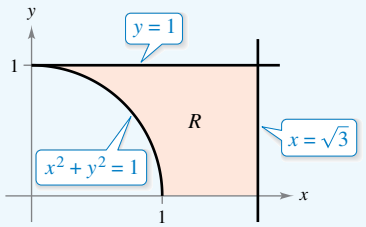
50. Inside the cardioid $r = 1 + \cos\theta$ and outside the circle $r = 3\cos\theta$

51. Inside the rose curve $r = 4\sin 3\theta$ and outside the circle $r = 2$

52. Inside the circle $r = 2$ and outside the cardioid $r = 2 - 2\cos\theta$

Exploring Concepts

53. Express the area of the region R in the figure using the sum of two double polar integrals. Then find the area of the region without using integrals.



54. Let R be the region bounded by the circle $x^2 + y^2 = 9$.

(a) Set up the integral $\displaystyle\int_R\int f(x, y)\, dA$.

(b) Convert the integral in part (a) to polar coordinates.

(c) Which integral would you choose to evaluate? Why?

55. Population

The population density of a city is approximated by the model

$f(x, y) = 4000e^{-0.01(x^2+y^2)}$

for the region $x^2 + y^2 \le 49$, where x and y are measured in miles. Integrate the density function over the indicated circular region to approximate the population of the city.

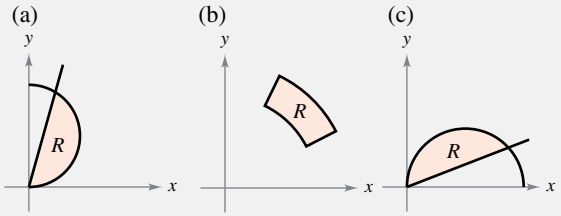
Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

56. HOW DO YOU SEE IT? Each figure shows a region of integration R for the double integral $\int_R\int f(x, y)\, dA$. For each region, state whether horizontal representative elements, vertical representative elements, or polar sectors would yield the easiest method for obtaining the limits of integration. Explain your reasoning.



57. Volume Determine the diameter of a hole that is drilled vertically through the center of the solid bounded by the graphs of the equations $z = 25e^{-(x^2+y^2)/4}$, $z = 0$, and $x^2 + y^2 = 16$ when one-tenth of the volume of the solid is removed.

58. Glacier

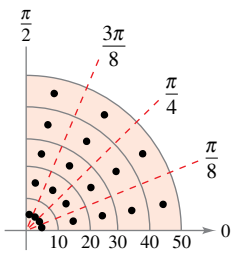
Horizontal cross sections of a piece of ice that broke from a glacier are in the shape of a quarter of a circle with a radius of approximately 50 feet. The base is divided into 20 subregions, as shown in the figure. At the center of each subregion, the height of the ice is measured, yielding the following points in cylindrical coordinates.

$\left(5, \frac{\pi}{16}, 7\right)$, $\left(15, \frac{\pi}{16}, 8\right)$, $\left(25, \frac{\pi}{16}, 10\right)$, $\left(35, \frac{\pi}{16}, 12\right)$, $\left(45, \frac{\pi}{16}, 9\right)$,
$\left(5, \frac{3\pi}{16}, 9\right)$, $\left(15, \frac{3\pi}{16}, 10\right)$, $\left(25, \frac{3\pi}{16}, 14\right)$, $\left(35, \frac{3\pi}{16}, 15\right)$, $\left(45, \frac{3\pi}{16}, 10\right)$,
$\left(5, \frac{5\pi}{16}, 9\right)$, $\left(15, \frac{5\pi}{16}, 11\right)$, $\left(25, \frac{5\pi}{16}, 15\right)$, $\left(35, \frac{5\pi}{16}, 18\right)$, $\left(45, \frac{5\pi}{16}, 14\right)$,
$\left(5, \frac{7\pi}{16}, 5\right)$, $\left(15, \frac{7\pi}{16}, 8\right)$, $\left(25, \frac{7\pi}{16}, 11\right)$, $\left(35, \frac{7\pi}{16}, 16\right)$, $\left(45, \frac{7\pi}{16}, 12\right)$

(a) Approximate the volume of the piece of ice.

(b) Ice weighs approximately 57 pounds per cubic foot. Approximate the weight of the piece of ice.

(c) There are 7.48 gallons of water per cubic foot. Approximate the number of gallons of water in the piece of ice.



Denis Burdin/Shutterstock.com

Approximation **In Exercises 59 and 60, use a graphing utility to approximate the iterated integral.**

59. $\int_{\pi/4}^{\pi/2}\int_0^5 r\sqrt{1 + r^3}\sin\sqrt{\theta}\, dr\, d\theta$

60. $\int_0^{\pi/4}\int_0^4 5re^{\sqrt{r\theta}}\, dr\, d\theta$

True or False? **In Exercises 61 and 62, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

61. If $\int_R\int f(r, \theta)\, dA > 0$, then $f(r, \theta) > 0$ for all (r, θ) in R.

62. If $f(r, \theta)$ is a constant function and the area of the region S is twice that of the region R, then

$$2\int_R\int f(r, \theta)\, dA = \int_S\int f(r, \theta)\, dA.$$

63. Probability The value of the integral

$$I = \int_{-\infty}^{\infty} e^{-x^2/2}\, dx$$

is required in the development of the normal probability density function.

(a) Use polar coordinates to evaluate the improper integral.

$$I^2 = \left(\int_{-\infty}^{\infty} e^{-x^2/2}\, dx\right)\left(\int_{-\infty}^{\infty} e^{-y^2/2}\, dy\right)$$
$$= \int_{-\infty}^{\infty}\int_{-\infty}^{\infty} e^{-(x^2+y^2)/2}\, dA$$

(b) Use the result of part (a) to determine I.

FOR FURTHER INFORMATION For more information on this problem, see the article "Integrating e^{-x^2} Without Polar Coordinates" by William Dunham in *Mathematics Teacher*. To view this article, go to *MathArticles.com*.

64. Evaluating Integrals Use the result of Exercise 63 and a change of variables to evaluate each integral. No integration is required.

(a) $\int_{-\infty}^{\infty} e^{-x^2}\, dx$ (b) $\int_{-\infty}^{\infty} e^{-4x^2}\, dx$

65. Think About It Consider the region R bounded by the graphs of $y = 2$, $y = 4$, $y = x$, and $y = \sqrt{3}x$ and the double integral $\int_R\int f(x, y)\, dA$. Determine the limits of integration when the region R is divided into (a) horizontal representative elements, (b) vertical representative elements, and (c) polar sectors.

66. Think About It Repeat Exercise 65 for a region R bounded by the graph of the equation $(x - 2)^2 + y^2 = 4$.

67. Probability Find k such that the function

$$f(x, y) = \begin{cases} ke^{-(x^2+y^2)}, & x \geq 0, y \geq 0 \\ 0, & \text{elsewhere} \end{cases}$$

is a probability density function. (*Hint:* Show that $\int_R\int f(x, y)\, dA = 1$.)

68. Area Show that the area A of the polar sector R (see figure) is $A = r\Delta r\Delta\theta$, where $r = (r_1 + r_2)/2$ is the average radius of R.

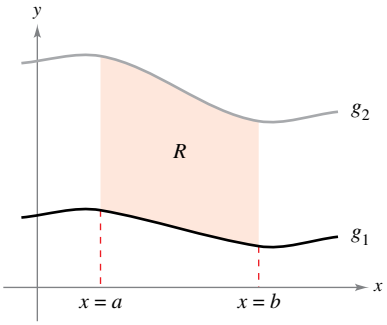
14.4 Center of Mass and Moments of Inertia

GO DIGITAL

- **Find the mass of a planar lamina using a double integral.**
- **Find the center of mass of a planar lamina using double integrals.**
- **Find moments of inertia using double integrals.**



Lamina of constant density ρ
Figure 14.33

Mass

Section 7.6 discussed several applications of integration involving a lamina of *constant* density ρ. For example, if the lamina corresponding to the region R, as shown in Figure 14.33, has a constant density ρ, then the mass of the lamina is given by

$$\text{Mass} = \rho A = \rho \iint_R dA = \iint_R \rho \, dA. \qquad \text{Constant density}$$

If not otherwise stated, a lamina is assumed to have a constant density. In this section, however, you will extend the definition of the term *lamina* to include thin plates of *variable* density. Double integrals can be used to find the mass of a lamina of variable density, where the density at (x, y) is given by the **density function ρ.**

Definition of Mass of a Planar Lamina of Variable Density

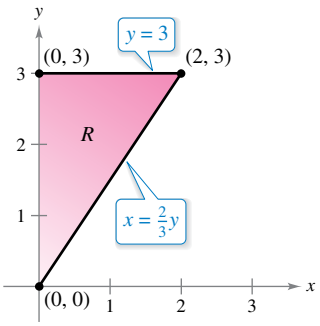
If ρ is a continuous density function on the lamina corresponding to a plane region R, then the mass m of the lamina is given by

$$m = \iint_R \rho(x, y) \, dA. \qquad \text{Variable density}$$

Density is normally expressed as mass per unit volume. For a planar lamina, however, density is mass per unit surface area.

EXAMPLE 1 Finding the Mass of a Planar Lamina

Find the mass of the triangular lamina with vertices $(0, 0)$, $(0, 3)$, and $(2, 3)$, given that the density at (x, y) is $\rho(x, y) = 2x + y$.



Lamina of variable density
$\rho(x, y) = 2x + y$
Figure 14.34

Solution As shown in Figure 14.34, region R has the boundaries $x = 0$, $y = 3$, and $y = 3x/2$ (or $x = 2y/3$). Therefore, the mass of the lamina is

$$\begin{aligned} m &= \iint_R (2x + y) \, dA \\ &= \int_0^3 \int_0^{2y/3} (2x + y) \, dx \, dy \\ &= \int_0^3 \left[x^2 + xy \right]_0^{2y/3} dy \qquad \text{Integrate with respect to } x. \\ &= \frac{10}{9} \int_0^3 y^2 \, dy \\ &= \frac{10}{9} \left[\frac{y^3}{3} \right]_0^3 \qquad \text{Integrate with respect to } y. \\ &= 10. \end{aligned}$$

In Figure 14.34, note that the planar lamina is shaded so that the darkest shading corresponds to the densest part. ■

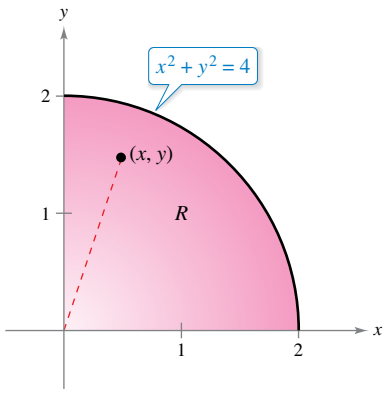
Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.



Density at (x, y): $\rho(x, y) = k\sqrt{x^2 + y^2}$
Figure 14.35

EXAMPLE 2 Finding Mass by Polar Coordinates

Find the mass of the lamina corresponding to the first-quadrant portion of the circle

$$x^2 + y^2 = 4$$

where the density at the point (x, y) is proportional to the distance between the point and the origin, as shown in Figure 14.35.

Solution At any point (x, y), the density of the lamina is

$$\rho(x, y) = k\sqrt{(x - 0)^2 + (y - 0)^2}$$
$$= k\sqrt{x^2 + y^2}$$

where k is the constant of proportionality. Because $0 \le x \le 2$ and $0 \le y \le \sqrt{4 - x^2}$, the mass is given by

$$m = \int_R\int k\sqrt{x^2 + y^2}\, dA$$
$$= \int_0^2 \int_0^{\sqrt{4-x^2}} k\sqrt{x^2 + y^2}\, dy\, dx.$$

To simplify the integration, you can convert to polar coordinates, using the bounds

$$0 \le \theta \le \pi/2 \quad \text{and} \quad 0 \le r \le 2.$$

So, the mass is

$$m = \int_R\int k\sqrt{x^2 + y^2}\, dA$$
$$= \int_0^{\pi/2} \int_0^2 k\sqrt{r^2}\, r\, dr\, d\theta \qquad \text{Polar coordinates}$$
$$= \int_0^{\pi/2} \int_0^2 kr^2\, dr\, d\theta \qquad \text{Simplify integrand.}$$
$$= \int_0^{\pi/2} \frac{kr^3}{3}\Big]_0^2 d\theta \qquad \text{Integrate with respect to } r.$$
$$= \frac{8k}{3}\int_0^{\pi/2} d\theta$$
$$= \frac{8k}{3}\Big[\theta\Big]_0^{\pi/2} \qquad \text{Integrate with respect } \theta.$$
$$= \frac{4\pi k}{3}.$$

TECHNOLOGY On many occasions, this text has mentioned the benefits of graphing utilities that perform symbolic integration. Remember that getting the best results from a graphing utility requires a knowledgeable user. For instance, notice how much simpler the integral in Example 2 becomes when it is converted to polar form.

Rectangular Form	Polar Form
$\int_0^2 \int_0^{\sqrt{4-x^2}} k\sqrt{x^2 + y^2}\, dy\, dx$	$\int_0^{\pi/2} \int_0^2 kr^2\, dr\, d\theta$

Use a graphing utility to evaluate both integrals. Note that some graphing utilities cannot evaluate the first integral, but any graphing utility that can perform double integration can evaluate the second integral.

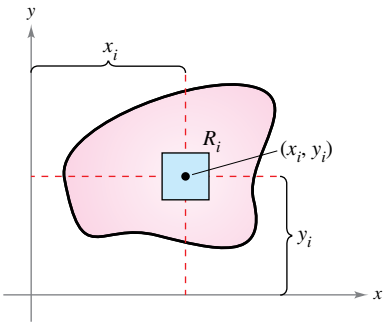
Moments and Center of Mass



$M_x = (\text{mass})(y_i)$
$M_y = (\text{mass})(x_i)$
Figure 14.36

For a lamina of variable density, moments of mass are defined in a manner similar to that used for the uniform density case. For a partition Δ of a lamina corresponding to a plane region R, consider the ith rectangle R_i of one area ΔA_i, as shown in Figure 14.36. Assume that the mass of R_i is concentrated at one of its interior points (x_i, y_i). The moment of mass of R_i with respect to the x-axis can be approximated by

$$(\text{Mass})(y_i) \approx [\rho(x_i, y_i)\,\Delta A_i](y_i).$$

Similarly, the moment of mass with respect to the y-axis can be approximated by

$$(\text{Mass})(x_i) \approx [\rho(x_i, y_i)\Delta A_i](x_i).$$

By forming the Riemann sum of all such products and taking the limits as the norm of Δ approaches 0, you obtain the following definitions of moments of mass with respect to the x- and y-axes.

Moments and Center of Mass of a Variable Density Planar Lamina

Let ρ be a continuous density function on the planar lamina R. The **moments of mass** with respect to the x- and y-axes are

$$M_x = \int_R\int (y)\rho(x, y)\,dA$$

and

$$M_y = \int_R\int (x)\rho(x, y)\,dA.$$

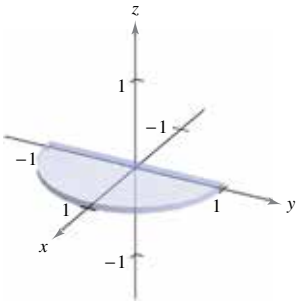
If m is the mass of the lamina, then the **center of mass** is

$$(\bar{x}, \bar{y}) = \left(\frac{M_y}{m}, \frac{M_x}{m}\right).$$

If R represents a simple plane region rather than a lamina, then the point $(\bar{x}, \bar{y})$ is called the **centroid** of the region.

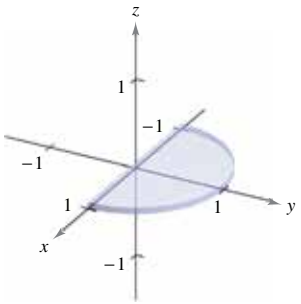
For some planar laminas with a constant density ρ, you can determine the center of mass (or one of its coordinates) using symmetry rather than using integration. For instance, consider the laminas of constant density shown in Figure 14.37. Using symmetry, you can see that $\bar{y} = 0$ for the first lamina and $\bar{x} = 0$ for the second lamina.

R: $0 \le x \le 1$
$-\sqrt{1 - x^2} \le y \le \sqrt{1 - x^2}$



Lamina of constant density that is symmetric with respect to the x-axis

R: $-\sqrt{1 - y^2} \le x \le \sqrt{1 - y^2}$
$0 \le y \le 1$



Lamina of constant density that is symmetric with respect to the y-axis

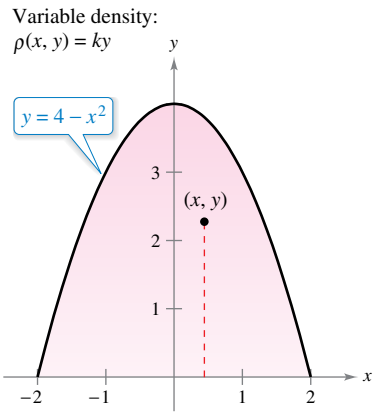
EXAMPLE 3 Finding the Center of Mass

See LarsonCalculus.com for an interactive version of this type of example.

Find the center of mass of the lamina corresponding to the parabolic region

$$0 \le y \le 4 - x^2$$ Parabolic region

where the density at the point (x, y) is proportional to the distance between (x, y) and the x-axis, as shown in Figure 14.38.



Parabolic region of variable density
Figure 14.38

Solution The lamina is symmetric with respect to the y-axis and $\rho(x, y) = ky$, where k is the constant of proportionality. So, the center of mass lies on the y-axis and $\bar{x} = 0$. To find $\bar{y}$, first find the mass of the lamina.

$$\begin{aligned} m &= \int_{-2}^{2}\int_{0}^{4-x^2} ky\, dy\, dx \\ &= \frac{k}{2}\int_{-2}^{2} y^2\Big]_{0}^{4-x^2} dx && \text{Integrate with respect to } y. \\ &= \frac{k}{2}\int_{-2}^{2} (16 - 8x^2 + x^4)\, dx \\ &= \frac{k}{2}\left[16x - \frac{8x^3}{3} + \frac{x^5}{5}\right]_{-2}^{2} && \text{Integrate with respect to } x. \\ &= k\left(32 - \frac{64}{3} + \frac{32}{5}\right) \\ &= \frac{256k}{15} && \text{Mass of the limina} \end{aligned}$$

Next, find the moment of mass about the x-axis.

$$\begin{aligned} M_x &= \int_{-2}^{2}\int_{0}^{4-x^2} (y)(ky)\, dy\, dx \\ &= \frac{k}{3}\int_{-2}^{2} y^3\Big]_{0}^{4-x^2} dx && \text{Integrate with respect to } y. \\ &= \frac{k}{3}\int_{-2}^{2} (64 - 48x^2 + 12x^4 - x^6)\, dx \\ &= \frac{k}{3}\left[64x - 16x^3 + \frac{12x^5}{5} - \frac{x^7}{7}\right]_{-2}^{2} && \text{Integrate with respect to } x. \\ &= \frac{4096k}{105} && \text{Moment of mass about } x\text{-axis} \end{aligned}$$

So,

$$\bar{y} = \frac{M_x}{m} = \frac{4096k/105}{256k/15} = \frac{16}{7}$$

and the center of mass is $\left(0, \frac{16}{7}\right)$. ■

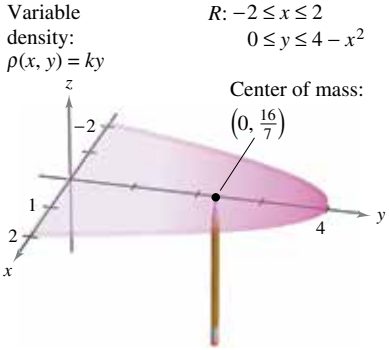


Figure 14.39

Although you can think of the moments M_x and M_y as measuring the tendency to rotate about the x- or y-axis, the calculation of moments is usually an intermediate step toward a more tangible goal. The use of the moments M_x and M_y is typical—to find the center of mass. Determination of the center of mass is useful in a variety of applications that allow you to treat a lamina as if its mass were concentrated at just one point. Intuitively, you can think of the center of mass as the balancing point of the lamina. For instance, the lamina in Example 3 should balance on the point of a pencil placed at $\left(0, \frac{16}{7}\right)$, as shown in Figure 14.39.

Moments of Inertia

The moments of M_x and M_y used in determining the center of mass of a lamina are sometimes called the **first moments** about the x- and y-axes. In each case, the moment is the product of a mass times a distance.

$$M_x = \int_R\int (y)\underbrace{\rho(x, y)\, dA}_{\text{Mass}} \qquad M_y = \int_R\int (x)\underbrace{\rho(x, y)\, dA}_{\text{Mass}}$$

Distance to x-axis (for M_x); Distance to y-axis (for M_y)

You will now look at another type of moment—the **second moment,** or the **moment of inertia** of a lamina about a line. In the same way that mass is a measure of the tendency of matter to resist a change in straight-line motion, the moment of inertia about a line is a *measure of the tendency of matter to resist a change in rotational motion.* For example, when a particle of mass m is a distance d from a fixed line, its moment of inertia about the line is defined as

$$I = md^2 = (\text{mass})(\text{distance})^2.$$
